(1) Evolution code : N=New, R=Revised, E=Effectivity, M=Moved

Intentionally left blank

This table gives, for each delivered aircraft, the cross reference between:

- The Manufacturing Serial Number (MSN).
- The Fleet Serial Number (FSN) of the aircraft as known by AIRBUS S.A.S.
- The registration number of the aircraft as known by AIRBUS S.A.S.
- The aircraft model.

M[(1)]	MSN	FSN	Registration Number	Model
	0035		HL7611	380-861
	0039		HL7612	380-861
	0059			380-861
	0068			380-861
	0075			380-861

MAIN FCOM CHANGES

Applicable to: ALL

INTRODUCTION

PURPOSE

The purpose of the Main FCOM Changes is to provide general information about this FCOM revision and to highlight the main changes.

Note: *In addition, each Documentary Unit (DU) provides highlights with the reason(s) for change and uses revision bars to indicate the revised sections.*

TIMEFRAME

The Main FCOM Changes are defined on a monthly basis, regardless of the revision cycle that is applicable to each Operator.
The subjects in the Main FCOM Changes are categorized by month, but include revision information from the preceding 6 months only.

JULY 2011

INTRODUCTION OF A TEMPORARY ABNORMAL BEHAVIOR CHAPTER RELATED TO THE FMS L2 STANDARD

Due to a misbehavior of the FMS L2 standard, the managed speed mode will revert to the selected speed mode 5 s after sequencing the MAP (Missed Approach Point), if the Vapp is the one computed by the FMS.
This misbehavior does not occur if, before sequencing the MAP (e.g during descent preparation), the flight crew manually enters the Vapp on the APPR panel of the FMS PERF page.

DECOMPRESSION DECELERATION DEVICE (DDD)

A caution is added in the cockpit door description chapter to highlight that the DDD should not be touched, to avoid damage to the device.

JUNE 2011

INTRODUCTION OF OEB 13: ERRONEOUS BAROMETRIC REFERENCE AFTER FCU RESET

If the Flight Control Unit (FCU) is switched OFF then ON, the barometric reference can erroneously initialize, at FCU power-up, to the default mode and value QNH 1013.

This erroneous barometric reference can appear on:
- One EFIS CP only, or
- Both EFIS CPs simultaneously.

In the case of FCU reset via the FCU brightness knob, the flight crew should check the barometric reference on both EFIS CPs, and set the appropriate mode and value if erroneously displayed.

INCREASE OF MAXIMUM CROSSWIND FOR LANDING (EA ENGINES)

The maximum certified crosswindat landing is increased from 35 kt to 40 kt. (30 kts for Korean air)

MAY 2011

No main FCOM change in May.

INTRODUCTION OF ATQC L50 V12 - ETC 39 (MP T81521)

Integration of the FCOM temporary information, associated with the ATQC database L50 V12 / ETC n° 39 (MP T81521).
In the case of an intermittent short-circuit, the GEN reset may result in the GEN recovery. An intermittent short-circuit may trigger several ELEC GEN 1(2)(3)(4) FAULT or the ELEC APU GEN A(B) FAULT alerts with the recovery of the GEN at each reset.
A GEN reset on intermittent short-circuits may result in an overvoltage or an overcurrent in the electrical network leading to potential damage on the equipment supplied by this power source.
Because at the time the ELEC GEN 1(2)(3)(4) FAULT or the ELEC APU GEN A(B) FAULT alert triggers the flight crew cannot identify whether the short-circuit is permanent or intermittent, they should not reset the GEN.
Therefore, ETC n°39 modifies the ELEC GEN 1(2)(3)(4) FAULT and the ELEC APU GEN A(B) FAULT alert to remove the GEN A(B) reset.

LOSS OF FMS VERTICAL FUNCTIONS WHEN PRESETTING THE QNH

Integration of a FCOM temporary DU on the preset of the QNH on the EFIS CP.
If the flight crew presets a QNH value equal to the lower(upper) limit, i.e. 745 hPa (22.00 inHg) or 1 100 hPa (32.48 inHg), the vertical functions on the master FMS side are lost.
Therefore, the flight crew should not preset a QNH limit value, i.e. 745 hPa (22.00 inHg) or 1 100 hPa (32.48 inHg)..
As soon as the flight crew changes the preset QNH value to another value, all FMS vertical functions are recovered.

MARCH 2011

INTRODUCTION OF A TEMPORARY FCOM DU RELATED TO THE FMS L2 STANDARD

Due to a misbehavior of the FMS L2 standard, the BARO/RADIO MINIMUM inserted on the APPR panel of the FMS ACTIVE/PERF and SEC/PERF pages is automatically rounded off to the nearest ten feet (e.g. 222 ft becomes 220 ft, 225 ft becomes 230 ft, and 240 ft stays 240 ft, etc.).
The APPR Panel of the FMS PERF pages and the PFD then display the rounded off BARO/RADIO MINIMUM value. The FWS also uses the rounded off BARO/RADIO MINIMUM value to trigger automatic callouts.
To cover this misbehavior, if the BARO/RADIO MINIMUM value is not a multiple of ten, the flight crew should insert on the APPR panel of the FMS PERF pages a BARO/RADIO MINIMUM value rounded up to the nearest ten feet. For example, if the MINIMUM is equal to 91 ft, the flight crew should insert '100 ft' on the APPR panel.
The SOP / Descent Preparation / FMS section is temporarily revised to reflect this recommendation.

INTRODUCTION OF ATQC L50 V11

Integration of the FCOM temporary information, associated with the ATQC database L50 V11 (MP T81448):

ETC n°0038 (MPT81449)

Several seals of aileron servocontrols (excluding EHAs) have defective seals, that can lead to a hydraulic leak. The leak has no impact as single failure, and does not lead to the loss of the associated hydraulic system. However, if the leak is combined with the loss of the associated hydraulic system, the servocontrol may lose the damping mode.
Therefore, if several failures affecting hydraulic system, PRIM, EHA, and ailerons are combined, and if the aircraft is flying at Mach 0.85, or above, undamped oscillation surface may occur.

To avoid the undamped surface oscillation from occurring, for aircraft with affected servocontrols, ETC n° 38 updates the following procedures:
- ELEC DC 1 BUS FAULT
- ELEC DC 2 BUS FAULT
- F/CTL L(R) OUTR AILERON FAULT
- F/CTL PRIM 1(2)(3)FAULT
- HYD G(Y) SYS PRESS LO
- HYD G+Y SYS PRESS LO

Overweight Landing

The Overweight Landing procedure requests to target VLS at the runway threshold. However, there are two cases in which the speed should not be reduced to VLS in the case of an overweight landing:

- If the flaps are locked, the approach speed is increased to ensure a sufficient tailstrike margin
- In the case of a double elevator fault, the approach speed is increased to ensure adequate manoeuvrability during the flare.

With ATQC L50 V11, the Overweight Landing procedure is updated to take into account these two cases.

INTRODUCTION OF TEMPORARY INFORMATION RELATED TO CAT 2 INOP STATUS

A CAT 2 message may appear on the INOP SYS section of the STATUS page, with no associated alert. This may happen in the case of a departure from a runway with no ILS, following a FMS reset.
The message should disappear if the flight crew temporarily tune an ILS on the POSITION / NAVAIDS page of the MFD.
The SOP / After Start section, and the Supplementary Procedures / Computer Resets / FMC A(B)(C) reset procedure are revised to reflect the above recommendation.
The FMS L2 Standard will cancel the OEB that requests FMC reset before each flight.
Therefore, the TDU SOP / After Start will be cancelled for aircraft with the FMS L2 Standard.

STANDARD OPERATING PROCEDURES (SOPs)

In the FMS Initialization chapter of the cockpit preparation, deletion of the recommendation to use the XCHECK WITH AVNCS function in order to check to performance data. At that stage of the flight preparation, the check of the takeoff weight may not be correct if refuel is not finished.

LIMITATIONS

Deletion of the ATA 32/Nose wheel steering offset limitation because this limitation is addressed in the MMEL.

INTRODUCTION OF BTV STEP 2 (MOD/MP 70408/T78730)

BTV step 2 introduces the availability of the Runway Overrun Warning and Runway Overrun Protection (ROW/ROP) when landing without autobrake.
BTV step 2 removes the operational limitations related to the selection of an exit less than 300 m from the runway end (150 m for CAT II/CAT III approaches).
BTV step 2 removes the limitation related to runways with a descending slope of more than 1.5%.

The alert BRAKES RWY OVERRUN PROT LOST is replaced by the alert SURV ROW/ROP LOST.

INTRODUCTION OF FWS STANDARD L51 (MOD 70027/MP T78651)

The FWS standard L51 introduces several minor changes on various procedures (e.g. changes in INOP SYS, in flight phases inhibition, wording, annunciations, actions).

It also introduces major procedural changes:

- NAV UNRELIABLE AIR SPEED INDICATION: The ECAM displays the entire NAV UNRELIABLE AIR SPEED INDICATION procedure without referring to the QRH
  A QRH revision will be issued before end of may 2011 to remove the Unreliable Air Speed procedure from the QRH.
- NAV ALL AIR DATA DISAGREE: The ECAM displays the entire NAV ALL AIR DATA DISAGREE procedure without referring to the QRH
- The ELEC EMER CONFIG procedure is updated:
  - Addition of a GENs reset procedure with BUS TIE off when the first GENs reset was not successful
  - Update of the APU CONSIDER display logic and wording, based on the aircraft current flight level when the alert triggers and based on the current maximum restricted flight level.
- Addition of the following alerts to the takeoff configuration test logic (If at least 3 GENs are concerned):
  - ELEC DRIVE 1(2)(3)(4) DISCONNECTED
  - ELEC GEN 1(2)(3)(4) FAULT
  - ELEC GEN 1(2)(3)(4) OFF.
- The ENG RELIGHT IN FLIGHT procedure is updated to take into account single or multiple engine relights (eg following a successful engine relight in an all engine flameout situation).

INTRODUCTION OF FGCU P9, SEC S9, AND FCDC F9 SOFTWARE STANDARDS (MOD 70683/MP T78703)

In the case of loss of segregation of the AC, or DC busbars, the display of CAT 3 SINGLE, or CAT 3 DUAL was not frozen below 200 ft. The FCDC F9 standard corrects this deviation.
In addition, these software standards of Flight Controls Computers introduce minor logic improvements (e.g. A/THR soft mode is deactivated below VLS).

INTRODUCTION OF 'NAV IN GO-AROUND' OPTION (MOD 70854/T81205)

In order to reduce the flight crew workload, this option enables to keep the NAV mode engaged, or to automatically arm the NAV mode, at the initiation of the go-around. The flight crew does not need to push the HDG/TRK knob immediately after go-around.
The Aircraft System / 22-Flight Guidance / AP/FD Modes / Go-Around is modified for aircraft having this option.

DECEMBER 2010

NEW FMS L2 STANDARD (MP T77504)

This FCOM revision introduces the following improvements of the new FMS L2 standard:

Cancellation of one Abnormal Behavior of the FMS EIS Standard: Erroneous Triggering of the STEP DELETED IN TMPY/SEC1(2)(3) Message

If the flight crew performs a direct to with abeam, an existing step is not deleted. However the FMS EIS standard erroneously triggered the STEP DELETED IN TMPY/SEC1(2)(3) message. This abnormal behavior is corrected with the FMS L2 standard.

FUEL&LOAD Page: MIN FUEL AT DEST

The FUEL&LOAD page is modified to enable the flight crew to manually enter a MIN FUEL AT DEST value. The SOPs / Cockpit Preparation / MFD FMS initialization / Fuel and Load are modified to give to the flight crew the ability to insert the MIN FUEL AT DEST during cockpit preparation.

PERF Page: PACKS and ANTI-ICE Fields

The organization of the T.O panel of the PERF page is changed in order to add two new settings: PACKS and ANTI-ICE. The SOPs / Cockpit Preparation / MFD FMS initialization / Takeoff Performance are modified to reflect these modifications.

AIRWAYS Page

For the FMS EIS standard, the flight crew can only enter a sequence of airways on the AIRWAYS page. For the FMS L2 standard, the flight crew can enter a sequence of airways and waypoints on the AIRWAYS page.

HOLD Page

For the FMS L2 Standard, in order to compute the time to exit the HOLD, the FMS considers an EXTRA fuel = 0 at the primary destination (instead of an EXTRA fuel = 0 at the alternate destination for the FMS EIS standard). As a consequence, on the HOLD page, the message LAST EXIT (FOR EXTRA FUEL=0 AT ALTN) is replaced by LAST EXIT (FOR EXTRA FUEL=0).

COMPANY T.O DATA REQUEST and RECEIVED COMPANY T.O DATA Page

The layout of the COMPANY T.O DATA REQUEST and RECEIVED COMPANY T.O DATA pages is modified.
On the RECEIVED T.O DATA page, the TOW received from the company is crosschecked with the TOW computed by the FMS. For the FMS L2 standard, if the received TOW is outside an acceptable margin, the received TOW appears in amber on the RECEIVED

COMPANY T.O DATA page. When in addition the received runway matches the runway selected on the active flight plan, the UPLINK/ACTIVE TOW DISAGREE message also appears on the RECEIVED COMPANY T.O DATA page (instead of the CHECK T.O DATA message for the FMS EIS standard) .

Data Entry Format for LAT/LONG

The format XDD°MM.M or DD°MM.MX is now a possible entry format for latitudes.
The format YDDD°MM.M or DDD°MM.MY is now a possible entry format for latitudes.
In addition, the following note related to LAT/LONG entry is no longer applicable:

Note: *The flight crew cannot enter only the degrees. If the flight crew enters, for example, N12/W120, the FMS will read this as N0012.0/W00120.0.*

With the FMS L2 standard, if the flight crew enters, for example, N12/W120, the FMS will read this as N12°00.0/W120°00.0.

SID Display on ND

For the FMS L2 Standard, the SID name (if the SID exists in the flight plan) appears on the ND during departure.

FLS anchor point display on ND

For the FMS L2 standard, the ident of the FLS anchor point is the ICAO code of the airport, followed by the threshold runway identifier (e.g. LFBO33L). For the FMS EIS standard, the ident of the FLS anchor point is RWYxxx, where xxx is the ident of the runway threshold (e.g. RWY33L).

Display of the Safety Height in QFE on VD (if QFE option installed)

The safety heights are now displayed on the VD when the QFE barometric setting is selected.

LOC Beam on ND

The LOC beam is displayed on the ND when an ILS, LOC or BAC approach is selected in the active flight plan. The LOC beam appears as a dotted magenta line.

NORMAL PROCEDURES/SOPs/COCKPIT PREPARATION

- In the SEC F-PLN part of the FMS Initialization, addition of the recommendation to erase the SEC data from the previous flight before creating a new SEC flight plan
- The chapter associated with the MFD ATC COM is moved before the flight crew obtains the ATC Clearance (instead of after they obtain the ATC clearance) in order to cover the case where the ATC clearance is obtained via datalink.

  That chapter contains:
  - A new action to erase all CPDLC messages from the previous flight before starting a new flight, in order to avoid confusing messages from the previous flight
  - The action to check that the ADS is armed if ADS services are expected. The action to check the ADS connected ground stations is deleted because the ground stations are usually not connected when the aircraft is on ground.

  The associated tasksharing table is modified accordingly.

INTRODUCTION OF THE FADEC 10.6 STANDARD APPLICABLE TO ROLLS ROYCE T900 ENGINE TYPE (MP T81353 - SB 73-8011)

The new FADEC standard 10.6 introduces a new engine protection to ensure that the Intermediate Pressure (IP) turbine remains contained in the case of an IP shaft failure between the compressor and the turbine.
In the case of a IP shaft failure, the FADEC automatically shutdowns the engine to prevent the IP turbine from reaching an overspeed that would lead to an uncontained IP turbine. Associated with the automatic engine shutdown, the FADEC triggers the ENG 1(2)(3)(4) FAIL - SHAFT FAILURE ECAM alert.

ADDITION OF A NOTE IN THE TRANSFORMER RECTIFIER (TR) 1(2)(ESS) RESET PROCEDURE

Addition of the note to inform that the flight crew should not pull the TR reset button more than 5 s during a TR reset, to avoid latching the ELEC TR 1(2) (ESS) FAULT alert.

NOVEMBER 2010

INTRODUCTION OF AN FMS TEMPORARY FCOM DU

When the flight crew tries to enter a reference ident in REF1(2) field on the EQUI-TIME POINT page, the FMS may erroneously reject the entered ident and display the NOT ALLOWED message in the FMS Message Area.

Two FCOM Temporary DUs - one per FMS standard - are issued to introduce this FMS misbehavior:

- For the FMS EIS (Entry Into Service) standard, the FMS misbehavior may occur after a manual or an automatic clear of REF1(2) field
- For the FMS L2 standard, the FMS misbehavior may occur only after an automatic clear of REF1(2) field. The anomaly is corrected for the manual clear of REF1(2) field.

NEW FMS L2 STANDARD (MP T77504): CANCELLATION OF FMS MISBEHAVIORS

The new FMS L2 standard cancels the following misbehaviors of the FMS EIS standard:

Erroneous Deletion of the Alternate Airport and Alternate Flight Plan

For the EIS standard, the FMS erroneously deleted the alternate flight plan when the flight crew activates the EOSID.

Erroneous Deletion of the Wind at Destination

For the EIS standard, the FMS erroneously deleted the wind at destination values, if the flight crew performs a go-around during an approach that has no associated missed approach.

Erroneous Display of the Cruise Wind Direction and Velocity

For the EIS standard, the FMS erroneously displayed the wind direction and velocity when the flight crew entered twice the same altitude in the altitude entry field.

Erroneous Display of the Offset Trajectory

For the EIS standard, for small offset values and at high speed, the FMS may not correctly display a part of the offset trajectory.

Erroneous Speed Label on the PERF Page in Engine-Out

For the EIS standard, the CLB panel of the PERF page displayed an erroneous managed speed target label in engine-out and when the aircraft was in level flight.

Erroneous Predictions when Flying a Holding Pattern in Lateral Selected Mode

For the EIS standard, the FMS may compute erroneous flight plan predictions when the aircraft flies a hold, and the NAV mode is not engaged.

Loss of Predictions After a Minor FMC Reset

For the EIS standard, after a minor FMC reset, the flight plan predictions may be lost.

Automatic FMC Reset At Access to the WIND Page

For the EIS standard, when the flight crew tried to access the WIND page, an automatic reset of the onside FMC occurs. Afterwards, the flight crew could no longer consult or change the winds on the WIND page.

Speed Change Indicator Not Displayed for CMS in HDG/TRK

For the EIS standard, in HDG/TRK mode and when the managed speed mode is active, the ND did not display the speed change indicator for a Constant Mach Segment (CMS).

Cancellation of ETC n°10

For the EIS standard, if one of the two alerts FQI FAULT, or FQMS 1+2 FAULT was triggered, the flight crew had to disregard the FMS fuel predictions, because the FMS fuel predictions were based on the FOB and GW from WBBC and their accuracy was degraded. For the L2 standard, the FMS computes its own FOB and GW based on Fuel Used, in the case of FQI FAULT or FQMS 1+2 FAULT. The accuracy of this computation is much better and allows to remove the FMS FUEL PRED DISREGARD line from the ECAM in the case of an FQMS 1+2 or FQI FAULT.

NEW FMS L2 STANDARD (MP T77504): VERT REV PAGE IMPROVEMENT

This FCOM revision introduces the following improvements of the new FMS L2 standard:

RTA Panel

The RTA panel of the VERT REV page is modified in order to provide a better layout of the RTA speed:
- The "ECON-RTA" label is replaced by the "RTA SPD" label
- The "ACTIVE MODE" line is deleted.

STEP ALTs Panel

The STEP ALTs panel of the VERT REV page is modified in order to provide a better layout of the OPTIMUM STEP POINT area:
- The label of the SELECT/UPDATE button is replaced by NEW SEARCH/INSERT AS OPT label
- The message "NO OPTIMUM STEP POINT" is replaced by "NO OPTIMUM STEP FOUND"
- If an optimum step already exists and no better optimum step is found after a NEW SEARCH, the NO NEW OPTIMUM STEP FOUND label appears
- During the optimum step point computation, the values of the distance/time predictions and fuel/time savings are now dashed. In the FMS EIS standard, the optimum step point area displays the NO OPTIMUM STEP POINT message instead of the distance/time predictions and fuel/time savings.

FCOM PURPOSE

Applicable to: ALL

The FCOM is the support documentation for flight crews. It provides them with all the necessary information about the operational, technical, procedural, and performance characteristics of the A380 aircraft, to ensure safe and efficient operations of the aircraft during normal and abnormal/emergency situations, that may occur on ground, or in flight.
The manual is not designed to provide basic jet aircraft piloting techniques, or information, that are considered as basic airmanship for trained flight crews that are familiar with that type of aircraft and with its general handling characteristics.

The FCOM is intended to be used:
- Directly as flight crew operating manual or to provide operators with a basis for their development of a customized airline operations manual, in accordance with applicable requirements
- As a comprehensive reference guide during initial and refresher flight crew training
  Practical and training-oriented information is addressed in the Flight Crew Training Manual (FCTM). *Refer to FCTM/OP-10 Introduction*. Moreover, the FCOM is not intended to be used for teaching basic piloting skills.

The Flight Crew Operating Manual (FCOM) complements the Approved Flight Manual (AFM).
If the data contained in this manual differs from the data in the AFM, the AFM remains the reference.
Airbus encourages all manual holders and users to submit any FCOM question and suggestion to:
E.MAIL: fltops.A380std@airbus.com

FLIGHT OPERATIONS SUPPORT AND SERVICES
1 ROND-POINT MAURICE BELLONTE
31707 BLAGNAC CEDEX, FRANCE
Fax: +33 5 61 93 29 68

FCOM CONTENTS

Applicable to: ALL

The contents of the FCOM are organized in the following four parts:
- System Descriptions (organized by ATA)
- Procedures (normal, abnormal/emergency, supplementary, and special operations)
- Limitations
- Performance (organized by phase of flight).

FCOM USE AND ORGANIZATION

Applicable to: ALL

DEFINITIONS OF WARNINGS, CAUTIONS, AND NOTES

WARNING	Provides operating procedures, techniques, or information that, if not applied, may result in injury or loss of life.
CAUTION	Provides operating procedures, techniques, or information that, if not applied, may result in damage to equipment.
NOTE	Provides operating procedures, techniques, or information that are considered essential to emphasize. A note may also contain safety related information.

INFORMATION TYPES AND LAYERS

The FCOM has technical information that may be used for:
- Flight crew operations in flight, or on ground
- Airlines operations on ground
- Training.

To take the above-noted objectives into account, the FCOM is organized in three layers as follows:
- Layer 1: "Need to know"
  Layer 1 presents information that is necessary in the cockpit.
- Layer 2: "Nice to know"
  Layer 2 presents information that is used as a reference, in order to fully understand the logic of the aircraft and pilot interfaces.
- Layer 3: Detailed information.
  Layer 3 provides more detailed explanations, that are not necessarily needed in flight.

HOW TO USE THE FCOM

Refer to DSC-46-20-50-10 How to Start the OPS LIBRARY .

FCOM REVISIONS

Applicable to: ALL

FCOM REVISIONS

FCOM revisions are issued to add, update, or revise information. The Operator determines the revision periodicity.

When necessary, a revision may be issued in between the defined periodicity (e.g. need for urgent update).
A vertical white bar appears to the left of all revised parts of the manual. The flight crew can display the reason for the change by clicking on the white bar.

L2 If the change is significant, the reason for the change is in bold.

L1 The FCOM also has a list of revisions. The list provides:
- A link to the applicable parts of the manual
- The technical reason for each revision.

TEMPORARY INFORMATION

Some FCOM sections may need a temporary update (e.g. to explain a system behavior that will be modified by a future standard). In such cases, the applicable FCOM section is changed to a Temporary Documentary Unit (TDU).
However, the initial content of the FCOM remains available, and can be accessed from the TDU .
Refer to DSC-46-20-50-10 How to Use Temporary Documentary Units .

OPERATIONS ENGINEERING BULLETINS

Operations Engineering Bulletins (OEB) are issued, when it is necessary to rapidly transmit technical and procedural information.
Refer to OEB-000 Introduction .
The OEB chapter provides a list of all applicable OEB s.

SEL	Select, Selected, Selector, Selection
SELCAL	Selective Calling
SEPDC	Secondary Electrical Power Distribution Center
SFC	Specific Fuel Consumption
SFCC	Slat Flap Control Computer
SFD	Standby Flight Display
SID	Standard Instrument Departure
SIGMET	Significant Meteorological Information
SIRU	Secure Interface Router Unit
SND	Standby Navigation Display
SOP	Standard Operating Procedure
SP	Space, Sampling
SPD	Speed
SPD LIM	Speed Limit
SPDB	Secondary Power Distribution Box
SPEC	Specification
SPECIF	Specification
SPLR	Spoiler
SPLY	Supply
SQWK	Squawk
SR	Specific Range
SRS	Speed Reference System
SS	Sky/Shading
SSA	Side Slip Angle
SSB	Single Side Band
STAR	Standard Terminal Arrival Route
STAT	Static
STBY	Standby
STD	Standard
STL	System Torque Limiter
STRG	Steering
STS	Status
SURV	Surveillance, Surveillance System

M(1)	Localization	DU Title	DU identification	DU date
	DSC-22-FG-80-40	**FCU Brightness Knobs**	00022764.0001001	14 JAN 10
	Criteria: DD **Applicable to: ALL** *Impacted DU: 00017142 FCU Brightness Knobs*			
	Reason for issue: *When the flight crew adjusts the FCU brightness knob, they can inadvertently switch off the FCU. In this case, if they immediately switch it back to on, the FCU erroneously detects a power supply failure, and the AFS CP is lost for the remainder of the flight. The flight crew should wait at least 3 s to switch back to on the FCU.* *The H5.0 FCU standard will correct this issue.*			
	DSC-22-FMS-10-40-30	**Start and Update of Predictions**	00016865.0001001	11 SEP 07
	Criteria: DD **Applicable to: ALL** *Impacted DU: 00007400 Start and Update of Predictions*			
	Reason for issue: *The flight plan predictions may be lost after a single FMC reset.*			

	DSC-22-FMS-20-30	**EQUI-TIME POINT page**	LG00079	
	DSC-22-FMS-20-30	**EQUI-TIME POINT page - Reference Ident**	00023579.0002001	04 NOV 10
	Criteria: T77504, DD **Applicable to: ALL** *Impacted DU: 00016694 EQUI-TIME POINT page - Reference Ident*			
	Reason for issue: *Due to a misbehavior of the FMS , the reference ident may be still kept in the FMS memory after an automatic clear (e.g. following the activation of a secondary flight plan) of REF 1(2) field on the EQUI-TIME POINT page.* *The consequence is that in some cases, the FMS may consider that the reference ident is already selected in the other reference entry field and therefore reject the entered reference ident and display the NOT ALLOWED message.*			

	DSC-22-FMS-20-30	**INIT Page**	LG00084	
	DSC-22-FMS-20-30	**INIT page - FROM TO entry fields**	00019651.0001001	11 SEP 07
	Criteria: DD **Applicable to: ALL** *Impacted DU: 00003510 INIT page - FROM TO entry fields*			
	Reason for issue: *The flight plan re-initialization, by entering the city-pair again, does not clear the performance data.*

	DSC-23-10-20-20	**Cockpit Handset**	00023043.0001001	05 MAR 10
	Criteria: T74757 **Applicable to: ALL** *Impacted DU: 00016492 Cockpit Handset* *Reason for issue:* *This TDU is issued in order to inform the flight crew that the communication between the cockpit and the Flight Crew Rest Compartment (FCRC) via the cockpit handset is not be possible.* *In order to call the FCRC , the flight crew must use the PILOT REST pb on the overhead CALL panel.* *The CIDS software standard 6.0 will correct this issue.*			
	DSC-23-10-30-10	**HF**	00023570.0001001	05 OCT 10
	Criteria: DD **Applicable to: ALL** *Impacted DU: 00002316 HF* *Reason for issue:* *When the HF 1(2) is in data mode, and the ECAM triggers the COM HF 1(2) DATALINK FAULT alert, most of the time, the HF 1(2) should automatically recover from its failure. The HF 1(2) should become operative again, and the ECAM alert should disappear.* *However, if the HF 2 fails in data mode, the HF 2 never recovers from its failure.* *Therefore, if the flight crew wants to use the HF in data mode, the flight crew should preferably use the HF 1 in data mode.* *A future RMP standard will correct this misbehavior.*			
	DSC-23-20	**RMP Overview**	LG00139	
	DSC-23-20	**Internal Communication Transmission Keys and Reception Knobs**	00023122.0001001	16 JUN 10
	Criteria: DD **Applicable to: ALL** *Impacted DU: 00002883 Internal Communication Transmission Keys and Reception Knobs* *Reason for issue:* *When the cabin crew makes a priority call, a buzzer sounds one time in the cockpit, instead of three times.* *However, the priority call still has priority over a normal call.* *This will be corrected by the CIDS software standard 6.0.*			

M(1)	Localization	DU Title	DU identification	DU date
	DSC-31-20-50	**EFIS Control Panel**	LG01538	
	DSC-31-20-50	**Barometric Reference**	00024027.0001001	01 APR 11

Criteria: DD
Applicable to: ALL
Impacted DU: 00000371 Barometric Reference

Reason for issue:

If the flight crew presets a QNH value equal to the lower(upper) limit, i.e. 745 hPa (22.00 inHg) or 1 100 hPa (32.48 inHg), the vertical functions on the master FMS side are lost:

- *If the flight crew presets the QNH limit value on the same side as the engaged AP (e.g. value of 1 100 hPa is preset on CM2 side and AP 2 is ON), on the master FMS side (e.g. CM2 side):*
  - *The predictions, the managed speed target and vertical mode targets are no more computed*
  - *A red scale appears on the VD*
  - *The managed speed target reverts to the selected speed target*
  - *The CLB(DES) mode reverts to OP CLB(VS/ FPA) mode.*
- *If the flight crew selects the QNH limit value on the opposite side of the engaged AP (e.g. pre-set value of 1 100 hPa is set on CM2 side and AP 1 is ON), on the master FMS side (e.g CM1):*
  - *The predictions, the managed speed target and vertical mode targets are no more computed*
  - *A red scale appears on the VD*
  - *If in managed speed mode, the airspeed target on the PFD is erroneous*
  - *If in managed vertical mode, the FD (FPV) may indicate erroneous orders.*

Therefore, the flight crew should not preset a QNH limit value, i.e. 745 hPa (22.00 inHg) or 1 100 hPa (32.48 inHg).. The above behavior is reversible, as soon as the flight crew changes the preset QNH limit value by another value, all FMS vertical functions are recovered.
A future ADIRU standard will correct this issue.

	DSC-46-10-20-70	**ATC MSG pb**	00023312.0001001	16 JUN 10

Criteria: T78399
Applicable to: ALL
Impacted DU: 00011365 ATC MSG pb

Reason for issue:
Due to a misbehavior of the new CLA3.1 ATC standard, the ATC MSG pb may not flash and the associated RING aural alert may not sound when a reminder appears in the ATC mailbox.
This misbehavior will be fixed in the next ATC standard.

	DSC-46-10-40	**How to Manage a Report Message**	00023313.0001001	16 JUN 10

Criteria: T78399
Applicable to: ALL
Impacted DU: 00018548 How to Manage a Report Message

Reason for issue:
Due to a misbehavior of the new CLA3.1 ATC standard, the ATC MSG pb may not flash and the associated RING aural alert may not sound when a reminder appears in the ATC mailbox.
This misbehavior will be fixed in the next ATC standard.

M(1)	Localization	DU Title	DU identification	DU date
	DSC-46-10-40	**How to Manage a Deferred Clearance Message**	00023314.0001001	16 JUN 10
	Criteria: T78399 **Applicable to: ALL** *Impacted DU: 00018549 How to Manage a Deferred Clearance Message* *Reason for issue:* *Due to a misbehavior of the new CLA3.1 ATC standard, the ATC MSG pb may not flash and the associated RING aural alert may not sound when a reminder appears in the ATC mailbox.* *This misbehavior will be fixed in the next ATC standard.*			

	DSC-46-20-50-50	**How to Load Data with the LOAD BOX**	LG02100	
	DSC-46-20-50-50	**Load Data via a USB Device**	00023385.0003001	03 SEP 10
	Criteria: T77588, T78666 **Applicable to: ALL** *Impacted DU: 00022220 Load Data via a USB Device* *Reason for issue:* *SB 46-8041 instals a new antivirus software on laptops fitted with OIS 2B standard. This new antivirus significantly increases the time necessary to load items via the LOAD BOX. Therefore, it is recommended to avoid uploading heavy items (e.g. operational manuals) by using the LOAD BOX.* *This behavior is corrected by the future OIS 2B+ standard.*			

	DSC-49-10	**System Architecture**	LG00411	
	DSC-49-10	**APU Starter**	00021434.0001001	14 NOV 08
	Criteria: DD **Applicable to: ALL** *Impacted DU: 00001759 APU Starter* *Reason for issue:* *This TDU is issued to ask flight crews to monitor the APU flap position before APU start. The flight crew must switch the APU START pb to ON when the APU flap is fully open (FLAP OPEN indication is displayed on the APU SD page).* *This will be corrected by a future APU ECB standard, that will monitor the flap position before starting the APU.*

OVERVIEW

Applicable to: ALL

The aircraft is a Very Long Range (VLR), subsonic, civil transport aircraft that has two passenger decks.

COCKPIT

The cockpit has two seats, designed for a two-member flight crew, and has three additional seats for observers.

CABIN

The passenger seating layout may vary, depending on Operator requirements. The certified maximum number of passengers is 853.
The two passenger decks offer a wide range of cabin arrangement possibilities. Each deck can either be serviced from the main deck only, or from both decks simultaneously.

CARGO

There are three cargo compartments under the main deck:
- Forward cargo compartment
- Aft cargo compartment
- Bulk cargo compartment

CREW REST COMPARTMENT

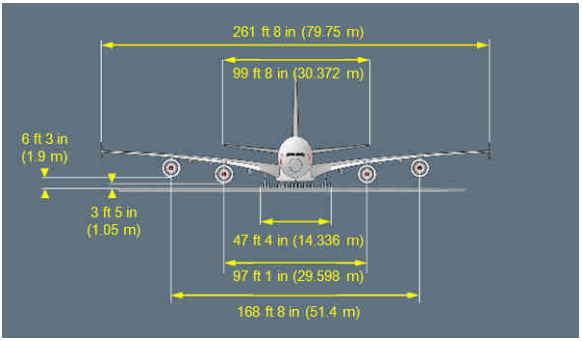
The aircraft has a:
- Flight crew rest compartment
- Lower cabin crew rest compartment.

Intentionally left blank

MAIN DIMENSIONS

Applicable to: ALL

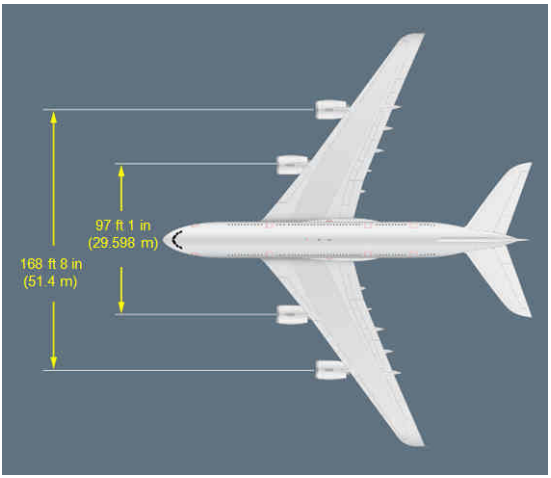
Front Dimensions



Note: *The height of the engines above the ground is displayed for MTOW.*

Side Dimensions

Top Dimensions



FUSELAGE

Applicable to: ALL

The aircraft has a full-length, double-deck fuselage, with a main and upper deck. The cockpit is between these two decks. Both decks can be accessed via cabin stairs, and galley lifts.

Each deck can have up to:
- 10 seats abreast in each row of the main deck
- 8 seats abreast in each row of the upper deck.

The aircraft has 8 pairs of large passenger doors. Five of these are on the main deck, and three on the upper deck.

WING

Applicable to: ALL

The wing has four engine pylons and supports the wing main landing gear.
L2 It has an area of 9 104 ft² and spans 261 ft 8 in.

L1 Each half-wing has the following moving surfaces:
- 3 ailerons that are used at low speeds. Some can be inhibited, depending on aircraft speed
- 8 moving surfaces that are used in various combinations as lift dumpers, spoilers, or speed brakes
- 8 slat surfaces for high-lift configurations
- 3 single-slotted flap surfaces for high-lift configurations.

The wing is also used as a fuel tank.

TAIL

Applicable to: ALL

VERTICAL STABILIZER

The vertical stabilizer has two rudder elements.

Tail left

HORIZONTAL STABILIZER

The horizontal stabilizer:
- Has two elevators, each of which is split into two parts
- Is used as a fuel tank.

OVERVIEW

Applicable to: ALL

The air-conditioning system is fully automatic. It provides continuous air renewal, and maintains a constant selected temperature in the cockpit, cabin zones, and in the crew rest compartments.
Air from the air-conditioning system is also used for cargo ventilation.
The bleed air system supplies two aircraft packs, with air from the engines, the APU , or the ground air connectors. This air is cooled in the packs.
This cooled air then flows out of the packs, and is combined with recycled cockpit and cabin air in the mixer unit.
Then, hot air from the bleed system is added to the mixed air, to obtain the selected temperature throughout the cockpit and cabin.
There are temperature selectors on the overhead panel, and in the cabin on the Flight Attendant Panels (FAP s).
In case both packs fail, the mixer unit can directly receive air from outside the aircraft, through the emergency RAM air inlets.

Note: *It is recommended not to exceed 30 min without air conditioning, with passengers on board: The lack of fresh air supply will reduce the quality of cabin air.*

PACKS

Applicable to: ALL

The packs provide cold air by cooling hot bleed air.
There are two packs, and they operate automatically and independently of each other.
Each pack has one heat exchanger, two cooling units (also referred to as REGUL A and REGUL B or Air Cycle Machines (ACM s)), and one pack controller.
In the event both ACM s fail, bleed air is cooled by the heat exchanger only: The pack operates in bypass mode (*Refer to DSC-21-10-30 Air Cycle Machine (ACM) Failures*).
The pack controllers each have two independent channels, and each of these channels can control the entire pack.
In the event a pack controller fails, the associated pack is lost.
For each pack, there are two pack valves. They regulate the quantity of hot bleed air that flows into each pack. The pack valves are automatically controlled by the pack controller, in accordance with the AIR FLOW selector position.

L2 A pack valve will automatically close, if there is not sufficient upstream pressure, or if the FIRE pb of the associated engine is pressed, and the appropriate crossbleed valves are closed.

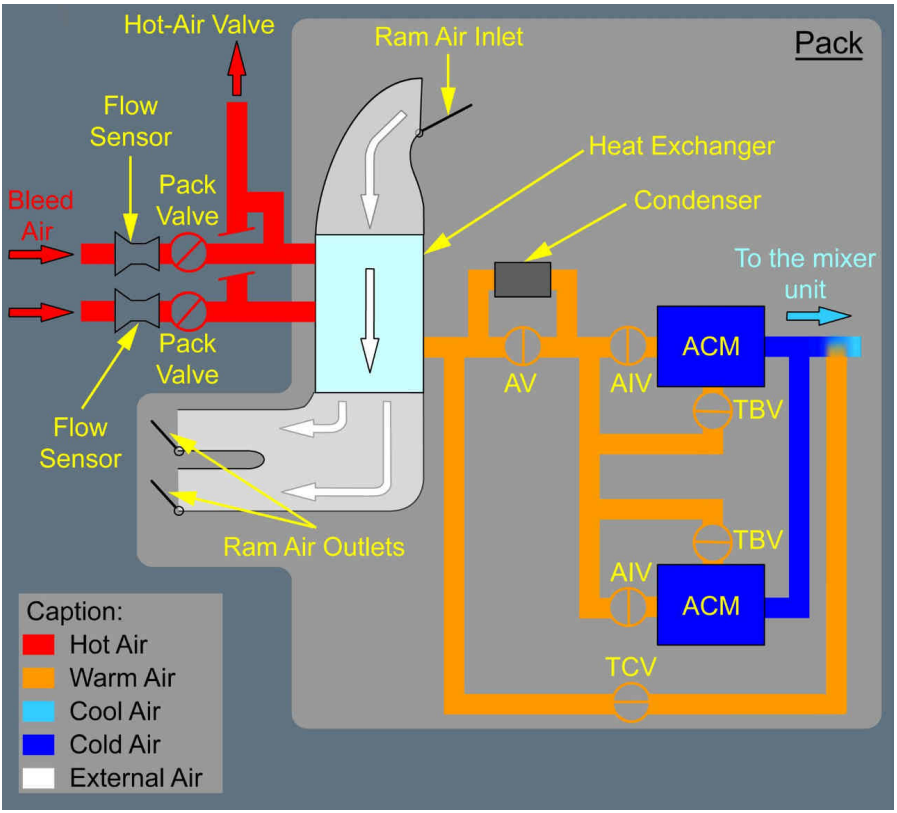
Both pack valves of a pack will automatically close, if:
- The associated PACK pb is set to OFF , or
- The associated pack overheats, and the aircraft is on ground, or
- One onside engine starts, and the crossbleed valves are closed.

All pack valves (of both packs) will automatically close, if:
- The DITCHING pb-sw is set to ON , or
- One door (or more) is opened, and at least one engine is running, or
- Any engine starts, and the crossbleed valves are opened, or
- The FIRE pb of any engine is pressed, and the crossbleed valves are opened.

L3 PACK DESCRIPTION

The hot bleed air flows into each pack, via the two pack valves, then enters the heat exchanger. This heat exchanger precools the air using external air. This external air enters through a ram air inlet door, and is then discharged overboard through two ram air outlet doors.

Pack



The cooled bleed air then enters the two ACM s for further cooling.

- Below FL 290 , a condenser dries the air before it enters the ACM , to prevent ice damage to the ACM . An Altitude Valve (AV) closes to redirect air to the condenser.
- Above FL 290 , the air is sufficiently dry. Therefore, the AV opens, and air goes directly to the ACM .

If an ACM fails, the associated ACM Isolating Valve (AIV) will close to isolate the failed ACM . A Temperature Control Valve (TCV) adjusts the pack outlet temperature, by adding air from the heat exchanger to the pack outlet flow.

If the temperature in the ACM is too low, an assigned bypass valve, in the ACM , will open to increase the temperature. This bypass valve is also referred to as the Turbine Bypass Valve (TBV).

For pack operation, the pack controller controls all the above-mentioned valves.

MIXER UNIT

Applicable to: ALL

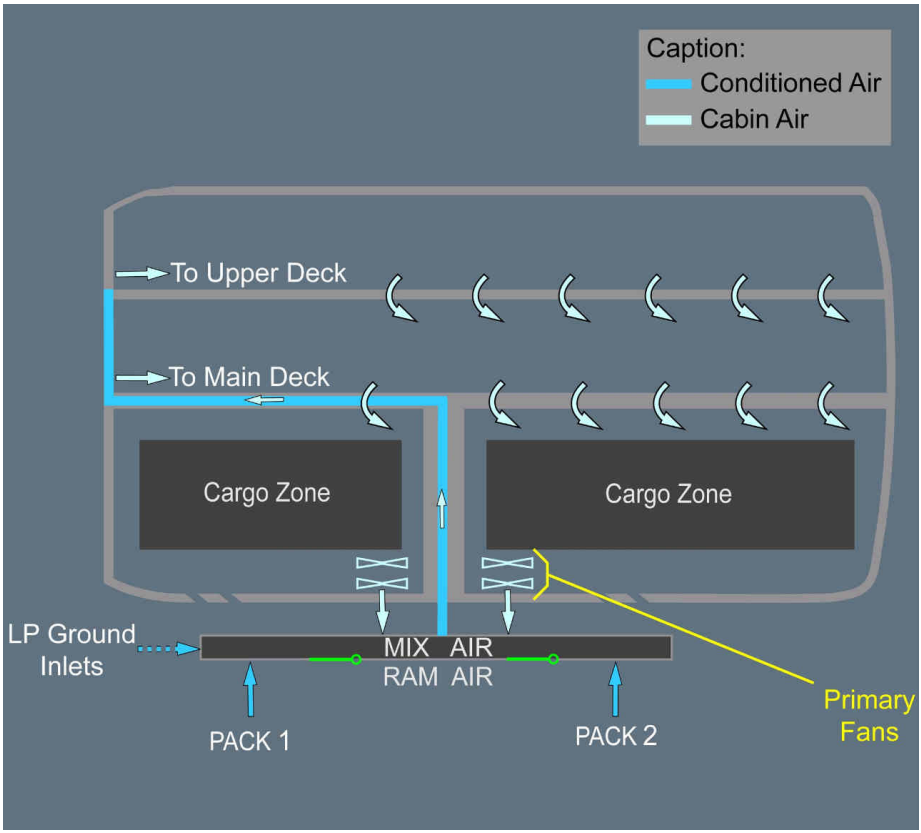
A mixer unit combines cold air from the packs with recycled air from the cockpit and cabin.

L2 The cockpit and cabin air recirculates to reduce the bleed air demand from the packs.

L1 There are four ventilation fans that recirculate cabin air to the mixer unit. These fans are also referred to as primary fans.

L2 There are also some secondary fans that recirculate air from the upper deck to the upper and to the main deck. For more information about cabin air recirculation, *Refer to DSC-21-20-30 Cabin Air Recirculation* .

Mixer Unit



L3 The fans are in the underfloor area of the main deck.
Two of the fans are controlled by the forward ventilation controller, and two by the aft ventilation controller.

L1 On ground, when the packs are off, the mixer unit can obtain cold air through the Low Pressure (LP) ground inlets that are connected to the ground carts.
In case both packs fail, the mixer unit can obtain external air through two emergency RAM air inlets (*Refer to DSC-21-10-10-20 Emergency RAM Air*).

TRIM AIR SYSTEM

Applicable to: ALL

The trim air system adjusts the temperature of the air in each cockpit and cabin zone. Temperature is adjusted by adding hot air from the bleed system to air from the mixer unit. Hot air is added via two hot-air valves and several trim air valves.

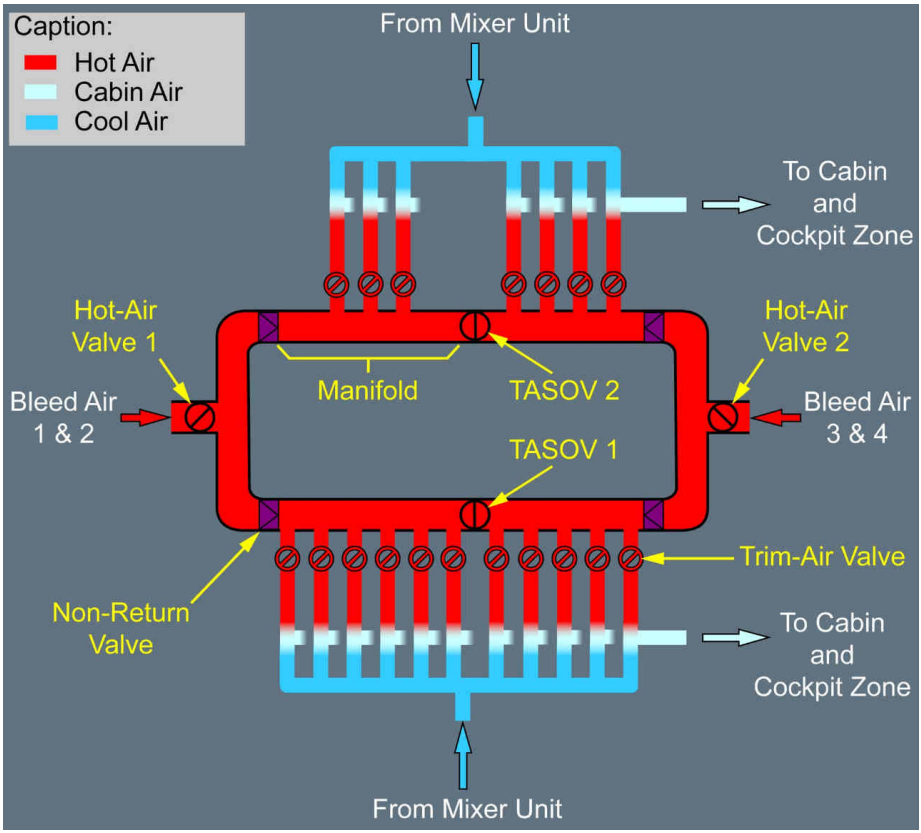
L3 The hot-air valves regulate the hot-air pressure in the trim air system.

Distribution to the cockpit and cabin is made via:

- Four hot-air manifolds
  Each hot-air valve feeds two of the manifolds.
  All of the manifolds are interconnected by two Trim Air Shut-Off Valves (TASOV s) and four trim air non-return valves.
  The TASOV s are normally closed, but they open, in case one trim air valve or one hot-air valve fails (*Refer to DSC-21-10-30 Trim Air Valve Failure*).
- Trim air valves
  There is one trim air valve for each one of the cockpit and cabin zones. There are two trim air valves assigned to the forward cargo compartment. Each trim air valve adds hot bleed air, from the four hot-air manifolds, to the air that comes from the mixer unit, to obtain the selected temperature in its assigned cockpit, cargo, and cabin zone.

There is one temperature controller, that has two independent channels.
Each independent channel the temperature controller can control the entire trim air system.
The temperature controller is hosted on the CPIOM B.

Trim Air System



EMERGENCY RAM AIR

Applicable to: ALL

Two emergency RAM air inlets ventilate the cockpit and cabin, in the event that both packs fail.

L3 The emergency RAM air inlets are controlled by the forward ventilation controller.

L1 The RAM AIR pb on the AIR panel activates the emergency RAM air. When set to ON, air from outside the aircraft flows through two emergency RAM air inlets, directly to the mixer unit, to continue ventilating and cooling both the cockpit and cabin.

L3 The two RAM air inlets are on the belly fairing.

L1 The RAM air inlets only open, if differential pressure is less than one psi.

L3 If differential pressure is greater than one PSI, two non-return valves, downstream of the emergency RAM air inlets, will not open. Therefore, no air will be supplied to the mixer unit.

Intentionally left blank

CABIN, COCKPIT ZONES, AND CREW REST COMPARTMENTS

Applicable to: ALL

CABIN AND COCKPIT

TEMPERATURE REGULATION

The flight crew can:
- Select the cockpit temperature with the COCKPIT selector on the AIR panel
- Select the cabin temperature with the CABIN selector, if the temperature of each cabin zone cannot be selected from the Flight Attendant Panels (FAPs)
- Set the CABIN selector to PURS SEL. In this case, the cabin crew can directly select the temperature of each cabin zone.

L2 The temperature selection ranges from 18 °C to 30 °C.

L3 The pack controller automatically controls the pack outlet temperature to set the temperature of the mixer unit to the lowest cabin temperature demand. Therefore, the cabin zone with the lowest heating demand does not receive any trim air.

The pack controller regulates the outlet temperature of its associated pack by adjusting:
- The Temperature Control Valve (TCV)
- The ram air inlet
- Both ram air outlets
- The Turbine Bypass Valves (TBVs).

Each trim air valve adjusts the temperature of its assigned cockpit and cabin zone.

L1 FLOW REGULATION

The flight crew can use the AIR FLOW selector on the AIR panel to adjust the flow of cold air from the packs, and recirculated air from the cabin/cockpit.

L2 If only one pack operates, or if the APU supplies bleed air, the pack controller automatically adjusts the airflow to high(HI) demand, regardless of the selection on the AIR FLOW selector.

L1 Automatic Mode

When the flight crew sets the AIR FLOW selector to NORM, the airflow in the cabin/cockpit is automatically controlled, depending on the number of passengers entered on the MFD, the aircraft flight level, and the temperature regulation selection on the CARGO AIR COND panel.

L2 The airflow in the cockpit and cabin is automatically controlled by:
- The pack controllers, that control the pack valves
- The ventilation controllers, that control the rotation speed of the cabin fans.

L1 Manual Mode

When the flight crew sets the AIR FLOW selector to one of the following positions, the airflow in the cockpit/cabin is manually selected:
- AIR FLOW selector set to MAN: The pack airflow is a default value
- AIR FLOW selector is set to LO: The pack airflow is 80 % of the MAN default value
- AIR FLOW selector set to HI: The pack airflow is 120 % of the MAN default value.

L2 When in manual mode:
- The airflow calculation does not take into account the number of passengers entered on the MFD, nor the aircraft flight level
- The airflow calculation depends on the temperature regulation selection on the CARGO AIR COND panel
- The rotation speed of the primary fans remains constant.

L1 **CREW REST COMPARTMENTS**

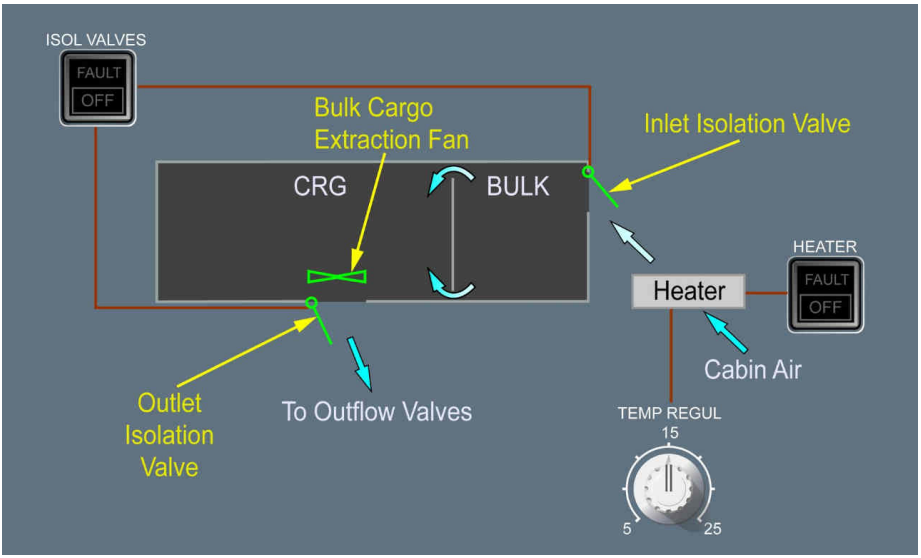
The flight(cabin) crew can adjust the temperature in the flight(cabin) crew rest compartments, with the dedicated temperature selector in each compartment.

BULK CARGO

Applicable to: ALL

The bulk cargo compartment has a temperature regulation system.
L2 The aft ventilation controller controls this system.
L1 Some air from the cabin recirculates into the bulk cargo compartment for ventilation and temperature regulation. This air is extracted by the bulk cargo extraction fan.
The TEMP REGUL selector on the cargo AIR COND panel controls the air temperature in the bulk cargo compartment.
If necessary, to obtain the desired temperature, an electrical heater heats the air that flows into the bulk cargo compartment.
Two isolation valves (one inlet and one outlet isolation valve) permit the isolation of the bulk cargo compartment. These valves are manually controlled using the BULK ISOL VALVES pb-sw on the CARGO AIR COND panel.

Bulk Cargo



FWD CARGO

Applicable to: ALL

The forward cargo compartment has a temperature regulation system, that uses air from the air conditioning system.

L2 The forward ventilation controller controls this system.

L1 Some air from the air-conditioning system flows into the forward cargo compartment for ventilation and temperature regulation. This air is extracted by the forward cargo extraction fan.

L2 The temperature of the forward cargo compartment is regulated with air from the:

- Cabin
- Mixer unit
- Trim air system.

  Two trim air valves are assigned to the forward cargo compartment.

L1 The flight crew selects the temperature of the forward cargo compartment with the FWD TEMP REGUL selector on the CARGO AIR COND panel.

If necessary (e.g. if smoke is detected in the cargo area), it is possible to isolate the forward cargo compartment, by closing the four isolation valves (three inlet isolation valves and one outlet isolation valve) of the forward cargo via the FWD ISOL VALVES pb-sw on the CARGO AIR COND panel.

Air Flow selector

The airflow in the cabin/cockpit is automatically controlled.
For additional information, *Refer to Flow Regulation / Automatic Mode* .

The airflow in the cabin/cockpit is in manual mode.
The pack airflow is a default value.
For additional information, *Refer to Flow Regulation / Manual Mode* .

The airflow in the cabin/cockpit is in manual mode.
The pack airflow is 80 % of the MAN default value.

The airflow in the cabin/cockpit is in manual mode.
The pack airflow is 120 % of the MAN default value.

PACK 1(2) PB

The pack is on, and automatically regulated.

The pack is off.

L12

Comes on:

- When any pack valve position disagrees with the requested position

  Associated with the following ECAM alert:
  - AIR PACK 1(2) VLV 1(2) FAULT (*Refer to procedure*)

- Or when the pack overheats

  Associated with the following ECAM alert:
  - AIR PACK 1(2) OVHT (*Refer to procedure*)

  The FAULT light goes off, when the overheat disappears.

- Or when the pack is failed.
  Associated with one of the following ECAM alerts:
  - AIR PACK 1(2) FAULT (*Refer to procedure*)
  - AIR PACK 1+2 FAULT (*Refer to procedure)*

- Or when there is a bleed leak on one pack.
  Associated the following ECAM alert:
  - AIR PACK 1(2) LEAK (*Refer to procedure)* .

HOT AIR 1(2) pb

The hot-air valve operates, and is automatically-controlled.

The hot-air valve is closed.

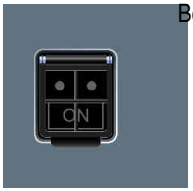
L12

An overheat is detected in the applicable duct.

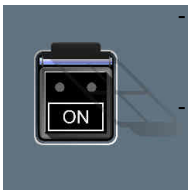
Associated with the following ECAM alerts:
- COND HOT AIR 1(2) FAULT (*Refer to PRO-ABN-ECAM-10-21-10-150 COND HOT AIR 1(2) FAULT*)
- COND DUCT OVHT (*Refer to PRO-ABN-ECAM-10-21-10-190 COND DUCT OVHT*).

The FAULT light goes off, when the temperature decreases below 70 °C , and the HOT AIR 1(2) pb is set to OFF .

RAM AIR PB



Both RAM air inlets are closed.



- When the differential pressure is lower than 1 PSI, and provided the DITCHING pb, on the CAB PRESS panel, is not set to ON: The RAM air inlets will open, and each outflow valve will open to approximately 50 %.
- If the differential pressure is higher than, or equal to, 1 PSI: Each outflow valve will continue to operate normally. The RAM air inlets remain closed.

Cockpit selector

The cockpit temperature is 24 °C.
Each gradation corresponds to 2 °C.

Note: Any selection change makes the system blow colder, or hotter air into the cockpit. This may result in temporary discomfort for the flight crew. To reach a stabilized temperature in the cockpit, the air conditioning system needs approximately 20 min: 10 min are necessary for cockpit temperature adjustment, and 10 min are necessary to compensate heat dissipation from the cockpit systems. After selecting a temperature value, wait until the cockpit temperature stabilizes, before selecting a new temperature.

CABIN selector

The cabin temperature is 24 °C.
Each gradation corresponds to 2 °C.

Note: *Any selection change makes the system blow colder, or hotter air into the cabin. This may result in temporary discomfort for the passengers. To reach a stabilized temperature in the cabin, the air conditioning system needs approximately 20 min: 10 min are necessary for cabin temperature adjustment, and 10 min are necessary to compensate heat dissipation from the cabin systems. After selecting a temperature value, wait until the cabin temperature stabilizes before selecting a new temperature.*

Cabin temperature regulation is only controlled from the Flight Attendant Panel (FAP).

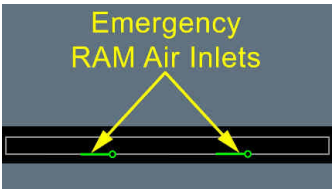
Mixer Unit



The emergency RAM air inlet is closed.

The emergency RAM air inlet is open.

The emergency RAM air inlet is abnormally closed.

The emergency RAM air inlet is abnormally open.

HOT AIR INDICATION

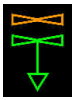
The hot-air valve is open.

The hot-air valve is abnormally open.

The hot-air valve is closed, with both associated pack valves closed.

The hot-air valve is closed, with at least one of the two associated pack valves open.

PRIMARY FANS

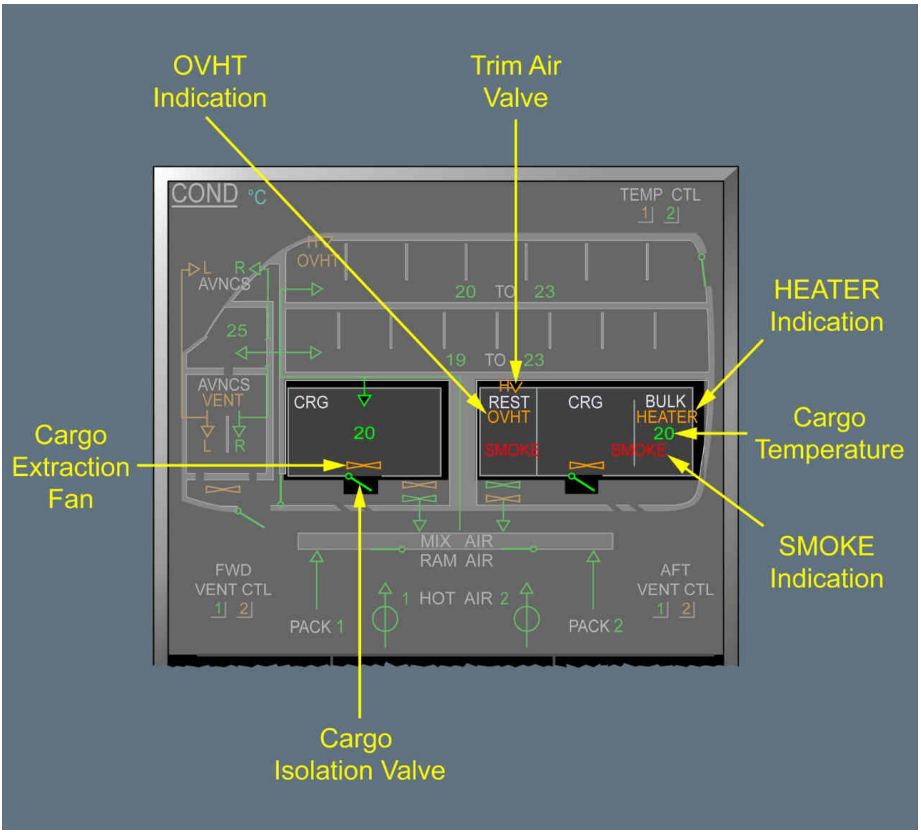


Nothing appears, when all primary fans operate.
The amber primary fan is failed.

CARGO

Applicable to: ALL

Cargo



BULK (FWD) CARGO TEMPERATURE

22

Indicates the current temperature in the bulk (forward) cargo compartment (in Deg. C).

BULK (FWD) CARGO EXTRACTION FAN

Nothing appears, when the bulk (forward) cargo fan operates.

The bulk (forward) cargo fan is failed.

BULK (FWD) CARGO ISOLATION VALVE

The bulk (forward) cargo outlet isolation valve is open.

The bulk (forward) cargo outlet isolation valve is abnormally open.

The bulk (forward) cargo outlet isolation valve is closed.

HEATER INDICATION

Nothing appears, when the bulk cargo heater operates.
The bulk cargo heater is failed, and the temperature in the bulk cargo compartment cannot be regulated.

SMOKE INDICATION

Smoke is detected in the indicated area (aft and bulk cargo compartment).

OVHT INDICATION

There is a duct overheat in the indicated cargo compartment.

TRIM AIR VALVE

The trim air valve in the indicated cargo compartment is failed.

CAB PRESS SYSTEM DISPLAY

Applicable to: ALL

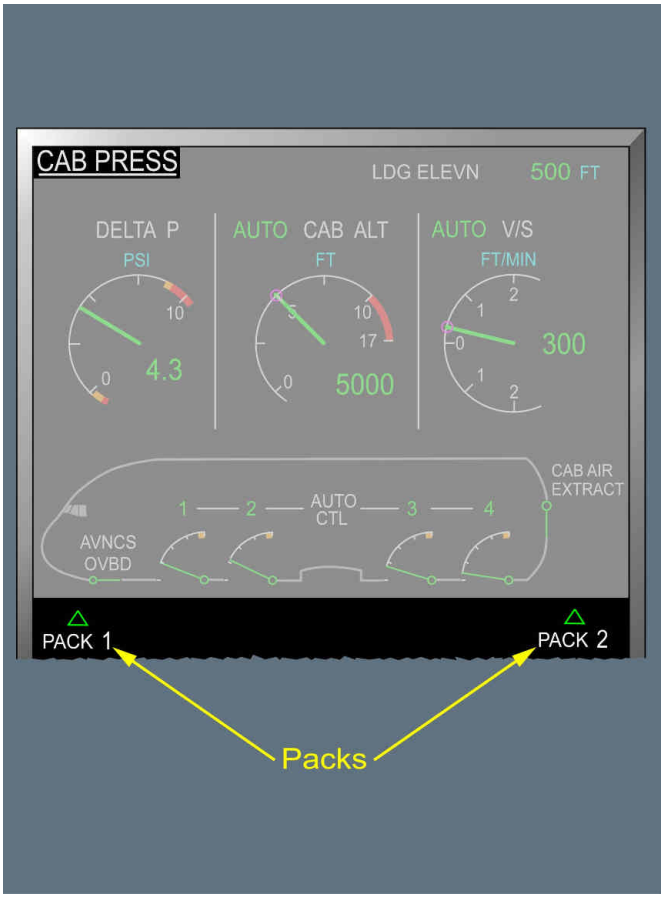
CAB PRESS System Display



PACKS

The pack valves associated with the pack are open.

The pack valves associated with the pack are closed.

MEMO

Applicable to: ALL

MEMO

RAM AIR : The emergency RAM air inlets are open, and the aircraft is on ground with no engine running.

RAM AIR : The emergency RAM air inlets are open, in all other cases.

AIR CYCLE MACHINE (ACM) FAILURE

Applicable to: ALL

- In the case one ACM of a pack fails, the other ACM continues to operate. The pack is still available, and there is no operational impact.

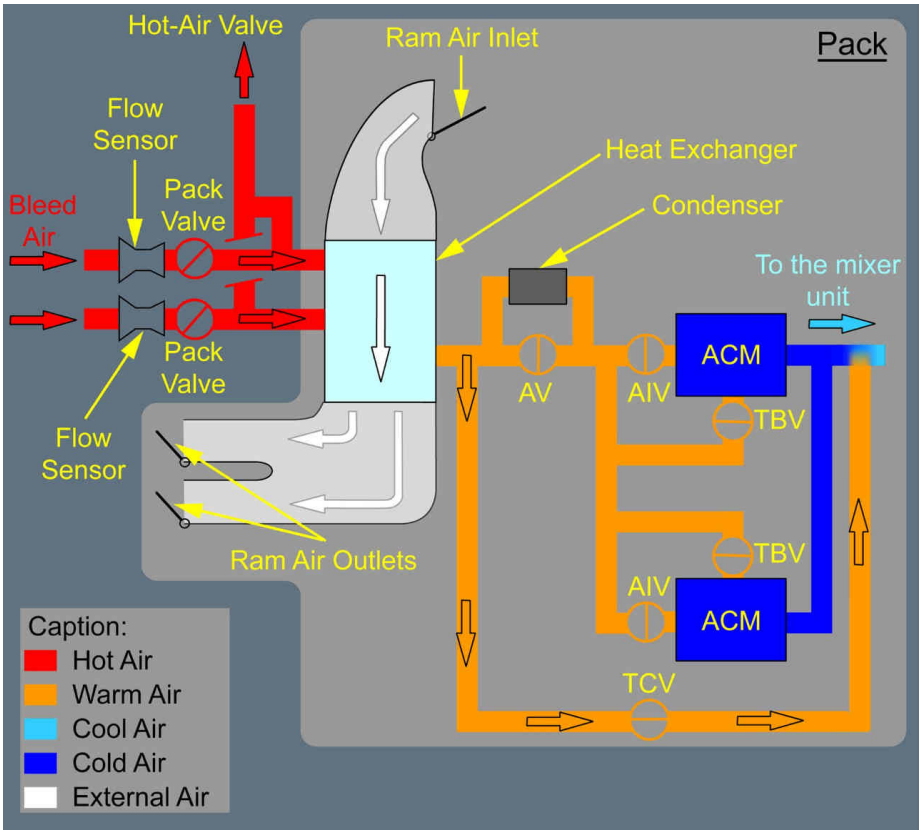
L2 *Note:* *The pack outlet temperature displayed on the BLEED SD page is the highest temperature of both ACM s. Refer to DSC-21-10-20-40 BLEED System Display . As a result, if one ACM of a pack fails, the indicated temperature may be the temperature of the failed ACM . In this case, the pack outlet temperature of the affected pack may be higher than the pack outlet temperature of the not affected pack.*

L1 - In the case both ACM s of a pack fail, the pack operates in bypass mode. Only the heat exchanger is used to cool the air from the bleed system.

In this configuration:

- Below FL 290: The pack must be set to OFF .
- Above FL 290: The pack can be used but pack performance is degraded.

Above FL 290 – Bypass Mode



TRIM AIR VALVE FAILURE

Applicable to: ALL

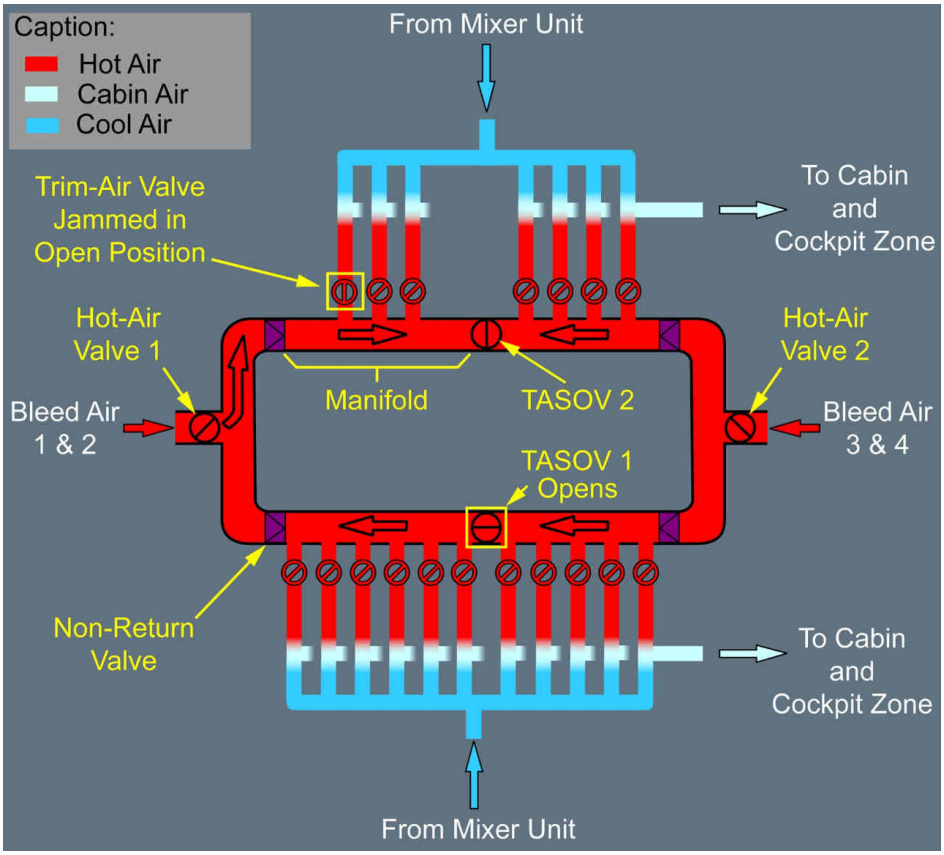
- If one TAV is jammed in closed position: Optimized temperature regulation will be lost in the affected zone.

L2 The affected zone is indicated on the COND system display (*Refer to DSC-21-10-20-50 Trim Air Valve (TAV)*).

L1 - If one TAV is jammed in open position: Temperature regulation in some cabin zones may be slightly degraded.

L3 The following graphic shows the trim air system with one trim air valve jammed in open position.

Trim Air Valve Jammed Open



In this example, the temperature controller:

- Opens TASOV 1,
- Controls the hot-air valve 2 to regulate the airflow of hot-air in the not affected manifolds
- Controls the hot-air valve 1 to regulate the airflow of hot air in the affected manifold. This airflow will depend on the heating demand of the affected cabin zone.

OVERVIEW

Applicable to: ALL

The aircraft has a fully automatic ventilation system that ventilates:

- The avionics bays
- The cockpit and cabin zones
- The IFE center
- The pack bays
- The bulk and aft cargo compartment.

Two ventilation controllers (forward and aft) control and monitor the ventilation systems of:

- The cockpit and cabin zones
- The IFE center
- The pack bays
- The bulk and aft cargo compartment.

Each ventilation controller has two redundant channels.

The ventilation system of the avionics bays has an assigned controller.

L3 The avionics ventilation system is independently controlled by an assigned function of the CPIOM B.

Intentionally left blank

AVIONICS VENTILATION DESCRIPTION

Applicable to: ALL

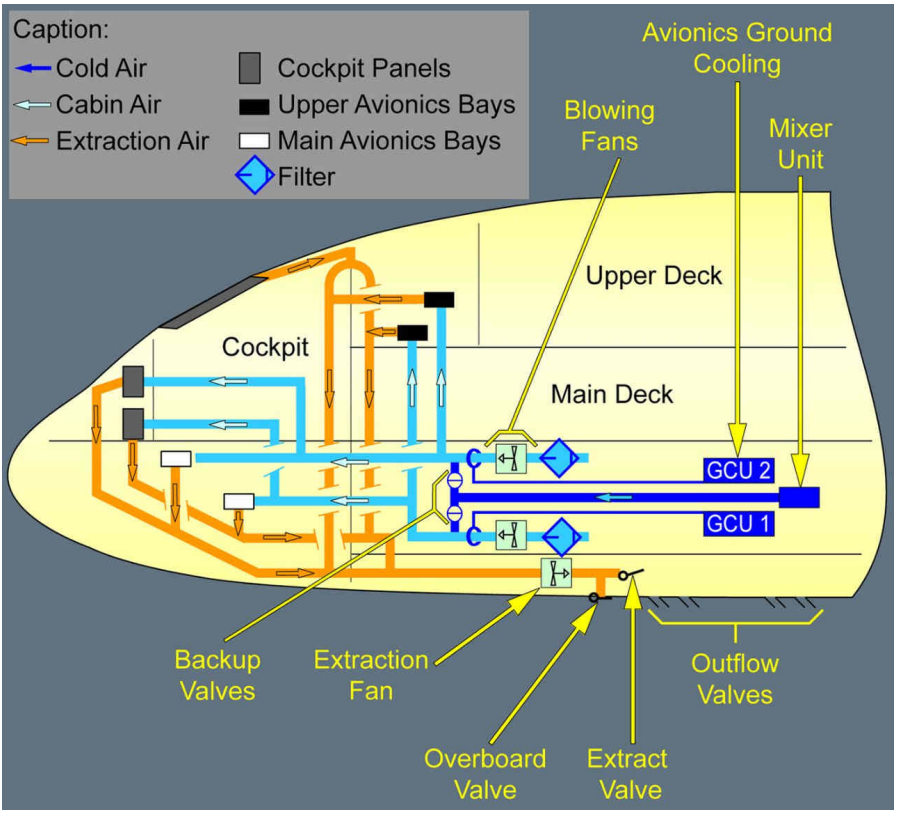
MAIN AND UPPER AVIONICS VENTILATION

The avionics ventilation system cools the electrical and electronic equipment within the electronic bays and the cockpit panels.
There are two avionics ventilation circuits: The left (L) and the right (R). Both the L and R circuits ventilate the cockpit panels, the main avionics bay, and the upper avionics bay.
On ground, the avionics ground cooling cools the air that is blown in the two ventilation circuits.

The avionics ventilation system:
- Uses air that is recirculated from the cabin
- Ventilates the various cockpit panels and equipment racks with this air
- Then extracts this air, and discharges it overboard.

L3 The batteries are ventilated in flight by cabin air that is extracted and discharged overboard via differential pressure.

MAIN and UPPER Avionics Ventilation



L1 **AFT AVIONICS BAY**

Cabin air, extracted then discharged overboard by the cabin air extraction system, ventilates the aft avionics compartment (*Refer to DSC-21-20-30 Lavatory and Galleys Air Extraction*).

L2 **BLOWING FANS**

There are two blowing fans, that blow recirculated air from the cabin into the various cockpit panels and equipment racks. Each avionics ventilation circuit has one blowing fan.

L3 For both avionics ventilation circuits, the air is first filtered, before it enters the blowing fan.

L2 Both blowing fans automatically operate, when the aircraft is electrically-powered. They are monitored and controlled by the avionics ventilation controller.

The air flow and temperature in both avionics ventilation circuits are automatically monitored and controlled.

AVIONICS GROUND COOLING

On ground, the avionics ground cooling system cools the air that is blown into the avionics bays and cockpit panels. The ground cooling system has two units, one for each avionics ventilation circuit.
The two units operate independently.
When the COOLG pb-sw is set to AUTO, the ground cooling system will activate automatically if the temperature of the blown air is high enough, and the air conditioning is OFF.

L3 For this to occur, air temperature from the blowing fan must be greater than 27 °C.

L1 The avionics ground cooling system uses the same cooling circuits, as those used to provide supplemental cooling to the galley.

L3 Each cooling unit is controlled by its own controller. The cooling unit controllers are located in the CPIOM A.

L2 BACKUP VALVES

Each ventilation circuit has one backup valve.
If the blowing fans cannot correctly ventilate the avionics, the backup valve of the affected circuit automatically opens. This enables air, added from the air conditioning system, to ventilate the avionics systems.

L3 The backup valve opens in case:

- The associated blowing fan fails.
- The associated filter is clogged.

The air from the air conditioning system comes directly from the mixer unit.

L2 Cabin and cockpit air conditioning and ventilation continue to operate normally.

EXTRACTION FAN

An extraction fan extracts air from the avionic bays and cockpit panels, either through the extract valve, or through the overboard valve.
The extraction fan operates, when the aircraft is electrically-powered. The extraction fan is monitored and controlled by the avionics ventilation controller.

L2 The avionics ventilation controller also:

- Monitors all ECAM alerts associated to the avionics ventilation system, and
- Displays the indications related to the avionics ventilation system on the COND SD page.

OVERBOARD VALVE AND EXTRACT VALVE

Ventilated air is discharged overboard through the overboard valve, or through the extract valve.

OVERBOARD VALVE

L3 Air is discharged overboard through the overboard valve by the extraction fan, or by differential pressure.

L1 The overboard valve opens:

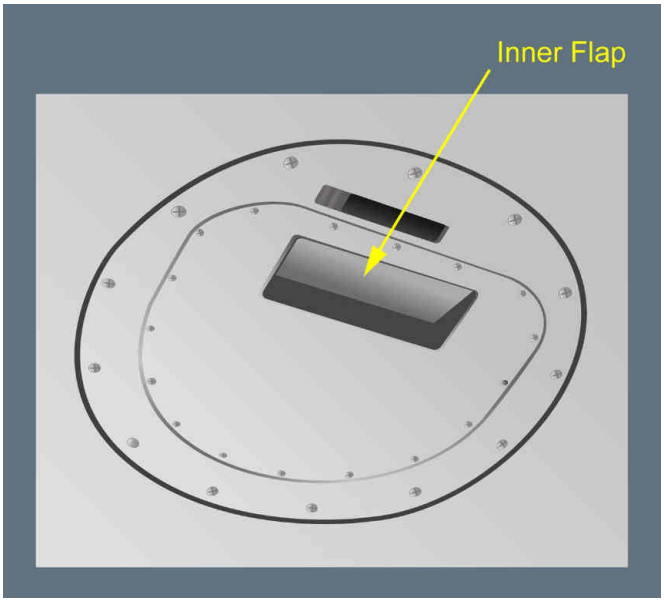
- Automatically, on ground, with the engines not running.

L3 The overboard valve closes, when both inner engines are started.

L1 - Manually, in flight, with some abnormal avionics ventilation cases, when the EXTRACT pb-sw on the VENT panel is set to OVRD (For more information on this configuration, *Refer to DSC-21-20-20-20 Override Configuration*). In such cases, the valve partially opens.

L3 The overboard valve partially opens, when its inner flap opens.

Overboard Valve Partially Open



L1 ### EXTRACT VALVE

When the overboard valve is closed, the extract valve opens.

L3 Air is discharged overboard by the extraction fan through the extract valve, then through the outflow valves.

L1 *Note:* *In case the DITCHING pb-sw is set to ON , the overboard valve will close, regardless of the EXTRACT pb-sw selection (Refer to DSC-21-30-40 Ditching).*

Intentionally left blank

OVERRIDE (OVRD) CONFIGURATION

Applicable to: ALL

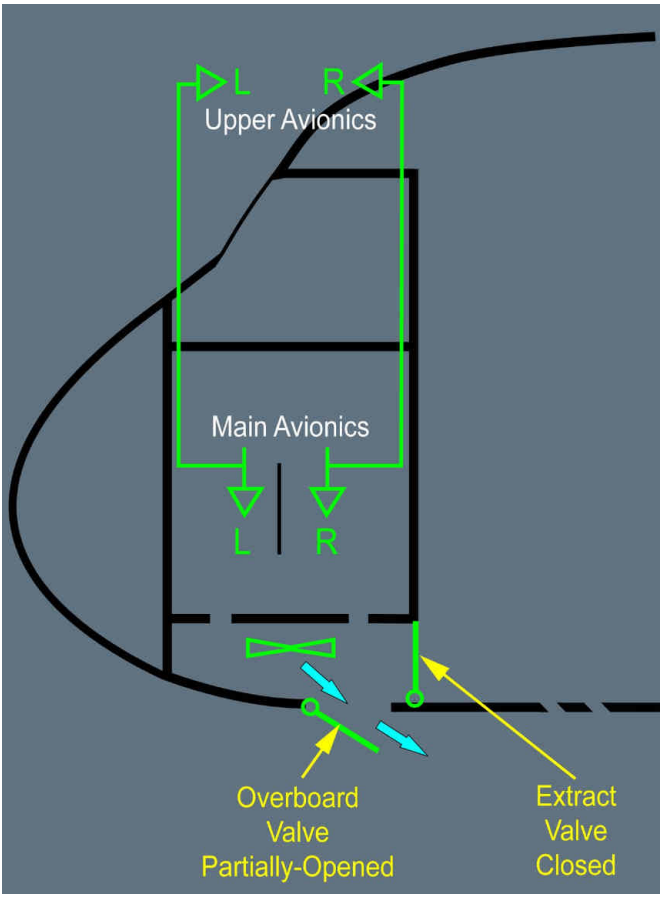
In flight, when the EXTRACT pb-sw on the VENT panel is set to OVRD:

- The overboard valve partially opens.
- The extract valve automatically closes.
- Air is extracted and discharged through the overboard valve, via differential pressure.

L2 The ECAM requests the flight crew to set the EXTRACT pb-sw to OVRD , in case:

- The VENT EXTRACT FAULT caution triggers on the ECAM
- The FIRE SMOKE/FUMES warning triggers, when smoke is detected in the avionics bay or the cockpit.

Override (OVRD) Configuration



CABIN AIR RECIRCULATION

Applicable to: ALL

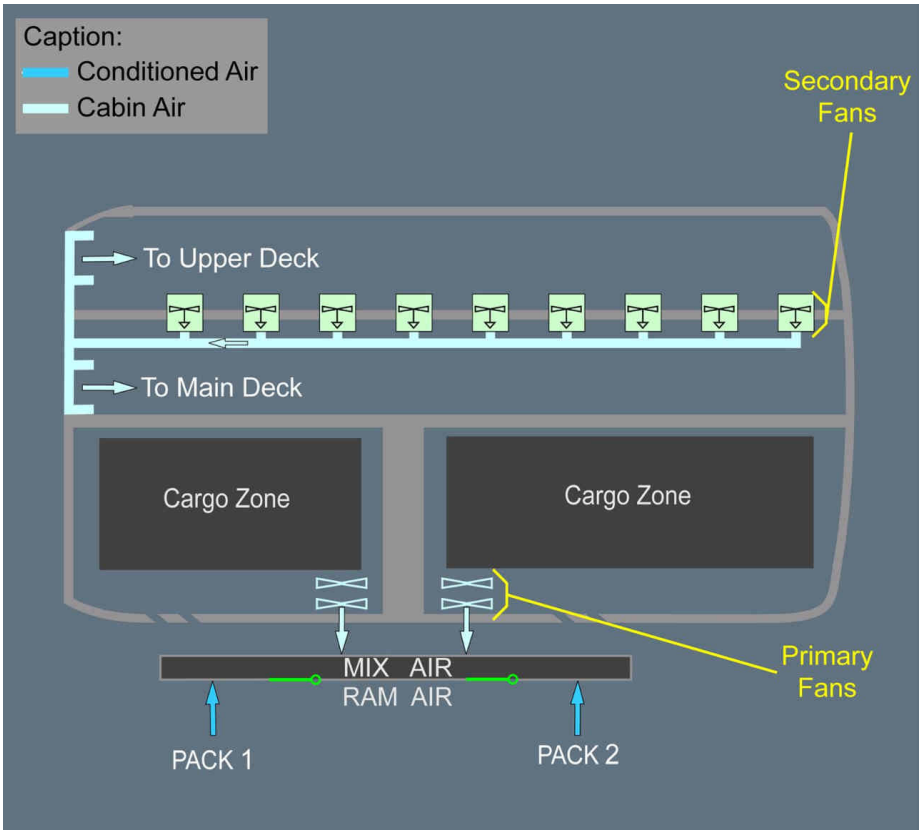
The primary fans recirculate the cabin air to the mixer unit (*Refer to DSC-21-10-10-20 Mixer Unit*). In addition, the secondary fans blow air from the upper deck, and recirculate it in the upper and main decks.

L2 The secondary fans are controlled by the ventilation controllers.

L3 There are 9 secondary fans, and they are in the upper deck of the cabin.

- 5 are controlled by the forward ventilation controller.
- 4 are controlled by the aft ventilation controller.

Cabin Air Recirculation



LAVATORY AND GALLEYS AIR EXTRACTION

Applicable to: ALL

In some cabin areas (e.g. lavatories, galleys, the aft avionics compartment) air is extracted, and then directly discharged overboard.

L3 On ground, or when the differential pressure is less than 1 PSI:

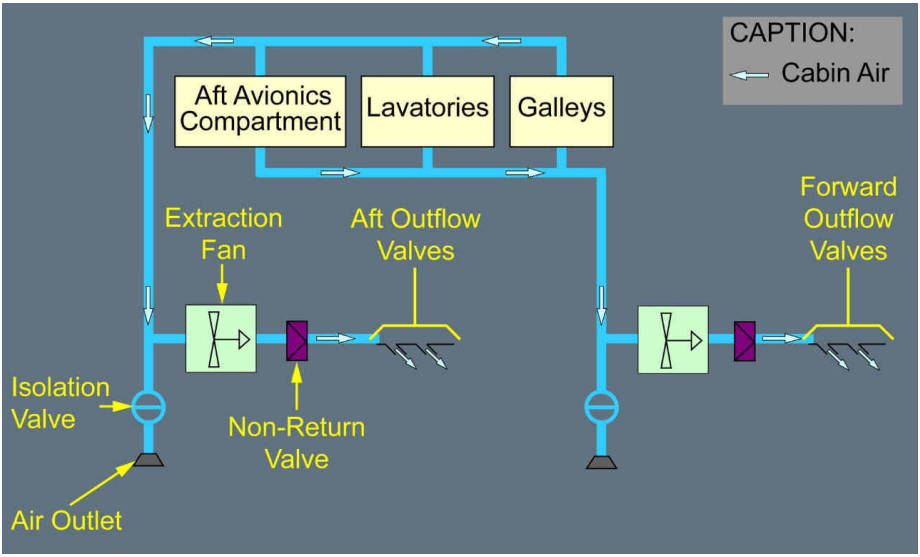
- Two extraction fans extract the air.
- The air is discharged overboard via the outflow valves.

In flight, when the differential pressure is greater than 1 PSI:

- The air is discharged directly overboard through two assigned outlets, via differential pressure.
- The two extraction fans automatically stop.

Each outlet has one isolation valve. When the aircraft is in flight, and the differential pressure is greater than 1 PSI, both isolation valves open.
One outlet is on the skin of the forward part of the aircraft.
The other outlet is on the skin of the aft part of the aircraft.
Either ventilation controller (forward or aft ventilation controller) can control the cabin air extraction system.

Cabin Air Extraction



Intentionally left blank

IN-FLIGHT ENTERTAINMENT (IFE) BAY VENTILATION

Applicable to: ALL

The In-Flight Entertainment (IFE) bay has a ventilation system that cools its electronic equipment. This ventilation system is fully automatic.

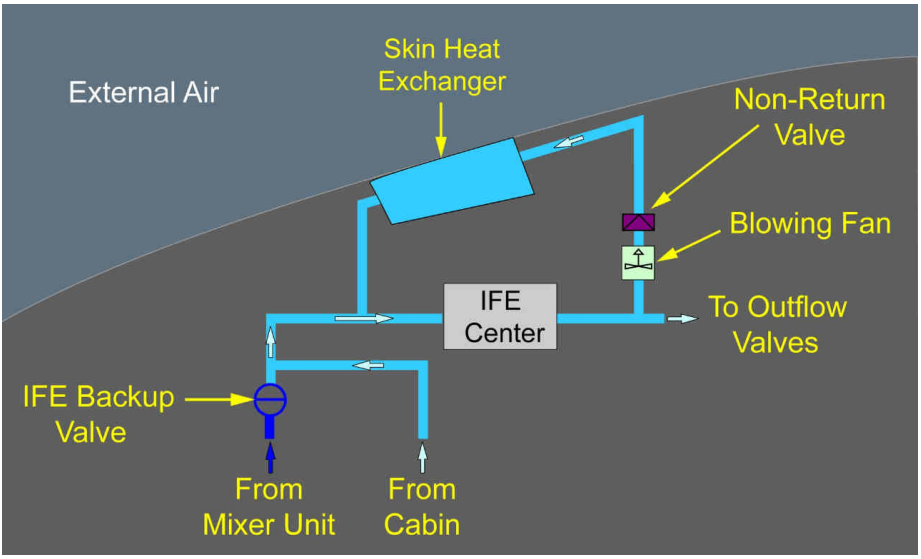
L2 It is controlled by the forward ventilation controller.

L3 The IFE bay is in the upper avionics bay.

The IFE bay is ventilated by air from the cabin, or by air from the air conditioning mixer unit:

- In flight, the IFE bay is normally ventilated by air from the cabin, that is blown into the IFE bay by a blowing fan. An aircraft-skin heat exchanger cools this air.
- On ground, or in some abnormal situations in flight (e.g. blowing fan failure, aircraft-skin heat exchanger failure), the IFE bay is ventilated by air from the mixer unit.

IFE Bay Ventilation



Intentionally left blank

PACK BAY VENTILATION

Applicable to: ALL

A ventilation system cools the two pack bays, and is fully automatic.

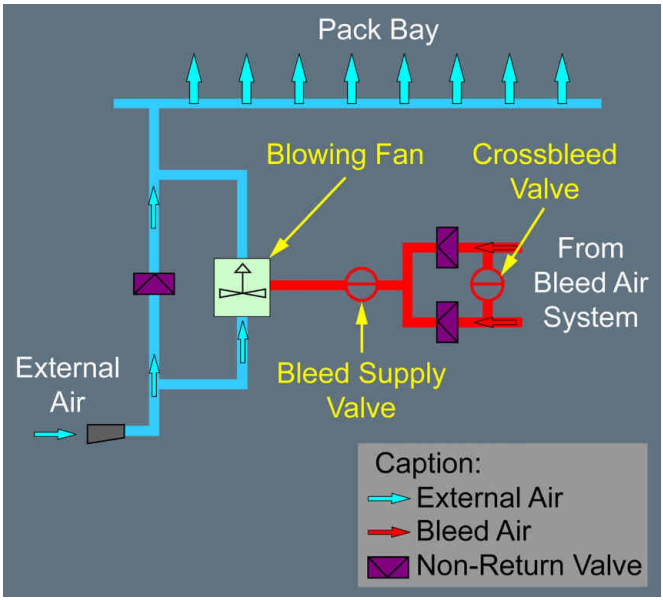
L3 The pack bay areas are ventilated by external air.

- In flight, external air flows into each pack bay area, through an air inlet. Both air inlets are in the belly fairing.
- On ground, two blowing fans ventilate both pack bay areas. These blowing fans are pneumatically-operated.
  Bleed air, from any available bleed supply, flows through two supply valves and drives both fans.
  The pack controller controls the blowing fans.

Air is discharged overboard, through 7 air outlets:

- Three in the belly fairing
- Four in the wing root.

Pack Bay Ventilation



Intentionally left blank

SUPPLEMENTAL COOLING SYSTEM

Applicable to: ALL

There are two independent cooling systems, that cool the galleys.

Each cooling system has:
- One cooling unit that cools the fluid of the system.
- One circuit that distributes this coolant fluid to all the galleys.

If one cooling system fails, the other one is sufficient to cool all the galleys.
Both supplemental cooling systems operate simultaneously, when the aircraft is electrically powered, and provided that COOLG pb-sw is set to AUTO.

Intentionally left blank

THS BAY VENTILATION

Applicable to: ALL

The Trimmable Horizontal Stabilizer (THS) bay is cooled by an assigned ventilation system. This ventilation system is fully automatic.

L2 It is controlled by the aft ventilation controller.

The THS bay is ventilated on ground, when the aircraft is electrically powered.

L3 The THS bay is ventilated with external air, that is blown by a blowing fan into the THS bay.

Intentionally left blank

BULK AND AFT CARGO VENTILATION

Applicable to: ALL

The bulk and aft cargo compartments are automatically ventilated.

L2 Some of the air that recirculates from the cabin flows into the bulk cargo compartment, via an inlet isolation valve.

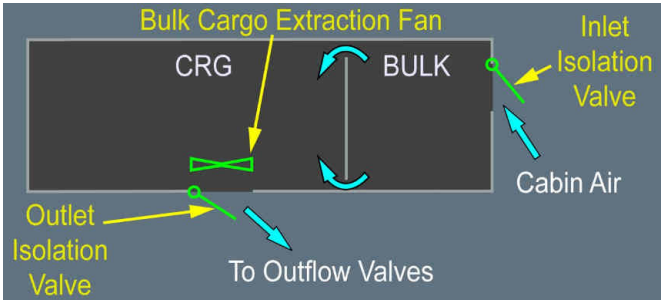
Air from the bulk cargo compartment is then used to ventilate the aft cargo compartment before this air is extracted outside.

An extraction fan then extracts air, via an outlet isolation valve, and discharges this air overboard through the outflow valves. This extraction fan is in the aft cargo compartment.

L1 Temperature regulation is possible for the bulk cargo compartment only (*Refer to DSC-21-10-10-30 Bulk Cargo*).

If necessary (e.g. if smoke is detected in the cargo area), it is possible to isolate the bulk and aft cargo compartments, via the BULK ISOL VALVES pb-sw on the CARGO AIR COND panel (*Refer to DSC-21-10-20-30 ISOL VALVES pb-sw*).

Bulk and Aft Cargo Ventilation



Intentionally left blank

FWD CARGO VENTILATION

Applicable to: ALL

The forward cargo compartment is automatically ventilated, with air from the air-conditioning system.

L2 Air flows into the forward cargo compartment, via three forward cargo inlet isolation valves.
An extraction fan then extracts this air, via an outlet isolation valve, and discharges this air overboard through the outflow valves.

L1 If necessary (e.g. smoke is detected in the cargo area), it is possible to isolate the forward cargo compartment, via the FWD ISOL VALVES pb-sw on the CARGO AIR COND panel.
The forward cargo compartment has a temperature regulation system: For more information about the forward cargo temperature regulation system, *Refer to DSC-21-10-10-30 FWD Cargo* .

The overboard valve is abnormally closed.

The overboard valve is abnormally open.

The overboard valve is abnormally partially open.

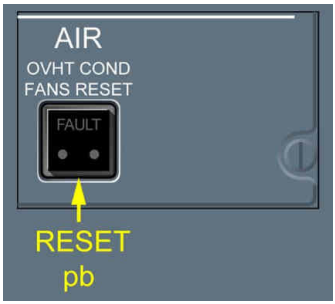
AIR MAINTENANCE PANEL

Applicable to: ALL



RESET pb

In the case of overheat of a ventilation system fan, the affected fan automatically stops. The Maintenance personnel uses this pushbutton to restart the fan.

No overheat is detected.

L12

One or several fans of the ventilation system failed due to overheat.
The FAULT light is not always associated with an ECAM alert, depending on the location and the number of the affected fan(s). For example:

- If one primary cabin fan fails, the ECAM alert COND ONE PRIMARY CABIN FAN FAULT triggers
- If one cabin air extraction fan fails, no ECAM alert triggers. There is no operational impact.

When pressed, resets the affected fan(s). When the reset is completed and successful, the FAULT light goes off.

OVERVIEW

Applicable to: ALL

In normal operation, the pressurization system does not require any action by the flight crew: Cabin air pressure is automatically-regulated to provide maximum passenger comfort.

The cabin pressure regulation is performed via the automatic control of the outflow valves during all flight phases, from takeoff to landing.

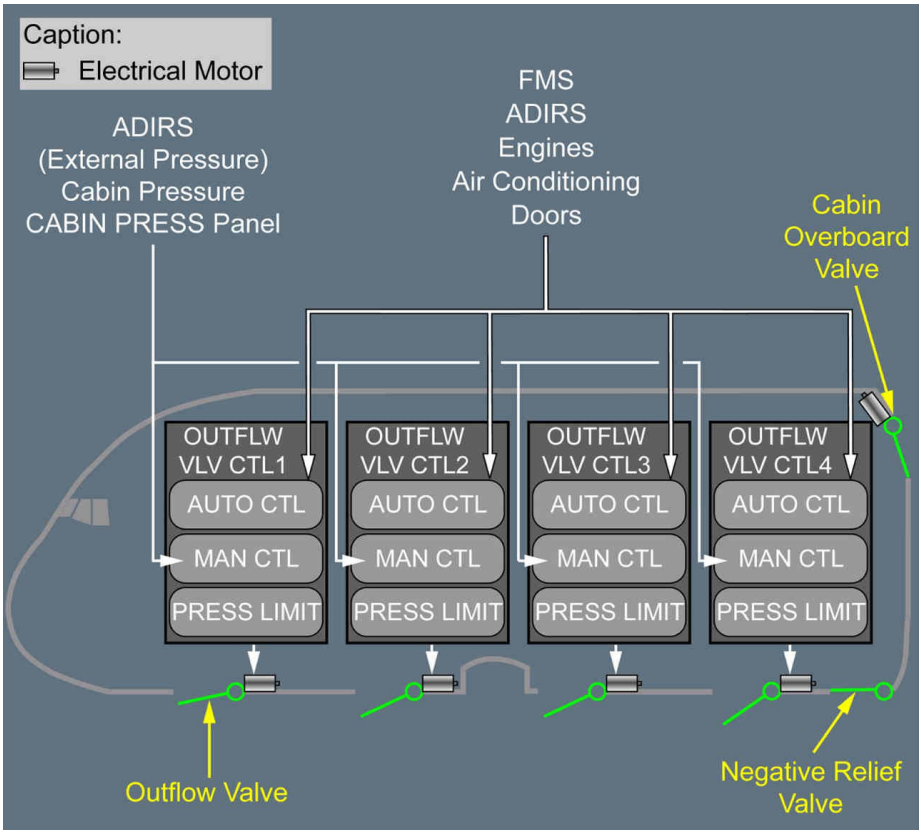
L2 During cruise the cabin altitude is regulated not to exceed 7 500 ft.

L1 If necessary, the flight crew can manually operate the cabin air pressurization system, by selecting the cabin altitude target, and/or the cabin vertical speed.

ARCHITECTURE

Applicable to: ALL

System Description



OUTFLOW VALVE CONTROLLERS

There are four outflow valve controllers. Each outflow valve controller automatically controls one outflow valve.

If one outflow valve controller fails, its assigned outflow valve automatically closes, and there is no operational impact.

L3 The CPIOM B hosts four redundant applications (the Cabin Pressure Control System (CPCS) applications), to operate the outflow valve controllers.

L1 **AUTOMATIC CONTROL MODE**

In automatic mode (when the CABIN ALT MODE pb-sw and CABIN V/S MODE pb-sw are set to AUTO), the four outflow valve controllers automatically control the cabin altitude target, and the cabin vertical speed.
The automatic control system of one outflow valve controller is sufficient to control the entire automatic system.
For more information on the normal operation of the pressurization system, *Refer to DSC-21-30-30-10 Automatic Operation* .
In order to automatically control cabin air pressurization, each outflow valve controller uses the FMS flight plan (including the landing field elevation), together with current outside air pressure, actual flight phase and air conditioning system status.

L2 Each outflow valve controller receives data from the following systems:
- The Flight Management System (FMS)

L3
- Destination QNH or QFE
- Cruise flight levels
- Landing field elevation
- Time to top of climb
- Time to top of descent
- Time to arrival
- Time to destination

L2 - The navigation systems (ADIRS)

L3
- Static pressure
- Barometric correction
- Dynamic air pressure

L2 - The landing gear

L3
- Landing gear on ground status

L2 - The engines

L3
- Engines running
- Engines at takeoff power

L2 - Air conditioning system

L3
- Pack valves status
- Pack flow
- Pack flow demand

L2 - The doors

L3
- Doors closed status.

This data is received via the avionics network, and the CPIOM B.

L1 **MANUAL CONTROL MODE**

If the automatic control systems of the four outflow valve controllers fail, the flight crew can manually control the cabin air pressure.

L2 In manual mode (when the CABIN ALT MODE pb-sw , or the CABIN V/S MODE pb-sw are set to MAN), the pressure controllers use cabin pressure from an assigned pressure sensor, and the external pressure from the ADIRS .

L1 Cabin vertical speed and/or cabin altitude target can be selected by the flight crew on the CAB PRESS panel.

Refer to DSC-21-30-40 Manual Operation

PRESSURE LIMITER FUNCTION

L3 Each outflow valve controller has an independent pressure limiter function, that operates in both automatic and manual mode, to:

- Prevent the differential pressure from going too high or too low.
  If the differential pressure exceeds 9 PSI , the pressure system limiter will open the four outflow valves.
  If the differential pressure goes below -0.725 PSI , the negative relief valves will open.
- Prevent the cabin altitude from going too high.
  The pressure limiter will close the four outflow valves in the event the cabin altitude exceeds 22 000 ft .

  Note: *However, if the cabin altitude exceeds 9 550 ft , the ECAM will trigger the CAB PRESS EXCESS CAB ALT warning on the EWD .*

OUTFLOW VALVES

There are four outflow valves:
- Two are in the forward part of the aircraft
- Two are in the aft part of the aircraft.

L2 The outflow valves are below the flotation line.

L1 The outflow valves control the cabin air pressure, by regulating cabin air outflow .

L3 Each outflow valve is driven by a single electrical motor. The outflow valve automatically-closes due to the differential pressure between the cabin and the external air, if its assigned motor is not electrically-supplied.

L2 *Note: When the RAM AIR pb is set to ON, and the differential pressure is lower than 1 PSI, the system automatically opens the outflow valves to approximately 50 %.*

L2 NEGATIVE RELIEF VALVES

There are two negative relief valves, that operate mechanically with differential pressure. The negative relief valves prevent the differential pressure from going too low.

L3 Both negative relief valves mechanically-open, if the differential pressure goes below –0.725 PSI.

L2 They are in the aft part of the aircraft above the flotation line.

CABIN AIR EXTRACT VALVE

Two independent cabin air extract valves automatically prevent cabin air pressure from going too high or too low, in the event that the pressurization system fails.

L3 These valves are controlled by the aft ventilation controller. They will automatically open, in the event that the pressurization limiter function fails to maintain the differential pressure between –0.725 PSI and 9.2 PSI.

L1 If necessary, these valves can be manually controlled via the CABIN AIR EXTRACT pb-sw (e.g. during smoke removal procedures).

L2 These valves are located in the aft pressure bulkhead.

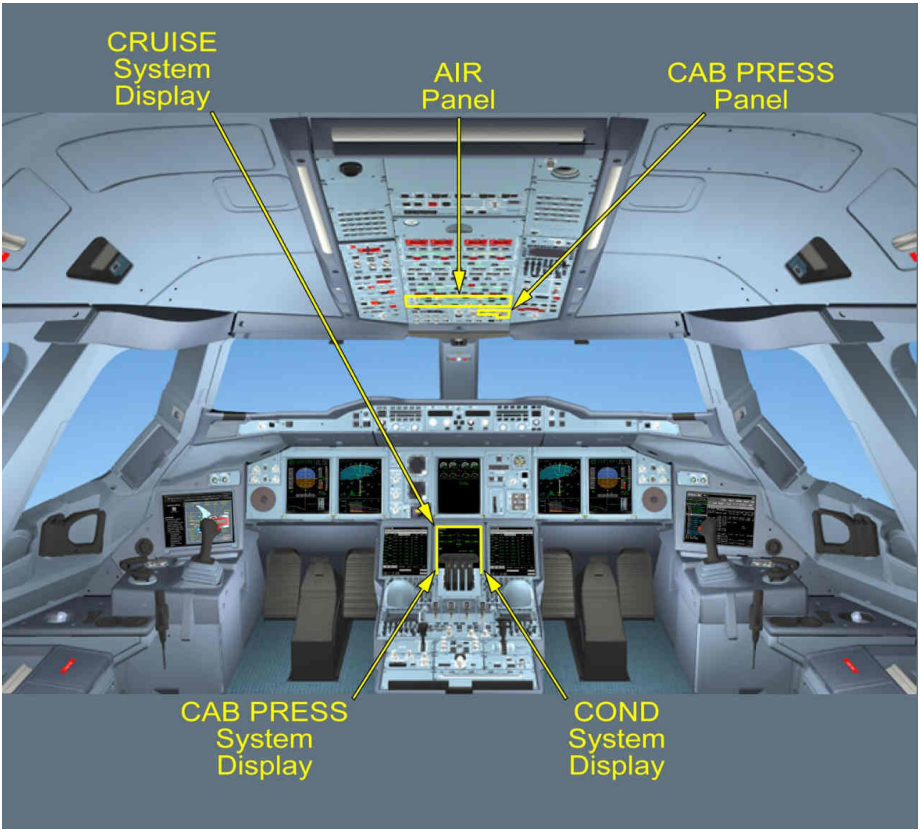
COCKPIT VIEW

Applicable to: ALL

General



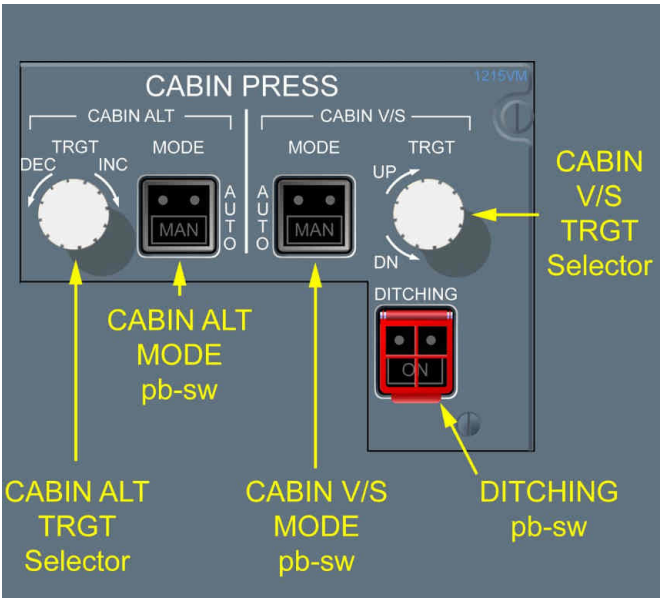
CABIN PRESS PANEL

Applicable to: ALL

CABIN PRESS PANEL

The CABIN PRESS panel is only used, when pressurization has to be controlled in manual mode, or in the event of a ditching.

CABIN PRESS Panel

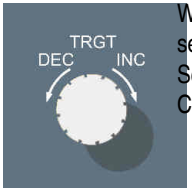


CABIN ALT MODE pb-sw

Cabin altitude is automatically regulated.

Cabin altitude is manually controlled: The cabin altitude target must be manually selected via the CABIN ALT TRGT selector.
The cabin altitude target remains steady at the current value until the flight crew manually selects a new cabin altitude target.

CABIN ALT TRGT selector



When the CABIN ALT MODE pb-sw is set to MAN, the flight crew uses the selector to manually select the cabin altitude target.
Selected cabin altitude target is displayed on the CAB PRESS, and on the CRUISE page of the SD.

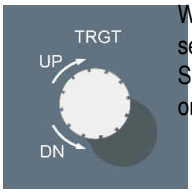
L2 The cabin altitude selection has a range of –2 000 ft to 15 000 ft.

CABIN V/S MODE pb-sw

Cabin vertical speed is automatically regulated according to the flight profile and the cabin altitude target.

Cabin pressure vertical speed is manually controlled. The vertical speed must be manually selected via the CABIN V/S TRGT selector.

CABIN V/S TRGT selector



When the CABIN V/S MODE pb-sw is set to MAN, the flight crew uses the selector to manually select the cabin pressure vertical speed.
Selected cabin pressure vertical speed is displayed on the CAB PRESS, and on the CRUISE page of the system display.

L2 The cabin vertical speed selection has a range of –1 500 ft/min to +2 500 ft/min.

DITCHING PB-SW

Normal position.

All valves are forced closed: The pressurization system is ready for ditching (*Refer to DSC-21-30-40 Ditching*).

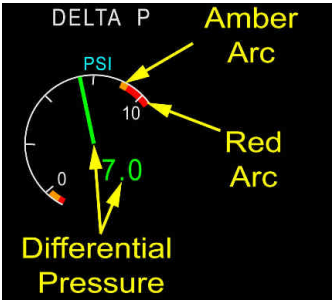
LDG ELEVN INDICATIONS

The landing elevation is 500 ft.

DELTA P INDICATIONS

DELTA P Indication



L2 Differential pressure display ranges from –1 PSI to 10.5 PSI.

L12

Differential pressure is normal.
The pressure is normal from -0.2 PSI to 8.92 PSI.
The green needle pulses during final approach, when the differential pressure is from 1.5 PSI to 8.92 PSI. It stops pulsing, when it goes below 1 PSI.

L12

Differential pressure is abnormal.
The amber arc indicates abnormal differential pressure from –0.72 PSI to -0.2 PSI, or from 8.92 PSI to 9.2 PSI.

L12

ifferential pressure is abnormal.
he red arc indicates abnormal differential pressure from –1 PSI to –0.72 PSI ,
r from 9.2 PSI to 10.5 PSI.

CAB ALT INDICATIONS

L2 The cabin altitude display ranges from –625 ft to +10 625 ft.

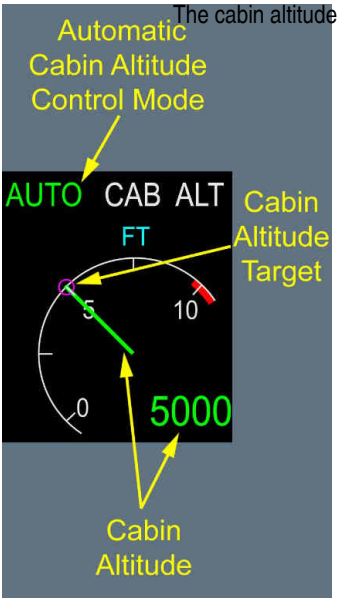
The cabin altitude needle pulses in green, if:
- The cabin altitude is higher than 8 300 ft, and lower than 9 550 ft.

The needle stops pulsing, if:
- The cabin altitude goes below 8 100 ft.

The red arc indicates the cabin altitude from 9 550 ft to 10 625 ft.

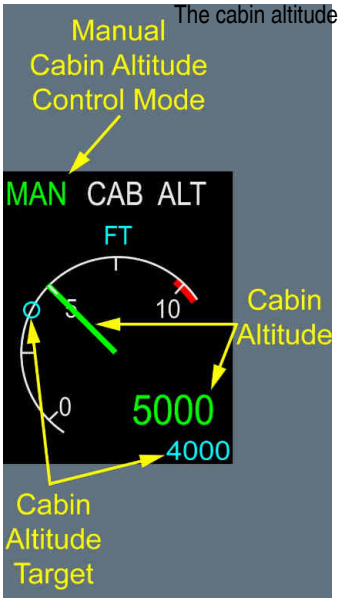
L1 AUTOMATIC CONTROL MODE

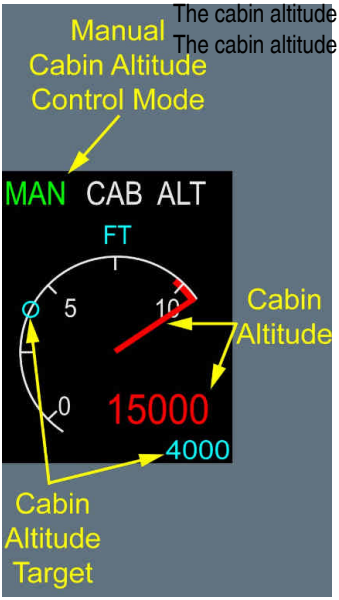
The cabin altitude control is in automatic mode.



MANUAL CONTROL MODE

The cabin altitude control is in manual mode.





The cabin altitude is in manual mode.
The cabin altitude is abnormal.

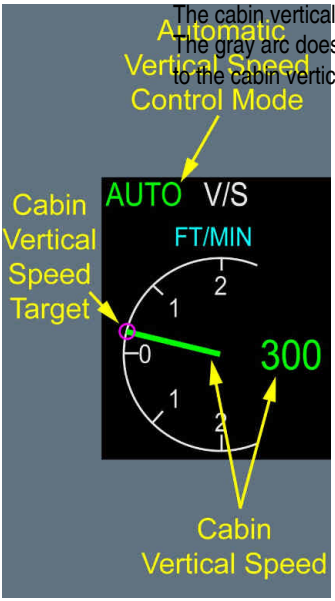
V/S INDICATIONS

L2 The cabin vertical speed display ranges from –2 500 ft/min to +2 500 ft/min.

The cabin vertical speed needle pulses in green, if:
- The cabin vertical speed is greater than 1 800 ft/min, and less than 6 350 ft/min.

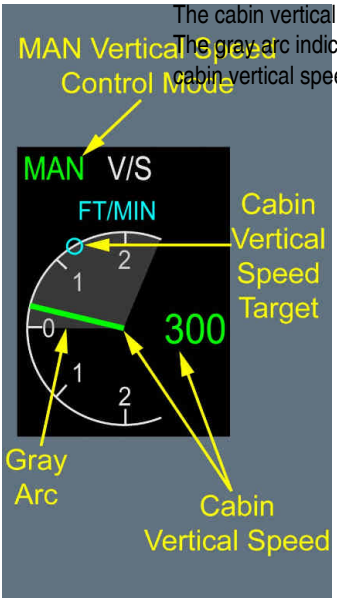
The needle stops pulsing, if:
- The cabin vertical speed becomes less than 1 600 ft/min, and is greater than –6 350 ft/min.

L1 AUTOMATIC MODE

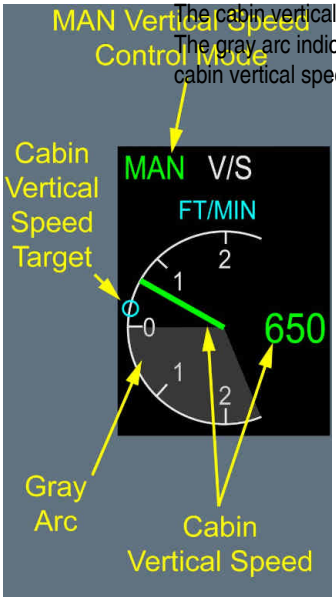


The cabin vertical speed is automatically controlled.
The gray arc does not appear, when the cabin vertical speed target is equal to the cabin vertical speed.

MANUAL MODE



The cabin vertical speed is manually controlled.
The gray arc indicates that the cabin vertical speed target is greater than the cabin vertical speed.



The cabin vertical speed is manually controlled.
The gray arc indicates that the cabin vertical speed target is lower than the cabin vertical speed.

CABIN AIR EXTRACT VALVE

The cabin air extract valves are closed.

The cabin air extract valves are open.

At least one cabin air extract valve is abnormally closed.

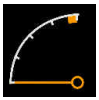
At least one cabin air extract valve is abnormally open.

OUTFLOW VALVE

The outflow valve is normally open to regulate the cabin pressurization.

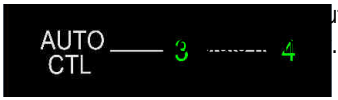
L12

The outflow valve is fully open, and the aircraft is in flight.
Appears if the outflow valve is open by more than 95 %.



The outflow valve is abnormally closed.

AUTOMATIC OUTFLOW VALVE CONTROL



utflow valve control (e.g. AUTO CTL 3 and AUTO CTL 4)
.

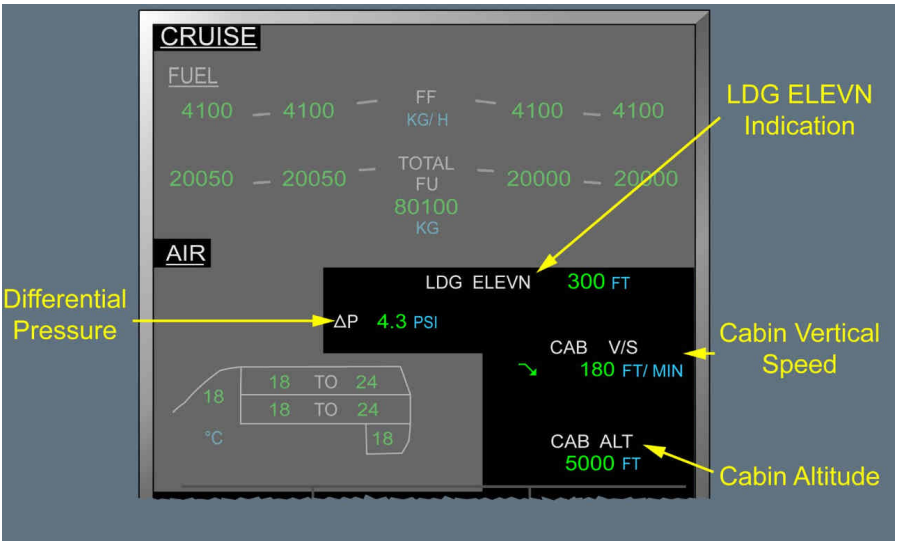
outflow valve control 4 operates normally.
outflow valve control 3 is failed.

CRUISE SYSTEM DISPLAY

Applicable to: ALL

CRUISE SYSTEM DISPLAY

CRUISE System Display



DIFFERENTIAL PRESSURE

L12

Differential pressure is normal.
Differential pressure is normal from –0.2 PSI to 8.92 PSI.

The differential pressure value pulses, when:
- The differential pressure is from 1.5 PSI to 8.92 PSI, and
- The aircraft is in final approach.

The differential pressure stops pulsing, when:
- The differential pressure goes below 1 PSI, or
- The aircraft is no longer in final approach.

L12

The differential pressure is abnormal.

The value of the differential pressure appears amber, if:
The differential pressure is from –0.72 PSI to –0.2 PSI
- The differential pressure is from 8.92 PSI to 9.2 PSI.

L12

The differential pressure is abnormal.

The value of the differential pressure appears red, if:
The differential pressure is lower than –0.72 PSI, or
- The differential pressure is greater than 9.2 PSI.

LDG ELEVN INDICATION

Appears in automatic operation.

CABIN VERTICAL SPEED

AUTOMATIC OPERATION

L12

The cabin vertical speed is automatically controlled.

The cabin vertical speed arrow:
Points up, when the cabin vertical speed is greater than 25 ft/min.
- Points down, when the cabin vertical speed is lower than –25 ft/min.
- Does not appear , when the cabin vertical speed is from –25 ft/min to 25 ft/min.

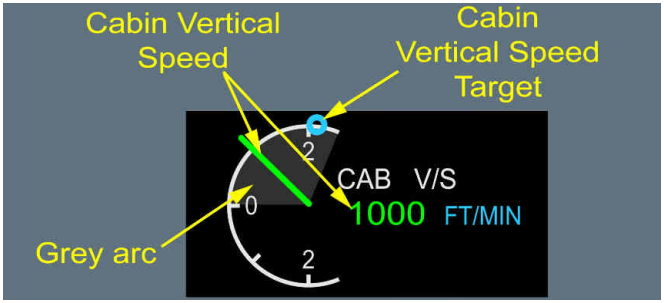
The cabin vertical speed value ranges from –6 350 ft/min to 6 350 ft/min.

The cabin vertical speed arrow, and the CAB V/S indication pulse, if:
- The cabin vertical speed ranges from -6 350 ft/min to –1 800 ft/min, and is lower, or equal to –1 600 ft/min for more than 5 s.
- The cabin vertical speed ranges from 1 800 ft/min to 6 350 ft/min, and is greater, or equal to 1 600 ft/min for more than 5 s.

The cabin vertical speed needle stops pulsing, when it ranges from –1 650 ft/min to 1 650 ft/min.

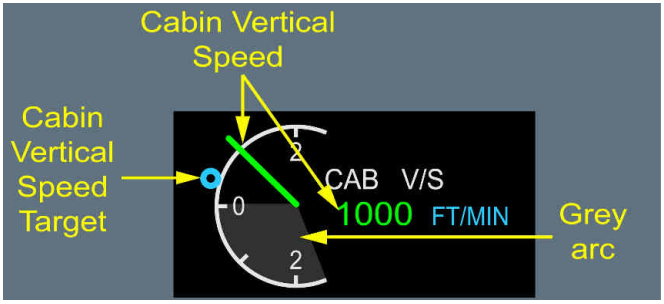
MANUAL OPERATION

Cabin Vertical Speed



The cabin vertical speed is manually controlled.
The gray arc indicates that the cabin vertical speed target is greater than the current cabin vertical speed.

Cabin Vertical Speed



The cabin vertical speed is manually controlled.
The gray arc indicates that the cabin vertical speed target is lower than the cabin vertical speed.
The gray arc does not appear when the cabin vertical speed is equal to the current cabin vertical speed.

L2 The cabin vertical speed display ranges from –2 500 ft/min to 2 500 ft/min.

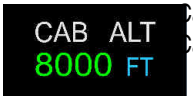
The cabin vertical speed needle, and the CAB V/S indication pulse, if:

- The cabin vertical speed ranges from -6 350 ft/min to –1 800 ft/min, and is lower, or equal to –1 600 ft/min for more than 5 s.
- The cabin vertical speed ranges from 1 800 ft/min to 6 350 ft/min, and is greater, or equal to 1 600 ft/min for more than 5 s.

The cabin vertical speed needle stops pulsing, when it ranges from –1 650 ft/min to 1 650 ft/min.

CABIN ALTITUDE

L12



Cabin altitude is normal.
Cabin altitude is normal from 2 000 ft to 9 550 ft.

L12

Cabin altitude is abnormal.
Cabin altitude is abnormal, when it is greater than 9 550 ft, with a landing field elevation lower than 9 550 ft.

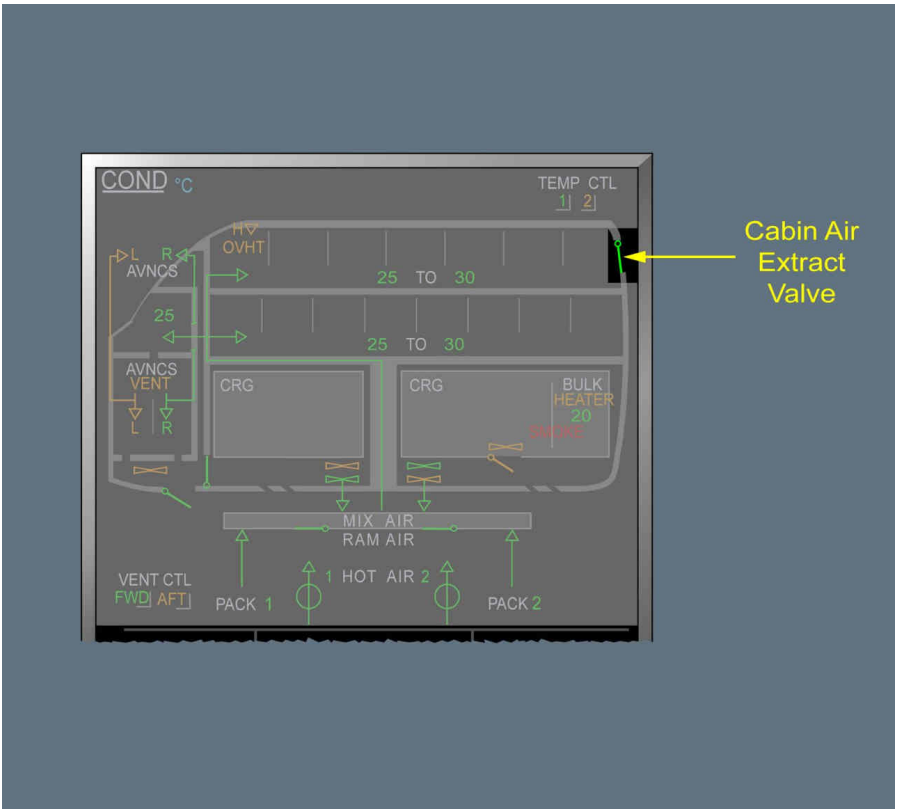
L2 The cabin altitude value ranges from 9 950 ft to 43 000 ft.
The CAB ALT indication pulses, if the cabin altitude value ranges from 8 300 ft to 9 550 ft, for more than 5 s. The CAB ALT indication stops pulsing, when the cabin altitude is lower than 8 100 ft.

COND SYSTEM DISPLAY

Applicable to: ALL

COND SYSTEM DISPLAY

COND System Display



CABIN AIR EXTRACT VALVE

The cabin air extract valves are closed.

The cabin air extract valves are open.

At least one cabin air extract valve is abnormally closed.

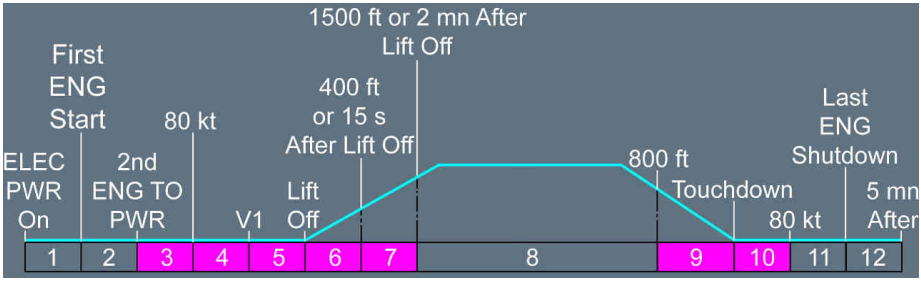
At least one cabin air extract valve is abnormally open.

MEMO

Applicable to: ALL

HI ALT AIRPORT The landing field elevation is above 8 550 ft . At least one flight crew member must don an oxygen mask.
For additional information on high altitude airport operation, *Refer to PRO-SPO-HAO High Altitude Airport Operation* .

Flight Phase Inhibition



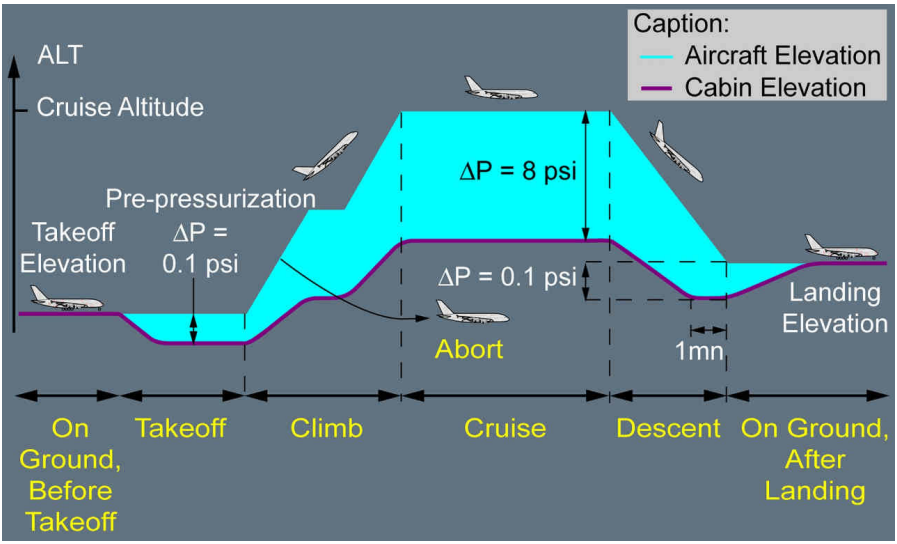
AUTOMATIC OPERATION

Applicable to: ALL

When the cabin pressurization system is automatically controlled (CAB ALT MODE pb-sw and CABIN V/S MODE pb-sw are both set to AUTO), the outflow valve controllers operate at the same time to automatically control cabin air pressurization, as follows:

PRESSURIZATION FLIGHT PROFILE

Pressurization Flight Profile



ON GROUND, BEFORE TAKEOFF

Before takeoff, all outflow valves open, to ensure there is no differential pressure between the air inside the aircraft and the external air.

TAKEOFF

During takeoff, the four pressure controllers pre-pressurize the aircraft to provide a smooth variation of the cabin vertical speed at liftoff.
The aircraft is pre-pressurized at a rate of –300 ft/min: This ensures a differential pressure of 0.1 PSI at liftoff.

L2 In addition, the aft outflow valves close during takeoff up to an altitude of 1 000 ft AGL.

L3 Closing the aft outflow valves is necessary to meet ditching requirements (e.g. ditching occurs just after takeoff).

L12

Note: *On ground, if at least one door is not closed and locked at takeoff power application: The four cabin pressure controllers will prevent cabin pressurization, by maintaining the four outflow valves open.*
In addition, the pack controller will keep both pack valves closed.

PRESSURIZATION TAKEOFF PHASE

The pressurization takeoff phase occurs, when:
- All doors are closed,
- The main landing gear is compressed, and
- At least three engines are at takeoff power.

CLIMB

During climb, when NAV mode is engaged, the cabin pressure is optimized for passenger comfort: The cabin vertical speed is determined to reach the scheduled cabin altitude at the top of climb defined by the FMS cruise FL.
During climb, when HDG mode is engaged, the cabin vertical speed is determined to reach a cabin altitude value, computed from the current aircraft altitude and vertical speed.

L2 The cabin vertical speed is limited to 1 000 ft/min.

Note: *When switching from NAV mode to HDG mode in climb, the cabin vertical speed computation logic changes (i.e. FMS flight plan data are not considered anymore). Therefore negative cabin V/S can be temporarily experienced during the transition.*

L3 **PRESSURIZATION CLIMB PHASE**

The pressurization climb phase occurs at liftoff (main landing gear no longer compressed).

CRUISE

During cruise, the cabin altitude is regulated not to exceed 7 500 ft.

L2 This corresponds to a differential pressure of approximately 8 PSI between the cabin air and the external air.

L3 **PRESSURIZATION CRUISE PHASE**

The pressurization cruise phase occurs, when:
- The cabin altitude is lower than 8 000 ft,
- The cabin altitude is 5 000 ft higher than the cabin altitude at takeoff, and
- The rate of climb of the aircraft is lower than 50 ft/min for at least 32 s.

DESCENT

During descent, the cabin vertical speed is controlled, to ensure that the cabin altitude reaches an altitude slightly below the landing field elevation prior to landing.

L2 The cabin pressure reaches the landing field pressure + 0.1 PSI, 1 min before landing.
This ensures that the aircraft is still pressurized at landing, and provides a smooth variation in cabin altitude if a go around is performed.
The aft outflow valves close at an altitude of 1 000 ft AGL, and remain closed until touchdown.

L3 Closing the aft outflow valves is necessary to meet ditching requirements (e.g. ditching occurs just after touchdown).

L2 The cabin descent rate is limited to 300 ft/min.

L3 PRESSURIZATION DESCENT PHASE

The pressurization descent phase occurs, when the aircraft rate of descent is greater than 150 ft/min.

ON GROUND, AFTER LANDING

At touchdown, all outflow valves open, to remove the residual differential pressure.

L3 Residual differential pressure removal takes less than 90 s.

PRESSURIZATION GROUND PHASE

The pressurization ground phase occurs, when the aircraft touches down (main landing gear compressed).

L2 ABORT

If the aircraft does not climb after takeoff, the cabin altitude will automatically stop climbing.
The cabin pressure is set back to the takeoff altitude pressure + 0.1 PSI.

L3 PRESSURIZATION ABORT PHASE

The pressurization abort phase occurs, when:

- The aircraft is at takeoff, and
- The aircraft altitude is lower than 8 000 ft, or the aircraft altitude is 5 000 ft higher than the aircraft altitude at takeoff,
- The aircraft rate of descent is greater than 250 ft/min.

Intentionally left blank

MANUAL OPERATION

Applicable to: ALL

If the automatic pressurization system fails, the flight crew can control the cabin air pressure, by using the manual pressurization system.

The manual pressurization system operates independently of the automatic pressurization system.

L2 To obtain the desired cabin altitude and vertical speed, the manual pressurization system uses external pressure from the ADIRS, as well as cabin pressure.

L1 There are two manual pressurization modes:

- The cabin altitude manual pressurization mode, that is activated by setting the CABIN ALT MODE pb-sw to MAN, and/or
- The vertical speed manual pressurization mode, that is activated by setting the CABIN V/S MODE pb-sw to MAN.

When any manual pressurization mode is activated, if no altitude or cabin vertical speed is selected on the CAB ALT TRGT selector or the V/S TRGT selector:

- The cabin altitude remains steady, and
- The cabin vertical speed is set at 0 ft/min.

CABIN ALTITUDE TARGET MANUAL PRESSURIZATION MODE

The flight crew selects the cabin altitude target on the CAB ALT TRGT selector.

If the vertical speed manual pressurization mode is not activated, the default vertical speed to reach the selected cabin altitude is:

- In descent: –300 ft/min
- In climb: 500 ft/min.

CABIN VERTICAL SPEED MANUAL PRESSURIZATION MODE

If the cabin vertical speed is selected on the CAB V/S TRGT selector(between –1 500 ft/min and +2 500 ft/min), the cabin altitude will change in accordance with the selected vertical speed, until the cabin altitude target is reached.

Note: The cabin altitude selection has priority over the selected vertical speed.

DITCHING

Applicable to: ALL

To prepare for ditching, the flight crew sets the DITCHING pb-sw on the CAB PRESS control panel to ON. This closes all the valves located below the flotation line.

L2 - The four outflow valves close.
- The overboard valve closes.

- All the cargo isolation valves close.
- The two pack valves close.
- The pack ram air inlet and outlets close.
- The two emergency RAM air inlets close.
- All the cabin fans stop.

In addition, when the DITCHING pb-sw is set to ON, the following functions are inhibited:
- The automatic inflation of escape slide at the M3 doors
- The automatic deployment of slide extension at the M1 doors.

VS1G

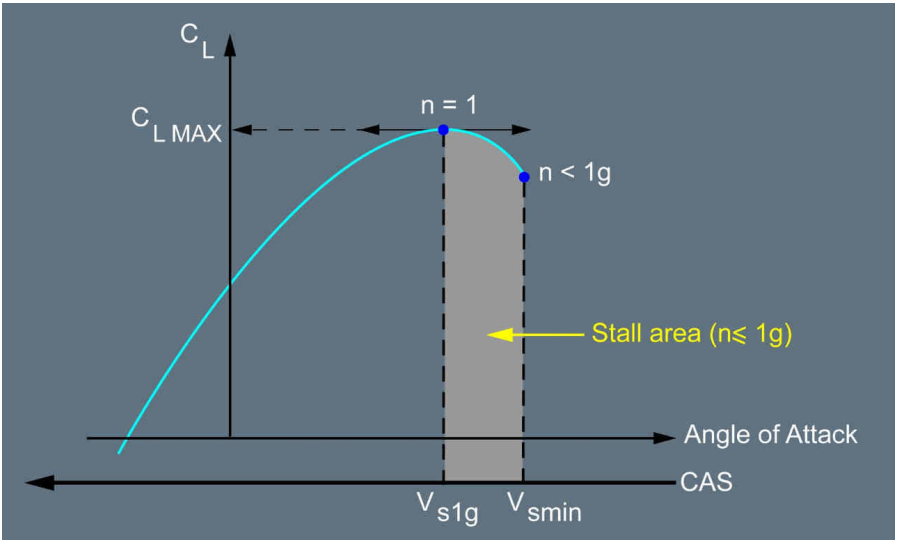
Applicable to: ALL

DEFINITION

Vs1g is the stall speed of the aircraft with a load factor of 1g, and idle thrust.
Vs1g is used as reference speed for the computation of other operational speeds (VLS, S, F, VREF).

L3 For conventional aircraft, the reference stall speed, Vsmin, corresponds to the conventional stall (i.e. when the lift suddenly collapses). At this moment, the load factor is always smaller than 1. This results in a Vsmin, which is lower than Vs1g.

Vs1g



Because of the high angle of attack protection (that the flight crew cannot override), the Airworthiness Authorities have reconsidered the definition of stall speed. It has been agreed that Vsmin = 0.94 * Vs1g.

L1 DISPLAY

Vs1g is not displayed.

L2 COMPUTATION

Vs1g is computed by the PRIMs.

It is a function of:
- slats / flaps position
- aircraft weight & CG
- aircraft altitude
- landing gear position

It is also computed by the FMS, for performance prediction, and characteristic speeds displayed on the MFD.

VLS

Applicable to: ALL

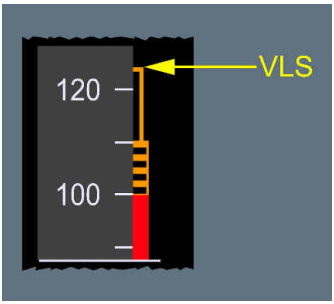
DEFINITION

VLS is the lowest selectable speed.
The speed target on the speed scale cannot be set below VLS .
VLS provides a margin against stall at low speeds, and towards buffet at high Mach number.

DISPLAY

VLS is displayed on the airspeed scale on the PFD .

VLS



VLS is displayed in flight only.

L3 VLS appears three seconds after liftoff and disappears at touchdown.

L1 *Note: The FMS also computes the VLS . It is displayed on the APPR panel of the FMS PERF page . (Refer to page)*

L2 COMPUTATION

VLS is computed by the PRIM s.

It is a function of:
- Vs1g
- The flight phase (takeoff, after takeoff, cruise, landing or go-around)
- The speed brake position

DURING TAKEOFF

VLS is the greater of:
- 1.15 * Vs1g, or
- The minimum of V2 /1.05 or 1.05 * VMCA

DURING ALL OTHER FLIGHT PHASES

As soon as the flaps configuration changes (crew action on lever or activation of the ARS), the computation of the VLS becomes the following:
- In CONF 1, after flaps auto retraction, VLS is the greater of:
  - 1.18 * Vs1g
  - VMCL (or VMCL-2 when two engines are inoperative on the same wing)
- In all other configurations, VLS is the greater of:
  - 1.23 * Vs1g

    Note: *1.19 * Vs1g in the case slats or flaps are jammed or failed.*

  - VMCL (or VMCL-2 when two engines are inoperative on the same wing)

SPEED BRAKE EFFECT

When the speed brakes are extended, VLS increases.
This increase is a function of the slats/flaps configuration and the speed brakes extension.
For full speed brakes extension, the following is added to VLS .

CONF	VLS increase
0	25 kt
1	25 kt
1+F	7 kt
2	10 kt
3	10 kt
FULL	8 kt

For speed brakes extension between 0 and full, the VLS increase is determined by linear interpolation.

GREEN DOT

Applicable to: ALL

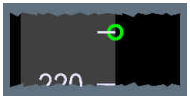
DEFINITION

Green dot is an optimized speed. It is an approximation of the best lift to drag ratio.
Flying at green dot speed provides the best climb performance.

Green dot is:
- The final takeoff speed
- The target speed in managed mode, when in CONF 0, when the approach phase of the FMS is active
- The drift down speed, in case of an engine failure.

DISPLAY

Green dot speed is displayed on the airspeed scale of the PFD .



Green dot speed is displayed in flight, when the FLAPS lever is at 0.

Note: The FMS also computes the green dot speed. It is displayed on the T. O, APPR, and GA panels of the FMS PERF page (Refer to page).

L2 COMPUTATION

Green dot speed is computed by the PRIM s.

It is a function of:
- The aircraft altitude
- The aircraft gross weight.

S

Applicable to: ALL

DEFINITION

S is:
- At takeoff or go-around: The minimum recommended speed at which the slats may be retracted from CONF 1+F or CONF 1 to CONF 0
- During approach: The target speed in managed mode, when in CONF 1 or CONF 1+F.

DISPLAY

S is displayed on the airspeed scale of the PFD .

S is displayed in flight, when the FLAPS lever is at 1.

L3 If the takeoff is performed in CONF 1+F, S appears three seconds after liftoff.

L1 *Note: The FMS also computes S . It is displayed on the T. O, APPR, and GA panels of the FMS PERF page (Refer to page).*

L2 **COMPUTATION**

S is computed by the PRIM s.

AT TAKEOFF

$S = 1.21 * Vs1g_{CONF\ 0}$

IN APPROACH

$S = \min [\max (1.21 * Vs1g_{CONF\ 0} ; VMCL + 20\ kt) ; VFE_{CONF\ 2} - 5\ kt]$

F

Applicable to: ALL

DEFINITION

F is:

- At takeoff or go-around: The minimum recommended speed at which the flaps may be retracted from CONF 2 or 3 to CONF 1+F after takeoff
- During approach: The target speed in managed mode, when in CONF 2 or CONF 3.

DISPLAY

F is displayed on the airspeed scale of the PFD .

F is displayed in flight, when the FLAPS lever is at 2 or 3.

L3 If the takeoff is performed in CONF 2 or 3, F appears three seconds after liftoff.

L1 *Note: The FMS also computes F . It is displayed on the T. O, APPR, and GA panels of the FMS PERF page (Refer to page).*

L2 **COMPUTATION**

F is computed by the PRIM s.

AT TAKEOFF

F = max (1.18 * $Vs1g_{CONF\ 1+F}$; VMCL + 5 kt)

IN APPROACH IN CONF 2

F = min [max (1.44 * $Vs1g_{CONF\ 2}$; VMCL + 15 kt) ; VFE_{CONF3} – 5 kt]

IN APPROACH IN CONF 3

F = min [max (1.32 * $Vs1g_{CONF\ 3}$; VMCL + 10 kt) ; $VFE_{CONF\ FULL}$ – 5 kt]

V ALPHA PROT

Applicable to: ALL

DEFINITION

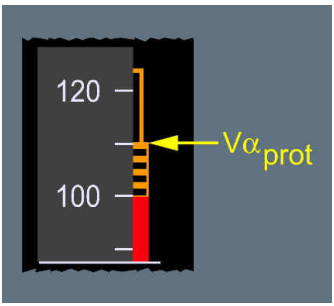
$V\alpha_{prot}$ is the speed at which the angle of attack is α_{prot}.
α_{prot} is the angle of attack at which the angle of attack protection becomes active.
For more information: *Refer to DSC-22-27-20 High Angle of Attack Protection*.

Note: In case of dynamic maneuvers, angle of attack protection may be active at a speed greater than $V\alpha_{prot}$.

DISPLAY

$V\alpha_{prot}$ is displayed on the airspeed scale of the PFD.

$V\alpha_{prot}$



$V\alpha_{prot}$ is displayed in flight, in normal law.

L3 $V\alpha_{prot}$ appears three seconds after liftoff and disappears at touchdown.

L2 COMPUTATION

$V\alpha_{prot}$ is computed by the PRIM s.

It varies with:
- The aircraft weight
- The altitude
- The Mach
- The slats/flaps configuration
- The speedbrake position.

V ALPHA MAX

Applicable to: ALL

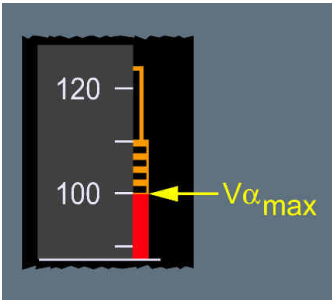
DEFINITION

$V\alpha_{max}$ is the speed at which the angle of attack is α_{max}.
α_{max} is the maximum angle of attack that can be reached in normal law.

DISPLAY

$V\alpha_{max}$ is displayed on the airspeed scale of the PFD.

$V\alpha_{max}$



$V\alpha_{max}$ is displayed in flight, in normal law.
L3 $V\alpha_{max}$ appears three seconds after liftoff and disappears at touchdown.

L2 COMPUTATION

$V\alpha_{max}$ is computed by the PRIMs.

It varies with:
- The aircraft weight
- The altitude
- The Mach
- The slats/flaps configuration
- The speedbrake position.

V ALPHA SW

Applicable to: ALL

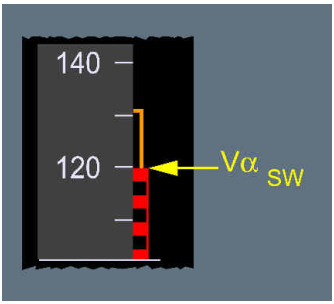
DEFINITION

$V\alpha_{sw}$ is the speed at which the angle of attack is α_{sw}.
α_{sw} is the angle of attack at which the stall warning is triggered.

DISPLAY

$V\alpha_{sw}$ is displayed on the airspeed scale of the PFD.

$V\alpha_{sw}$



$V\alpha_{sw}$ is displayed in flight, in alternate or direct law.

L3 $V\alpha_{sw}$ appears three seconds after liftoff and disappears at touchdown.

L2 COMPUTATION

$V\alpha_{sw}$ is computed by the PRIMs.

It varies with:
- The aircraft weight
- The altitude
- The Mach
- The slats/flaps configuration
- The speedbrake position.

Note: *The FWC computes the stall warning, independently of the computation of $V\alpha_{sw}$. If all PRIMs fail, $V\alpha_{sw}$ is lost, but the stall warning remains available.*

VMAX

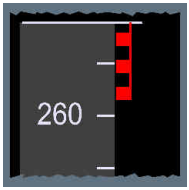
Applicable to: ALL

DEFINITION

VMAX is the maximum allowed speed.

DISPLAY

VMAX is displayed on the airspeed scale of the PFD .



VMAX is displayed in flight.

L3 VMAX appears three seconds after liftoff and disappears at touchdown.

L2 COMPUTATION

VMAX is determined by the PRIM s.

VMAX is equal to:

- In clean configuration, gear up : VMO / MMO
  Refer to LIM-13 Maximum Operating Speed VMO/MMO

  Note: The display of the VMAX does not take reflect the maximum speed displayed by the ECAM , if any (for example in direct law)

- In clean configuration, gear down : VLE / MLE
  Refer to LIM-13 Maximum Speeds with the Landing Gear Extended

  In clean configuration gear down revenue flight : VMO / MMO $_{\text{revenue flight}}$

  Note: Maintenance action is required before the revenue flight, to dispay VMO / MMO $_{\text{revenue flight}}$ instead of VMO / MMO .

  In high lift configuration, gear up : VFE
  Refer to LIM-13 Maximum Flaps/Slats Speeds

  In high lift configuration gear down : min (VFE , VLE / MLE)

When all PRIM s are failed, VMAX is equal to VMO / MMO , whatever the aircraft configuration (landing gear or slats/flaps).

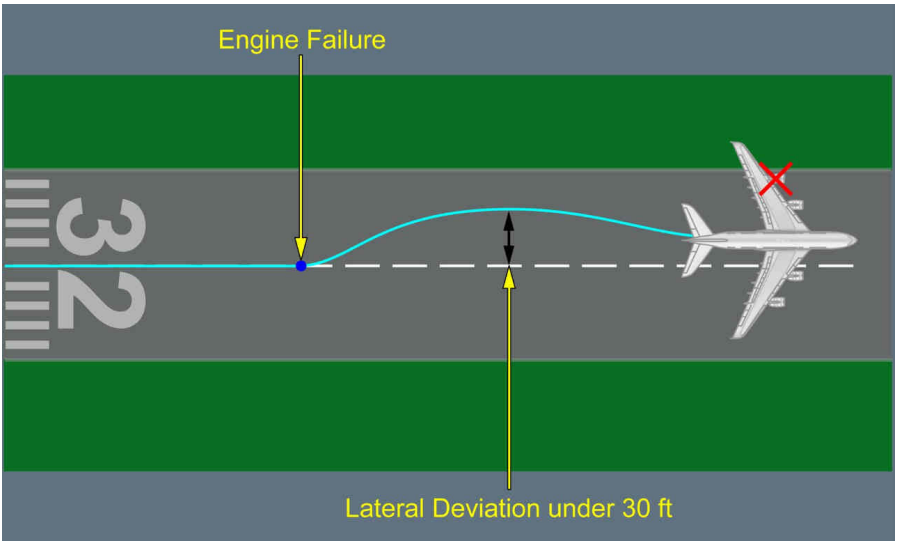
VMCG

Applicable to: ALL

DEFINITION

VMCG is the minimum speed on the ground during takeoff, at which the aircraft can be controlled by the use of primary flight controls only, after a sudden failure of the critical engine, the other engines remaining at takeoff power.
During the recovery maneuver, the path of the aircraft may not deviate from the runway center-line by more than 29.5 ft .

VMCG



DISPLAY

VMCG is not displayed.

L2 COMPUTATION

VMCG is not computed. It is determined during flight tests.
VMCG is used for takeoff speed computation. *Refer to PER-TOF-TOR-SRS Takeoff Speeds*

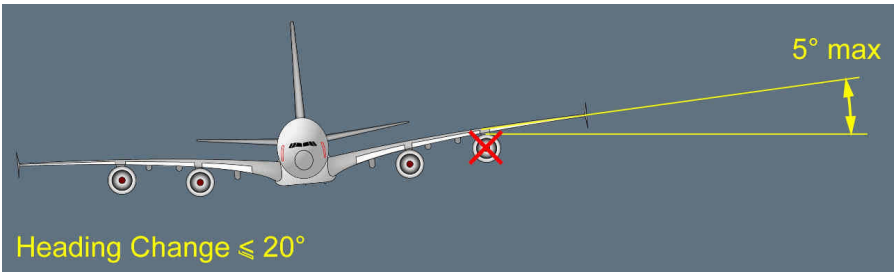
VMCA

Applicable to: ALL

DEFINITION

VMCA is the minimum speed in flight, at which the aircraft can be controlled with a maximum bank angle of 5 ° , after a sudden failure of the critical engine, the other engines remaining at takeoff power, with the gear up and the flaps in takeoff position.
During the recovery maneuver, the heading change may not exceed 20 ° .

VMCA



DISPLAY

VMCA is not displayed.

L2 COMPUTATION

VMCA is not computed. It is determined during flight tests.
VMCA is used for takeoff speed computation. *Refer to PER-TOF-TOR-SRS Takeoff Speeds*

VMCL

Applicable to: ALL

DEFINITION

VMCL is the minimum speed in flight, at which the aircraft can be controlled with a maximum bank angle of 5 ° , after a sudden failure of the critical engine, the other engines remaining at go-around power, with the gear up and the flaps in go-around position.

DISPLAY

VMCL is not displayed.
However, VLS is limited by VMCL .

L2 **COMPUTATION**

VMCL is not computed. It is determined during flight tests. *Refer to LIM-13 Minimum Control Speeds*

VMCL-2

Applicable to: ALL

DEFINITION

VMCL-2 is the minimum speed in flight, at which the aircraft can be controlled with a maximum bank angle of 5 ° , after two engines fail on the same wing, the other engines remaining at go-around power, with the gear up and the flaps in go-around position.

DISPLAY

VMCL-2 is not displayed.
However, when two engines are inoperative on the same wing, VLS is limited by VMCL-2 .

L2 *Note: If three engines are failed, VLS is not limited by VMCL-2 .*

COMPUTATION

VMCL-2 is not computed. It is determined during flight tests. *Refer to LIM-13 Minimum Control Speeds*

VMU

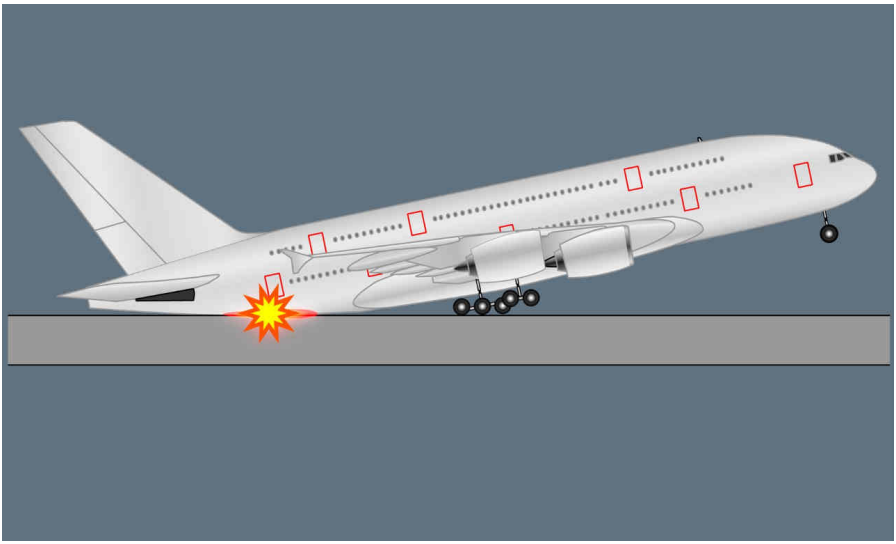
Applicable to: ALL

DEFINITION

VMU is the minimum speed at which the aircraft can safely lift off and continue the takeoff.
On geometrically limited aircraft, attempting to takeoff at a speed below VMU will result in a tailstrike.

L3 To demonstrate VMU during flight tests, at low speed, the pilot maintains full back stick until the tail touches the ground. This pitch attitude is maintained until the aircraft lifts off.

VMU



L1 **DISPLAY**

VMU is not displayed.

L2 **COMPUTATION**

VMU is not computed. It is determined during flight tests.
VMU is used for takeoff speed computation.

VFE

Applicable to: ALL

DEFINITION

VFE is the maximum speed with the slats or flaps extended.
There is one VFE per configuration. *Refer to LIM-13 Maximum Flaps/Slats Speeds*

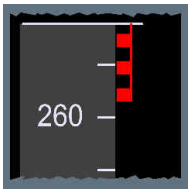
DISPLAY

The VFE is displayed on the airspeed scale of the PFD .

L2 The display of the VFE is based on:
- The actual position of the slats and flaps during retraction
- The position of the FLAPS lever during extension

In the case of a slats or flaps jamming, the display of the VFE is based on the actual position of the slats and flaps. The VFE corresponding to the abnormal configuration is also displayed on the ECAM .

L1



L2 **COMPUTATION**

The VFE s are not computed. They are included in the PRIM s. *Refer to LIM-13 Maximum Flaps/Slats Speeds*

Note: *The overspeed warning is independent of the display of the VFE s.*
When all PRIM s are failed, the VFE is not displayed, but the overspeed warning remains available.

VFE NEXT

Applicable to: ALL

DEFINITION

VFE NEXT is the VFE of the next more extended configuration.
The aim of VFE NEXT is to remind the flight crew the maximum speed at which they can extend the next configuration during approach.

DISPLAY

VFE NEXT is displayed on the airspeed scale of the PFD.

VFE NEXT is displayed in flight, below 20 000 ft.

L2 In the case of a slats or flaps jamming, the display of VFE NEXT is based on the actual position of the slats and flaps.

COMPUTATION

VFE NEXT is not computed. It is included in the PRIMs.

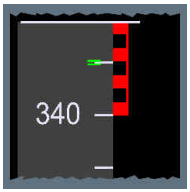
VMO / MMO

Applicable to: ALL

DEFINITION

VMO / MMO is the maximum speed in clean configuration.

DISPLAY



L2 COMPUTATION

VMO / MMO is computed by the ADIRU s.
VMO / MMO is sent to the PRIM s for display.

L3 There is a backup link between the ADIRU s and the CDS , to enable VMO / MMO display when all PRIM s fail.

L2 VMO / MMO is the smallest of:
- VMO
- MMO converted into CAS at this altitude.

Refer to LIM-13 Maximum Operating Speed VMO/MMO
During a revenue flight with gear down, the VMO / MMO $_{\text{gear down}}$ is displayed. (Maintenance action is required prior to dispatch).

V1

Applicable to: ALL

DEFINITION

V1 is the maximum speed at which the crew can decide to reject the takeoff, and is ensured to stop the aircraft within the limits of the runway.

DISPLAY

V1 is displayed on the airspeed scale of the PFD .

If V1 is outside of the airspeed scale, it is displayed at the top of the airspeed scale.

An auto call-out announces when the speed reaches V1 .

V1 Synthetic Voice

L2 COMPUTATION

V1 is not computed by the aircraft systems.
The crew inserts V1 on the T.O panel of the FMS PERF page.(*Refer to DSC-22-FMS-20-30-22FMS502BC PERF page*)

VR

Applicable to: ALL

DEFINITION

VR is the speed at which the pilot rotates in order to reach V2 before reaching a height of 35 ft .

DISPLAY

VR is displayed on the airspeed scale of the PFD . It is represented by a blue dot.

L2 COMPUTATION

VR is not computed by the aircraft systems.

The crew inserts VR on the T.O panel of the FMS PERF page.(*Refer to DSC-22-FMS-20-30-22FMS502BC PERF page*)

V2

Applicable to: ALL

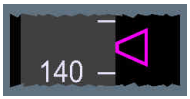
DEFINITION

V2 is the takeoff safety speed.

L2 V2 is determined in order to:
- Be reached before 35 ft , after rotation at VR , in case of an engine failure.
- Ensure a minimal climb gradient during the second segment
- Ensure a sufficient margin towards stall and VMCA . V2 must be greater than
  - 1.13 Vs1g
  - 1.10 VMCA

L1 DISPLAY

V2 is displayed on the airspeed scale of the PFD .



L2 COMPUTATION

V2 is not computed by the aircraft systems.
The crew inserts V2 on the T.O panel of the FMS PERF page.(*Refer to DSC-22-FMS-20-30-22FMS502BC PERF page*)

VREF

Applicable to: ALL

DEFINITION

VREF is the reference speed used for normal approach and landing.
This speed is used to compute the regulatory landing performance of the aircraft.
It is also used as a reference when computing landing performance with failures.

DISPLAY

VREF is not displayed on the PFD .
It is displayed on the APPR panel of the FMS PERF page. (*Refer to DSC-22-FMS-20-30-22FMS502BC PERF page*)

L2 **COMPUTATION**

VREF is equal to the VLS of CONF FULL.

VAPP

Applicable to: ALL

DEFINITION

VAPP is the final approach speed.

DISPLAY

There is no specific indication for the VAPP . It is displayed as the speed target during the approach phase.

L2 **COMPUTATION**

VAPP is computed by the FMS .
VAPP = $VLS_{LDG\ CONF}$ + (5 ≤ headwind/3 ≤ 15)
The VAPP can be updated by the crew on the APPR panel of the FMS PERF page. (*Refer to DSC-22-FMS-20-30-22FMS502BC PERF page*)

Intentionally left blank

GENERAL

Applicable to: ALL

In the normal flight envelope, the flight control laws enable the same flying techniques than on a conventional aircraft.

In extreme situations, the flight control laws provide protections in order to:
- Give full authority to the flight crew in order to achieve the best possible aircraft performance
- Reduce the risk of over-controlling/over-stressing the aircraft
- Remain within safe limits.

Within the normal flight envelope, the autopilot is available. When out of the normal envelope, the AP disengages, and manual flight remains possible (efforts on the controls indicate the non-normal situation).

LOAD FACTOR PROTECTION

Applicable to: ALL

The load factor is automatically limited to:
- +2.5g to –1g, when the slats are retracted
- 2g to 0g, when the slats are extended.

BANK ANGLE

Applicable to: ALL

The maximum achievable bank angle is 67 °(60 ° in high lift configurations).

When the bank angle exceeds 45 °:
- The AP disengages
- The FD disappears, but remains engaged.

PITCH ATTITUDE PROTECTION

Applicable to: ALL

PITCH UP PROTECTION

The pitch attitude is limited to 30 ° nose up, progressively reduced to 25 ° at low speed.

When the pitch attitude is above 25 ° nose up:
- The AP disengages
- The FD no longer appears, but remains engaged.

PITCH DOWN PROTECTION

The pitch attitude is limited to 15 ° nose down.

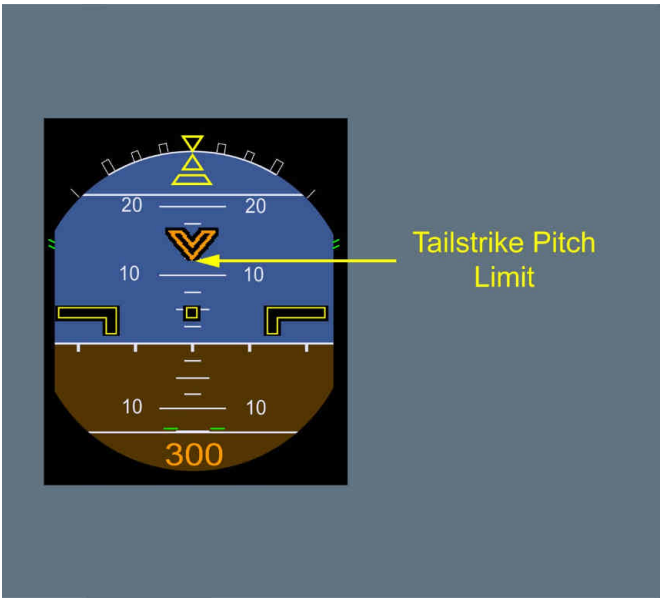
When the pitch attitude is below 13 ° nose down:
- The AP disengages
- The FD no longer appears, but remains engaged.

PITCH ATTITUDE ALERT

During landing, if the pitch attitude is excessive close to the ground, an aural alert “PITCH PITCH” is triggered.

Pitch Synthetic voice
The pitch attitude aural alert is available during manual landings, below 400 ft RA .
It is triggered when the pitch attitude is above 12 ° (i.e. maximum achievable geometrical angle on ground, with the landing gear compressed). For more information : *Refer to PRO-NOR-SOP-210-A Landing-GROUND CLEARANCE* .
A tailstrike pitch limit also appears for takeoff and landing. For more information: *Refer to Tailstrike Pitch Limit display conditions*

Tailstrike Pitch Limit



If a tailstrike is detected, the TAIL STRIKE alert is triggered (*Refer to procedure*).

HIGH SPEED PROTECTION

Applicable to: ALL

In normal law, the aircraft is protected against excessive overspeed.
The AP disengages at VMO + 15 kt or MMO + M 0.04 .
The high speed protection is active 10 kt above VMO or M .02 above MMO .

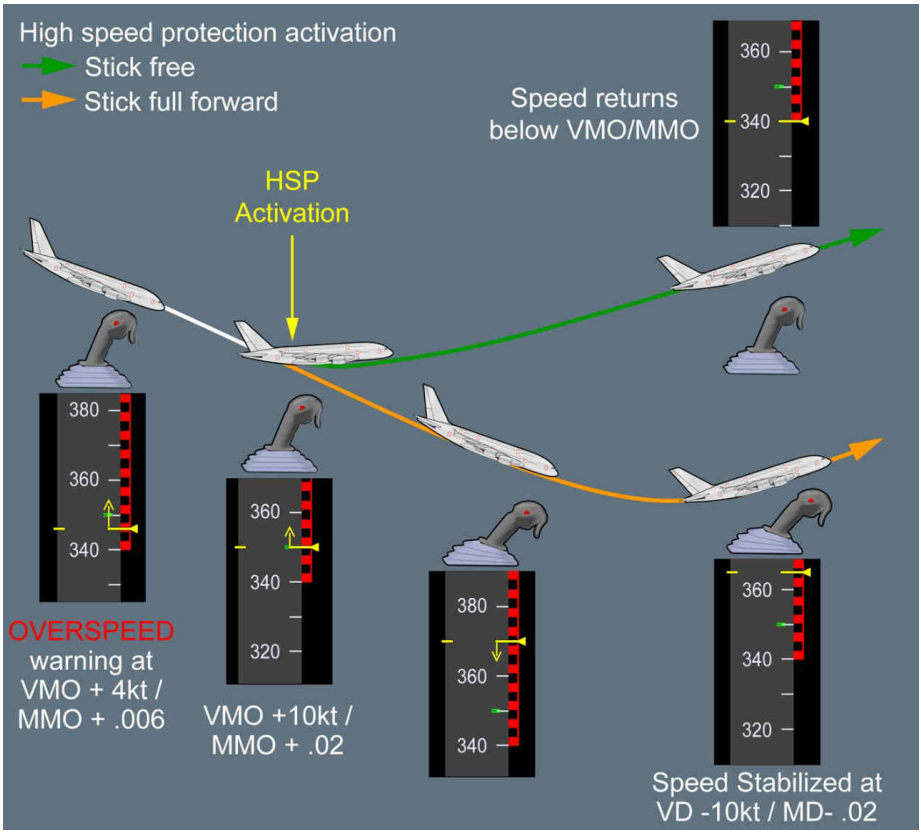
Note: Whatever the active flight control law, the OVERSPEED warning is triggered 4 kt above VMO , or M 0.006 above MMO (Refer to PRO-ABN-ECAM-10-27-10-50 OVERSPEED).

When high speed protection is active:
- The bank angle is limited to 45°
- The pitch trim position is frozen
- Positive static stability is restored (the pitch attitude increases when the speed increases)
- Positive spiral stability is restored (the bank angle returns to 0° when the sidestick is released)
- The speed stabilizes at VD - 10 kt / MD - M .02 if the sidestick is full forward,or
  The speed will return below VMO / MMO , if the sidestick is released.

L2 *Note: VD/MD is the design dive speed, which is the maximum structural speed.*

- *VD = 375 kt*
- *MD = M 0.96*

High Speed Protection

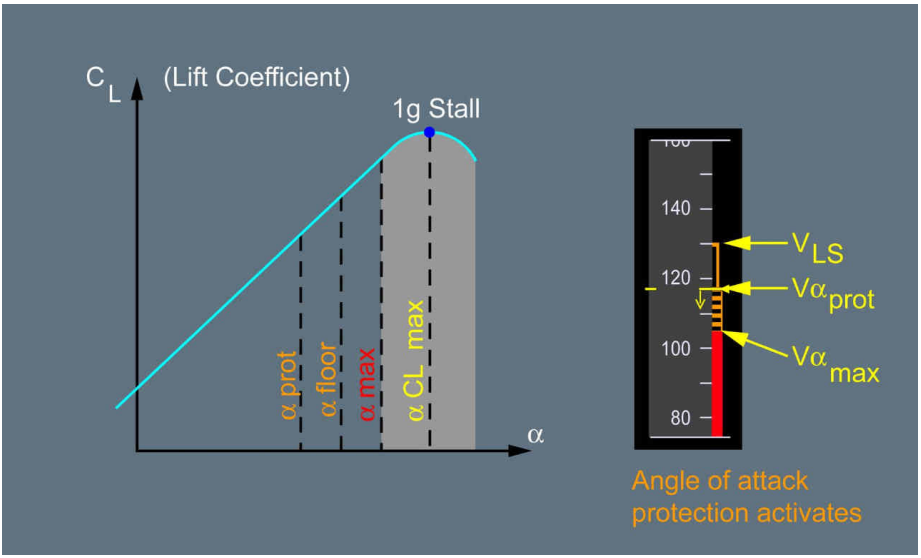


ANGLE OF ATTACK PROTECTION

Applicable to: ALL

In normal law, the aircraft is protected against stall, in dynamic maneuvers or gusts.
The angle of attack protection activates when the angle of attack exceeds α_{prot}. In any case, the angle of attack cannot exceed α_{max}.

Angle of attack protection



When the angle of attack protection is active:

- The pitch control law controls the angle of attack (the angle of attack is proportional to the sidestick deflection) between:
  - α_{max} (Full back stick)
  - α_{prot} (Sidestick at neutral)
- Static stability is restored
- The bank angle is limited by the maximum achievable load factor (The maximum achievable bank angle is greater than 45°).

LOW ENERGY PROTECTION

Applicable to: ALL

The objectives of the low energy alert and of the alpha floor function are to protect the flight path angle by providing means to achieve a proper level of energy:

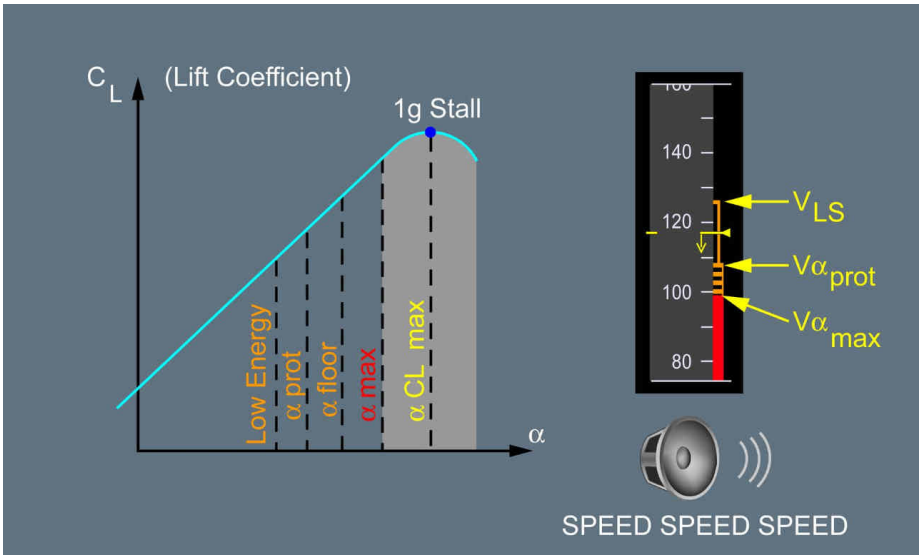
- The low energy alert is the first level of protection. It requires crew action, for manual thrust increase.
- The alpha floor function is the second level of protection. It automatically sets maximum thrust. For more information: *Refer to DSC-22-27-20-20A Alpha Floor Protection* .

When it is not possible to recover a positive flight path angle using the pitch control, an aural alert "SPEED SPEED SPEED" is repeated every 5 seconds, as long as the thrust has not been sufficiently increased.

Speed (Synthetic voice)
The low energy alert is triggered when the speed is between VLS and $V\alpha_{prot}$.

L2 The low energy alert is triggered when the speed is close to $V\alpha_{prot}$, but it can be triggered closer to VLS, in the case of:
- A negative flight path angle, or
- A negative speed trend.

Low Energy Warning



L1 The low energy alert will be triggered during deceleration before the activation of α-floor. The delay between the low energy alert and the activation of α-floor depends on the deceleration rate.

The low energy alert is available:
- Below 2 500 ft RA
- Above 100 ft RA for landing, above 200 ft RA for takeoff

- In CONF 2, 3 and FULL

L2 If the slats or flaps are jammed, the low energy alert is available when the aircraft is not in clean configuration.

L1 - In all flight control laws (Normal, Alternate, and Direct)

It is inhibited when:
- At least one engine thrust lever is at TOGA , or
- α-floor is active, or
- The angle of attack has reduced below the warning threshold.

L2 The low energy alert requires the following equipment
- 1 PRIM
- 1 ADIRS
- 1 RA

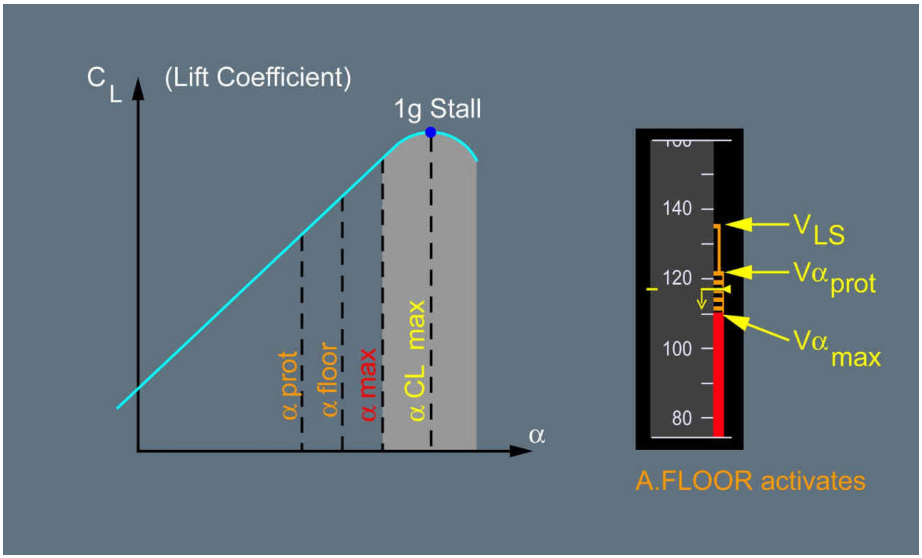
ALPHA FLOOR PROTECTION

Applicable to: ALL

To avoid flying at low speed with a low thrust, the α-floor function automatically applies TOGA thrust, when the angle of attack exceeds the α-floor threshold (between α-prot and α-max). TOGA thrust is applied, whatever the thrust lever position and A/THR engagement status.
If the A/THR was previously not active, it automatically activates. The thrust remains at TOGA , as long as the A/THR is active. (*Refer to DSC-22-FG-50-50-C A/THR Mode Reversion*)

L2 The α-floor function activates when one of the following conditions is true:
- The angle of attack is greater than α-floor (α-floor depends on the aircraft's configuration)
- The angle of attack protection is active, and the sidestick deflection is close to full back stick
- The pitch up attitude protection is active, and the sidestick deflection is close to full back stick

Alpha Floor



L1 α-floor is available:
- From liftoff down to 100 ft RA
- In normal law.

α-floor is inhibited if one of the following conditions occurs:
- The Mach is above 0.5
- The AP / FD TCAS mode engages following a Resolution Advisory, and the thrust levers are at or below the CL detent.

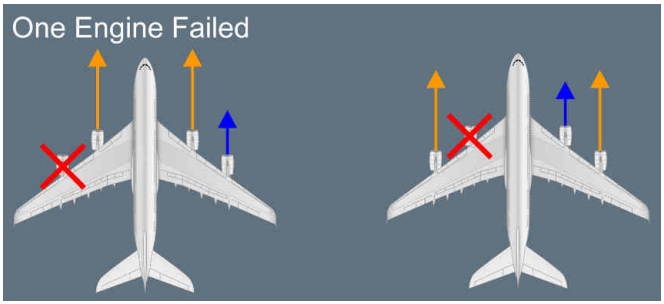
L3 If at least one thrust lever is below the CL detent, when the TCAS mode engages, the α-floor is inhibited during 5 s , to enable the flight crew to set the thrust levers to the CL detent.

L2 The α-floor remains inhibited as long as the TCAS mode is engaged.

ENGINE FAILURE CASE

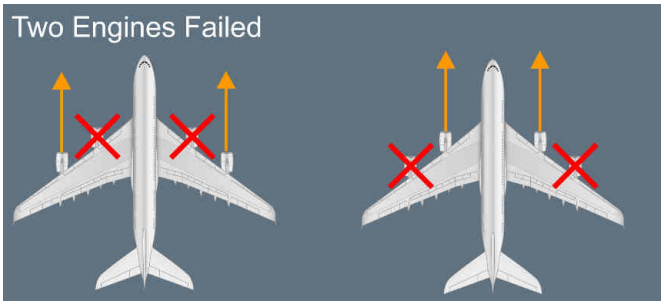
When one engine is failed, α-floor remains available. To avoid thrust dissymmetry, TOGA thrust will not be commanded on the engines opposite to the failed engine. On this engine, the thrust is frozen at the moment of α-floor activation.

One Engine Failed



When two engines are failed, α-floor remains available if the two failed engines are symmetrical (i.e. if engines 1 and 4, or engines 2 and 3 are failed).

Two Engines Failed



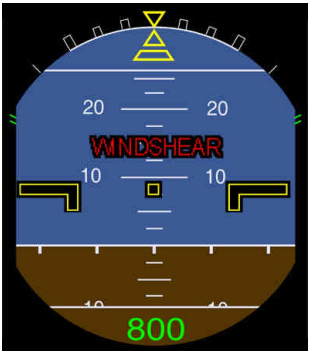
REACTIVE WINDSHEAR DETECTION

Applicable to: ALL

A windshear alert triggers, when the aircraft encounters wind gradients during takeoff and landing, which could reduce the margin towards stall.

The windshear alert consists of:

- A red windshear message displayed on both PFD.



It flashes during 9 s, then remains steady, as long as the windshear is detected.

- An aural WINDSHEAR alert

Windshear (Synthetic voice)

L2 The reactive windshear detection is performed by the PRIMs.

It is available:

- During takeoff: 3 s after liftoff, and until reaching 1 300 ft
- During landing: From 1 300 ft to 50 ft.

It is inhibited if the aircraft is in CONF 0.

AIRCRAFT SYSTEMS

22 - AFS INTRODUCTION

Intentionally left blank

DSC-22-INT-PLP PRELIMINARY PAGES

TABLE OF CONTENTS

System Description.....A
Overall Architecture.....B

Intentionally left blank

SYSTEM DESCRIPTION

Applicable to: ALL

OVERVIEW

The Auto Flight System (AFS) includes:

- The Flight Guidance (FG)
  The FG provides guidance in accordance with flight targets selected by the flight crew, or managed by the Flight Management System.
- The Flight Management System (FMS)
  The FMS manages the flight plan, defined by the flight crew, and provides flight parameters to the FG accordingly.

The AFS also includes:

- The Flight Envelope (FE)
- The Flight Control Data Concentrator (FCDC).

FLIGHT GUIDANCE (FG)

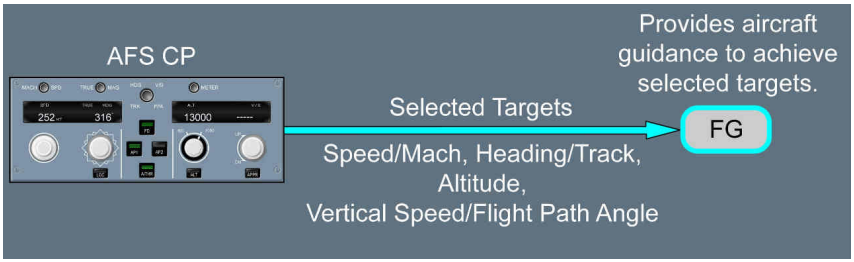
FG OBJECTIVES

The objectives of the FG are to provide lateral and vertical guidance, including speed or Mach control, based on defined targets. These targets can be either selected or managed.

Selected Targets

The flight crew selects the targets via the short-term interface: The AFS Control Panel (CP). Then the FG uses these targets to perform selected guidance.

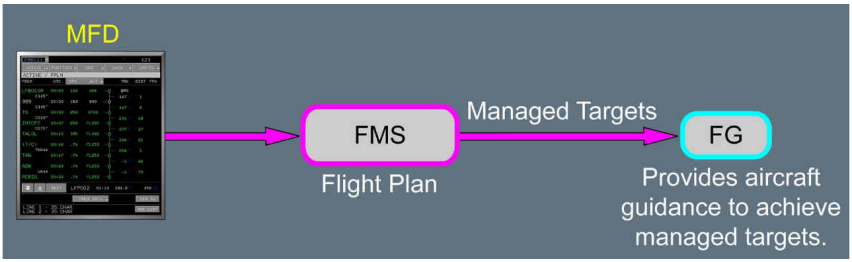
Selected Guidance



Managed Targets

The flight crew uses the long-term interface, the Multi Function Display (MFD), to prepare the flight plan. The FMS calculates managed targets accordingly. Then the FG uses these targets to perform managed guidance.

Managed Guidance



Selected and Managed Guidance — Combinations

Lateral guidance and vertical guidance can be selected or managed, independently of each other. However, managed vertical guidance is not possible, when selected lateral guidance is used.

L2 The following table outlines the possible combinations:

L12

		Lateral	
		Selected	Managed
Vertical	Selected	Yes	Yes
	Managed	No	Yes

L1 Speed or Mach can be either selected or managed, regardless of lateral and vertical guidance.

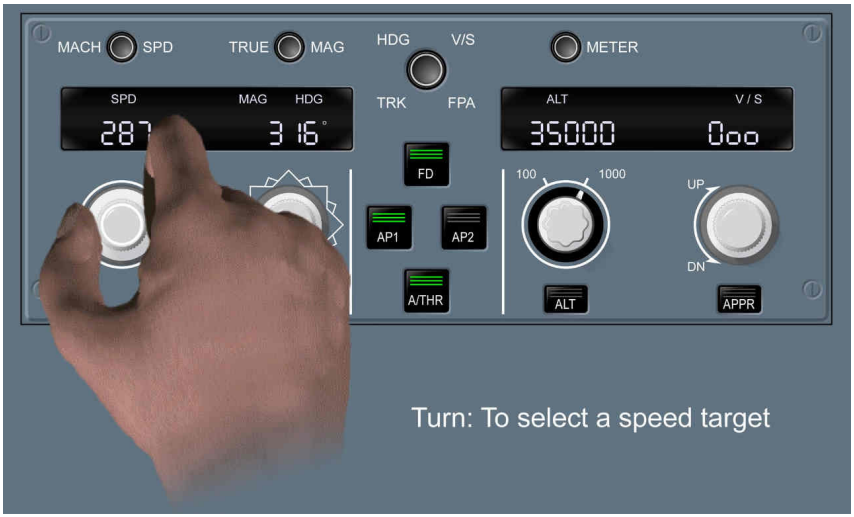
AFS CP Philosophy

On the AFS CP , the SPD /MACH, HDG / TRK , V/S / FPA knobs can be turned, pulled, and pushed. This enables the flight crew to:

- Preselect a target: Turn
- Engage a mode that will guide the aircraft to a selected target: Pull
- Arm or engage a mode that will guide the aircraft to a managed target: Push.

Here is an example with the SPD/MACH knob .

AFS CP Philosophy: Turn to Select a Speed Target



AFS CP Philosophy: Pull to engage selected speed mode

AFS CP Philosophy: Push to arm or engaged managed speed mode

When in managed guidance, the flight crew can take over control at any time, and change to selected guidance.

FG FUNCTIONS: AP , FD AND A/THR

In order to achieve its objectives (lateral guidance, vertical guidance, including speed or Mach control), the FG uses:

- The Autopilot 1 and/or 2 (AP 1 and/or AP 2)
  The AP provides flight guidance by calculating pitch, roll, yaw and nosewheel steering orders.
- The Flight Directors 1 and 2 (FD 1 and FD 2)
  The FD s display guidance orders on the PFD s to assist the flight crew to fly the aircraft manually. When the AP is engaged, the flight crew can use the FD orders to monitor the guidance.
- The Autothrust (A/THR)
  A/THR controls the thrust by sending commands to the engines.

Refer to AFS - FLIGHT GUIDANCE / GENERAL .

FLIGHT MANAGEMENT SYSTEM (FMS)

LONG-TERM GUIDANCE

The Flight Management System (FMS) provides long-term guidance along the inserted flight plan.

To achieve these long-term objectives, the FMS computes managed targets, that are then sent to the FG .

FMS FUNCTIONS

In addition to long-term guidance, the FMS :
- Provides flight planning and navigation information
- Calculates and optimizes performance data
- Displays information on the MFD , ND and PFD .

Refer to AFS - Flight Management System / General .

FLIGHT ENVELOPE (FE)

The FE computes the aircraft normal flight envelope. The FE is used by the FG and by the flight controls to prevent the aircraft from exiting the envelope.
Refer to DSC-22-27-20 General .

L3 FLIGHT CONTROL DATA CONCENTRATOR (FCDC)

The FCDC :
- Determines the approach capability for the AFS
  For more information, *Refer to Limitations / Required Conditions for F-APP, F-APP+RAW, or RAW ONLY Approach Capability* , and *Refer to Limitations / Required Equipment for CAT2, or CAT3 Approach Capability* .
- Interfaces the AP , FD and A/THR with the FWS to allow the associated alerts to be triggered
- Generates maintenance messages for the AFS (FG and FE).

The FCDC also performs functions for the flight controls (e.g. monitoring and display of the flight control surfaces position, transmission of flight control parameters to the recorders): *Refer to Flight Controls / FCDC* .

OVERALL ARCHITECTURE

Applicable to: ALL

GENERAL

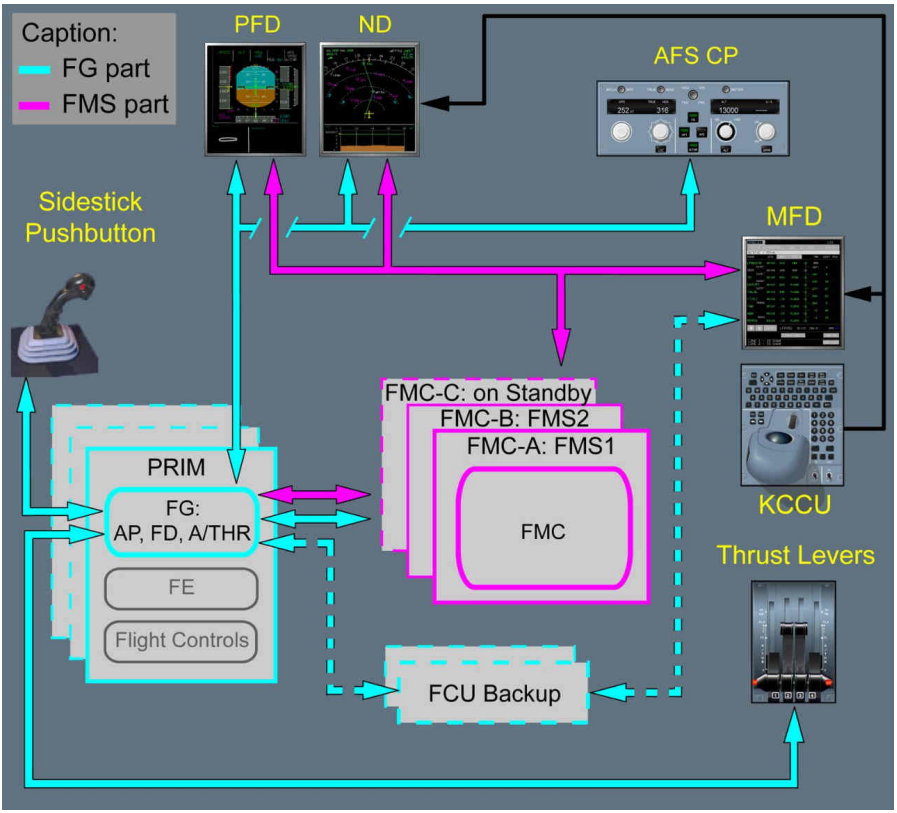
The AFS has:

- Three Primary flight control and guidance computers (PRIM s)
- Three Flight Management Computers (FMC s).

The flight crew interfaces with the AFS via:

- One AFS Control Panel
  The AFS CP has a backup, displayed on the MFD s. This backup is referred to as the FCU backup / AUTO FLT page.
- Two Multi Function Displays (MFD s)
- Two Primary Flight Displays (PFD s)
- Two Navigation Displays (ND s)
- One sidestick pushbutton on each sidestick
- Four thrust levers, and two A/THR instinctive disconnect pushbuttons.

OVERALL ARCHITECTURE



PRIMARY FLIGHT CONTROL AND GUIDANCE COMPUTER (PRIM)

There are three PRIM s, that operate the FG . Each PRIM can operate one or both AP s, and/or both FD s, and/or the A/THR .
The PRIM s also operate the FE and flight control functions.
For the PRIM architecture for the FG , *Refer to AFS - FLIGHT GUIDANCE / PRIM ARCHITECTURE FOR FG* .

FLIGHT MANAGEMENT COMPUTER (FMC)

There are two FMS s (FMS 1 and FMS 2), that are using three FMC s: FMC -A, FMC -B and FMC -C.

In normal operation:
- FMC -A operates FMS 1
- FMC -B operates FMS 2
- FMC -C is on standby, ready to operate FMS 1 or FMS 2.

Each FMC can operate all the flight management functions.
Refer to AFS - Flight Management System / Architecture .

AFS CONTROL PANEL

The AFS Control Panel is the main interface with the FG . The flight crew can:

- Engage managed or selected guidance
- Select targets for short-term guidance (speed/Mach, heading/track, altitude, vertical speed/flight path angle)
- Engage the AP , FD and A/THR
- Select altitude display in meters
- Select magnetic or true North reference.

In case the AFS CP fails, the MFD FCU BKUP / AFS CP page provides all the AFS CP controls and indicators (For more information, *Refer to Flight Guidance / FCU Backup*).

MULTI FUNCTION DISPLAY (MFD)

The MFD is the main interface with the FMS . It is also the interface of the FCU BKUP .
The flight crew can navigate through the MFD pages, and enter or modify data, with the Keyboard and Cursor Control Unit (KCCU).
For more information, *Refer to FMS / MFD* , and *Refer to Flight Guidance / FCU Backup* .

Note: The MFD also displays:
- *The Air Traffic Control (ATC) Communication pages*
- *The Surveillance (SURV) pages*
- *The FCU backup pages.*

PRIMARY FLIGHT DISPLAY (PFD)

The PFD mainly displays:
- Primary flight parameters (bank angle, pitch angle, speed, Mach, heading, track, altitude, vertical speed, flight path vector, velocity vector)
- Selected and managed guidance targets (e.g. speed and altitude targets)
- Armed and engaged modes, landing capability, AP, FD and A/THR engagement status on the Flight Mode Annunciator (FMA)
- Flight Director guidance orders
- Instrument approach information.

NAVIGATION DISPLAY (ND)

The ND mainly displays lateral and vertical parts of flight plans, and their associated navigation information. The flight crew can use the ND to modify the lateral part of the flight plan by using the KCCU.
The flight crew controls the ND display via an EFIS Control Panel, located on the glareshield.

SIDESTICKS

Asidestick pb located on each sidestick, allows the AP to be disengaged.
When the AP is not engaged, the flight crew uses the sidesticks to fly the aircraft.

THRUST LEVERS

The flight crew interfaces with the A/THR via the thrust levers. The detent positions are sent to the PRIMs. Then the A/THR sends thrust commands to the Full Authority Digital Engine Control (FADEC) system. The FADEC system regulates the engine thrusts.
When armed or active, the Autothrust can be disconnected by one of the two instinctive disconnect pushbuttons located on the thrust levers.

INTRODUCTION

Applicable to: ALL

Flight Guidance (FG) operates by using the following modes:

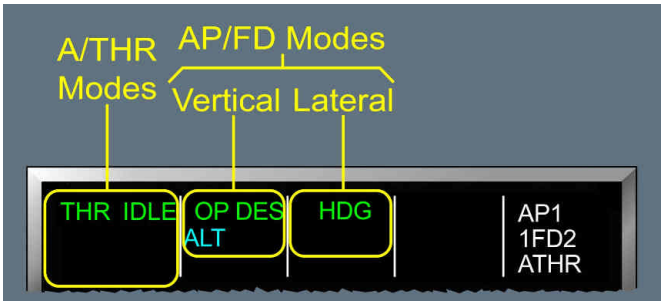
- AP/FD lateral modes
  These modes control the lateral trajectory.
- AP/FD vertical modes

  These modes can control either:
  - The vertical trajectory, or
  - The Speed or Mach.
- A/THR modes

  These modes can control either:
  - The thrust, or
  - The speed or Mach.

Speed or Mach cannot be simultaneously controlled by the AP/FD and the A/THR.
The FG modes appear on the Flight Mode Annunciator (FMA) of the Primary Flight Displays (PFDs).

A/THR Modes and AP/FD Modes

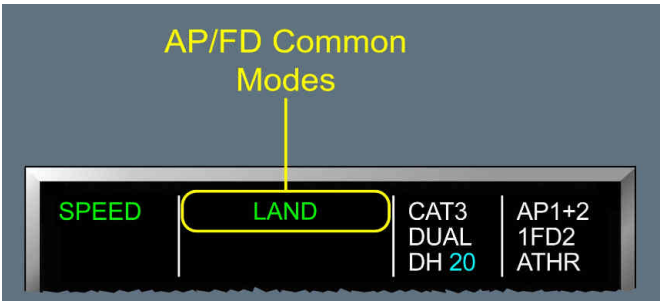


Some AP/FD lateral and vertical modes are specifically linked to each other to form common modes.
A common mode fulfills the objectives of both a lateral and a vertical mode.

LAND is an example of a common mode:

- The lateral objective is to guide the aircraft along the LOC beam
- The vertical objective is to guide the aircraft along the G/S beam.

AP/FD Common Modes



SELECTED AND MANAGED MODES

Applicable to: ALL

Guidance is either selected or managed. Therefore, the corresponding modes are also referred to as either selected or managed:

Guidance	Managed Modes	Selected Modes
Lateral	NAV LOC*, LOC LOC B/C*, LOC B/C F-LOC*, F-LOC RWY, RWY TRK GA TRK	HDG, TRACK
Vertical	SRS CLB ALT*, ALT ALT CRZ*, ALT CRZ ALT CST*, ALT CST DES G/S*, G/S F-G/S*, F-G/S TCAS	OP CLB ALT*, ALT ALT CRZ*, ALT CRZ OP DES V/S, FPA
Lateral and Vertical	LAND FLARE ROLL OUT (1)	
Speed or Mach	SPEED, MACH with FMS reference.	SPEED, MACH with AFS CP reference.

(1) *These modes are common modes.*

INTERACTION BETWEEN AP / FD AND A/THR

Applicable to: ALL

The AP / FD vertical mode determines the associated A/THR mode:

- When an AP / FD vertical mode controls a speed or Mach target, the A/THR mode controls thrust.

L2 The vertical trajectory is a result of speed or Mach, and of thrust.

L1 - When an AP / FD vertical mode controls the vertical trajectory, the A/THR mode controls a speed or Mach target.

Note: During ROLL OUT , and during FLARE with the AP on, the A/THR mode controls thrust at idle.

- If no AP / FD mode is engaged, A/THR engages in SPEED or MACH mode, in order to control a speed or Mach target.

AP / FD		A/THR	
Vertical Modes	**Objectives**	**Modes**	**Objectives**
SRS OP CLB CLB OP DES DES in idle path	Control of Speed or Mach Target	THRUST Modes	Control of Thrust
V/S / FPA ALT* , ALT ALT CST* , ALT CST ALT CRZ* , ALT CRZ DES in geometric path G/S* , G/S F-G/S* , F-G/S TCAS LAND common mode FLARE common mode with FD s engaged only	Control of Vertical Trajectory	SPEED / MACH	Control of Speed or Mach Target
FLARE common mode during autoland	Control of Vertical Trajectory	THRUST Mode	Control of Thrust at Idle
None		SPEED / MACH	Control of Speed or Mach

For information on AP / FD modes, *Refer to AP/FD Modes / General* .

Intentionally left blank

GENERAL

Applicable to: ALL

There are three PRIMs. Each PRIM can operate one or both APs, and/or FDs, and/or A/THR.

L2 Due to the fact that each PRIM can operate the A/THR, there are three A/THR channels.

L1 To determine which PRIM will operate the engaged AP(s), FDs, and A/THR, each PRIM computes its operational capability, taking into account:

- Manual flight control law capability
- FE, AP, and approach capability
- A/THR capability.

The Master PRIM is the PRIM that has the best operational capability. The Slave 1 PRIM has the second best operational capability, and the Slave 2 PRIM has the third best.

When all the PRIMs have the same capability:

- PRIM1 is the Master PRIM
- PRIM2 is the Slave 1 PRIM
- PRIM3 is the Slave 2 PRIM.

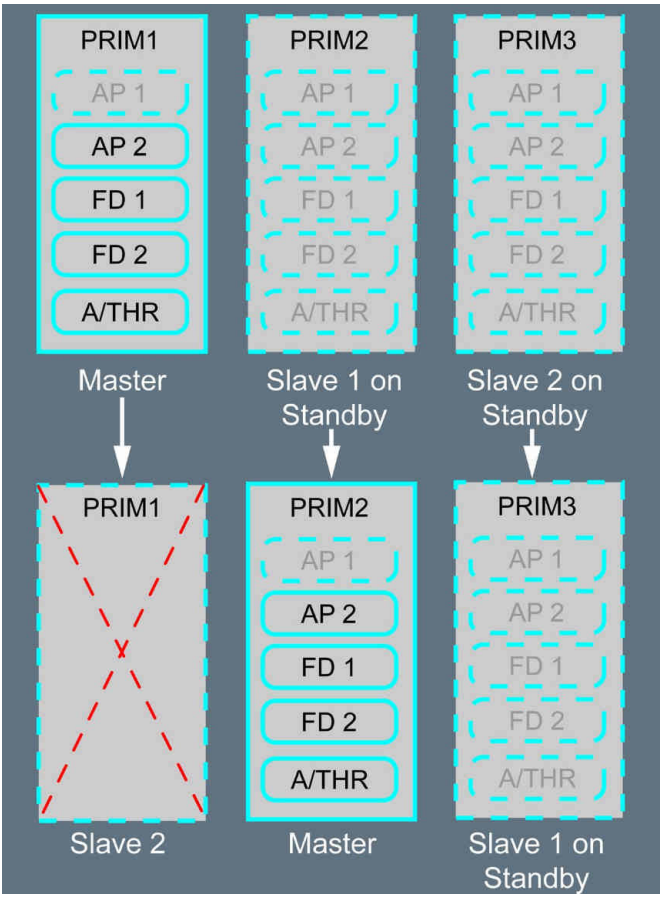
The Master PRIM has the priority to operate AP(s), FDs and A/THR.

If the Master PRIM loses the best operational capability, the engaged AP, FDs and A/THR do not disconnect. They are transferred to the Slave 1 PRIM, and:

- The Slave 1 PRIM becomes the Master PRIM
- The two other PRIMs become Slave 1 PRIM and Slave 2 PRIM.

In the following example, all the PRIMs initially have the same capability, AP2 is engaged, FDs are engaged, A/THR is armed or active, and PRIM1 fails:

PRIM Architecture

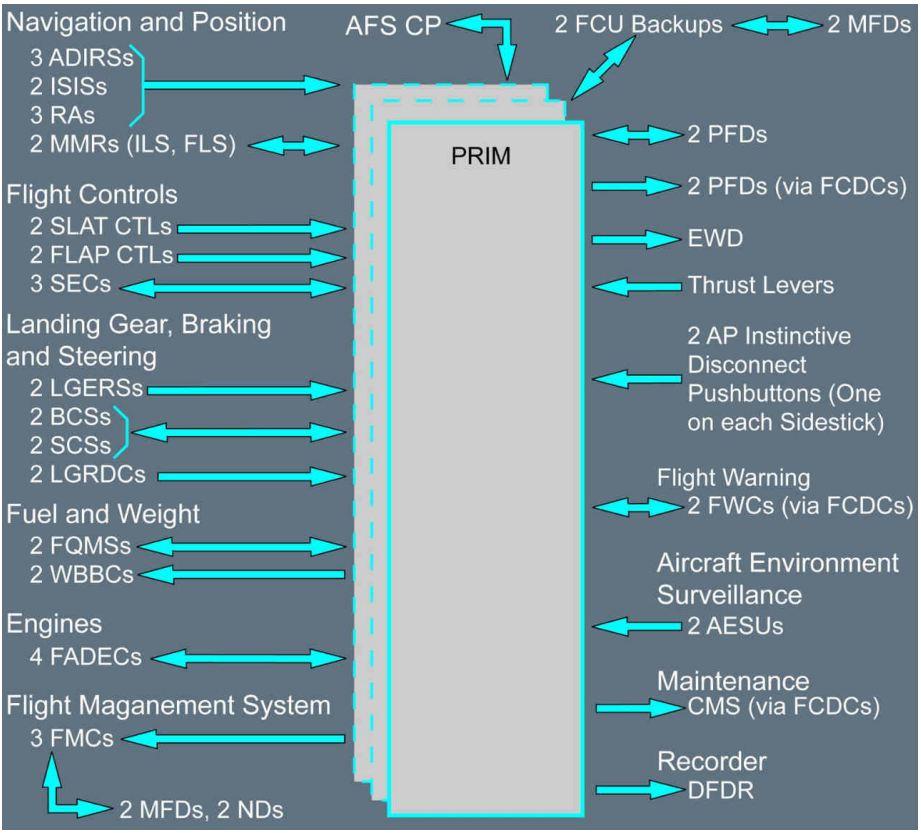


PRIM INTERFACES FOR FG

Applicable to: ALL

L2 The PRIM interfaces with the following peripheral systems:

PRIM Interfaces for FG



Intentionally left blank

GENERAL

Applicable to: ALL

The Flight Director (FD) displays guidance orders on the Primary Flight Displays (PFDs):
- If no AP is engaged, the flight crew can manually fly the aircraft by following FD orders
- If at least one AP is engaged, the flight crew can use the FD to monitor the flight guidance.

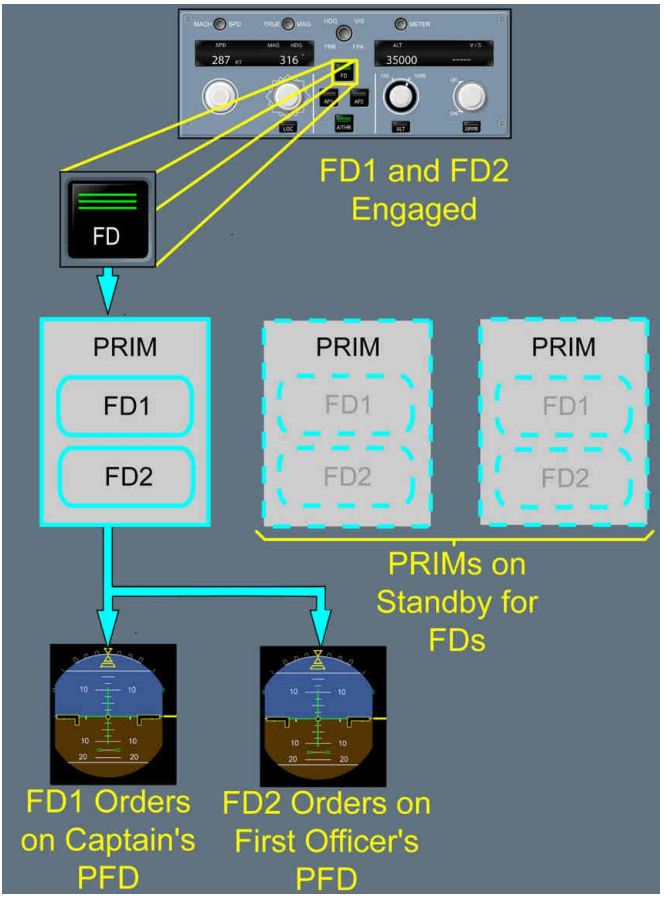
There are two FDs, referred to as FD1 and FD2:
- FD1 guidance orders appear on the Captain's PFD

FD1 uses data from the systems on the Captain's side:
- When in managed mode, FD1 guidance orders are computed by using FMS1 data
- L2 FD1 uses ADIRS1 data.

L1 - FD2 guidance orders appear on the First Officer's PFD.

FD2 uses data from the systems on the First Officer's side:
- When in managed mode, FD2 guidance orders are computed by using FMS2 data
- L2 FD2 uses ADIRS2 data.

Flight Director



FD DISPLAY

Applicable to: ALL

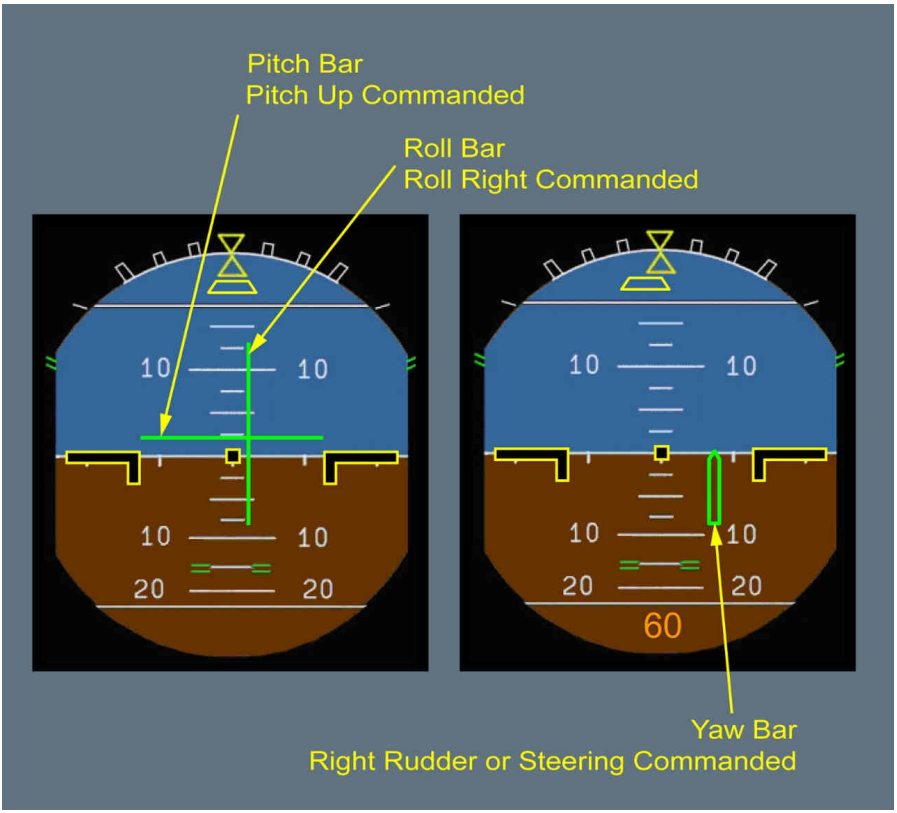
The pitch, roll, and yaw bars respectively indicate the pitch, roll, and yaw FD guidance orders.

Note: *Independently from FD display, the Flight Path Vector (FPV) or Velocity Vector (VV) can be displayed on the PFD s. The FPV (VV) does not indicate guidance orders. The flight crew must not use the FPV (VV) as guidance orders. However, the FPV (VV) provides an indication of the aircraft trajectory with respect to the ground reference.*
For definition and display conditions of the FPV (VV), Refer to DSC-31-20-20-100 Flight Path Vector(Velocity Vector) .

FD s ARE ENGAGED

When the FD s are engaged, the PFD s can display the roll, pitch and yaw bars.

Pitch, Roll, and Yaw FD Bars



The roll bar appears on the PFD s, when a lateral mode is engaged.
The pitch bar appears on the PFD s , when a vertical mode is engaged.

In RWY , FLARE , and ROLL OUT , the yaw bar appears:
- With the pitch bar in RWY
- With the roll and pitch bars in FLARE
- Alone in ROLL OUT .

The FD bars disappear, if the aircraft pitch exceeds 13 ° down or 25 ° up, or if the aircraft bank angle exceeds 45 ° . However, the FD s remain engaged.

Note: *In this case, when the FD bars disappear, if the AP was previously engaged, it disengages.*

FD s ARE NOT ENGAGED

If the FD s are not engaged, the FD bars do not appear on the PFD s.

Intentionally left blank

INTRODUCTION

Applicable to: ALL

FD1 and FD2 engage at the same time.

L2 PRELIMINARY REQUIRED CONDITIONS FOR FD ENGAGEMENT

In order to be able to engage both FDs, all of the following conditions must be previously met:
- At least one PRIM is available
- At least two ADRs are available
- At least two IRS are available in NAV mode
- The AFS CP, or the AFS CP page of the FCU backup is available
- One of the following flight control laws is active: Normal, alternate 1A, or alternate 1B.

ENGAGEMENT CONDITIONS

Applicable to: ALL

GROUND ENGAGEMENT AT AIRCRAFT POWER-UP

The FDs automatically engage at aircraft power-up.

MANUAL ENGAGEMENT

Both FD1 and FD2 manually engage, when the flight crew presses the FD pb on the AFS CP. If no AP was previously engaged, then HDG or TRACK, and V/S or FPA engage. The FD bars flash for 10 s.

AUTOMATIC ENGAGEMENT

If not already engaged, FD1 and FD2 automatically engage, if:
- The flight crew engages a go-around , or
- The AP/FD TCAS mode engages upon a Resolution Advisory alert, or
- The AP disengages, when ROLL OUT is engaged.
  The PFDs then display the yaw bar.

ENGAGEMENT ANNUNCIATION

Applicable to: ALL

When the FD s engage:
- The FD pb on the AFS CP comes on
- 1FD2 appears on both FMA s
- When a mode is active, the PFD s display the FD orders.
  For FD display conditions on PFD s, *Refer to DSC-22-FG-30-20 FD Display* .

The engagement status of the FD appears in the AP , FD , A/THR engagement status column of both FMA s.

FD 1 and FD 2 Engaged

The possible FD messages are:

FMA Message	Meaning
1FD2	FD 1 and FD 2 are engaged.
1FD1	FD 1 is engaged, and FD 1 guidance orders are displayed on both PFD s.
2FD2	FD 2 is engaged, and FD 2 guidance orders are displayed on both PFD s.
No FD message	No FD is engaged.

DISENGAGEMENT OF BOTH FD s

Applicable to: ALL

In normal operation, FD 1 and FD 2 disengage at the same time.
When the FD s disengage with no AP engaged, lateral and vertical modes will disengage (if engaged).
If the A/THR is engaged in THRUST mode, A/THR automatically reverts to SPEED or MACH mode.
When the FD s disengage with one AP engaged, the AP lateral and vertical modes remain engaged.

MANUAL DISENGAGEMENT

The flight crew can manually disengage the FD s by pressing the FD pb .

AUTOMATIC DISENGAGEMENT

The FD s automatically disengage, if one of the following occurs:

- With no AP engaged, the aircraft speed is either:
  - Below VLS – 2 kt in DES or OP DES
    If the A/THR is engaged, it reverts to SPEED or MACH , and increases the thurst to recover the speed target. A triple click aural warning sounds.
  - Above VMAX + 4 kt kt in CLB or OP CLB.
    The OVERSPEED alert triggers.
    If the A/THR is engaged, it reverts to SPEED or MACH , and reduces the thurst to recover the speed target. A triple click aural warning sounds.

L3 - In ROLL OUT , the difference between the aircraft track and the runway track is more than 20 °

L1 - The FD s become inoperative.

L2 One of the preliminary conditions required for FD engagement is no longer met (*Refer to FD Engagement / Introduction*).

Note: 1. If the FD s are inoperative, the AP is also inoperative.
2. If both AFS CP and AFS CP page on FCU backup are not available, when LAND , FLARE , ROLL OUT or go-around is engaged, the FD s remain operative and engaged.

L1 *Note: If the FD s automatically disengage, they will not automatically reengage.*

DISENGAGEMENT ANNUNCIATION

Applicable to: ALL

When both FDs disengage:

- The FD pb goes off
- 1FD2 message is cleared from the FMA.

If FD1(2) disengages with the FD2(1) still engaged: The 2FD2 (1FD1) message replaces the 1FD2 message on both FMAs.

PITCH AND ROLL BAR FLASHING

Applicable to: ALL

The pitch and/or roll bars flash for 10 s on both PFD s:

- If an automatic mode reversion to HDG / TRACK (V/S / FPA) occurs
  The roll (pitch) bar will flash.
  A triple click aural warning sounds.
- If all AP and FD s were previously off, and the flight crew engages the AP or the FD s.
  HDG / TRACK and V/S / FPA engage. Both pitch and roll bars will flash.

The pitch and roll bars permanently flash on PFD 1(2), if a failure occurs in approach:

- LOC* , LOC B/C* , LOC , LOC B/C , LAND or FLARE is engaged, and:
  - The ILS 1(2) receiver fails, or
  - The GLS 1(2) receiver fails, or
  - The MMR 1(2) fails, or
  - The GLS ground station fails, or
  - The ILS transmitter fails.

  Note: 1. If only the LOC (G/S) signal is failed, only the roll (pitch) bar will flash.
  2. The pitch and/or roll bars flash on both PFD s.

L3 This is applicable above 15 ft RA .

L1 - F-LOC* , F-LOC , F-G/S* , or F-G/S is engaged, and:
  - The FLS function in MMR 1(2) fails, or
  - The MMR 1(2) fails, or
  - Three FMC s are fault.

  Note: The pitch and roll bars flash on both PFD s.

L3 This is applicable above 15 ft RA .

L1 The bar(s) stop flashing, when one of the engaged above mode disengages.

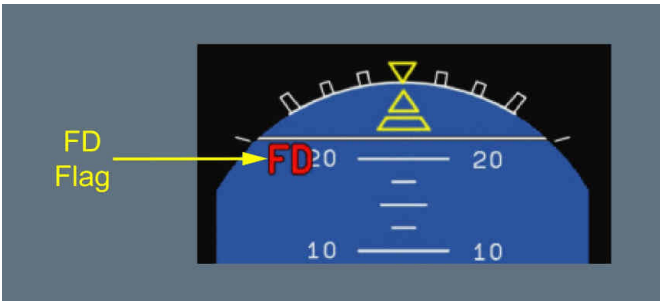
Note: In some cases, all AP and FD s disengage at once, or 7 s after the failure (Refer to AP Automatic Disengagement). Then, the FD s automatically reengage in HDG / TRACK and V/S / FPA . A triple click aural warning sounds. The FD bars flash for 10 s on both PFD s.

FD FLAG

Applicable to: ALL

If pitch, roll, and yaw orders are not available when the FDs are engaged: A red FD flag flashes on the PFDs, and then remains steady. The PFDs will not display the bars.

FD Flag



GENERAL

Applicable to: ALL

The Autopilot (AP):
- Stabilizes the aircraft around its center of gravity
- Controls the lateral trajectory
- Controls the vertical trajectory, or speed/Mach
- Coordinates with the A/THR
- Performs the automatic landing, or the go-around.

The AP generates:
- Pitch, roll, and yaw orders
- The nosewheel angle.

There are two APs: AP1 and AP2. Only one operates at a time.
L2 AP1 uses ADIRS1, and AP2 uses ADIRS2.

Intentionally left blank

Introduction

INTRODUCTION

Applicable to: ALL

AP1 and AP2 usually engage separately. In some conditions, the flight crew can engage both at the same time.

L2 PRELIMINARY CONDITIONS REQUIRED FOR AP ENGAGEMENT

In order to be able to engage AP1 and/or AP2, all of the following conditions must be previously met:

- At least one PRIM is available
- At least two ADRs are available
- At least two IRS are available in NAV mode
- The AFS CP, or the AFS CP page of the FCU backup is available
- One of the following flight control laws is active: Normal, alternate 1A, or alternate 1B.

Intentionally left blank

Engagement Conditions

ENGAGEMENT OF ONE AP

Applicable to: ALL

One AP engages when the flight crew presses the AP1 pb or the AP2 pb on the AFS CP, and:

- The aircraft is in flight for more than 5 s
- The aircraft pitch, bank angle, and speed are not excessive.

L2
- The pitch is between -11 ° and 22.5 °
- The bank angle is less than 40 °
- The speed is between VLS and VMAX.

Note: *1. In flight, the flight crew can also engage the AP, if the sidestick or rudder pedals are deflected. The AP becomes active, as soon as the flight crew stops moving the sidestick and the rudder pedals.*

2. AP engagement increases the breakout force on the sidesticks and on the rudder pedals.

L1 If the FDs were previously engaged, the AP engages in the current FD engaged modes.
If the FDs were not previously engaged, the AP engages in HDG or TRACK, and V/S or FPA. The FD bars flash for 10 seconds.

ENGAGEMENT OF BOTH AP s

Applicable to: ALL

When one AP is engaged, the flight crew can engage the other second AP by pressing the corresponding AP pb, when one of the following conditions is met:

- The following approach modes are armed or engaged:
  - LOC is armed, or LOC* or LOC is engaged, and
  - G/S is armed, or G/S* or G/S is engaged

L3 - LAND is engaged

L1 - Go-around is engaged.

When both APs are engaged, AP1 is active, and AP2 is on standby, regardless of the order of AP engagement.

Intentionally left blank

Engagement Annunciation

ENGAGEMENT ANNUNCIATION

Applicable to: ALL

When AP1(2) engages:
- The AP1(2) pb comes on
- Both FMAs display:
  - AP1 (AP2)
  - AP1+2, if both APs are engaged.

The engagement status of the AP appears in the AP, FD, A/THR engagement status column of FMAs.

AP1 Engaged

The possible AP messages are:

FMA Message	Meaning
AP1	AP1 is engaged.
AP2	AP2 is engaged.
AP1+2	Both APs are engaged.

Intentionally left blank

MANUAL DISENGAGEMENT

Applicable to: ALL

The flight crew disengages one AP by pressing the AP1(2) pb, when AP1(2) is already engaged.

The flight crew disengages all AP(s) engaged by:

- Pressing the sidestick pb on either sidestick, or
- Moving a sidestick, or

L3 The sidestick deflection goes beyond 5° on pitch axis, or 6° on roll axis.

L1 - Moving the rudder pedals.

L3 The rudder pedal deflection goes beyond 10°.

L1 Airbus recommends disengaging all AP(s) engaged by pressing the sidestick pb two times. The other ways of disengagement are to be avoided. Disengaging all AP(s) engaged by moving a sidestick, or the rudder pedals may be very uncomfortable for passengers.

Note: *At the end of the flight, any engaged AP will not automatically disengage.*

AUTOMATIC DISENGAGEMENT

Applicable to: ALL

The AP automatically disengages, if one of the following occurs:

- The aircraft pitch, bank angle, speed/Mach, or Angle Of Attack (AOA) becomes excessive:

L2 • The pitch is below - 13 ° , or above 25 °

Note: The FD bars no longer appear.

• The bank angle exceeds 45 °

Note: The FD bars no longer appear.

• The speed is above VMO + 15 kt , or the Mach is above MMO + 0.04
For information on high speed protection, *Refer to Flight Envelope / High Speed Protection* .

L1 • The angle of attack is above α_{prot} + 1 ° .
L3 This is applicable above 100 ft RA .
L1 For information on angle of attack protection, *Refer to Flight Envelope / Angle of Attack Protection* .

L3 This is not applicable in LAND below 200 ft RA .

L1 - A failure occurs in approach:

• The three RA s are fault, when:
■ LOC is armed, or
■ LOC* or LOC is engaged, or
■ LAND or FLARE is engaged.

• The ILS transmitter fails, when LOC* , LOC , LOC B/C* , LOC B/C , or LAND is engaged
L3 This is applicable above 200 ft RA .
The failure must be confirmed for 7 s .

L1 • The GLS ground station fails, when LOC* , LOC , or LAND is engaged
L3 This is applicable above 200 ft RA .
The failure must be confirmed for 7 s .

• The three FMC s are fault, when F-LOC* , F-LOC , F-G/S* or F-G/S is engaged
The FLS deviations are no longer available.
This is applicable above 200 ft RA .
The triple FMC failure must be confirmed 7 s .

L1 • Both ILS receivers, or both MMR s fail, when:
■ LOC or LOC B/C is armed, or
■ LOC* , LOC , LOC B/C* , LOC B/C , LAND , FLARE , or ROLL OUT is engaged.

• Both GLS receivers fail, when:
■ LOC is armed, or
■ LOC* , LOC , LAND , FLARE , or ROLL OUT is engaged.

- The FLS function in both MMR s are failed, or both MMR s are failed, when:
  - F-LOC , or F-G/S is armed, or
  - F-LOC* , F-LOC , F-G/S* , or F-G/S is engaged.

L2 • The difference between the aircraft track and the runway track is above 7 ° when in LOC , or LAND .

L3 The difference must be confirmed 5 s .
This is applicable between 700 ft and 200 ft RA .

L1 *Note: 1. In all these cases of failure in approach: If the FD s were previously engaged, they disengage, and reengage in HDG / TRACK and V/S / FPA . A triple click oral warning sounds. The FD bars flash for 10 s .*
2. If the LOC, F-LOC, G/S or F-G/S deviation is lost, the FD pitch and/or roll bars may permanently flash: Refer to DSC-22-FG-30-50 Pitch and Roll Bar Flashing .

- Both AP s are engaged in SRS GA , and SRS GA disengages
AP 2 disengages, and AP 1 remains engaged.

L3 - The aircraft is on ground in autoland, and the flight crew:
  • Initiates a go-around (SRS GA and GA TRK engage)

    Note: If the FD s were not previously engaged, they engage.

  • Or sets all thrust levers on or above FLX/MCT detent.

- During an autoland in ROLL OUT , the difference between the aircraft track, and the runway track is more than 20 °

  Note: If the FD s were previously engaged, they disengage.

L2 - The flight crew has engaged the AP while the sidestick or the rudder pedals are deflected, and the sidestick or rudder pedals are still deflected 6 seconds after AP engagement

L1 - The AP becomes inoperative.

L2 One of the preliminary conditions required for AP engagement is no longer met (*Refer to AP Engagement / Introduction*).

Note: 1. If the AP is failed, the FD s are also failed.
2. If both AFS CP and AFS CP page on FCU backup are not available, when LAND , FLARE , ROLL OUT or go-around is engaged, the AP remains operative and engaged.

DISENGAGEMENT ANNUNCIATIONS AND WARNINGS

Applicable to: ALL

When AP 1(2) disengages:
- AP1(2) pb goes off
- On both FMA s:
  - If one AP was previously engaged, the AP1 (AP2) message disappears
  - If both AP s were previously engaged, the AP2 (AP1) message replaces the AP1+2 message.

Different warnings will trigger, depending on the way of disconnection.

Note: When both AP s are engaged, and only one AP disengages, the warnings will not trigger.

DISCONNECTION VIA THE SIDESTICK PUSHBUTTON

The normal way to disconnect the AP is to press the sidestick pushbutton two times.

When the flight crew presses the sidestick pushbutton for the first time, the following warnings will trigger, and will continue, until the flight crew presses the sidestick pushbutton a second time:
- The AP OFF memo appears on the PFD s and on the EWD
- A cavalry charge, at low volume

L3 The maximum duration is 0.8 s .

L1 - The MASTER WARN light comes on.

L2 The flight crew must press the sidestick pushbutton two times within 1.8 s .

Note: If the flight crew presses the sidestick pushbutton one time, then presses the MASTER WARN light within 1.8 s , the above warnings will stop.

L1 If the flight crew does not quickly press the sidestick pushbutton a second time, the following additional warnings will trigger:
- A cavalry charge, at high volume
- The AUTO FLIGHT AP OFF alert.

L2 The additional warnings will trigger 1.8 s after the sidestick pushbutton is pressed the first time.

L1 Pressing the MASTER WARN light , or the sidestick pushbutton a second time, will clear all warnings and memos.

OTHER WAYS OF DISCONNECTION

If the AP disengages, without any flight crew action on the sidestick pushbutton, the following warnings will trigger:
- Cavalry charge at high volume
- The AUTO FLIGHT AP OFF alert.

L2 For more information, *Refer to PRO-ABN-ECAM-10-22-FG-10 AUTO FLT AP OFF* .

L1 When the flight crew presses the MASTER WARN light , or the sidestick pushbutton (one time), all warnings will stop.

Intentionally left blank

GENERAL

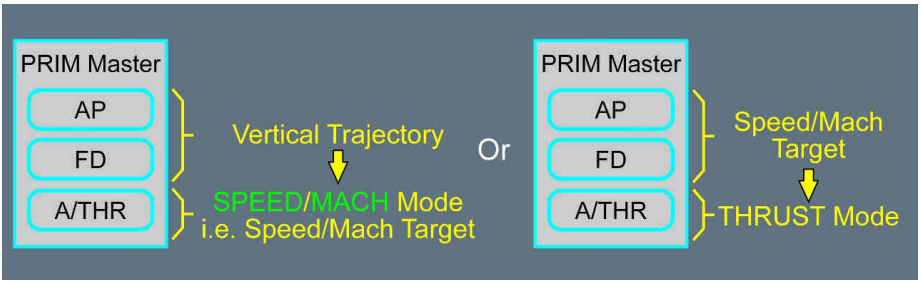
Applicable to: ALL

The autothrust (A/THR) manages the engine thrust.
The A/THR is either armed, active, or disconnected.

When active, the A/THR can work in two different types of mode:
- SPEED / MACH mode: The A/THR continuously adjusts the thrust in order to maintain a speed/Mach target, e.g. during cruise, and approach
- THRUST modes: The A/THR controls a fixed thrust, in accordance with the engaged THRUST mode.

The A/THR modes are automatically linked to the AP / FD vertical modes:
- When an AP / FD vertical mode controls the trajectory (e.g. altitude acquire modes, altitude hold modes, V/S / FPA , G/S , F-G/S), the A/THR is in SPEED / MACH mode
- When an AP / FD vertical mode adjusts the aircraft pitch in order to keep a speed/Mach target (e.g. climb, descent), the A/THR is in THRUST mode.

AP / FD / A/THR Interaction



When the A/THR is active, the A/THR thrust target is sent to the four FADEC s. The FADEC s computes thrust commands, in accordance with the aircraft environment and status. The thrust commands are then sent to the engines.
When the A/THR is armed, the FADEC s compute the thrust commands in accordance with the thrust lever positions, and the selection of FMS PERF page - T.O panel.
When the A/THR is disconnected, the FADEC s compute the thrust commands in accordance with the thrust lever positions.
For more information on thrust control performed by the FADEC s: *Refer to Engines / Thrust Control* .

A/THR ARCHITECTURE

Applicable to: ALL

Each PRIM can perform the A/THR . Therefore, there are three A/THR channels. The Master PRIM performs the A/THR . For information on Master PRIM , *Refer to PRIM Architecture for FG* .

L2 If no AP is engaged, or AP 1 is engaged, the A/THR uses ADIRS 1. If AP 2 is engaged, the A/THR uses ADIRS 2.

THRUST LEVERS

Applicable to: ALL

The flight crew uses the thrust levers to:

- Arm, activate, and disconnect the A/THR
- Engage the takeoff and go-around modes
  For more information, *Refer to AP/FD Modes / SRS TO Engagement Conditions* , and *Refer to AP/FD Modes / SRS GA Engagement Conditions* .
- Manually control the thrust of each engine, when the A/THR is disconnected
  For more information on the use of the thrust levers when the A/THR is disconnected, *Refer to Engines / Thrust Control in Manual Mode* .
- Engage reverse thrust on engine 2 and 3.

The thrust levers have:

- Four detents: 0 (idle), CL, FLX-MCT, TOGA.
- Two instinctive disconnect pushbuttons.

For more information on the thurst levers, *Refer to Controls and Indicators / Thrust Levers* .

Intentionally left blank

PRELIMINARY CONDITIONS REQUIRED FOR A/THR ARMING OR ACTIVATION

Applicable to: ALL

L2 In order to be able to arm or activate the A/THR, all of the following conditions must be previously met:

- At least one PRIM is available
- The A/THR is not disconnected for the remainder of the flight
- At least three FADECs are able to perform the A/THR
- At least two FADECs are in normal mode
- At least one ADR is available

L3 - The vertical speed and the altitude are available from at least:

- Two ADIRS, or
- One ADIRS and one ISIS, or
- One ADIRS, if A.FLOOR is engaged.

L2 - The AFS CP, or the AFS CP page of the FCU backup is available, except in A.FLOOR , go-around, LAND, FLARE or ROLL OUT

- The aircraft weight is available.

A/THR ARMING

Applicable to: ALL

The flight crew arms the A/THR at takeoff, by setting the thrust levers to TOGA or FLX-MCT, in accordance with TOGA, FLEX or DERATED selection on the T.O panel of the FMS PERF page . The A/THR controls the thrust at TOGA, FLEX or DERATED.
When the aircraft reaches the thrust reduction altitude, the flight crew activates the A/THR by setting the thrust levers at the CL detent (or FLX-MCT detent, if at least one engine is out).
For scenario example, *Refer to DSC-22-FG-50-60 From Takeoff to Thrust Reduction Altitude* .
The flight crew also arms the A/THR by engaging a go-around: The flight crew sets the thrust levers at the TOGA detent. The A/THR controls the thrust at TOGA thrust.
When the aircraft reaches the GA thrust reduction altitude, the flight crew activates the A/THR by setting the thrust levers at the CL detent (or FLX-MCT detent, it at least one engine is out).

ARMING CONDITIONS

The A/THR arms, if one of the following occurs:

- SRS TO engages
  For more information, *Refer to SRS TO Engagement Conditions* .
- SRS GA engages
  For more information, *Refer to SRS GA Engagement Conditions* .

- The A/THR is disconnected, and the flight crew presses the A/THR pb , when:
  - The thrust levers are:
    - Above CL, when all engines are operative
    - Above FLX-MCT, if at least one engine is out.
  - The aircraft is above 100 ft RA , or all RA s are failed.
  - LAND or FLARE is not engaged.
- The A/THR is disconnected, and the AP / FD TCAS mode engages upon a Resolution Advisory alert, when the thrust levers are in the arming range.

In addition, when the A/THR is active, it can become armed by a flight crew action on the thrust levers: *Refer to A/THR Activation / Effect of thrust lever movement when the A/THR is active* .

FMA DISPLAY

When the A/THR is armed:
- The FMA displays:
  - The A/THR message on the third line of the fifth column
  - MAN TOGA, MAN FLX +XX or MAN DTO message on the first and second lines of the first column. The message is in a white box.
- The A/THR pb light is illuminated on the AFS CP.

The FMA message appears as follows:

Conditions		Thrust lever position	FMA Message (1)
From takeoff, and until the thrust reduction altitude.	TOGA has been selected on the T.O panel of the FMS PERF page.	TOGA (2) (3)	MAN TOGA
	FLX has been selected on the T.O panel of the FMS PERF page.	FLX-MCT (4)	MAN FLX +XX
	DERATED has been selected on the T.O panel of the FMS PERF page.	FLX-MCT (5)	MAN DTO
In descent, or approach.	The flight crew engages a go-around.	TOGA (2) (3)	MAN TOGA

(1) *The FMA message appears in a white box, on the first and second lines of the first column.*
(2) *If the flight crew sets the thrust levers to FLX-MCT, MAN MCT will appear on FMA.*
(3) *If the flight crew sets the thrust levers between CL and TOGA, but not at the CL, FLX-MCT, or TOGA detent, MAN THR will appear on FMA.*
(4) *If at least one engine is out, the flight crew can set the thrust levers to TOGA.*
(5) *If at least one engine is out, the flight crew must not set the thrust levers to TOGA.*

L2 The following table presents the detailed display conditions of MAN TOGA, MAN FLX +XX, MAN DTO, MAN MCT, and MAN THR messages:

FMA Message (1)	Display Conditions
MAN TOGA	At least one thrust lever is set to the TOGA detent.
MAN FLX +XX	All of the following conditions are met: - The A/THR is armed - FLX has been selected on the T.O panel of the FMS PERF page - The most forward thrust lever is on the FLX-MCT detent.
MAN DTO	All of the following conditions are met: - The A/THR is armed - DERATED has been selected on the T.O panel of the FMS PERF page - The most forward thrust lever is on the FLX-MCT detent.
MAN MCT	All of the following conditions are met: - The A/THR is armed - The most forward thrust lever is on the FLX-MCT detent - The engagement conditions of MAN FLX +XX or MAN DTO are not met.
MAN THR	The A/THR is armed, and one of the following conditions is met: - The most forward thrust lever is between the FLX-MCT and TOGA detents, or - All the thrust levers are between the CL and FLX-MCT detents.

(1) The FMA message appears in a white box.

A/THR ACTIVATION

Applicable to: ALL

When active, the A/THR controls:
- The thrust, when an A/THR THRUST mode is engaged, or
- The speed/Mach, when the A/THR SPEED/MACH mode is engaged.

The thrust lever positions determine the maximum thrust that the A/THR can command (except in A.FLOOR).

The normal position of the thrust levers is:
- At the CL detent, when all engines are operative
- At the FLX-MCT detent for the operative engines, when at least one engine is out.

ACTIVATION CONDITIONS

The A/THR activates, if one of the following occurs:

- The A/THR is armed, and the flight crew sets the thrust levers on the active range:

L13

Engine Condition	Active Range
All engines are operative.	Between idle and CL detents (idle excluded, CL included). However, the A/THR also activates, if: - TOGA is selected on the T.O panel of the FMS PERF page, and: • At least one thrust lever is on or below the CL detent, and • The others are on or below FLX-MCT detent. - FLX or DERATED TO is selected on the T.O panel of the FMS PERF page, and: • At least one thrust lever is on or below the CL detent, and • The others are below FLX-MCT detent.
At least one engine is out. (1)	Between idle and FLX-MCT detents (idle excluded, FLX-MCT included). If the engine-out has occurred during a flex or derated takeoff, the flight crew activates the A/THR by: 1. Setting all the thrust levers of operative engines below FLX-MCT, 2. Then, settings all the thurst levers of operative engines back to FLX-MCT.

(1) The thrust lever of each engine-out should be at the idle detent.

- The A/THR is disconnected, and the flight crew presses the A/THR pb when:
  - The thrust levers are on the active range, or at the idle detent
  - L3 The aircraft is above 100 ft RA , or all RA s are failed
  - LAND or FLARE is not engaged.
- L1 The A/THR is disconnected, and the AP / FD TCAS mode engages upon a Resolution Advisory alert, when the thrust levers are on the active range
- A.FLOOR engages.
  For A.FLOOR engagement conditions, *Refer to Flight Envelope / Protections / Alpha Floor*).

  Note: A.FLOOR engages regardless of the initial A/THR status, and the position of the thrust levers.

DISPLAY

When the A/THR is active:

- The FMA displays:
  - The A/THR message on the third line of the fifth column
  - The A/THR mode in green on the first line of the first column.
- The A/THR pb light is illuminated on the AFS CP.

EFFECT OF THRUST LEVER MOVEMENT WHEN THE A/THR IS ACTIVE

A/THR TRANSITION FROM ACTIVE TO ARMED

When the A/THR is active, it becomes armed, when as described in the following table:

L13

Engine Condition	When the A/THR is active, it becomes armed, when:
All engines are operative.	All the thrust levers are above the CL detent. Or at least one thrust lever is above the FLX-MCT detent. If FLX or DERATED TO is selected, the A/THR also becomes armed, if at least one thrust lever is at the FLX-MCT detent.
At least one engine is out.	At least one thrust lever is above the FLX-MCT detent.

When the A/THR becomes armed, the thrust immediately increases, in accordance with the thrust lever position.

A/THR LIMITED

The AUTO FLT A/THR LIMITED alert triggers, when:
- All the thrust levers are set below the CL detent, when all engines are operative, or
- All the thrust levers are set below the FLX-MCT detent, when at least one engine is out.

The FMA displays THR LVR on the first line of the first column.
LVR CLB or LVR MCT (in engine-out) flashes on the third column of the FMA.
The AUTO FLT A/THR LIMITED alert is repeated every 5 s, until the flight crew moves the thrust levers to the CL detent or FLX-MCT detent (in engine-out).

ASYMMETRIC THRUST LEVERS

When the A/THR is active with all engines operative, and at least one thrust lever is set out of the CL detent, LVR ASYM message flashes on the third line of the first column of the FMA.

L3 The LVR ASYM message can appear in other cases.

LVR ASYM appears, when all of the following conditions are met:
- The A/THR is armed, or active
- One thrust lever is on the CL (FLX-MCT) detent, and at least one thrust lever is out of the CL (FLX-MCT) detent
- All the engines are operative.

Intentionally left blank

A/THR DISCONNECTION

Applicable to: ALL

The A/THR disconnects, if one of the following occurs:
- The flight crew presses one A/THR instinctive disconnect pushbutton
- The flight crew sets all the thrust levers at the idle detent
- The flight crew presses the A/THR pb

L2 This is applicable, if neither LAND nor FLARE is engaged.

L1 - The A/THR becomes inoperative.

L2 One of the preliminary conditions required for A/THR arming or activation is no longer met. For more information, *Refer to DSC-22-FG-50-30 Preliminary Conditions Required for A/THR Arming or Activation* .

L1 It is recommended to disconnect the A/THR by pressing one A/THR instinctive disconnect pushbutton. In this case, at A/THR disconnection, the engine thrust target will immediately be set to the thrust lever position.

L13

CAUTION	If the flight crew presses, and holds one A/THR instinctive disconnect pushbutton for more than 15 seconds, the A/THR will be disconnected for the remainder of the flight. All A/THR modes, including A.FLOOR will be lost. The A/THR will be recovered at the next aircraft power-up. The A/THR will be recovered, when one of the following occurs: - Five seconds after all engines shutdown - After power-up of all PRIMS and all FADECs.

THRUST LOCK FUNCTION

The THRUST LOCK function activates when an A/THR involuntary disconnection occurs, and:
- THR LK flashes on the third line of the first column on the FMA
- The AUTO FLT A/THR OFF alert triggers, asking the flight crew to move the thrust levers
- If the flight crew does not move the thrust levers within 5 s , the ENG THRUST LOCKED alert will trigger every 5 s .

L2 However, the ENG THRUST LOCKED alert is inhibited during takeoff.

L1 The thrust is locked at its level prior disconnection, until the flight crew moves the thrust levers. Then, the THR LK message disappears.
For information on involuntary disconnection, *Refer to A/THR Involuntary Disconnection* .

A/THR DISCONNECTION ANNUNCIATIONS AND WARNINGS

Applicable to: ALL

Different warnings trigger, depending on if the A/THR disconnection is voluntary or involuntary.

VOLUNTARY DISCONNECTION

A voluntary disconnection occurs when:
- The flight crew presses one A/THR instinctive disconnect pushbutton, or
- The flight crew sets all the thrust levers to idle.

When the aircraft is below 50 ft RA, and the flight crew sets all the thrust levers to idle, no warning triggers.

In all other cases of voluntary disconnection, the following warnings trigger:
- The A/THR OFF memo appears on the PFDs and on the EWD

L3 The maximum duration is 9 seconds.

L1 - The MASTER CAUT light comes on

L3 The maximum duration is three seconds.

L1 - The Single Chime.

Pressing the A/THR instinctive disconnect pushbutton, or the MASTER CAUT light clears all the warnings.

INVOLUNTARY DISCONNECTION

A involuntary disconnection occurs when:
- The flight crew presses the A/THR pb on the AFS CP , or
- The A/THR becomes inoperative.

L2 One of the preliminary conditions required for A/THR arming or activation is no longer met:
Refer to DSC-22-FG-50-30 Preliminary Conditions Required for A/THR Arming or Activation .

L1 The following warnings trigger:
- The AUTO FLT A/THR OFF alert
  For the procedure associated to the alert, *Refer to PRO-ABN-ECAM-10-22-FG-20 AUTO FLT A/THR OFF* .
- The MASTER CAUT light comes on
- The Single Chime.

The flight crew can cancel the alert by:
- Pressing one A/THR instinctive disconnect pushbutton
- Arming, or activating the A/THR , if the A/THR is operative.

GENERAL

Applicable to: ALL

When the A/THR is active, an A/THR mode is engaged.
The A/THR modes are: THRUST, SPEED/MACH and RETARD.

THRUST MODES

Applicable to: ALL

When the AP/FD vertical mode is SRS, OP CLB, CLB, OP DES, or DES in idle path, the A/THR is in THRUST mode.
When a THRUST mode is engaged, the A/THR commands the thrust. The thrust target depends on the THRUST mode. However, the thrust target can be limited by the thrust lever position, when the thrust levers are below the CL detent (or FLX MCT, when at least one engine is out).

THRUST MODE OPERATION

After takeoff, when the aircraft reaches the thrust reduction altitude, LVR CLB flashes on the FMA , asking the flight crew to set the thrust levers to the CL detent. The thrust reduction (THR RED) altitude is displayed on the T.O panel of the FMS PERF page.

L2 The thrust reduction altitude may be below, equal to, or above the ACCEL ALT. Therefore, the thrust reduction altitude can be reached when SRS TO , CLB or OP CLB is engaged.

L1 The following table presents the display conditions of the THRUST modes.

AP / FD Vertical Mode	Additional Conditions	Thrust Lever Position for Operative Engines (Detent)	THRUST Mode (Displayed on FMA) (1) .
SRS TO , CLB , or OP CLB is engaged, and the aircraft is above the thrust reduction altitude	The engagement conditions of THR DCLBX , THR NOISE , or THR CLB* are not met.	CL, or FLX-MCT if at least one engine is out.	THR CLB , or THR MCT if at least one engine is out.
	- DERATED has been selected on the CLB panel of the FMS PERF page - The thrust goes toward derated climb thrust, but the derated climb thrust is not yet achieved.	CL	THR DCLB*
	- DERATED has been selected on the CLB panel of the FMS PERF page - The engines apply derated climb thrust.	CL	THR DCLBx

Continued on the following page

Continued from the previous page

SRS TO , or CLB is engaged, and the aircraft is above the thrust reduction altitude	- A NOISE THR has been selected on the T.O panel of the FMS PERF page (or on the CLB panel), and - The altitude is below the NOISE END altitude. *Refer to Scenario Examples / Noise Abatement Departure Procedure .*	CL	THR NOISE *(2)*
CLB is engaged, and the aircraft is above the thrust reduction altitude	- A NOISE THR has been selected on the T.O panel of the FMS PERF page (or latter on the CLB panel), and - The altitude is above the NOISE END altitude, and - The thrust goes toward the climb thrust, but the climb thrust target is not yet achieved.	CL	THR CLB* *(2)*
DES in idle path	The FMS requests a thrust slightly higher than the idle thrust.	CL, or FLX-MCT if at least one engine is out	THR DES
	The FMS requests the idle thrust.	CL, or FLX-MCT if at least one engine is out	THR IDLE
OP DES	N/A	CL, or FLX-MCT if at least one engine is out.	THR IDLE
SRS GA is engaged, and the aircraft is above the GA thrust reduction altitude	N/A	CL, or FLX-MCT if at least one engine is out	THR CLB , or THR MCT if at least one engine is out.

(1) The FMA displays the THRUST mode on the first line of the first column.

(2) THR NOISE and THR CLB are not available, if a least one engine is out.*

L2 **DETAILED ENGAGEMENT CONDITIONS**

The following table presents the detailed engagement conditions of the THRUST modes:

THRUST Mode (1)	Engagement Conditions (2)
THR CLB	All of the following conditions are met: - The A/THR is active - DERATED has not been selected on the CLB panel of the FMS PERF page - The aircraft is not in a Noise Abatment Departure Procedure - SRS TO, CLB , OP CLB , or SRS GA is engaged - The engagement conditions of THR LVR are not met. For engagement conditions of THR LVR , See .
THR DCLB*	All of the following conditions are met: - The A/THR is active - DERATED has been selected on the CLB panel of the FMS PERF page - At least one thrust lever is on the CL detent, and the others are on or below the CL detent. - SRS TO, CLB , OP CLB , or SRS GA is engaged - The thrust goes toward derated climb thrust - The engagement conditions of THR LVR are not met. For engagement conditions of THR LVR , See .
THR DCLBX	All of the following conditions are met: - The A/THR is active - DERATED has been selected on the CLB panel of the FMS PERF page - At least one thrust lever is on the CL detent, and the others are on or below the CL detent. - SRS TO, CLB , OP CLB , or SRS GA is engaged - The engines apply derated climb thrust - The engagement conditions of THR LVR are not met. For engagement conditions of THR LVR , See .
THR NOISE	All of the following conditions are met: - The A/THR is active - A NOISE THR has been selected on the T.O panel of the FMS PERF page (or on the CLB panel) - The altitude is below the NOISE END altitude - SRS TO or CLB is engaged - All the engines are operative - The engagement conditions of THR LVR are not met. For engagement conditions of THR LVR , See .

Continued on the following page

Continued from the previous page

THR CLB*	All of the following conditions are met: - The A/THR is active - A NOISE THR has been selected on the T.O panel of the FMS PERF page (or latter on the CLB panel) - The altitude is above the NOISE END altitude - The thurst goes towards the climb thrust, but the climb thrust target is not yet achieved. - CLB is engaged - All the engines are operative - The engagement conditions of THR LVR are not met. For engagement conditions of THR LVR , See .
THR DES	All of the following conditions are met: - The A/THR is active - DES is engaged in idle path - The FMS requests a thrust slightly higher than the idle thrust - The engagement conditions of THR LVR are not met. For engagement conditions of THR LVR , See .
THR IDLE	The A/THR is active, and one of the following conditions is met: - OP DES , DES in idle path, or the A/THR RETARD mode is engaged For information on the A/THR RETARD mode, *Refer to DSC-22-FG-50-50 RETARD Mode* . - The engagement conditions of THR LVR are not met. For engagement conditions of THR LVR , See .
THR MCT	All of the following conditions are met: - The A/THR is active - At least one engine is out - At least one thrust lever is on the MCT detent - SRS TO, CLB , OP CLB , or SRS GA is engaged - The engagement conditions of THR LVR are not met. For engagement conditions of THR LVR , See .

Continued on the following page

Continued from the previous page

THR LVR	The A/THR is active, and one of the following condition is met: - All the thrust levers are below the CL detent, when all engines are operative, or - All the thrust levers are below the MCT FLX detent, when at least one engine is out.
A.FLOOR	A.FLOOR engages. For A.FLOOR engagement conditions, *Refer to Fligth Envelope / Protections / Alpha Floor* . Note: *A.FLOOR can engage, even if the A/THR was not previously armed, or active.*

(1) The FMA displays the THRUST mode on the first line of the first column.

(2) The thrust lever position refers to the thrust levers of operative engines. The thrust levers of inoperative engines should be at the idle detent.

SPEED/MACH MODE

Applicable to: ALL

With the A/THR active, SPEED or MACH engages when one of the following AP / FD vertical mode is engaged:
- V/S / FPA
- Altitude mode: ALT* , ALT , ALT CST* , ALT CST , ALT CRZ* , ALT CRZ
- DES in geometric path
- Approach mode: G/S* , G/S , F-G/S* , F-G/S , LAND , FLARE (except when RETARD is engaged in autoland below 50 ft)
- AP / FD TCAS mode.

If all AP s and all FD s are disengaged with the A/THR is active, the A/THR is in SPEED / MACH . When the A/THR is in SPEED / MACH , the A/THR adjusts the thrust in order to acquire and hold a speed/Mach target.
The FMA displays SPEED or MACH on the first line of the first column.

The speed/Mach target is:
- Managed, when the target comes from the FMS
  For engagement conditions of managed speed/Mach, *Refer to Managed Speed/Mach / Engagement Conditions* .
- Selected, when the target comes from the SPD/MACH knob of the AFS CP .
  For engagement conditions of selected speed/Mach, *Refer to Selected Speed/Mach / Engagement Conditions*

The speed/Mach target is always limited by VLS , and VMAX -5 kt kt. In addition, when the speed/Mach is managed, the speed/Mach does no go below the maneuvring speed of the current slats/flaps configuration (Green Dot, F , S).

SPEED or MACH engages, in accordance with the speed/Mach switching selection: *Refer to DSC-22-FG-60-40 Speed/Mach Switching* .

L2 A/THR SOFT MODE

FUNCTION

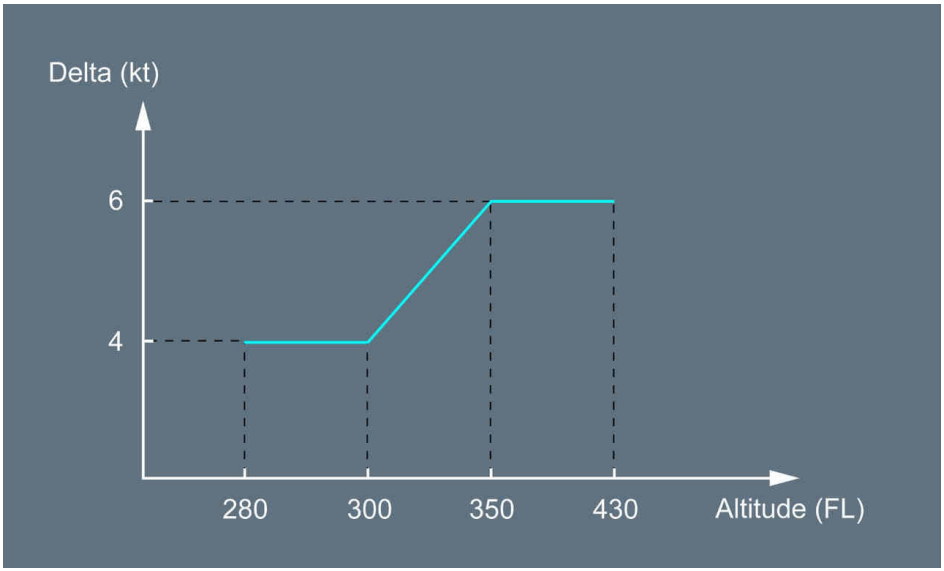
The A/THR soft mode is available when the A/THR is in SPEED/MACH. This mode reduces the thrust variation, specifically in light turbulence. The mode allows slight variation of the speed/Mach.

ACTIVATION

The A/THR soft mode activates, when all of the following conditions are met:
- The A/THR is in SPEED/MACH
- The AP is engaged
- ALT, ALT CST, ALT CRZ or DES is engaged
- At least three engines are operative
- The aircraft is in clean configuration, the gear is up, and the speed brakes are retracted

- The aircraft is above FL280, and the Mach corresponding to the speed/Mach target is above 0.55
- The aircraft speed is not beyond the speed/Mach target + or - delta.
  However, if the speed/Mach go beyond speed/Mach target + or - delta, and returns inside speed/Mach target + or - delta in less than 30 s, then the soft mode remains engaged.
  Delta depends on the altitude, and is described as follows:

Delta



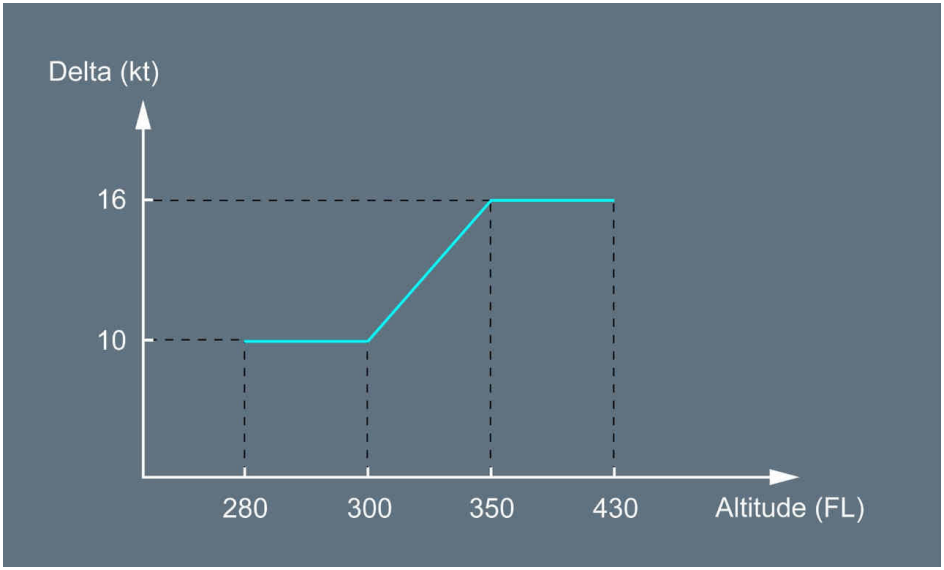
Note: *There is no message to indicate that the A/THR soft mode is active.*

DEACTIVATION

The A/THR soft mode deactivates, when one of the following occurs:

- One of the conditions required to activate the A/THR soft mode is no longer met
- The aircraft speed is beyond the speed/Mach target + or - delta for 4 s.
  Delta depends on the altitude, and is described as follows:

Delta



- The aircraft speed is greater than VMAX - 5 ft
- The aircraft speed is below VLS.

RETARD MODE

Applicable to: ALL

The A/THR RETARD mode is only available during automatic landing.

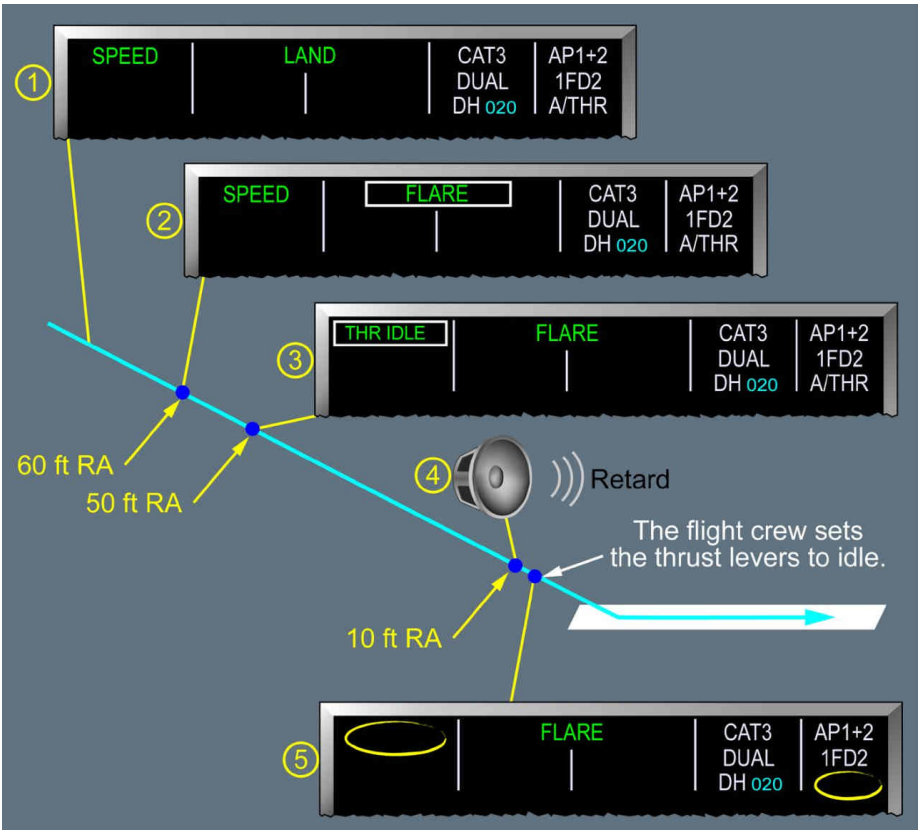
The RETARD mode engagement occurs as follows:

1. At least one AP is engaged. The LAND mode, and the A/THR SPEED mode are engaged.
2. At approximately 60 ft RA , FLARE engages.
3. When the aircraft reaches 50 ft RA , the A/THR RETARD mode automatically engages. The FMA displays THR IDLE . The A/THR controls thrust at idle.

4. A RETARD callout triggers at 10 ft RA , asking the flight crew to set the thrust levers to idle.
5. The flight crew sets the thrust levers to idle: The A/THR disconnects, and so RETARD disengages.

Here is an example:

RETARD Mode



L2 If the last AP disengages when RETARD is engaged, RETARD disengages, and SPEED engages.

L1 *Note:* *In manual landing, the RETARD callout triggers at 20 ft RA .*

L2 In manual or automatic landing, the RETARD callout triggers, independently of the thrust levers position.

L1 In manual or automatic landing, if the flight crew does not set the thrust levers to idle:

- The RETARD callout is repeated
- The spoilers will not extend after touchdown, and the autobrake will not activate.
  For more information ground spoiler extension, *Refer to Flight Controls / Ground Spoiler Control.*
  For more information on autobrake activation, *Refer to Landing Gear / Autobrake* .

A/THR MODE REVERSIONS

Applicable to: ALL

The following table presents the A/THR mode reversions:

L12

Initial A/THR Mode	A/THR Mode after Reversion	Conditions Leading to A/THR Mode Reversion	Warning
THRUST	SPEED / MACH	With no AP engaged, the FD s automatically disengage, when: - The aircraft speed is below VLS - 2 kt when DES or OP DES is engaged, or - The aircraft speed is above VMAX + 4 kt when CLB or OP CLB is engaged.	A triple click aural warning sounds. If the aircraft speed goes above VMAX + 4 kt , the OVERSPEED alert triggers.
THR NOISE , or THR CLB*	THR CLB	The aircraft does not follow the speed target. The reversion occurs, when: - The aircraft speed is below VLS , or - The aircraft speed is 10 kt below the speed target, and the flight path angle is below 0.5 ° .	A triple click aural warning sounds.
Whatever A/THR mode. The A/THR can be armed, active, or disconnected.	A.FLOOR	*Refer to Flight Envelope / Protections / Alpha Floor* .	*Refer to DSC-22-FG-50-50-C ALPHA FLOOR* .

ALPHA FLOOR

The α-floor protection triggers when the aircraft angle of attack is above a pre-determined threshold function of the configuration. For engagement conditions of A.FLOOR , *Refer to Flight Envelope / Protections / Alpha Floor* .

When the α-floor protection triggers:
- The A/THR automatically activates, independently of the previous A/THR engagement status
- A.FLOOR engages
- The A/THR commands TOGA thrust, regardless of the thrust lever positions.
  If at least one engine is failed, the A/THR commands symmetrical thrust on the engines: *Refer to Flight Envelope / Protections / Engine Failure Case* .

The protection is available from lift-off down to 100 ft RA in approach.

The following indications appear:
- As long as the α-floor conditions are met:
  - The FMA displays A.FLOOR with a flashing amber box on the first line of the first column
  - The EWD displays A.FLOOR .
- When the aircraft leaves the α-floor conditions: The FMA displays TOGA LK with a flashing amber box on the first line of the first column, indicating that TOGA thrust is still frozen.

A.FLOOR or TOGA LK can only be disengaged by disconnecting the A/THR .

Intentionally left blank

INTRODUCTION

Applicable to: ALL

For scenario examples on A/THR :

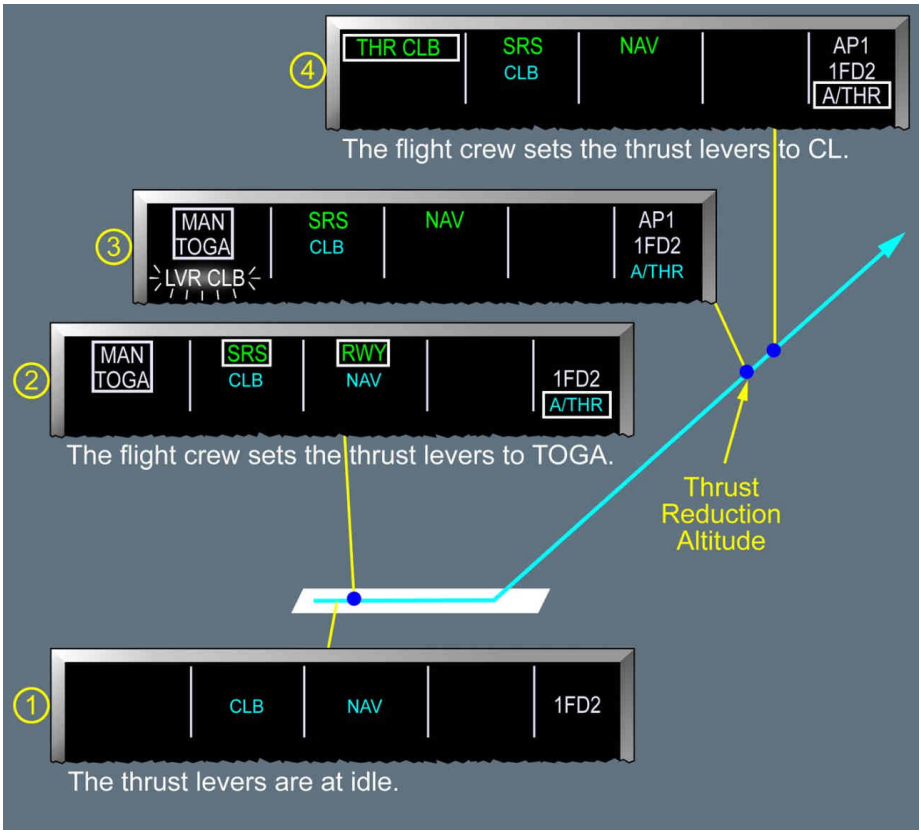
- *Refer to DSC-22-FG-50-60 From Takeoff to Thrust Reduction Altitude*
- *Refer to DSC-22-FG-50-60 Noise Abatement Departure Procedure* .

FROM TAKEOFF TO THRUST REDUCTION ALTITUDE

Applicable to: ALL

The aircraft is on ground, and the flight crew has selected TOGA on the T.O panel of the FMS PERF page. The flight crew sets the thrust levers to TOGA: The A/THR arms, the engines apply TOGA thrust, MAN TOGA appears on the FMA, and SRS TO engages.
When the aircraft reaches the thrust reduction altitude, LVR CLB flashes, and the flight crew sets the thrust levers to CL: The A/THR activates, and THR CLB engages.

From Takeoff to Thrust Reduction Altitude



NOISE ABATEMENT DEPARTURE PROCEDURE

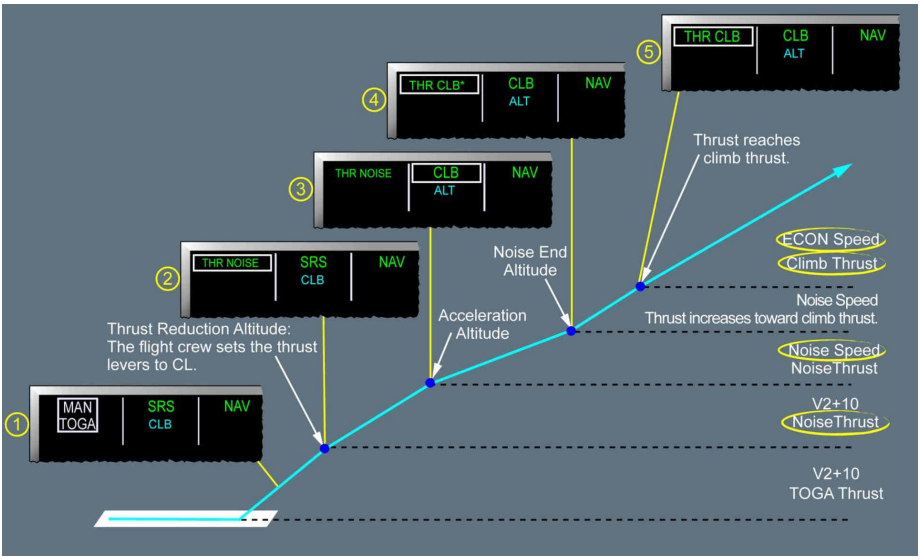
Applicable to: ALL

When on ground, the flight crew has performed the following selections on the T.O panel of the FMS PERF page:

- TOGA
- A NOISE END altitude, a NOISE SPD, and an N1 target in the NOISE THR entry field.
  For more information on the Noise Abatement Departure Procedure, *Refer to FMS / NADP* .

THR NOISE and THR CLB* are the A/THR modes of the Noise Abatement Departure Procedure. They engage as follows:

Noise Abatement Departure Procedure



Intentionally left blank

GENERAL

Applicable to: ALL

The speed/Mach control is:

- Managed, when the target comes from the FMS
- Selected, when the target comes from the SPD/MACH knob on the AFS CP .

In flight, either the AP / FD or the A/THR can acquire and hold a speed/Mach target (*Refer to DSC-22-FG-10 Interaction Between AP/FD and A/THR*). However, managed speed/Mach control and selected speed/Mach control require that the A/THR be armed or active.

Intentionally left blank

DISPLAY

Applicable to: ALL

When the speed/Mach target is managed, the SPD/MACH window on the AFS CP displays dashes (For more information on SPD/MACH window, *Refer to DSC-22-FG-80-20-A SPD/MACH Window*).

The PFD airspeed scale indicates the managed speed target with a magenta triangle.
When the Mach is managed, the PFD s indicates the associated speed target by a magenta triangle.
For more information on the speed target display on PFD , *Refer to DSC-31-20-20-40 General Airspeed Indications* .

Note: *The managed speed/Mach target may be beyond VLS and VMAX - 5 kt . But the FG will limit the speed to VLS and VMAX - 5 kt .*

ENGAGEMENT CONDITIONS

Applicable to: ALL

The speed/Mach becomes managed, if one of the following occurs:

- On ground, when V2 is inserted on the T.O panel of the FMS PERF page

L2 This is applicable, if:

- The AP and/or FD s is(are) engaged, or
- One engine is started, or
- The flight crew presses the SPD/MACH knob on the AFS CP .

L1 - SRS TO or SRS GA engages

L12

Note: *At takeoff, SRS will not engage, if V2 is not available.*
However, if the three FMC s are fault, SRS TO is still available, and V2 is equal to the speed target of the AFS CP .

- In flight, the flight crew presses the SPD/MACH knob on the AFS CP , and a managed speed/Mach target is available.
For more information on the SPD/MACH knob , *Refer to DSC-22-FG-80-20-A SPD/MACH Knob* .

MANAGED SPEED/MACH CONTROL AVAILABILITY

If all AP s and FD s are off, the managed speed/Mach control is only available when the FMS flight phase is the approach phase. The A/THR is then in SPEED mode.
The managed speed/Mach target is still available, if the flight crew inserts a speed/Mach on the DES panel of the FMS PERF page to replace the ECON DES SPD or MACH. Although the flight crew selects the value, this speed/Mach target is a managed target.

For more information on the ECON DES SPD or MACH, *Refer to DSC-22-FMS-10-50-20-22FMS1050A Speed Profile - DESCENT* .

MANAGED SPEED/MACH TARGET

Applicable to: ALL

When speed/Mach is managed, the target is defined as follows:

L12

AP / FD Engaged Mode or FMS Flight Phase	Managed Speed/Mach Target
SRS TO is engaged, and the aircraft is on ground.	V2 If V2 is lost, the managed speed target remains engaged, and equals V2, because the PRIM s memorize the target value at SRS TO engagement.
SRS TO is engaged, and the aircraft is airborne.	V2 + 10 kt Note: *However, the magenta triangle appears on V2 on the PFD s.* If V2 is lost by the FMS , the managed speed target remains engaged, and equals V2 + 10 kt , because the PRIM s memorizes the target value at SRS TO engagement.
SRS TO is engaged, and at least one engine is out.	Memorized aircraft speed at engine-out detection. The target value is limited by V2 and V2 + 15 kt .
SRS GA is engaged.	Memorized aircraft speed at SRS GA engagement. The lower limit of the target is the VAPP that the PRIM s memorize at 700 ft RA . The higher limit of the target is the lowest value between: - VLS + 25 kt (or VLS + 15 kt in engine-out) - VMAX - 5 kt .

Continued on the following page

Continued from the previous page

- The FMS flight phase is the approach phase In this case, the AP (s) and/or FD s may be on or off Or - F-G/S , G/S , LAND or FLARE is engaged	VAPP, corrected from the Ground Speed Mini function *Refer to Ground Speed Mini Function .* Before reaching the landing configuration, the speed will not go below: - Green Dot, in clean configuration - S, in CONF 1 - F, in CONF 2 - F, in CONF 3, when CONF full is the landing configuration (as defined in the APPR panel of the FMS PERF page). Note: *When the managed speed target is limited by Green Dot, S, or F, the short-term managed speed appears. The FG uses the short-term managed speed as the current speed/Mach target.* *For more information on the short-term managed speed, Refer to DSC-22-FG-60-20 Short-Term Managed Speed .* The PRIM s memorize the VAPP at 700 ft RA , so if the FMS loses the VAPP below 700 ft RA , the managed speed target is still computed. The lower limit of the managed speed target is the VAPP that is computed by the FMS , and displayed on the MFD . The higher limit of the managed speed target is the VFE NEXT (or VFE - 5 kt in full configuration) of the landing configuration.
For All other cases	The managed speed/Mach target is provided by the FMS : - If NAV is engaged, the managed speed/Mach target is defined by the speed/Mach profile of the FMS flight plan. All the speed/Mach constraints are taken into account. - If NAV is not engaged, the managed speed/Mach target is defined by the speed/Mach profile of the FMS flight plan. But the speed/Mach constraints are not taken into account. For information on the speed/Mach profile, *Refer to DSC-22-FG-60-20 FMS Speed/Mach Target .* Note: *The managed speed/Mach target may exceed the flight envelope limits, or the maneuvring speed of the current slats/flaps configuration: The short-term managed speed then appears. The FG uses the short-term managed speed as the current speed/Mach target.* *For more information on the short-term managed speed, Refer to DSC-22-FG-60-20 Short-Term Managed Speed .*

GROUND SPEED MINI FUNCTION

Applicable to: ALL

When the aircraft flies an approach in managed speed, the managed speed target, displayed by the magenta triangle on the PFDs, is variable. This managed speed target is VAPP, displayed on the APPR panel of the FMS PERF page, and corrected by the Ground Speed Mini function.

ACTIVATION CONDITIONS OF THE GROUND SPEED MINI FUNCTION

The speed target is VAPP, corrected by the Ground Speed Mini function, when the speed is managed, and:

- The FMS flight phase is the approach phase, or

L2 In this case, the AP(s) and/or FDs may be on or off

L1 - F-G/S, G/S, LAND or FLARE is engaged.

However, if the aircraft is not in landing configuration, as defined in the APPR panel of the FMS PERF page, the speed will be limited by Green Dot, S, or F, in accordance with the slats/flaps configuration.

When the aircraft is in landing configuration:

- If the A/THR is active, the SPEED mode is engaged, and the A/THR acquires the managed speed target

L3 *Note: In autoland, when FLARE is engaged, the RETARD mode will engage at 50 ft RA: SPEED will disengage, and the ground speed mini function will no longer be effective.*

L1 - If the A/THR is disconnected, the flight crew manually adjust the thrust in order to acquire the managed speed target.

GROUND SPEED MINI FUNCTION PRINCIPLE

The purpose of the Ground Speed Mini function is to take advantage of the aircraft inertia, when the wind varies during the approach. It does so by providing the adequate indicated speed target (i.e. the managed speed target represented by the magenta triangle). When the aircraft flies this indicated speed target, the energy of the aircraft is maintained above a minimum level ensuring standard aerodynamic margins versus stall.

The minimum energy level is the energy level the aircraft will have at touch down if it lands with the indicated airspeed equal to VAPP , and with the wind equal to the tower reported wind as inserted on the APPR panel of the FMS PERF page. The ground speed then equals the Ground Speed Mini.

L2 Ground Speed Mini = VAPP - TOWER HEADWIND COMPONENT

For definition of the TOWER HEADWIND COMPONENT, *Refer to DSC-22-FG-60-20-A Managed Speed Target Computation* .

L1 The Ground Speed Mini is not displayed to the flight crew.
During the approach, the FG continuously computes the managed speed target, in order to keep the ground speed at, or above the Ground Speed Mini.

L2 MANAGED SPEED TARGET COMPUTATION

The computation of the managed speed target uses the TOWER HEADWIND COMPONENT, the CURRENT HEADWIND COMPONENT, and the VAPP .

TOWER WIND

The tower wind is the average wind provided by the ATIS or the tower. The flight crew enters the tower wind in the MAG WIND entry field on the APPR panel of the FMS PERF page.

TOWER HEADWIND COMPONENT

The TOWER HEADWIND COMPONENT is the MAG WIND projected on the runway axis.

CURRENT HEADWIND COMPONENT

The current wind measured by the ADIRS s is projected on the aircraft axis to define the CURRENT HEADWIND COMPONENT (instantaneous headwind).

VAPP

The FMS computes the VAPP , and displays it on the APPR panel of the FMS PERF page.
VAPP is computed as follows:
VAPP = VLS + 1/3 of the TOWER HEADWIND COMPONENT
In the formula, VLS is the VLS computed by the FMS . For more information on VLS computation by FMS , *Refer to DSC-22-FMS-20-30-22FMS502BC PERF page - Landing Configuration and VLS* .
“1/3 of the TOWER HEADWIND COMPONENT” has a limit of 5 kt , as a minimum value.
The flight crew can modify the VAPP .

MANAGED SPEED TARGET COMPUTATION

The FG continuously computes the managed speed target that is equal to VAPP plus an additional variable gust:
Managed speed target = VAPP + 0.33 * gust
The gust is the instantaneous difference between the CURRENT HEADWIND COMPONENT and the TOWER HEADWIND COMPONENT. The gust has a limit of 0, as a minimum value.
The VAPP is corrected by a third of the variable gust to avoid too high speeds during the flare.

The managed speed target has the following limits:
- VAPP , as the minimum value
- VFE NEXT, in configuration 0, 1, 2, 3, VFE - 5 kt in configuration full, as the maximum value.

FMS SPEED/MACH TARGET

Applicable to: ALL

The FMS speed/Mach targets are used to define the speed/Mach profile.

For information on the speed/Mach profile, *Refer to DSC-22-FMS-10-50-20-22FMS1050A Flight Phases - Speed Profile* .

In the following table, the first column indicates the FMS speed/Mach targets, and the second column indicates where the FMS speed/Mach targets are displayed:

FMS Speed/Mach Target	FMS PERF Page
V2 NOISE SPD	T.O Panel
ECON RTA NOISE SPD CLB SPD LIM SPD CSTR HOLD SPD PROC SPD EO-GDOT EO-LRC	CLB Panel
ECON RTA SPD LIM CMS HOLD SPD PROC SPD EO-ECON EO-LRC	CRZ Panel

Continued on the following page

Continued from the previous page

ECON RTA *Note:* *When the FMS flight phase is the descent phase, and the DES mode is engaged, the FG does not accurately maintain the ECON speed/Mach (or RTA speed/Mach). However, the managed speed/Mach should not go beyond the high and low speed margins.*  *Each margin is indicated by two dashes on the PFD airspeed scale.* *For more information on high and low speed margins, Refer to DSC-22-FMS-10-50-20-22FMS1050A Speed Profile - DESCENT .* SPD CSTR HOLD SPD PROC SPD DES SPD LIM	DES Panel
VAPP	APPR Panel

SHORT-TERM MANAGED SPEED

Applicable to: ALL

The short-term managed speed may appear when the speed/Mach is either managed, or selected. This speed is indicated by a magenta dot on the PFD airspeed scale.

WHEN THE SPEED/MACH IS MANAGED

The short-term managed speed appears, when the managed speed/Mach target exceeds the flight envelope limits, or the maneuvring speed of the current slats/flaps configuration:

If the managed speed/Mach target is:	Then, the short-term managed speed is equal to:
Above VMAX - 5 kt (e.g. VFE - 5 kt in high-lift configuration, with the gear up, when the aircraft is climbing)	VMAX - 5 kt

Continued on the following page

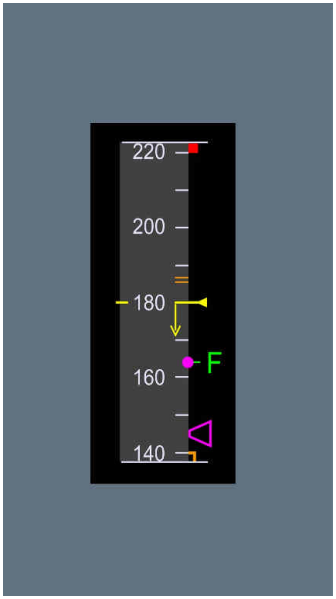
Continued from the previous page

Below VLS	VLS
Below the maneuvring speed of the current slats/flaps configuration: Green Dot, S, F This occurs, for example: - In approach, or - When the aircraft flies a holding pattern, and the HOLD speed is below green dot.	Green Dot, S, F

L2 The short-term managed speed is inhibited when:
- The FMS flight phase is cruise, or
- The AP/FD DES mode is engaged.

L3 *Note: The short-term managed speed only appears, if the difference between the short-term managed speed, and the managed speed/Mach target (i.e. magenta triangle) is equal to, or higher than 2 kt.*

L1 The FG uses the short-term managed speed, as the current speed/Mach target.
Thus, when the speed/Mach is managed, the FG always uses a speed/Mach target that is limited by VLS, and VMAX - 5 kt.
The following illustration of the PFD airspeed scale provides an example of the short-term managed speed when speed/Mach is managed:



The aircraft is in approach, in CONF 2. The managed speed target is VAPP. The short-term managed speed is F. F is the current speed target.

WHEN THE SPEED/MACH IS SELECTED

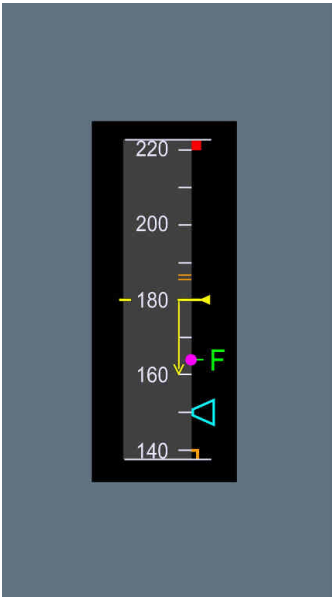
The short-term managed speed is the speed/Mach target, that would be used if the flight crew engages the managed speed/Mach control.

L3 *Note:*

1. *The short-term managed speed only appears, if the difference between the short-term managed speed, and the selected speed/Mach target (i.e. blue triangle) is equal to, or higher than 2 kt.*
2. *When the aircraft is in the deceleration segment toward a hold speed, or speed limit, the short-term managed speed is the managed ECON speed, and not the hold speed, or the speed limit.*

L1 The following illustrations of the PFD airspeed scale provide examples of the short-term managed speed when speed/Mach is selected:

EXAMPLE 1

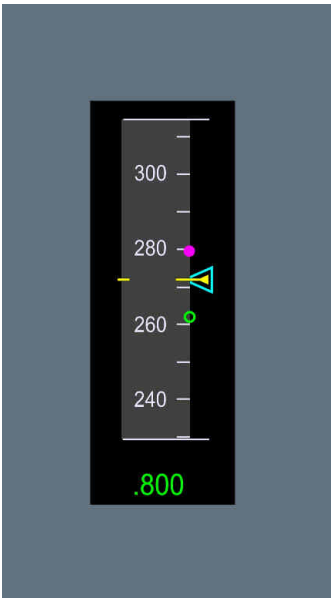


The aircraft is in approach, in CONF 2, and the selected speed target is 150 kt. The short-term managed speed is F.

At this moment, if the flight crew engages the managed speed control:

- The managed speed target would be VAPP
- The short-term managed speed would remain equal to F
- The current speed target would be F.

EXAMPLE 2



The aircraft is in cruise, the selected Mach target is 0.8, and the ECON Mach is 0.82. The short-term managed speed is the ECON Mach.
At this moment, if the flight crew engages the managed Mach control, the managed Mach target would be the ECON Mach (i.e. 0.82).

DISENGAGEMENT CONDITIONS

Applicable to: ALL

The speed/Mach is no longer managed, if one of the following occurs:

- The flight crew selects a speed/Mach target by pulling the SPD/MACH knob on the AFS CP
- The flight crew has preselected a speed/Mach on the CLB or CRZ panel of the FMS PERF page, and the associated FMS flight phase engages

- The managed speed/Mach target is lost

L2 This is not applicable, if one of the following conditions is met:

- SRS TO or SRS GA is engaged
- LAND or FLARE is engaged
- ROLL OUT is engaged

L3 - LAND is armed below 700 ft RA.

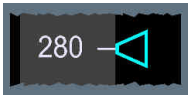
L1 If the managed speed/Mach target is lost, the speed/Mach target reverts to selected, and becomes equal to the current aircraft speed/Mach.

- All APs and FDs disengage, and the FMS flight phase is not the approach phase.
  The speed/Mach target becomes selected, and equal to the current aircraft speed/Mach.

DISPLAY

Applicable to: ALL

When a speed/Mach target is selected, the SPD/MACH window on the AFS CP displays the target.



The PFD airspeed scale indicates the selected speed target with a blue triangle.
When the Mach is selected, the PFD displays the associated speed target on the airspeed scale.
For more information on the speed target display on PFD , *Refer to DSC-31-20-20-40 General Airspeed Indications* .

Note: *The selected speed/Mach target may be set beyond VLS and VMAX - 5 kt . However, the guidance limits the speed to VLS and VMAX - 5 kt .*

SELECTED SPEED/MACH PRIORITY

Applicable to: ALL

Selected speed has priority over managed speed. The only automatic change from selected to managed speed/Mach target occurs at go-around engagement.

When in selected speed/Mach, if the situation calls for managed speed/Mach, then both PFDs and both MFDs display a message, that proposes a manual change to managed speed or Mach:

- SET HOLD SPD, when flying a holding pattern
- CHECK SPD MODE, when:
  - The FMS flight phase becomes cruise, and a speed/Mach presel has not been defined for the cruise phase
  - The aircraft sequences a CMS start waypoint
  - The FMS flight phase becomes descent.
- SET EO SPD SETTING when in engine-out, and the speed selected on the AFS CP is 10 kt away from EO green dot.
  This message invites the flight crew to select a speed closer to the EO green dot, or to engage managed speed/Mach control.

ENGAGEMENT CONDITIONS

Applicable to: ALL

The speed/Mach target becomes selected, if one the following occurs:

- The flight crew pulls the SPD/MACH knob on the AFS CP in flight

L3 This is also applicable, if:

- The aircraft is on ground with all engines stopped
- All FMC s are fault in flight, or on ground with all engines stopped.

L1 For more information on the SPD/MACH knob , *Refer to DSC-22-FG-80-20-A SPD/MACH Knob* .

- The flight crew has preselected a speed/Mach on the CLB or CRZ panel of the FMS PERF page, and the associated FMS flight phase engages
  The SPD /MACH window on the AFS CP will display the selected speed/Mach target.
- The managed speed/Mach target is lost, and reverts to selected
  For more information, *Refer to Managed Speed/Mach / Disengagement Conditions* .
- All AP (s) and FD s disengage, and the FMS flight phase is not the approach phase
  The selected speed/Mach target becomes the current aircraft speed/Mach.
- At liftoff, if the speed target was not managed.
  The selected speed target becomes the current aircraft speed at liftoff.

L2 *Note: The SPD/MACH window, and the blue triangle on the PFD airspeed scale display this new speed target.*

L1 *Note: The selected speed/Mach target is always limited by VLS , and by VMAX - 5 kt .*

DISENGAGEMENT CONDITIONS

Applicable to: ALL

The selected speed/Mach target disengages, if one of the following occurs:

- The speed/Mach target becomes managed
- L3 On ground, the FDs engage (e.g. at aircraft power-up)
- On ground, the engines are started, while the AP and/or FDs is(are) engaged.

FMS FLIGHT PLAN PREDICTIONS WHEN IN SELECTED SPEED/MACH

Applicable to: ALL

In most cases, when the speed/Mach is selected, the FMS flight plan predictions consider that the speed/Mach remains selected, until the next SPD LIM, SPD CSTR, or the next phase, whichever comes first, and then the speed/Mach becomes managed.
For more information, *Refer to FMS / Fligth Plan Predictions / Selected Speed/Mach* .

SPEED/MACH SWITCHING

Applicable to: ALL

Speed/Mach switching can be automatic, or manual.

AUTOMATIC SWITCHING

During climb, when the crossover altitude is reached, the speed target (selected or managed) changes automatically to the associated Mach target.
During descent, when the crossover altitude is reached, the Mach target (selected or managed) changes automatically to the associated speed target.
The crossover altitude is at approx. 30 000 ft . It is based on the ECON MACH value.

MANUAL SWITCHING

When the speed/Mach is selected, the flight crew can perform the switching, by pressing the SPD/MACH pb on the AFS CP (For more information on the SPD/MACH pb , *Refer to DSC-22-FG-80-20-A SPD/MACH pb*).

Intentionally left blank

AP/FD MODES GENERAL

Applicable to: ALL

The AP/FD modes are either lateral, vertical, or common.

AP/FD LATERAL MODES

The AP/FD lateral modes are:

RWY , RWY TRK	Runway mode, Runway track mode
NAV	Navigation mode
HDG , TRACK	Heading mode, Track mode HDG and TRACK are the lateral basic modes.
LOC *, LOC	Localizer capture mode, Localizer track mode
LOC B/C *, LOC B/C	Localizer back course capture mode, Loc back course track mode
F-LOC *, F-LOC	Flight Management System Landing System Localizer capture mode, Flight Management System Landing System Localizer track mode
GA TRK	Go-around track mode

L2 BANK ANGLE LIMITATION

The following limitations apply when the AP is engaged. However, if the AP is not engaged, the FD orders respect the bank angle limitations.
In addition to the bank angle limitation, there is a bank angle protection. For more information, *Refer to DSC-22-27-20 Bank Angle Protection* .

When all Engines are Operative

AP/FD Lateral Mode	Bank Angle Limitation
HDG, TRACK	Bank Angle Limitation NAV	Function of the True Air Speed, the maximum is 30°.

Continued on the following page

Continued from the previous page

AP/FD Lateral Mode	Bank Angle Limitation
LOC*, LOC B/C*, F-LOC*	30°
LOC, LOC B/C, F-LOC, LAND, FLARE	Bank Angle Limitation 
When at least one Engine is Inoperative

AP/FD Lateral Mode	Bank Angle Limitation
HDG, TRACK	Bank Angle Limitation NAV	15°

Continued on the following page

Continued from the previous page

AP/FD Lateral Mode	Bank Angle Limitation
LOC*, LOC B/C*, F-LOC*	30°
LOC, LOC B/C, F-LOC, LAND, FLARE	Bank Angle Limitation 
AP/FD VERTICAL MODES

The AP/FD vertical modes are:

SRS	Speed Reference System mode, used during takeoff and go-around SRS TO refers to SRS mode during takeoff, and SRS GA refers to SRS mode during go-around.
CLB	Climb mode
DES	Descent mode
OP CLB	Open Climb mode
OP DES	Open Descent mode
V/S, FPA	Vertical Speed mode, Flight Path Angle mode V/S and FPA are the vertical basic modes.
ALT*, ALT *(1)*	Altitude capture mode, Altitude hold mode
ALT CST*, ALT CST *(1)*	Altitude constraint capture mode, altitude constraint hold mode
ALT CRZ*, ALT CRZ *(1)*	Altitude capture of the cruise flight level, Altitude hold of the cruise flight level
G/S*, G/S	Glide slope capture mode, Glide slope track mode
F-G/S*, F-G/S	FLS-G/S capture mode, FLS-G/S track mode
TCAS	AP/FD TCAS mode

(1) ALT, ALT CST*, and ALT CRZ* are referred to as the altitude acquire modes.*
ALT, ALT CST, and ALT CRZ are referred to as the altitude hold modes.

AP/FD COMMON MODES

The AP/FD common modes are:

LAND	Land mode
FLARE	Flare mode
ROLL OUT	Rollout mode

AP/FD MODE STATUS AND DISPLAY

Applicable to: ALL

An AP/FD lateral or vertical mode can be armed, engaged, or disengaged.
When an AP/FD lateral mode is armed, the FMA displays the lateral mode in blue, on the second line of the third column. When an AP/FD lateral mode is engaged, the FMA displays the lateral mode in green, on the first line of the third column.
When an AP/FD vertical mode is armed, the FMA displays the vertical mode in blue, on the second line of the second column. When an AP/FD vertical mode is engaged, the FMA displays the vertical mode in green, on the first line of the second column.
When an AP/FD lateral or vertical mode is disengaged, the FMA does not display the disengaged mode.
An AP/FD common mode can either be engaged or disengaged.
When an AP/FD common mode is engaged, the FMA displays the common mode in green, on the first line of the second and third columns. When an AP/FD common mode is disengaged, the FMA does not display the mode.
When all APs and FDs are disengaged, all AP/FD modes are disengaged.

General

GENERAL

Applicable to: ALL

At takeoff, the Speed Reference System (SRS) vertical mode, and the runway (RWY) lateral mode simultaneously engage. They disengage at different moment. In some cases, RWY is replaced by RWY TRK.

For scenario examples on takeoff:

- *Refer to DSC-22-FG-70-120-20 Takeoff with NAV*
- *Refer to DSC-22-FG-70-120-20 Takeoff with HDG/TRK Preset* .

Intentionally left blank

SRS TO Mode

GENERAL

Applicable to: ALL

The Speed Reference System (SRS) mode is a managed vertical mode. This mode is used during takeoff, and during go-around. The present chapter deals with the SRS mode during takeoff, also referred to as the SRS TO mode. The FMA announces the SRS TO mode by SRS .
SRS TO controls the speed via the elevators, in order to steer the aircraft along a vertical path.

L2 The guidance law also includes:
- A flight path angle protection, that ensures a positive climb
- A pitch angle protection to reduce the aircraft nose-up (14 ° of maximum pitch attitude).

L1 SRS TO engages when the flight crew sets the thrust levers to TOGA or FLX-MCT, V2 is inserted on the T.O panel of the FMS PERF page, and the slats are extended.

Note: When V2 is inserted, or SRS TO is engaged, the speed automatically becomes managed. For more information engagement conditions of managed speed, Refer to Managed Speed/Mach / Engagement Conditions .

When the aircraft is on ground, V2 is the speed target. When the aircraft is airborne, V2 + 10 kt becomes the speed target. If one engine fails, the speed target is the current aircraft speed at the engine failure detection. However, the speed target is limited by V2 and V2 + 15 kt . For more information on the speed target, *Refer to Speed/Mach Control / Managed Speed/Mach Target* .
In main cases, SRS TO disengages at the acceleration altitude: CLB or OP CLB engages.

ENGAGEMENT CONDITIONS

Applicable to: ALL

SRS TO engages, when all of the following conditions are met:
- The aircraft is on ground

L3 The aircraft must be on ground for at least 30 s .

L1 - V2 is inserted on the T.O panel of the FMS PERF page

L2 Or, the three FMC s are fault. In this case, V2 will be equal to the speed target of the AFS CP .

L1 - The slats are extended
- The flight crew sets all the thrust levers:
  - To TOGA, or
  - To FLX-MCT, when FLX or DERATED has been selected on the T.O panel of the FMS PERF page.

Refer to Scenario Examples / Takeoff with NAV , step 2, and *Refer to Scenario Examples / Takeoff with HDG/TRK Preset* , step 2.

DISENGAGEMENT CONDITIONS

Applicable to: ALL

SRS TO mode disengages, when one of the following occurs:

- CLB or OP CLB is armed, and the aircraft reaches the acceleration altitude
  CLB or OP CLB engages.
- The aircraft reaches the capture zone of the AFS CP selected altitude
  ALT* engages.

L3 This scenario is applicable, if the aircraft is above 400 ft RA.

L1 - NAV is engaged, and the aircraft reaches the capture zone of the altitude constraint
  ALT CST* engages.

L3 This scenario is applicable, if the aircraft is above 400 ft RA.

L1 - The flight crew pushes the ALT pb
  ALT engages.

- The flight crew pulls the ALT knob
  OP CLB or OP DES engages.
- The flight crew pushes the ALT knob, when all of the following conditions are met:
  - NAV is engaged
  - CLB is not armed
  - The AFS CP selected altitude is above the aircraft altitude
  - The acceleration altitude is above the aircraft altitude

L3 • The vertical flight plan is valid.

L1 CLB engages.

- The flight crew pulls the V/S / FPA knob.
  V/S / FPA engages.

REVERSION

SRS TO reverts to OP CLB, when the AFS CP selected altitude is above the aircraft altitude, and the flight crew pulls the SPD/MACH knob. A triple click aural warning sounds.

RWY Mode

GENERAL

Applicable to: ALL

The Runway (RWY) mode is a managed lateral mode.
When the LOC signal is available, the RWY mode gives lateral guidance orders during takeoff, and initial climb.

L2 The RWY guidance law aim to maintain the aircraft on the runway centerline during the takeoff run, and on the LOC beam when the aircraft in airborne. To do so, RWY provides the FD yaw bar order.

L1 RWY arms when the aircraft approaches the runway threshold.
RWY engages when the flight crew sets the thrust levers to TOGA, or FLX-MCT.
If NAV is armed, RWY disengages at 30 ft RA, and NAV engages.
If a HDG/TRK preset was defined (NAV not armed), RWY disengages at 50 ft RA, and RWY TRK engages.

ARMING CONDITIONS

Applicable to: ALL

RWY arms, when the aircraft approaches the runway threshold.

L3 RWY arms, when all of the following conditions are met:

- The aircraft is on ground for more than 120 s
- The flaps lever is not in the 0 detent
- The LOC signal is valid
- A LOC B/C approach is not selected in the flight plan
- The ILS course is equal to the runway heading, as inserted in the flight plan
- The aircraft heading reaches 115 ° of the ILS course
- The LOC deviation reaches one dot, and decreases.

DISARMING CONDITIONS

Applicable to: ALL

L3 RWY disarms, when one of the following occurs:

- The flaps lever is set to the 0 detent
- The LOC signal becomes invalid
- A LOC B/C approach is selected in the flight plan
- The ILS course is no longer equal to the runway heading, as defined is the flight plan
- The aircraft becomes airborne.

ENGAGEMENT CONDITIONS

Applicable to: ALL

RWY engages, if all of the following conditions are met:

- L3 - The aircraft is on ground for more than 30 s
- The flaps lever are not in the 0 detent
- The LOC signal is valid
- L2 - The LOC deviation below 0.5 dot
- L3 - The aircraft heading is within 20 ° of the ILS course
- The ILS course is equal to the runway heading, as defined in the flight plan
- L1 - The flight crew sets the thrust levers to:
  - TOGA, if TOGA has been selected on the T.O panel of the FMS PERF page, or
  - FLX-MCT, if FLEX or DERATED has been selected on the T.O panel of the FMS PERF page.

DISENGAGEMENT CONDITIONS

Applicable to: ALL

RWY disengages, if one of the following occurs:

- NAV is armed, and the aircraft reaches 30 ft RA
  NAV engages.
- L2 - NAV is not armed, and the aircraft reaches 50 ft RA
  RWY TRK engages.
- L1 - The flight crew pulls the HDG/TRK knob
  HDG/TRACK engages.
- L3 - The aircraft heading deviates from more than 20 degrees from the ILS course.
  HDG/TRACK engages.

RWY TRK Mode

GENERAL

Applicable to: ALL

The Runway Track (RWY TRK) mode is a managed lateral mode.
The RWY TRK mode guides the aircraft along a constant track target. The track target is the aircraft track at RWY TRK engagement.
RWY TRK engages at 50 ft RA, if NAV was neither armed, nor engaged.

ENGAGEMENT CONDITIONS

Applicable to: ALL

The RWY TRK automatically engages at 50 ft RA, if:

L3 - The FMS flight phase is takeoff, and

L1 - NAV is not engaged.

DISENGAGEMENT CONDITIONS

Applicable to: ALL

RWY TRK disengages, when one of the following occurs:

- The flight crew pulls the HDG/TRK knob
  HDG/TRACK engages.
- NAV is armed, and the aircraft reaches the capture zone of the active leg
  NAV engages.
- The flight crew inserts a DIRECT TO.
  NAV engages.

Intentionally left blank

General

GENERAL

Applicable to: ALL

The Heading (HDG), TRACK and Navigation (NAV) modes guides the aircraft laterally. They are mainly used during climb, cruise and descent.

Intentionally left blank

HDG/TRACK Mode

GENERAL

Applicable to: ALL

Heading (HDG) and TRACK are selected lateral modes. They are the basic modes of lateral guidance.
HDG/TRACK guides the aircraft laterally along the heading/track target, that appears in the HDG/TRK window on the AFS CP . For more information on the HDG/TRK window, *Refer to DSC-22-FG-80-20-B HDG/TRK Window* .

ENGAGEMENT CONDITIONS

Applicable to: ALL

HDG / TRACK engages, when one of the following occurs:
- The flight crew pulls the HDG/TRK knob on the AFS CP in flight

L3 This is applicable, if:
- The aircraft is in flight, for at least 5 s after liftoff
- Not in LAND , FLARE , or ROLL OUT
- Not in GA TRK below 100 ft RA .

L1 For more information on the HDG/TRK knob , *Refer to DSC-22-FG-80-20-B HDG/TRK Knob* .
- NAV disengages after:

L3
- The flight plan becomes invalid, or
  For more information, *Refer to NAV Disengagement Conditions* .

L1
- The aircraft has reached a flight plan discontinuity.

This is a reversion. A triple click aural warning sounds, and the FD roll bar flashes for 10 s .

L23

Note: *1. The reversion to HDG / TRACK also occurs, if the flight plan becomes invalid.*

This occurs when for example:
- *The FMS aircraft position is lost, or*
- *The ground speed is invalid.*

2. If a managed vertical mode was previously engaged, it simultaneously reverts to a selected vertical mode:
- *If CLB was engaged, OP CLB engages*
- *If ALT CST* , ALT CRZ* , or DES was engaged, V/S / FPA engages*
  The FD pitch bar will flash for 10 s .
- *If ALT CST was engaged, ALT engages.*

- All AP and FD s were previously off, and the flight crew engages the AP or the FD s

  Note: *1. The AP or FD s engage in basic modes: HDG / TRACK , and V/S / FPA .*
  2. If the FD engages, the FD bars flash for 10 s .

L2 - The APPR pb (LOC pb) is on, and the flight crew presses the APPR pb (LOC pb) again, when the approach mode is engaged

L3 - The approach is modified in the flight plan, when LOC* , LOC , F-LOC* , F-LOC , LOC B/C* , or LOC B/C is engaged
This is a reversion. A triple click aural warning sounds. HDG / TRACK , and V/S / FPA will engage. The FD bars will flash for 10 s .

Note: *1. If the approach is modified, when one of the above approach modes is armed, the approach mode will disarm. HDG / TRACK will not engage.*
2. Below 700 ft RA , it will not be possible to modify the approach, if:
- *LOC is armed or engaged, with G/S armed or engaged*
- *LOC is armed or engaged, with F-G/S armed or engaged*
- *F-LOC is armed or engaged, with F-G/S armed or engaged.*

L1 - LOC* , LOC , F-LOC* , F-LOC , LOC B/C* , or LOC B/C is lost after a failure occurs in approach (*Refer to AP Automatic Disengagement*)
This is a reversion. A triple click aural warning sounds. All AP (s) and FD s disengage. The FD s reengage in HDG / TRACK , and V/S / FPA . The FD bars flash for 10 s .

L3 - RWY disengages after the aircraft has deviated from the ILS course for more than 20 ° .

L1 HDG or TRACK engages, in accordance with the HDG-V/S / TRK-FPA selection: *Refer to DSC-22-FG-70-30-20 HDG-V/S / TRK-FPA Selection* .

HDG-V/S / TRK-FPA SELECTION

Applicable to: ALL

HDG-V/S is automatically selected:
- At aircraft power-up, or
- When the flight crew engages a go-around.

L2 This is not applicable if the TRK mode was engaged before go-around. In this case, TRK mode remains engaged, with TRK-FPA selection.

L1 .
The flight crew switches from one selection to another, by pressing the HDG-V/S / TRK-FPA pb on the AFS CP .

When HDG-V/S is selected:
- HDG appears on the HDG/TRK window of the AFS CP
  For more information on the HDG/TRK window, *Refer to Controls and Indicators / HDG/TRK Window* .
- V/S appears on the V/S / FPA window of the AFS CP
  For more information on the V/S / FPA window, *Refer to Controls and Indicators / V/S / FPA Window* .
- HDG and/or V/S mode(s) can be engaged
- TRACK and FPA modes cannot be engaged
- If the VV pb is pressed on the EFIS CP , the associated PFD displays the Velocity Vector (VV) in black.
  For more information on the VV, *Refer to DSC-31-20-20-100 Flight Path Vector(Velocity Vector)* .

When TRK-FPA is selected:
- TRK appears on the HDG/TRK window of the AFS CP
- FPA appears on the V/S / FPA window of the AFS CP
- HDG and/or V/S mode(s) cannot be engaged
- TRACK and FPA modes can be engaged
- Both PFD s display the Flight Path Vector (FPV) in green.
  For more information on the FPV , *Refer to DSC-31-20-20-100 Flight Path Vector(Velocity Vector)* .

HDG / TRK PRESET

Applicable to: ALL

The FG has a HDG/TRK preset function for takeoff and go-around.
If the flight crew decides not to fly the flight plan after a takeoff or go-around, they may preset a heading or a track on the AFS CP by turning the HDG/TRK knob .

AT TAKEOFF

Turning the HDG/TRK knob before takeoff and up to 30 ft RA , defines a HDG/TRK preset, and NAV disarms. The preset value remains displayed in the HDG/TRK window (even when RWY TRK engages at 50 ft RA).
When the flight crew pulls the HDG/TRK knob (at least 5 s after liftoff), HDG or TRACK engages. The aircraft follows the preset target.

AT GO-AROUND

Turning the HDG/TRK knob when LOC* , LOC , F-LOC* , F-LOC , LAND , FLARE , ROLL OUT or GA TRK is engaged, defines a HDG/TRK preset. The preset value remains displayed in the HDG/TRK window, as long as one of these modes is engaged.

If a HDG (TRK) is preset when the flight crew initiates a go-around, GA TRK lateral mode engages, until the flight crew pulls the HDG/TRK knob .

L3 In this case, NAV mode does not arm. *Refer to DSC-22-FG-70-100-10 General* .

L1 When the flight crew pulls the HDG/TRK knob , HDG (TRACK) engages, and the heading/track target is the HDG/TRK preset.

L3 This is applicable, if the flight crew pulls the HDG/TRK knob above 100 ft RA .

L1 **CANCELLATION**

The flight crew can cancel a HDG/TRK preset by:

- Arming NAV , by pushing the HDG/TRK knob , or
- Engaging NAV , by activating a DIR TO with the FMS , or

L3 This is applicable, if:

- Below 700 ft RA , LOC* , LOC , F-LOC* , F-LOC , LOC B/C* or LOC B/C , LAND , FLARE , ROLL OUT is not engaged
- Below 100 ft RA , GA TRK is not engaged
- Below 30 ft RA , the FMS flight phase is not takeoff.

L1 For more information on DIR TO, *Refer to FMS / DIRECT TO* .

- Disengaging the AP and FD s.

HEADING/TRACK TARGET

Applicable to: ALL

When HDG/TRACK engages, the heading/track target is defined as followed:

HDG/TRACK engages after:	Heading/Track Target
The flight crew has pulled the HDG/TRK knob knob.	The heading/track selected with the HDG/TRACK knob, or the HDG/TRK preset.
For all other cases	The current heading or track of the aircraft. Note: *The HDG/TRK window automatically displays this target at HDG/TRACK engagement.*

DISENGAGEMENT CONDITIONS

Applicable to: ALL

HDG/TRACK disengages, when another lateral mode engages.

NAV Mode

GENERAL

Applicable to: ALL

The Navigation (NAV) mode is a managed lateral mode, that guides the aircraft laterally along the FMS flight plan. It is designed to have a zero crosstrack error.
NAV usually arms before engaging.

ARMING CONDITIONS

Applicable to: ALL

L2 For NAV arming, the lateral flight plan must be available.

L1 NAV arms, when one of the following occurs:
- The aircraft is on ground, and:
  - There is no HDG/TRK preset
  - RWY engages, or no lateral mode is engaged.
- The flight crew pushes the HDG/TRK knob on the AFS CP
- The flight crew activates a DIR TO / INTERCEPT with the FMS .
  For more information on DIR TO / INTERCEPT, *Refer to FMS / DIRECT TO* .
- The flight crew initiates a go-around.

L2 This is not applicable if a HDG / TRK was preset.
For more information on NAV arming in the case of a go-around, *Refer to DSC-22-FG-70-100-10 General* .

L3 Except in the case of a go-around, NAV cannot arm, if one of the following modes is engaged: LOC* , LOC , F-LOC* , F-LOC , LOC B/C* , LOC B/C , LAND , FLARE , ROLL OUT .

DISARMING CONDITIONS

Applicable to: ALL

L2 NAV disarms, when one of the following occurs:
- The flight crew presets a HDG/TRK for takeoff

L3 - NAV engages
- The flight crew pulls the HDG/TRK knob

L2 - The flight crew arms or engages an approach mode

L3 - GA TRK engages
- The flight plan becomes invalid.
  For more information, *Refer to NAV Disengagement Conditions* .

ENGAGEMENT CONDITIONS

Applicable to: ALL

For NAV engagement, the lateral flight plan must be available.

NAV engages, if one of the following occurs:

- NAV is armed, and the aircraft reaches 30 ft RA after takeoff
- NAV is armed, and the aircraft reaches the capture zone of the flight plan active leg
- The flight crew activates a DIR TO on the MFD

L3 This is not applicable, if LOC* , LOC , F-LOC* , F-LOC , LOC B/C* or LOC B/C , LAND , FLARE , ROLL OUT is engaged below 700 ft RA .

L1 - The flight crew initiates a go-around above 100 ft RA , and the aircraft reaches the capture zone of the flight plan active leg.

L2 This is not applicable if a HDG / TRK was preset.

For more information on NAV engagement in the case of a go-around, *Refer to DSC-22-FG-70-100-10 General* .

L1 When NAV is engaged, the HDG/TRK window on the AFS CP displays dashes.

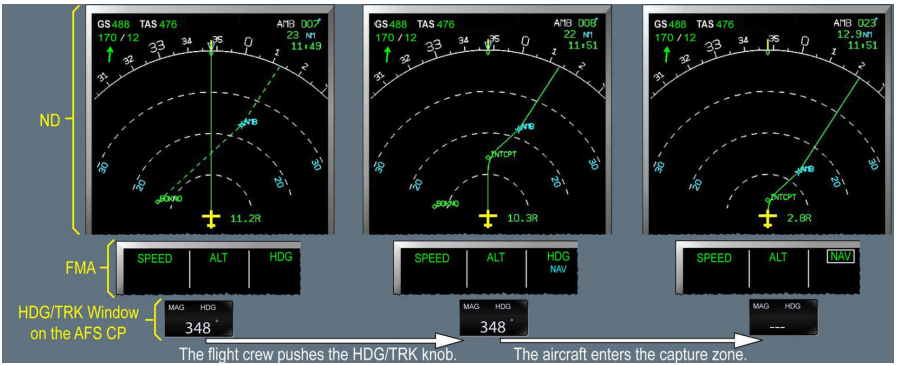
CAPTURE ZONE OF THE FLIGHT PLAN ACTIVE LEG

When NAV is armed, it automatically engages, if:

- The aircraft track line intercepts the flight plan between the FROM and the TO waypoints
- The intercept waypoint (INTCPT) is displayed on the ND
- The aircraft reaches the capture zone of the flight plan active leg.

The following is an example:

Capture Zone



DISENGAGEMENT CONDITIONS

Applicable to: ALL

NAV disengages, when another lateral mode engages.

L2 NAV disengages, when one of the following occurs:

- The flight crew pulls the HDG/TRK knob to engage HDG/TRACK
- The aircraft reaches a flight plan discontinuity
  This is a reversion. A triple click aural warning sounds. HDG/TRACK engages. The FD roll bar flashes for 10 s.

L23

Note: *1. The reversion to HDG/TRACK also occurs, if the flight plan becomes invalid.*

This occurs when for example:

- *The FMS aircraft position is lost, or*
- *The ground speed is invalid.*

2. If a managed vertical mode was previously engaged, it simultaneously reverts to a selected vertical mode:

- *If CLB was engaged, OP CLB engages*
- *If ALT CST*, ALT CRZ*, or DES was engaged, V/S / FPA engages*
  The FD pitch bar will flash for 10 s.
- *If ALT CST was engaged, ALT engages.*

- LOC*, F-LOC*, LOC B/C*, or GA TRK engages.

INTERACTIONS WITH VERTICAL MODES

Applicable to: ALL

When NAV is engaged with the managed vertical modes CLB or DES, the guidance takes into account the altitude and speed constraints, linked to waypoints on the lateral flight plan.
When NAV is disengaged, the managed vertical modes are not available, and all altitude and speed constraints are disregarded.

Intentionally left blank

General

GENERAL

Applicable to: ALL

During climb, OP CLB or CLB guides the aircraft vertically to an altitude target.
V/S / FPA can also climb the aircraft: *Refer to V/S / FPA* .

Intentionally left blank

OP CLB Mode

GENERAL

Applicable to: ALL

Open Climb (OP CLB) mode is a selected vertical mode.
OP CLB guides the aircraft vertically to the AFS CP selected altitude. All altitude constraints are disregarded.

When OP CLB is engaged:
- OP CLB controls the speed/Mach target (selected or managed)
- If the A/THR is active, the A/THR will control the thrust.

OP CLB usually arms before it engages.

For scenario examples on climb with OP CLB mode:
- *Refer to DSC-22-FG-70-120-40 At the Acceleration Altitude*
- *Refer to DSC-22-FG-70-120-40 The Flight Crew Pulls the ALT Knob*
- *Refer to DSC-22-FG-70-120-40 NAV Disengages* .

OP CLB ASSOCIATION WITH ALTITUDE MODES

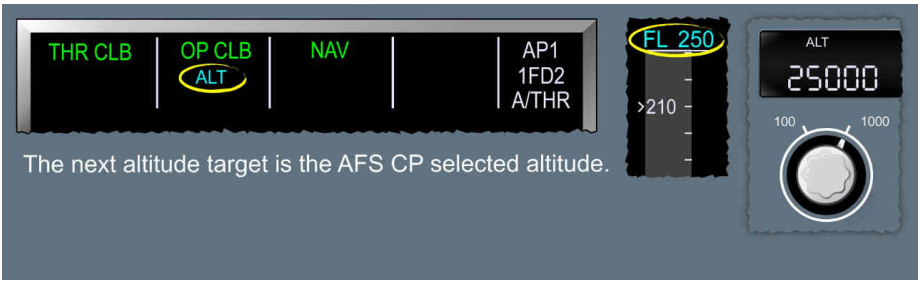
Applicable to: ALL

OP CLB is always associated to an altitude mode.
When OP CLB is engaged:

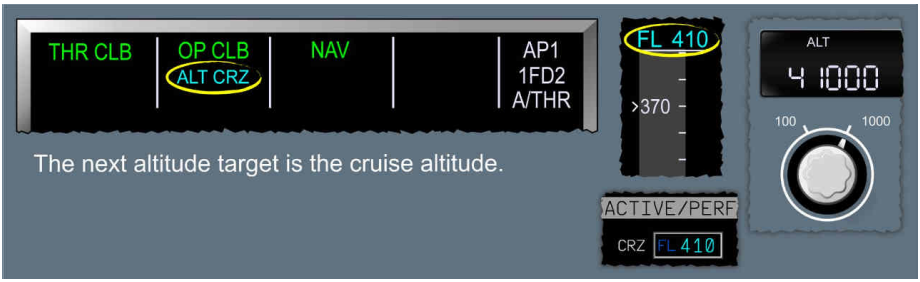
Conditions	**The FMA displays the following message on the second line of the second column:**
The next altitude target is the AFS CP selected altitude. In addition, the AFS CP selected altitude is not set the cruise altitude.	ALT (ALT is armed)
The next altitude target is the cruise altitude. In this case, the AFS CP selected altitude is equal to the cruise altitude. Note: *The cruise altitude is defined on the CRZ panel of the FMS PERF page.*	ALT CRZ (ALT CRZ is armed)

The following are examples:

OP CLB and ALT armed



OP CLB and ALT CRZ armed



ARMING CONDITIONS

Applicable to: ALL

OP CLB arms, when all of the following conditions are met:

- The aircraft is on ground, or SRS is engaged (TO or GA)
- NAV is neither armed nor engaged, or the vertical fight plan is not available
- The Acceleration (ACC) altitude is available, and is below the AFS CP selected altitude.

Refer to Scenario Examples / At the Acceleration Altitude , step 1.

DISARMING CONDITIONS

Applicable to: ALL

L2 OP CLB disarms, when one of the following occurs:

- V/S/FPA engages

L3 - The ACC altitude becomes equal to, or above the AFS CP selected altitude

- CLB arms.

ENGAGEMENT CONDITIONS

Applicable to: ALL

OP CLB engages, when one of the following occurs:

- The AFS CP selected altitude is above the aircraft altitude, and the flight crew pulls the ALT knob

L3 This scenario is applicable, if:

- LAND is not engaged
- If SRS GA is engaged, the aircraft is above 100 ft RA
- The aircraft is airborne for at least 5 s.

L1 - SRS is engaged (TO or GA) with OP CLB armed, and the aircraft reaches the ACC altitude

L3 This scenario is applicable, if the aircraft is airborne for at least 5 s.

L2 - SRS is engaged (TO or GA), and the flight crew pulls the SPD/MACH knob.

L3 This scenario is applicable, if:

- The AFS CP selected altitude is above the aircraft altitude
- If SRS GA is engaged, the aircraft is above 100 ft RA
- The aircraft is in flight for at least 5 s.

L1 When OP CLB engages, ALT automatically arms.

REVERSIONS

OP CLB also engages, when one of the following reversions occurs:

- CLB and NAV are engaged, and NAV disengages
  Refer to Scenario Examples / NAV disengages .

L3 - CLB is engaged, and the vertical flight plan becomes invalid

- CLB is engaged, and the FMS flight phase changes to the descent or approach phase

L1 - SRS TO is engaged, the AFS CP selected altitude is above the aircraft altitude, and the flight crew pulls the SPD/MACH knob .

The reversion is announced by a triple click aural warning.

DISENGAGEMENT CONDITIONS

Applicable to: ALL

OP CLB disengages, when another vertical mode engages.

L2 OP CLB disengages, when one of the following occurs:

- The aircraft reaches the capture zone of the AFS CP selected altitude ALT* engages.
- ALT CRZ is armed, and the aircraft reaches the capture zone of the cruise altitude ALT CRZ* engages.
- The flight crew pushes the ALT knob, when:
  - NAV is engaged
  - The vertical flight plan is available
  - L3 The FMS flight phase is neither the descent nor the approach phase.
- L2 The flight crew pulls the V/S / FPA knob to engage V/S/FPA
- The flight crew pushes the ALT knob to engage ALT.

L1 **REVERSION**

OP CLB reverts to V/S/FPA, when the flight crew sets the AFS CP selected altitude below the aircraft altitude. A triple click aural warning sounds. The pitch bar flashes for 10 s.

CLB Mode

GENERAL

Applicable to: ALL

Climb (CLB) mode is a managed vertical mode.
CLB guides the aircraft vertically along the FMS flight plan, to the AFS CP selected altitude, or to the next altitude constraint, whichever comes first. Therefore, altitude constraints, associated with applicable waypoints, are taken into account.
CLB can only be engaged, when NAV is engaged.

When CLB is engaged:
- The AP / FD s controls the speed/Mach target (selected or managed) through the elevators

  Note: *The Flight Guidance system does not adjust the speed/Mach target to match the altitude constraints.*

- If the A/THR is active, the A/THR will control the thrust.

CLB usually arms before it engages.

For scenario examples on climb with CLB mode:
- *Refer to DSC-22-FG-70-120-50 At the Acceleration Altitude*
- *Refer to DSC-22-FG-70-120-50 Climbing toward an Altitude Constraint* .

CLB ASSOCIATION WITH ALTITUDE MODES

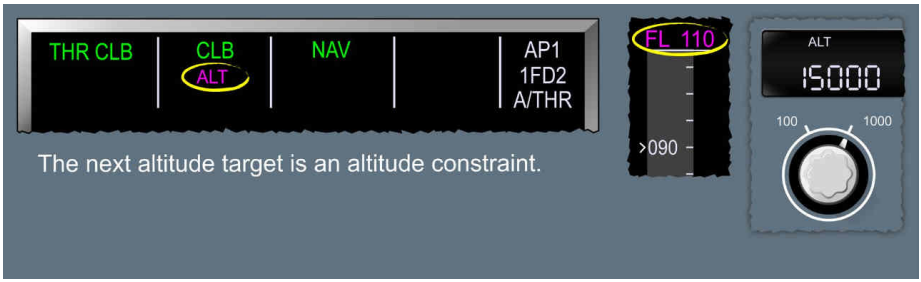
Applicable to: ALL

CLB is always associated to an altitude mode.
When CLB is engaged:

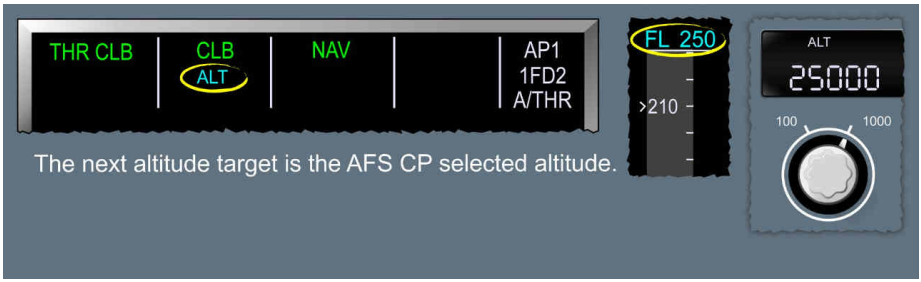
Conditions	The FMA displays the following message on the second line of the second column:
The next altitude target is the AFS CP selected altitude. In addition, the AFS CP selected altitude is not set to the cruise altitude. However, the AFS CP selected altitude can be equal to an altitude constraint.	ALT (ALT is armed)
The next altitude target is an altitude constraint, and the AFS CP selected altitude is above the altitude constraint.	ALT (ALT CST is armed)
The next altitude target is the cruise altitude. In this case, the AFS CP selected altitude is equal to the cruise altitude. Note: *The cruise altitude is defined on the CRZ panel of the FMS PERF page.*	ALT CRZ (ALT CRZ is armed)

The following are examples:

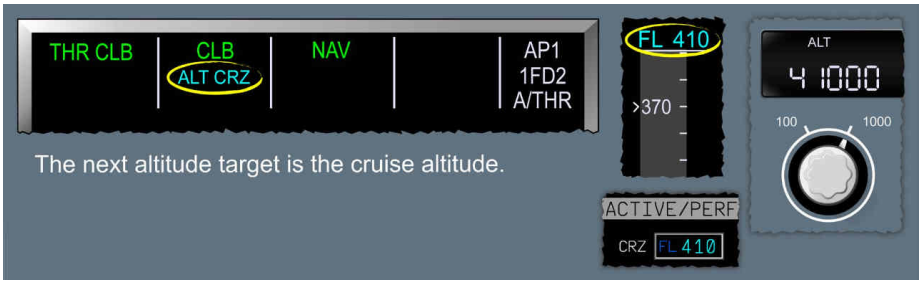
ALT CST arms



ALT arms



ALT CRZ arms



ARMING CONDITIONS

Applicable to: ALL

CLB arms, when the aircraft is on ground, or when SRS is engaged (TO or GA) and:

- NAV is armed, or engaged
- The Acceleration (ACC) altitude is available, and is below:
  - The AFS CP selected altitude
  - The next altitude constraint.

L2 - The vertical flight plan is available.

L1 *Refer to Scenario examples / At Acceleration Altitude* , step 1.

L2 CLB also arms, when CLB was previously engaged, and ALT CST* engages. This scenario is possible, when the AFS CP selected altitude is set to be above the altitude constraint. *Refer to Scenario Examples / Climbing towards an Altitude Constraint* , steps 1 and 2.

L1 The ACC altitude is displayed on the T.O and GA panel of the FMS PERF page. The flight crew can modify the ACC altitude. For more information , *Refer to FMS / Acceleration Altitude on T.O Panel* , and *Refer to FMS / Acceleration Altitude on GA Panel* .

DISARMING CONDITIONS

Applicable to: ALL

CLB disarms, when one of the following occurs:

- NAV disarms, or NAV disengages

L2 - The flight crew sets the AFS CP target altitude to the altitude constraint, when ALT CST* or ALT CST is engaged

- OP CLB, or V/S /FPA engages

L3 - The ACC altitude becomes equal to, or above, the subsequent target altitude, when the aircraft is on ground, or when SRS is engaged (TO or GA)

- The AFS CP selected altitude is set to be below the aircraft altitude
- The vertical fight plan becomes invalid
- The FMS flight phase changes to the descent or approach phase.

ENGAGEMENT CONDITIONS

Applicable to: ALL

CLB engages, when one of the following occurs:

- SRS is engaged (TO or GA) with CLB armed, and the aircraft reaches the ACC altitude

L3 This is applicable, if the aircraft is airborne for at least 5 s .

L1 *Refer to Scenario Examples / At the Acceleration Altitude* , step 3.

- ALT CST is engaged with CLB armed, and the aircraft sequences the altitude constraint
  Refer to Scenario Examples / Climbing towards an Altitude Constraint , step 4.
- The AFS CP selected altitude is set to be above the aircraft altitude, and the flight crew pushes the ALT knob .

This scenario is applicable, if:

- NAV is engaged

L3
- CLB is not yet armed
- The FMS flight phase is neither the descent nor the approach phase
- The vertical flight plan is valid
- The aircraft is in flight for at least 5 s .

L2 Note: *If the aircraft altitude is within the capture zone of the AFS CP selected altitude, CLB will immediately disengage, and ALT* will engage.*

DISENGAGEMENT CONDITIONS

Applicable to: ALL

CLB disengages, when another vertical mode engages.

L2 This signifies that CLB disengages, when one of the following occurs:

- The aircraft reaches the capture zone of the AFS CP selected altitude: ALT* engages
- The aircraft reaches the capture zone of the altitude constraint: ALT CST* engages
  Refer to Scenario Examples / Climbing towards an Altitude Constraint , step 2.
- The aircraft reaches the capture zone of the cruise altitude: ALT CRZ* engages
- The flight crew pulls the V/S / FPA knob to engage V/S / FPA
- The flight crew pulls the ALT knob to engage ALT
- NAV disengages.
  OP CLB engages.
  However, in some cases, this scenario is a reversion: *Refer to DSC-22-FG-70-40-30-B Reversions* .

REVERSIONS

CLB also disengages, when one of the following reversions occurs:

- NAV disengages after:
  - The aircraft has reached a flight plan discontinuity, or
  - The next altitude target was an altitude constraint, and the flight crew has engaged HDG / TRACK mode.

  OP CLB engages.
  Refer to OP CLB / Scenario Examples / NAV disengages .
- The flight crew sets the AFS CP selected altitude below the aircraft altitude
  V/S / FPA engages on the current vertical speed or current flight path angle.
- The vertical flight plan becomes invalid
  OP CLB engages.
- L3 - The FMS flight phase changes to the descent or approach phase.
  OP CLB engages.

L1 The reversion is announced by a triple click aural warning.
If CLB reverts to V/S / FPA , the FD pitch bar will flash for 10 s .

Intentionally left blank

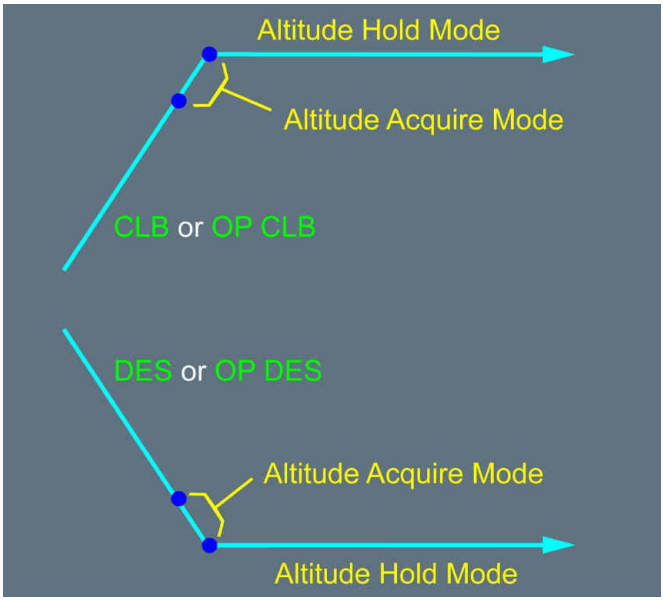
General

GENERAL

Applicable to: ALL

When climbing (descending) toward an altitude target, CLB or OP CLB (DES or OP DES) is engaged. When approaching the altitude target, an altitude acquire mode engages. When reaching the altitude target, an altitude hold mode engages.

ALT acquire mode, and ALT hold mode



The altitude target is one of the following: An altitude constraint (associated to a waypoint), the cruise altitude, the AFS CP selected altitude.
The altitude acquire mode is one of the following: ALT *, ALT CST *, ALT CRZ *.
The altitude hold mode is one of the following: ALT , ALT CST , ALT CRZ .

For scenario examples on altitude acquire and altitude hold:
- *Refer to DSC-22-FG-70-120-60 CLB and ALT - Example 1*
- *Refer to DSC-22-FG-70-120-60 CLB and ALT - Example 2*
- *Refer to DSC-22-FG-70-120-60 CLB and ALT CST*
- *Refer to DSC-22-FG-70-120-60 CLB and ALT CRZ*

- *Refer to DSC-22-FG-70-120-60 OP CLB and ALT*
- *Refer to DSC-22-FG-70-120-60 OP CLB and ALT CRZ* .

WHEN THE VERTICAL GUIDANCE IS MANAGED

When the vertical guidance is managed, CLB or DES guides the aircraft toward the next altitude target.

The next altitude target is the first altitude among the following that the aircraft will reach:
- The AFS CP selected altitude
- The altitude constraint (associated to a waypoint)
- The cruise altitude.

The altitude acquire mode, and the altitude hold mode are as follows:

Conditions	Altitude Acquire Mode	Altitude Hold Mode	Scenario Example
The next altitude target is the AFS CP selected altitude. In addition, the AFS CP selected altitude is not set the cruise altitude. However, the AFS CP selected altitude can be equal to an altitude constraint.	ALT*	ALT	*Refer to Scenario Examples / CLB and ALT - Example 1* , and *Refer to Scenario Examples / CLB and ALT - Example 2* .
The next altitude target is an altitude constraint, and the AFS CP selected altitude is above (below) the altitude constraint in climb (descent).	ALT CST*	ALT CST	*Refer to Scenario Examples / CLB and ALT CST* .
The next altitude target is the cruise altitude. In this case, the AFS CP selected altitude is equal to the cruise altitude. Note: 1. *The cruise altitude is defined on the CRZ panel of the FMS PERF page. For more information on the cruise altitude, Refer to FMS / Cruise Fligth Level* . 2. *If the AFS CP selected altitude is set above the cruise altitude, the cruise altitude is automatically updated to the AFS CP selected altitude.*	ALT CRZ*	ALT CRZ	*Refer to Scenario Examples / CLB and ALT CRZ* .

WHEN THE VERTICAL GUIDANCE IS SELECTED

When the vertical guidance is selected, OP CLB or OP DES guides the aircraft toward the AFS CP selected altitude.

All the altitude constraints are disregarded.

The altitude acquire mode, and the altitude hold mode are as follows:

Conditions	Altitude Acquire Mode	Altitude Hold Mode	Scenario Example
The AFS CP selected altitude is below the cruise altitude.	ALT*	ALT	*Refer to Scenario Examples / OP CLB and ALT .*
The AFS CP selected altitude is equal to the cruise altitude. *Note:* 1. *The cruise altitude is defined on the CRZ panel of the FMS PERF page. For more information on the cruise altitude, Refer to FMS / Cruise Fligth Level .* 2. *If the AFS CP selected altitude is set above the cruise altitude, the cruise altitude is automatically updated to the AFS CP selected altitude.*	ALT CRZ*	ALT CRZ	*Refer to Scenario Examples / OP CLB and ALT CRZ .*

Intentionally left blank

Altitude Acquire Modes

GENERAL

Applicable to: ALL

The altitude acquire mode is one of the following: ALT*, ALT CST*, ALT CRZ*.
ALT* mode guides the aircraft to acquire the AFS CP selected altitude.
ALT CST* guides the aircraft to acquire an altitude constraint.
ALT CRZ* guides the aircraft to acquire the cruise altitude, as selected on the MFP PERF page, and on the AFS CP.
When the aircraft reaches the altitude target, the altitude hold mode (ALT, ALT CST, or ALT CRZ) engages.

ARMING AND DISARMING CONDITIONS

Applicable to: ALL

An altitude acquire mode arms or disarms, when the corresponding altitude hold mode arms or disarms: *Refer to Altitude Hold Modes / Arming Conditions* , and *Refer to Altitude Hold Modes / Disarming Conditions* .

ENGAGEMENT CONDITIONS

Applicable to: ALL

The altitude acquire mode engages, when one of the following occurs:
- The altitude hold mode is armed, and the aircraft reaches the capture zone of the altitude target

L3 - The flight crew engages the AP, when all of the following conditions are met:
  - The AP was not previously engaged
  - The altitude hold mode is engaged
  - The aircraft is within 250 ft of the altitude target.

DISENGAGEMENT CONDITIONS

Applicable to: ALL

The altitude acquire mode disengages, when one of the following occurs:
- The aircraft reaches the altitude target
  The altitude hold mode engages.
- The aircraft reaches the glideslope capture zone, when:
  - LOC or LOC* is engaged, and
  - G/S is armed.

  G/S engages.

- The aircraft reaches the F-glideslope capture zone, when:
  - F-LOC, F-LOC*, LOC or LOC* is engaged, and
  - F-G/S is armed.

  F-G/S engages.
- The flight crew pulls the V/S / FPA knob
  V/S / FPA engages.
- The flight crew engages go-around.
  SRS GA engages.

ADDITIONAL SCENARIO: ALT* DISENGAGEMENT (REVERSION)

ALT* disengages, if the flight crew sets the AFS CP selected altitude out of the capture zone. V/S / FPA engages. A triple click aural warning sounds. The FD pitch bar flashes for 10 s.

ADDITIONAL SCENARIOS: ALT CST* DISENGAGEMENT

ALT CST* disengages, when one of the following occurs:
- The flight crew pulls the ALT knob
  OP CLB or OP DES engages.
- The flight crew presses the ALT pb.
  ALT CST engages.

REVERSIONS

ALT CST* reverts to V/S / FPA, when one of the following occurs:
- NAV disengages
  A triple click aural warning sounds. The FD pitch bar flashes for 10 s.

L3
- The vertical flight plan is lost.
  A triple click aural warning sounds. The FD pitch bar flashes for 10 s.

L1 **ADDITIONAL SCENARIOS: ALT CRZ* DISENGAGEMENT**

ALT CRZ* disengages, when one of the following occurs:
- The flight crew pulls the ALT knob
  OP CLB or OP DES engages.
- The flight crew presses the ALT pb.
  ALT engages.

REVERSION

ALT CRZ* reverts to V/S / FPA if NAV disengages. A triple click aural warning sounds. The FD pitch bar flashes for 10 s.

GUIDANCE

Applicable to: ALL

L2 The altitude acquire mode has a V/S control law that is a function of the difference between aircraft altitude and the altitude target.

Intentionally left blank

Altitude Hold Modes

GENERAL

Applicable to: ALL

The altitude hold mode is one of the following: ALT, ALT CST, ALT CRZ.
The altitude hold mode maintains a target altitude. This target altitude is either the AFS CP selected altitude, or an altitude constraint.

ARMING CONDITIONS

Applicable to: ALL

The altitude hold mode arms, when the aircraft climbs or descends toward an altitude target.
However, the altitude hold mode do not arm, when one of the following mode is engaged: G/S*, G/S, F-G/S*, F-G/S, LAND, FLARE, ROLL OUT.

ALT ARMING

ALT arms, when one of the following occurs:
- OP CLB engages, and the AFS CP selected altitude is not set to the cruise altitude
- OP DES engages
- CLB engages, when the next altitude target is:
  - Equal to the AFS CP selected altitude
  - Not equal to the cruise altitude.
- The next altitude target is the AFS CP selected altitude, and DES engages
- The next altitude target is the AFS CP selected altitude, and V/S / FPA engages
- The aircraft is on ground, or SRS TO or SRS GA engages, and:
  - The next altitude target is the AFS CP selected altitude
  - The AFS CP selected altitude is below the acceleration altitude.

ALT CST ARMING

ALT CST arms, when CLB (DES) engages, and:
- The next target altitude is an altitude constraint
- The AFS CP selected altitude is above (below) the altitude constraint.

ALT CRZ ARMING

ALT CRZ arms, when one of the following occurs:
- The AFS CP selected altitude is equal to the cruise altitude, and the cruise altitude becomes the cruise altitude

L3 This scenario is possible, if ALT is not engaged.

L1 - ALT is armed, and the AFS CP selected altitude is set to the cruise altitude.

FMA MESSAGE

The following table presents the FMA message, when an altitude hold mode is armed:

Conditions on Altitude (1)	The armed altitude hold mode is:	The FMA displays the following message on the second line of the second column:
The next altitude target is the AFS CP selected altitude. In addition, the AFS CP selected altitude is not set to the cruise altitude. However, the AFS CP selected altitude can be equal to an altitude constraint.	ALT	ALT
All of the following conditions are met: - The next altitude target is an altitude constraint - CLB (DES) is engaged, and the AFS CP selected altitude is above (below) the altitude constraint.	ALT CST	ALT
The next altitude target is the cruise altitude. In this case, the AFS CP selected altitude is equal to the cruise altitude. *Note: The cruise altitude is defined on the CRZ panel of the FMS PERF page.*	ALT CRZ	ALT CRZ

(1) The overall conditions of altitude hold mode arming are presented above.

DISARMING CONDITIONS

Applicable to: ALL

The altitude hold mode disarms, when G/S* or F-G/S* engages.

L2 The altitude hold mode disarms in the other following cases.

ALT DISARMING

ALT disarms, when one of the following occurs:

- ALT CST arms
  This occurs when: OP CLB (OP DES) is engaged, with the AFS CP selected altitude set above (below) the altitude constraint, and CLB (DES) engages.

L3 - SRS GA engages, and the AFS CP selected altitude is above the acceleration altitude.

L2 ALT CST DISARMING

ALT CST disarms, when one of the following occurs:

- CLB or DES is engaged, and the AFS CP selected altitude becomes the next altitude target
- CLB is engaged, and OP CLB or V/S / FPA engages

- DES is engaged, and OP DES or V/S / FPA engages

L3 - DES is engaged, and SRS GA engages.

L2 **ALT CRZ DISARMING**

ALT CRZ disarms, when the AFS CP selected altitude is set below the cruise altitude: ALT arms.

ENGAGEMENT CONDITIONS

Applicable to: ALL

The altitude hold mode engages, when the altitude acquire mode is engaged, and the aircraft reaches the altitude target.

L2 The difference between the aircraft altitude and the altitude target is less than 40 ft for more than one second.

L1 **ADDITIONAL SCENARIOS: ALT ENGAGEMENT**

ALT engages, when one of the following occurs:

- The flight presses the ALT pb, and all of the following conditions are met:

L3 This scenario is not possible, if one of the following modes is engaged: ALT CST*, ALT CST, LAND, SRS GA below 100 ft RA.

L1 - ALT CST is engaged, and the flight crew sets the AFS CP selected altitude to the altitude constraint

L2 - ALT CST is engaged, and NAV disengages

L3 - ALT CST engaged, and the vertical flight plan is lost.

L2 **ADDITIONAL SCENARIOS: ALT CST ENGAGEMENT**

ALT CST engages, when one of the following occurs:
- ALT CST* is engaged, and the flight crew presses the ALT pb.
- The flight crew pushes the ALT knob, and all of the following conditions are met:
  - ALT is engaged
  - The aircraft altitude is equal to the altitude constraint
  - The AFS CP selected altitude is set above the aircraft altitude
  - L3 The AFS CP selected altitude is at least 250 ft above the aircraft altitude.
  - L2 NAV is engaged
  - The FMS flight phase is neither descent, nor approach
  - L3 The vertical flight plan is valid.
- L2 The flight crew pushes the ALT knob, and all of the following conditions are met:
  - ALT is engaged
  - The aircraft altitude is equal to the altitude constraint
  - The AFS CP selected altitude is set below the aircraft altitude
  - L3 The AFS CP selected altitude is at least 250 ft below the aircraft altitude.
  - L2 One of the following modes is engaged: NAV, LOC*, LOC, LOC B/C*, LOC B/C
  - The FMS flight phase is not one of the following: Takeoff, climb, go-around.

L3 **ADDITIONAL SCENARIOS: ALT CRZ ENGAGEMENT**

ALT CRZ engages, when:
- ALT is engaged, and
- The aircraft altitude is equal to the AFS CP selected altitude, and
- The flight crew sets the cruise altitude to the aircraft altitude.

DISENGAGEMENT CONDITIONS

Applicable to: ALL

COMMON SCENARIOS

The altitude hold mode disengages, when any other vertical modes engages.

The altitude hold mode disengages, when one of the following occurs:
- The flight crew pulls the ALT knob
  OP CLB or OP DES engages.
- The flight crew pulls the V/S / FPA knob
  V/S / FPA engages.

L3 - The flight crew engages the AP, when all of the following conditions are met:
- The AP was not previously engaged
- The aircraft is within 250 ft of the altitude target.

The altitude acquire mode engages.

L1 - The aircraft reaches the glideslope capture zone, when:
- LOC* or LOC is engaged, and
- G/S is armed.

G/S* engages.

- The aircraft reaches the F-glideslope capture zone, when:
  - LOC*, LOC, F-LOC*, F-LOC is engaged, and
  - F-G/S is armed.

  F-G/S* engages.
- The flight crew engages go-around.
  SRS GA engages.

ADDITIONAL SCENARIOS: ALT DISENGAGEMENT

ALT disengages, when one of the following occurs:
- The flight crew pushes the ALT knob, when all of the following conditions are met:
  - The AFS CP selected altitude is above the aircraft altitude
  - NAV is engaged

L3 - The vertical flight plan is valid

L1 - The FMS flight phase is neither descent, nor approach.

  CLB engages.
- The flight crew pushes the ALT knob, when all of the following conditions are met:
  - The AFS CP selected altitude is below the aircraft altitude
  - One of the following modes is engaged: NAV, LOC*, LOC, LOC B/C*, LOC B/C

L3 - The vertical flight plan is valid

L1 - The FMS flight phase is not one of the following: Takeoff, climb, go-around.

  DES engages.

L2 - The flight crew pushes the ALT knob, and all of the following conditions are met:
- The aircraft altitude is equal to the altitude constraint
- The AFS CP selected altitude is set above the aircraft altitude

L3 The AFS CP selected altitude is at least 250 ft above the aircraft altitude.

L2 - NAV is engaged
- The FMS flight phase is neither descent, nor approach

L3 - The vertical flight plan is valid.

L2 ALT CST engages.

- The flight crew pushes the ALT knob, and all of the following conditions are met:
  - The aircraft altitude is equal to the altitude constraint
  - The AFS CP selected altitude is set below the aircraft altitude
  - L3 The AFS CP selected altitude is at least 250 ft below the aircraft altitude.
  - L2 One of the following modes is engaged: NAV, LOC*, LOC, LOC B/C*, LOC B/C
  - The FMS flight phase is not one of the following: Takeoff, climb, go-around.

  ALT CST engages.
- L3 The aircraft altitude is equal to the AFS CP selected altitude, and the flight crew sets the cruise altitude to the aircraft altitude
  ALT CRZ engages.
- The flight crew engages the AP, when:
  - The AP was not previously engaged
  - The aircraft altitude is within 250 ft of the AFS CP selected altitude.

  ALT* engages.

ADDITIONAL SCENARIOS: ALT CST DISENGAGEMENT

ALT CST disengages, when one of the following occurs:
- The aircraft sequences the waypoint, for which the altitude constraint is associated
- NAV disengages

  ALT engages.
- L3 The vertical flight plan is lost
- L1 The flight crew set the AFS CP selected altitude to the altitude constraint

  ALT engages.
- L3 The flight crew engages the AP, when:
  - The AP was not previously engaged, and
  - The aircraft altitude is within 250 ft of the altitude constraint.

  ALT CST* engages.
- L1 The flight crew deletes the altitude constraint.

  CLB or DES engages.

ADDITIONAL SCENARIOS: ALT CRZ DISENGAGEMENT

ALT CRZ disengages, when one of the following occurs:

- The AFS CP selected altitude is below the aircraft altitude, and the flight crew pushes the ALT knob
  DES engages.

L3 - The flight crew engages the AP, when:
  - The AP was not previously engaged, and
  - The aircraft altitude is within 250 ft of the cruise altitude.

  ALT CRZ* engages.

Intentionally left blank

General

GENERAL

Applicable to: ALL

During descent, OP DES or DES guides the aircraft vertically to an altitude target, or to a glideslope or F -glideslope capture zone.
V/S / FPA can also descent the aircraft: *Refer to V/S / FPA* .

Intentionally left blank

OP DES

GENERAL

Applicable to: ALL

Open Descent (OP DES) is a vertical selected mode.
When OP DES is engaged, the AP/FD adjusts the pitch in order to maintain a speed/Mach target (selected or managed). The A/THR then maintains idle thrust.
All the altitude constraints are disregarded.

ENGAGEMENT CONDITIONS

Applicable to: ALL

OP DES engages, if the AFS CP selected altitude is below the aircraft altitude, and the flight crew pulls the ALT knob.

L3 OP DES cannot engage, if:
- SRS GA is engaged below 100 ft RA, or
- LAND is engaged.

DISENGAGEMENT CONDITIONS

Applicable to: ALL

OP DES disengages, if one of the following conditions is met:
- The aircraft reaches the capture zone of the AFS CP selected altitude
  ALT* engages.
- ALT CRZ is armed, and the aircraft reaches the capture zone of the cruise altitude.
  ALT CRZ* engages.
- The flight crew presses the ALT knob
  ALT engages.
- The flight crew pushes the ALT knob, when all of the following conditions are met:
  - One of the following modes is engaged: NAV, LOC*, LOC, LOC BC*, LOC BC
  - L3 The FMS flight phase is cruise or descent
  - The vertical flight plan is valid.

L1 DES engages.
- The flight crew pulls the V/S / FPA knob
  V/S / FPA engages.
- The aircraft reaches the glideslope capture zone, when:
  - LOC* or LOC is engaged, and
  - G/S is armed.

  G/S* engages.

- The aircraft reaches the glideslope capture zone, when:
  - One of the following modes is engaged: LOC*, LOC, F-LOC*, F-LOC, and
  - G/S is armed.

  F-G/S* engages.
- The flight crew engages go-around.
  SRS GA engages.

REVERSION

OP DES reverts to V/S / FPA, if the flight crew sets the AFS CP selected altitude above the aircraft altitude. A triple click aural warning sounds. The FD pitch bar flashes for 10 seconds.

DES

GENERAL

Applicable to: ALL

DES is a managed vertical mode.
DES guides the aircraft vertically along the vertical flight plan. All the altitude constraints, associated to waypoints, are taken into account.
When DES is engaged in idle path, the AP/FD adjusts the pitch in order to maintain a speed/Mach target (selected or managed). The A/THR then maintains idle thrust.
When DES is engaged in geometric path, the AP/FD controls the vertical trajectory. The A/THR is then in SPEED/MACH.

ARMING CONDITIONS

Applicable to: ALL

DES arms, when one of the following occurs:
- DES is previously engaged, and ALT CST* engages
- The flight crew pushes the ALT knob, when all of the following conditions are met:
  - ALT is engaged
  - The aircraft is on an altitude constraint
  - The AFS CP selected altitude is below the aircraft altitude
  - One of the following mode is engaged: NAV, LOC*, LOC, LOC BC*, LOC BC

L3 • The FMS flight phase is cruise, descent, or approach.

L1 ALT CST engages.

DISARMING CONDITIONS

Applicable to: ALL

DES disarms, when one of the following occurs:

L2 - ALT CSTR* is engaged, and one of the following modes engages: OP DES, V/S / FPA, ALT*, ALT, G/S*, SRS GA
- ALT CSTR is engaged, and one of the following modes engages: OP DES, V/S / FPA, ALT, G/S*, SRS GA
- ALT CST* or ALT CST is engaged, and the AFS CP selected altitude is set:
  - To the altitude constraint

L3 • Or above the aircraft altitude.

L1 - NAV, LOC*, or LOC disengages, whereas the mode was previously engaged

L3 - The vertical flight plan is lost.

ENGAGEMENT CONDITIONS

Applicable to: ALL

DES engages, when one of the following occurs:

- ALT CSTR is engaged with DES armed, and the aircraft sequences ALT CSTR waypoint
- The flight crew pushes the ALT knob when ALT CRZ is engaged, and the AFS CP selected altitude is below the aircraft altitude
- The flight crew pushes the ALT knob, and all of the following conditions are met:
  - The AFS CP selected altitude is below the aircraft altitude
  - One of the following modes is engaged: NAV, LOC*, LOC, LOC BC*, LOC BC, F-LOC*, F-LOC
  - DES is not armed
  - The FMS flight phase is cruise, descent, or approach
  - The vertical flight plan is valid.

  However, DES will not engage, if one of the following modes is engaged: G/S*, G/S, F-G/S*, F-G/S, LAND.

DISENGAGEMENT CONDITIONS

Applicable to: ALL

DES disengages, when one of the following occurs:

- The aircraft reaches the capture zone of the AFS CP selected altitude
  ALT* engages.
- The aircraft reaches the capture zone of the altitude constraint
  ALT CST* engages.
- The flight crew presses the ALT knob
  ALT engages.
- The flight crew pulls the ALT knob
  OP DES engages.
- The flight crew pulls the V/S / FPA knob
  V/S / FPA engages.
- The aircraft reaches the glideslope capture zone when:
  - LOC* or LOC is engaged, and
  - G/S is armed.

  G/S* engages.
- The aircraft reaches the F-glideslope capture zone when:
  - One of the following modes is engaged: LOC*, LOC, F-LOC*, F-LOC, and
  - F-G/S is armed.

  F-G/S* engages.
- The flight crew engages go-around.
  SRS GA engages.

REVERSIONS

DES reverts to V/S / FPA, when one of the following occurs:

- The flight crew sets the AFS CP selected altitude above the aircraft altitude
- One of the following modes was engaged, and disengages: NAV, LOC*, LOC, LOC BC*

L3 - The vertical flight plan is lost.

L1 A triple click aural warning sounds. The FD pitch bar flashes for 10 seconds.

Intentionally left blank

GENERAL

Applicable to: ALL

V/S and FPA are selected vertical modes. They are the basic modes of vertical guidance.
V/S / FPA acquires and holds the vertical speed or the flight path angle, that is displayed in the V/S / FPA window of the AFS CP . For more information, *Refer to DSC-22-FG-80-20-D V/S / FPA Window* .

When V/S / FPA engages following a reversion, the V/S / FPA target is the V/S / FPA that has the aircraft when V/S / FPA engages.

ENGAGEMENT CONDITIONS

Applicable to: ALL

V/S / FPA engages, when one of the following occurs:

- The flight crew pulls the V/S / FPA knob

L3 V/S / FPA will not engage, if LAND is engaged, or SRS GA is engaged below 100 ft RA .

L1 - The AP s and FD s are disengaged, and the flight crew engages the FD s or the AP HDG / TRACK also engages. The FD pitch and roll bars flash for 10 seconds.

L3 - No vertical mode is engaged, and the flight crew engages the FD s
This scenario is possible, if the aircraft is airborne for 5 seconds.

L1 - A reversion to V/S / FPA occurs.

V/S or FPA engages, in accordance with the HDG-V/S / TRK-FPA selection. For more information on HDG-V/S / TRK-FPA selection: *Refer to Lateral Guidance from Takeoff to Descent / HDG-V/S / TRK-FPA Selection* .

REVERSIONS TO V/S / FPA

A vertical mode reverts to V/S / FPA, when one of the following occurs:

- The flight crew sets the AFS CP selected altitude out of the capture zone.

L2 - OP DES, or DES is engaged, and the AFS CP selected altitude is set above the aircraft altitude

- OP CLB, or CLB is engaged, and the AFS CP selected altitude is set below the aircraft altitude

L1 - NAV disengages, when one of the following modes is engaged: DES, ALT CST*, ALT CRZ*

L3 - The vertical flight plan is lost, when one of the following modes is engaged: DES, ALT CST*, ALT CRZ*

- The flight crew changes the approach when:
  - G/S* or G/S is engaged, and
  - The aircraft is below 700 ft RA.
- The flight crew changes the approach when F-G/S* or F-G/S is engaged.

L1 - G/S* or G/S is engaged, and LOC* or LOC disengages

- F-GS* or F-G/S is engaged, and the lateral approach mode disengages
- The flight crew presses the LOC pb, when G/S* or G/S is engaged.

DISENGAGEMENT CONDITIONS

Applicable to: ALL

V/S / FPA disengages, when one of the following occurs:

- The aircraft reaches the capture zone of the AFS CP selected altitude
  ALT* engages.
- ALT CRZ is armed, and the aircraft reaches the capture zone of the cruise altitude
  ALT CRZ* engages.
- The flight crew pulls the ALT knob
  OP CLB or OP DES engages.
- The flight crew pushes the ALT knob
  - NAV is engaged
  - The AFS CP selected altitude is above the aircraft altitude
  - L3 The FMS flight phase is neither descent, nor approach
  - The vertical flight plan is valid.

  L1 CLB engages.
- The flight crew pushes the ALT knob
  - One of the following modes is engaged: NAV, LOC*, LOC, LOC BC*, LOC BC
  - The AFS CP selected altitude is below the aircraft altitude
  - L3 The FMS flight phase is cruise, or descent
  - The vertical flight plan is valid.

  L1 DES engages.
- The flight crew presses the ALT pb
  ALT engages.
- The aircraft reaches the glideslope capture zone when:
  - LOC* or LOC is engaged
  - G/S is armed.

  G/S* engages.
- The aircraft reaches the F-glideslope capture zone when:
  - LOC*, LOC, F-LOC*, F-LOC is engaged
  - F-G/S is armed.

  F-G/S* engages.
- The flight crew engages go-around.
  SRS GA engages.

General

GENERAL

Applicable to: ALL

The aircraft flies the following types of approach:

- Precision approach: ILS approach, and GLS approach
- Non-Precision Approaches (NPA s):
  - VOR , VOR / DME , NDB , NDB / DME and RNAV approaches
  - ILS with glideslope out, LOC only, and LOC B/C approaches.

For scenario examples on approaches:

- *Refer to DSC-22-FG-70-120-90 ILS Approach and Autoland*
- *Refer to DSC-22-FG-70-120-90 VOR Approach Flown with FLS Function*
- *Refer to DSC-22-FG-70-120-90 LOC only Approach Flown with FLS Function*

Intentionally left blank

ILS Approach

ILS APPROACH

Applicable to: ALL

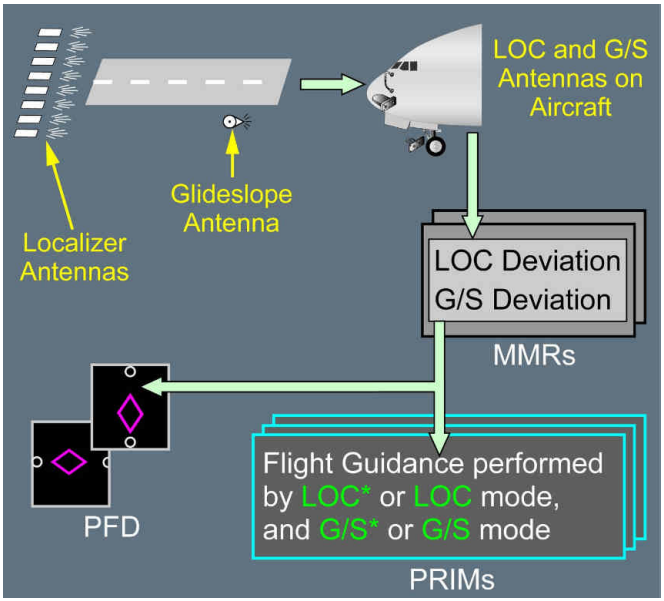
An ILS approach uses the Localizer (LOC) and Glideslope (G/S) signals emitted from localizer antennas and a glideslope antenna on ground. Each MMR computes LOC and G/S deviations. The Flight Guidance uses the LOC and G/S deviations in order to fly the aircraft along the LOC and G/S beams.

The ILS approach modes are:

	Lateral Guidance	Vertical Guidance
Above 400 ft RA	LOC* : Capture of the LOC beam LOC : Track of the LOC beam.	G/S* : Capture of the G/S beam G/S : Track of the G/S beam.
Below 400 ft RA , and until end of roll out	LAND : Track of LOC and G/S beams FLARE : Alignment of the yaw axis on the runway centerline, and flare on the pitch axis ROLL OUT : Track of the runway centerline, and nose down.	

Each ILS receiver is hosted in one MMR .

ILS Architecture



In accordance with the approach capability, and the Decision Height (DH), the flight crew can, or must perform an autoland. For more information, *Refer to Limitations / Required Equipement for CAT2, or CAT3 Approach Capability* .
To fly an ILS approach, the flight crew selects an ILS approach on the FMS ARRIVAL page.

ILS SELECTION

Applicable to: ALL

STANDARD SELECTION

To fly an ILS approach, the flight crew selects an ILS approach on the FMS ARRIVAL page.

NON-STANDARD SELECTION

MANUAL TUNING ON THE FMS

If the flight crew manually-tunes an ILS on the FMS POSITION / NAVAIDS page, the aircraft will fly the manually-tuned ILS .

L2 In addition, if the flight crew has selected another ILS approach on the FMS ARRIVAL page:
- The ILS approach selected on the FMS ARRIVAL page will be disregarded, and the MFD will display the RUNWAY / LS DISAGREE message
- The aircraft will fly the manually-tuned ILS .

L1 #### MANUAL TUNING ON THE RMP

If all the FMC s are fault, the flight crew selects STBY RAD NAV on one RMP , and manually-tunes an ILS (frequency and course).

ILS SELECTION IN THE ILS RECEIVERS

L2 When an approach is selected on the FMS ARRIVAL page, or manually-tuned on FMS or RMP , the ILS frequency and course are sent to both ILS receivers. For more information on ILS receivers, *Refer to Navigation / MMR / Architecture* .

ILS APPROACH SEQUENCE

Applicable to: ALL

The sequence to fly an ILS approach is:
1. The flight crew selects an ILS approach on the FMS ARRIVAL page.
2. The FMS approach phase activates:
   - Manually, when the flight crew clicks on the ACTIVATE APPR on the FMS PERF page, or
   - Automatically, when NAV is engaged, and the aircraft flies the DECEL pseudo waypoint.

   For more information on the activation of the FMS approach phase, *Refer to DSC-22-FMS-10-50-20 Flight Phases - Overview* .

Then, the managed speed target becomes Green Dot, S, F, and VAPP corrected from the Ground Speed Mini function, in accordance with the slats/flaps configuration. For more information, *Refer to Speed/Mach Control / Managed Speed/Mach Target* .

3. The flight crew presses the APPR pb on the AFS CP :
   - LOC and G/S arm
   - The flight crew can engage the second AP .
4. The aircraft reaches the capture zone of the LOC beam: LOC* engage.
5. The aircraft becomes established on the LOC beam: LOC engage.
6. The aircraft reaches the capture zone of the G/S beam: G/S* engages.

L2 *Note: G/S* can also engage before LOC engagement, when LOC* is engaged.*

L1 7. The aircraft becomes established on the G/S beam: G/S engages.

L2 *Note: G/S can only engage, when LOC is engaged.*

L1 8. At 400 ft RA , LAND engages.

9. At Decision Height (DH), the flight crew can disengage all AP engaged to land manually.
10. At approximately 60 ft RA , FLARE engages.
11. At touch down, ROLL OUT engages.
12. At the end of the roll out, if an autoland was performed, the flight crew disengages all AP engaged.

Note: Instead of pressing the APPR pb (at step 3), the flight crew can press the LOC pb to intercept the LOC beam: LOC arms, LOC engages, and LOC engages.*
When ready to intercept the G/S beam, the flight crew presses the APPR pb : G/S arms, G/S engages, and G/S engages.*

Intentionally left blank

GLS Approach

GLS APPROACH

Applicable to: ALL

The Global Navigation Satellite System (GNSS) Landing System (GLS) is a system that enables the flight crew to fly a precision approach in an ILS look alike way.

The GLS ground station sends to the aircraft:
- Position corrections
- Satellite integrity information
- Data for approach path definition.

On the aircraft, the LOC antenna receives these data, and sends them to both Multi-Mode Receivers (MMRs).

Each MMR computes the GLS lateral deviation and the GLS vertical deviation, from the following data:
- The GPS position from the GPS receiver
- The data received from the GLS ground station.

The GLS lateral deviation is referred to as the LOC deviation. The GLS vertical deviation is referred to as the G/S deviation.
To fly a GLS approach, the flight crew selects a GLS approach on the FMS ARRIVAL page.
The approach modes are:

Lateral	Vertical
LOC*, LOC	G/S*, G/S
LAND, FLARE, ROLL OUT	

Intentionally left blank

NPA Flown with FLS Function

VOR, VOR/DME, NDB, NDB/DME OR RNAV APPROACH FLOWN WITH FLS FUNCTION

Applicable to: ALL

The FLS function provides the flight crew with an interface to fly a VOR , VOR / DME , NDB , NDB / DME or RNAV approach in an ILS look alike way. The Flight Guidance uses:

- Pseudo LOC deviation, referred to as F-LOC deviation
- Pseudo G/S deviation, referred to as F-G/S deviation.

Each MMR computes the F-LOC and F-G/S deviations by comparing the FMS position, associated to the barometric altitude, with:

- The pseudo LOC beam, referred to as the F-LOC beam, and
- The pseudo G/S beam, referred to as the F-G/S beam.

The set of F-LOC beam, and F-G/S beam is also referred to as the FLS beam.
The FLS beam is defined in the FMS , based on NPA data, stored in the navigation database.

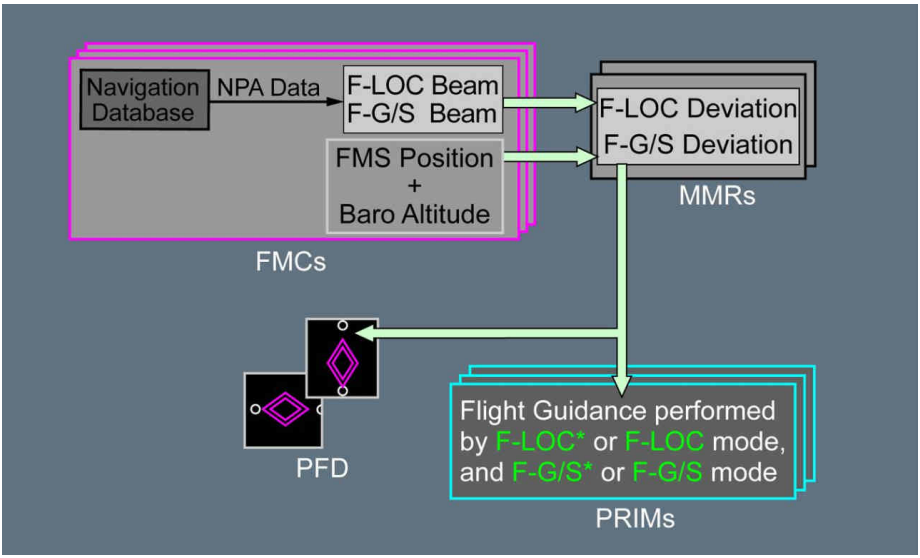
Note: Depending on the NPA , the F-LOC beam may not be aligned with the runway centerline.

For more information on the definition of the FLS beam, *Refer to FMS* / FLS Beam Computation.
The approach modes are:

Lateral Guidance	Vertical Guidance
F-LOC* : Capture of F-LOC beam F-LOC : Track of F-LOC beam.	F-G/S* : Capture of F-G/S beam F-G/S : Track of F-G/S beam.

L2 These approach modes use the same guidance laws as LOC* , LOC , G/S* , and G/S modes.

FLS Function Architecture



L1 To fly a NPA with the FLS function, the flight crew selects one of the following approaches on the FMS ARRIVAL page:

NPA	Approach Selection on the FMS ARRIVAL Page
VOR , VOR / DME	VOR
NDB , NDB / DME	NDB
RNAV	RNV, or GPS

For the approach sequence, *Refer to DSC-22-FG-70-80-30 Sequence of an NPA Flown with FLS Function* .

ILS WITH G/S OUT, LOC ONLY, OR LOC B/C APPROACH FLOWN WITH FLS FUNCTION

Applicable to: ALL

The aircraft can fly an ILS with glideslope out, a LOC only, or a LOC B/C approach with the FLS function.

The following table indicates:
- The approach selection on the FMS ARRIVAL page
- The approach modes used by the Flight Guidance.

NPA	Approach Selection on the FMS ARRIVAL Page	Approach Modes	
		Lateral Guidance	Vertical Guidance
ILS with glideslope out	ILS In addition, the flight crew deselects the G/S on the FMS POSITION / NAVAIDS page.	LOC*: Capture of the LOC beam LOC: Track of the LOC beam.	F-G/S*: Capture of the F-G/S beam F-G/S: Track of the F-G/S beam.
LOC only	LOC		
LOC B/C	BAC	LOC B/C*: Capture of the LOC beam LOC B/C: Track of the LOC beam.	

FLS FUNCTION AVAILABILITY

Applicable to: ALL

The FLS function becomes available, if the flight crew selects:

- A VOR, NDB, RNV, GPS, LOC or BAC approach on the FMS ARRIVAL page

L3 The FLS function is not available for SDF, and LDA approaches.

L1 - An ILS approach on the FMS ARRIVAL page, and deselects the G/S by clicking on the DESELECT GLIDE button on the FMS POSITION / NAVAIDS page

However, the FLS function is not available, if the NPA is as follows:

- The Missed Approach Point is before the runway threshold, and
- The difference between the final approach course and the runway course is more than 50°.

When the flight crew selects an NPA, and if the FLS function is not available for this NPA, the NO FLS FOR THIS APPR message appears on the FMS message area.

SEQUENCE OF AN NPA FLOWN WITH FLS FUNCTION

Applicable to: ALL

The sequence to fly a NPA with the FLS function, is:

1. The flight crew selects a NPA on the FMS ARRIVAL page.
2. The flight crew presses the LS pb on the EFIS CP : The LS deviations appear on the PFD , and the FLS capability appears on the FMA .
3. The FMS approach phase activates:
   - Manually, when the flight crew clicks on the ACTIVATE APPR on the FMS PERF page, or
   - Automatically, when NAV is engaged, and the aircraft flies the DECEL pseudo waypoint.

   For more information on the activation of the FMS approach phase, *Refer to DSC-22-FMS-10-50-20 Flight Phases - Overview* .

Then, the managed speed target becomes Green Dot, S, F, and VAPP corrected from the Ground Speed Mini function, in accordance with the slats/flaps configuration. For more information, *Refer to Speed/Mach Control / Managed Speed/Mach Target* .

4. The flight crew presses the APPR pb on the AFS CP : F-LOC , LOC , or LOC B/C arms, and F-G/S arms.
5. The aircraft reaches the capture zone of F-LOC , LOC or LOC B/C beam: F-LOC* , LOC* , or LOC B/C* engages.
6. The aircraft becomes established on the F-LOC , LOC or LOC B/C beam: F-LOC , LOC , or LOC B/C engages.
7. The aircraft reaches the capture zone of F-G/S beam: F-G/S* engages.

   Note: *F-G/S* can also engage, when F-LOC* , LOC* , or LOC B/C* is engaged.*

8. The aircraft becomes established on the F-G/S beam: F-G/S engages.
9. At the MDA (Minimum Descent Altitude):
   - If one AP is engaged, the flight crew disengages the AP
   - The flight crew disengages the FD s
   - The flight crew sets the LS pb off.

   Note: *At MDA - 50 ft , if one AP is still engaged, the DISCONNECT AP FOR LDG message appears on the FMA (on the second and third columns of the third line).*

10. The flight crew manually lands the aircraft.

Note: *Instead of pressing the APPR pb (at step 3), the flight crew can press the LOC pb to intercept the F-LOC , LOC or LOC B/C beam: F-LOC , LOC , or LOC B/C arms, F-LOC* , LOC* , or LOC B/C* engages, and F-LOC , LOC , or LOC B/C engages.*
When reading to intercept the F-G/S beam, the flight crew presses the APPR pb : F-G/S arms, F-G/S engages, and F-G/S engages.*

NPA Flown without FLS Function

VOR, VOR/DME, NDB, NDB/DME OR RNAV APPROACH FLOWN WITHOUT FLS FUNCTION

Applicable to: ALL

The flight crew can also fly a VOR, VOR/DME, NDB, or NDB/DME approach:
- In NAV, with selected vertical modes
- In selected vertical and lateral modes.

The flight crew can also fly an RNAV approach in NAV, with selected vertical modes.

The sequence is:
1. The flight crew selects a VOR, NDB, RNV, or GPS approach on the FMS ARRIVAL page.
2. The FMS approach phase activates:
   - Manually, when the flight crew clicks on the ACTIVATE APPR on the FMS PERF page, or
   - Automatically, when NAV is engaged, and the aircraft flies the DECEL pseudo waypoint. Then, the managed speed target becomes Green Dot, S, F, and VAPP corrected from the Ground Speed Mini function, in accordance with the slats/flaps configuration.

The flight crew does not press the APPR pb.

ILS WITH GLIDESLOPE OUT, LOC ONLY, OR LOC B/C APPROACH FLOWN WITHOUT FLS FUNCTION

Applicable to: ALL

The aircraft can fly an ILS with glideslope out, a LOC only, or a LOC B/C approach without the FLS function.

The following table indicates:
- The approach selection on the FMS ARRIVAL page
- The AP/FD modes used by the Flight Guidance.

NPA	Approach Selection on the FMS ARRIVAL Page	Approach Modes	
		Lateral Guidance	Vertical Guidance

Continued on the following page

Continued from the previous page

ILS with glideslope out	ILS In addition, the flight crew deselects the G/S on the FMS POSITION / NAVAIDS page.	LOC*: Capture of the LOC beam LOC: Track of the LOC beam.	ALT*, ALT FPA (or V/S)
LOC only	LOC		
LOC B/C	BAC	LOC B/C*: Capture of the LOC beam LOC B/C: Track of the LOC beam.	

The sequence to fly the approach without the FLS function is:

1. The flight crew selects the approach on the FMS ARRIVAL page.
2. The FMS approach phase activates:
   - Manually, when the flight crew clicks on the ACTIVATE APPR on the FMS PERF page, or
   - Automatically, when NAV is engaged, and the aircraft flies the DECEL pseudo waypoint.

   Then, the managed speed target becomes Green Dot, S, F, and VAPP corrected from the Ground Speed Mini function, in accordance with the slats/flaps configuration.
3. The flight crew presses the LOC pb on the AFS CP: LOC, or LOC B/C arms. The flight crew manages the vertical guidance by using selected vertical modes: ALT*, ALT, FPA (or V/S).
4. The aircraft reaches the capture zone of the LOC or LOC B/C beam: LOC*, or LOC B/C* engages.
5. The aircraft becomes established on the LOC or LOC B/C beam: LOC, or LOC B/C engages.
6. At the Minimum Descent Altitude (MDA), if one AP is engaged, the flight crew disengages the AP.

   Note: *At MDA - 50 ft, if one AP is still engaged, the DISCONNECT AP FOR LDG message appears on the FMA (on the second and third columns of the third line).*

7. The flight crew manually lands the aircraft.

LOC* Mode

GENERAL

Applicable to: ALL

The Localizer capture (LOC*) mode captures the localizer beam of the ILS(GLS).

ARMING AND DISARMING CONDITIONS

Applicable to: ALL

L2 LOC* and LOC modes arm (disarm) together and simultaneously. The arming is announced by LOC on the FMA .
For LOC arming conditions, *Refer to LOC Mode / Arming Conditions* .
For LOC disarming conditions, *Refer to LOC Mode / Disarming Conditions* .

ENGAGEMENT CONDITIONS

Applicable to: ALL

LOC* engages, when LOC is armed, and the aircraft reaches the capture zone, or the pre-capture zone of the LOC beam.
The capture zone is a zone available, when the LOC deviation is less than 2.3 dots.

The pre-capture zone is a zone available, when:
- The LOC deviation is more than 2.3 dots
- The FMS is in GPS PRIMARY.

When LOC is armed, and the aircraft reaches the pre-capture zone of the LOC beam, LOC* engages, and pre-captures the LOC beam, by using FMS data.
When the LOC deviation becomes less than 2.3 dots, LOC* no longer uses the FMS data: LOC* performs the LOC capture by using the LOC deviation.

Note: *On the PFD, and on the ND, the flight crew will observe movement of the LOC deviation toward the center of the scale, only when the LOC deviation is less than 2 dots. This occurs when the aircraft is in the capture zone.*

The pre-capture of the LOC beam allows to:
- Enhance the performance of the LOC capture
- Avoid a false capture
- Capture the LOC beam without overshoot.

L2 **CAPTURE ZONE OF THE LOC BEAM**

The aircraft reaches the capture zone of the LOC beam, when one of the following occurs:
- The LOC deviation is less than 2.3 dots, and:
  - The difference between the track and the QFU is less than 115 °, and
  - The roll order is such that LOC* will capture the LOC beam with a single turn.
- The LOC deviation is less than 1.3 dot, and the difference between the track and the QFU is less than 15 °.

PRE-CAPTURE OF THE LOC BEAM

The aircraft reaches the pre-capture zone of the LOC beam, when all of the following conditions are met:
- The LOC deviation is more than 2.3 dots
- The FMS is in GPS PRIMARY
- The difference between the track and the QFU is less than 115 °
- The roll order is such that LOC* will capture the LOC beam with a single turn.

DISENGAGEMENT CONDITIONS

Applicable to: ALL

LOC* disengages, when another lateral mode engages.

L2 LOC* disengages, when one of the following occurs:
- The aircraft becomes established on the LOC beam

L3 LOC* is engaged for more than 10 s , and the LOC deviation becomes less than 0.2 dot.

L2 LOC engages.
- The flight crew presses the LOC pb , and no vertical approach mode is engaged
  HDG / TRACK engages.

  Note: *If a vertical approach mode was previously engaged, LOC* remains engaged, and a vertical mode reversion occurs.*

- The flight crew pulls the HDG/TRK knob
  HDG / TRACK engages.

  Note: *If a vertical approach mode was previously engaged, lateral and vertical mode reversions occur: Refer to DSC-22-FG-70-90-10-GDISE Reversions .*

L3 - The aircraft is above 700 ft RA , and the flight crew inserts a DIRECT TO
  NAV engages.

L2 - The flight crew performs a go-around
  SRS GA and GA TRK engage.

L2 **REVERSIONS**

LOC* reverts to HDG/TRACK, when one of the following occurs:

- The flight crew presses the APPR pb, and one of the following conditions is met:
  - G/S is armed
  - G/S* is engaged
  - G/S is engaged
  - F-G/S is armed
  - F-G/S* is engaged
  - F-G/S is engaged.

  A triple click aural warning sounds. The vertical approach mode disengages, and V/S / FPA engages. The pitch and roll bars flash for 10 s.
- The flight crew pulls the HDG/TRK knob, and one of the following mode is engaged: G/S*, G/S, F-G/S*, or F-G/S.
  HDG/TRACK and V/S / FPA engage.
  A triple click aural warning sounds. The pitch and roll bars flash for 10 s.

L3 - The flight crew changes the approach on the FMS ARRIVAL page, and one of the following conditions is met:
  - G/S is armed
  - G/S* is engaged
  - G/S is engaged
  - F-G/S is armed
  - F-G/S* is engaged
  - F-G/S is engaged.

  HDG/TRACK and V/S / FPA engage.
  This scenario is applicable, if the aircraft is above 700 ft RA.
  A triple click aural warning sounds. The pitch and roll bars flash for 10 s.

Intentionally left blank

LOC Mode

GENERAL

Applicable to: ALL

The Localizer track mode tracks the localizer beam of the ILS(GLS).

ARMING CONDITIONS

Applicable to: ALL

L3 In order to be able to arm LOC , all of the following conditions must be previously met:
- At least one ILS (GLS) receiver is operative
- When both ILS (GLS) receivers are operative: The ILS frequency(GLS channel) and course must be equal in both ILS (GLS) receivers.

In addition, in order to arm LOC with the APPR pb , one RA must be operative.

L2 LOC can only arm when:
- HDG / TRACK or NAV is engaged

L3 - The aircraft is above 400 ft RA .

L1 LOC arms, when the flight crew presses the APPR pb , or the LOC pb , and one of the following conditions is met:
- The flight crew has selected an ILS(GLS) approach on the FMS ARRIVAL page

L2 *Note: For ILS approach, the flight crew may have deselected the G/S on the FMS POSITION NAVAIDS page (Refer to FMS / Deselect Glideslope Button)*

L1 - The flight crew has manually-tuned an ILS(GLS) on the FMS POSITION NAVAIDS page (*Refer to FMS / Landing System Identifier Entry Field*)

Note: If the flight crew has selected a different ILS(GLS) approach on the FMS ARRIVAL page:
- *The aircraft will fly the manually-tuned ILS(GLS)*
- *The MFD displays the RUNWAY / LS DISAGREE message.*

- The flight crew has manually-tuned the frequency(channel) and course of an ILS(GLS) on the RMP (*Refer to DSC-34-10-60-30 How to Tune Navaids in Standby RadNav*)
- The flight crew has selected a LOC only approach on the FMS ARRIVAL page.

For information on approach selection on the FMS ARRIVAL page, *Refer to FMS / Approach List* .

DISARMING CONDITIONS

Applicable to: ALL

L2 LOC disarms, when one of the following occurs:
- G/S or F-G/S is armed, and the flight crew presses the APPR pb
- Neither G/S, nor F-G/S is armed, and the flight crew presses the LOC pb

L3 - NAV arms
- The flight crew engages go-around
- The flight crew modifies the approach selection.

  Note: *The flight crew can change the approach selection, only when the aircraft is above 700 ft RA.*

- The ILS(GLS) frequency(channel) and course are not equal in both ILS(GLS) receivers.

ENGAGEMENT CONDITIONS

Applicable to: ALL

LOC engages, when LOC* is engaged, and the aircraft becomes established on the LOC beam.

L3 The aircraft becomes established on the LOC beam, when:
- LOC is engaged for more than 10 s, and
- The LOC deviation becomes less than 0.2 dot.

DISENGAGEMENT CONDITIONS

Applicable to: ALL

LOC disengages, when another lateral mode engages.

L2 LOC disengages, when one of the following occurs:
- G/S is engaged, and the aircraft reaches 400 ft RA
  LAND engages.
- The flight crew presses the LOC pb, and no vertical approach mode is engaged
  HDG/TRACK engages.
- The flight crew pulls the HDG/TRK knob, and no vertical approach mode is engaged
  HDG/TRACK engages.

L3 - The aircraft is above 700 ft RA, and the flight crew inserts a DIRECT TO
  NAV engages.

L2 - The flight crew performs a go-around
  SRS GA and GA TRK engage.

L2 REVERSIONS

LOC reverts to HDG/TRACK, when one of the following occurs:

- The flight crew presses the APPR pb, and one of the following conditions is met:
  - G/S is armed
  - G/S* is engaged
  - G/S is engaged
  - F-G/S is armed
  - F-G/S* is engaged
  - F-G/S is engaged.

  A triple click aural warning sounds. The vertical approach mode disengages, and V/S / FPA engages. The pitch and roll bars flash for 10 s.
- The flight crew pulls the HDG/TRK knob, and one of the following mode is engaged: G/S*, G/S, F-G/S*, or F-G/S.
  HDG/TRACK and V/S / FPA engage.
  A triple click aural warning sounds. The pitch and roll bars flash for 10 s.

L3 - The flight crew changes the approach on the FMS ARRIVAL page, and one of the following conditions is met:
  - G/S is armed
  - G/S* is engaged
  - G/S is engaged
  - F-G/S is armed
  - F-G/S* is engaged
  - F-G/S is engaged.

  HDG/TRACK and V/S / FPA engage.
  This scenario is applicable, if the aircraft is above 700 ft RA.
  A triple click aural warning sounds. The pitch and roll bars flash for 10 s.

Intentionally left blank

G/S* Mode

GENERAL

Applicable to: ALL

The Glide Slope Capture (G/S*) mode captures the glide slope beam of the ILS(GLS).

ARMING AND DISARMING CONDITIONS

Applicable to: ALL

L2 G/S* and G/S modes arm (disarm) together and simultaneously. The arming is announced by G/S on the FMA .

For G/S arming conditions, *Refer to G/S Mode / Arming Conditions* .

For G/S disarming conditions, *Refer to G/S Mode / Disarming Conditions* .

ENGAGEMENT CONDITIONS

Applicable to: ALL

G/S* engages when the aircraft reaches the capture zone of the G/S beam, and:

- G/S is armed, and
- LOC* or LOC is engaged.

L2 The aircraft reaches the capture zone of the G/S beam, when one of the following occurs:

- Passage far from the G/S beam:
  - The G/S deviation is less than 2 dots
  - The pitch order is such that G/S* will capture the G/S beam with a single resource.
- Passage near the G/S beam: The G/S deviation is less than a threshold depending on the radio altitude.
  This threshold is between 0.1 and 0.3 dot.

DISENGAGEMENT CONDITIONS

Applicable to: ALL

G/S* disengages when another lateral mode engages.

L2 G/S* disengages, when one of the following occurs:

- The aircraft becomes established on the G/S beam

L3 G/S is engaged for more than 15 s, and the G/S deviation becomes less than 0.3 dot.

L2 G/S engages.

- The flight crew pulls the V/S / FPA knob
  V/S / FPA engages.

- The flight crew pulls the ALT knob
  OP CLB or OP DES engages.
- The flight crew presses the ALT pb
  ALT engages.
- The flight crew performs a go-around
  SRS GA and GA TRK engage.

L2 **REVERSIONS**

G/S* reverts to V/S / FPA, when one of the following occurs:

- LOC disengages
  A triple click aural warning sounds. V/S / FPA and HDG/TRACK engage. The pitch and roll bar flash for 10 s.
- The flight crew presses the APPR pb
  A triple click aural warning sounds. V/S / FPA and HDG/TRACK engage. The pitch and roll bar flash for 10 s.
- The flight crew presses the LOC pb
  A triple click aural warning sounds. V/S / FPA engages. The pitch bar flashes for 10 s.

L3 - The aircraft is above 700 ft RA, and the flight crew changes the approach on the FMS ARRIVAL page.
  A triple click aural warning sounds. V/S / FPA and HDG/TRACK engage. The pitch and roll bar flash for 10 s.

G/S Mode

GENERAL

Applicable to: ALL

The Glide Slope track (G/S) mode tracks the glide slope beam of the ILS(GLS).

ARMING CONDITIONS

Applicable to: ALL

L3 In order to be able to arm G/S , all of the following conditions must be met:
- At least one RA is operative
- At least one ILS (GLS) receiver is operative
- When both ILS (GLS) receivers are operative: The ILS(GLS) frequency(channel) and course must be equal in both ILS (GLS) receivers.

L1 G/S arms, when the flight crew presses the APPR pb , and one of the following conditions is met:
- The flight crew has selected an ILS(GLS) approach on the FMS ARRIVAL page

L3 This is applicable, if the aircraft is above 400 ft RA .

L1 - The flight crew has manually-tuned an ILS(GLS) on the FMS POSITION NAVAIDS page (*Refer to FMS / Landing System Identifier Entry Field*)

L3 This is applicable, if the aircraft is above 400 ft RA .

L1 <u>Note:</u> *If the flight crew has selected a different ILS(GLS) approach on the FMS ARRIVAL page:*
- *The aircraft will fly the manually-tuned ILS(GLS)*
- *The MFD displays RUNWAY / LS DISAGREE message.*

- The flight crew has manually-tuned the frequency(channel) and course of an ILS(GLS) on the RMP (*Refer to DSC-34-10-60-30 How to Tune Navaids in Standby RadNav*).

L3 This is applicable, if the aircraft is above 400 ft RA .

G/S cannot arm, if one of the following mode is engaged: SRS TO , RWY , RWY TRK , SRS GA , GA TRK .

L1 For information on approach selection on the FMS ARRIVAL page, *Refer to FMS / Approach List* .

DISARMING CONDITIONS

Applicable to: ALL

L2 G/S disarms, when one of the following occurs:
- The flight crew presses the APPR pb, or the LOC pb
- LOC disarms
- LOC*, or LOC is lost.

ENGAGEMENT CONDITIONS

Applicable to: ALL

G/S engages, when LOC and G/S* are engaged, and the aircraft becomes established on the G/S beam.

L3 The aircraft becomes established on the G/S beam, when:
- G/S* is engaged for more than 15 s, and
- The G/S deviation becomes less than 0.3 dot.

DISENGAGEMENT CONDITIONS

Applicable to: ALL

G/S disengages when another lateral mode engages.

L2 G/S disengages, when one of the following occurs:
- LOC is engaged, and the aircraft reaches 400 ft RA
  LAND engages.
- The flight crew pulls the V/S / FPA knob
  V/S / FPA engages.
- The flight crew pulls the ALT knob
  OP CLB or OP DES engages.
- The flight crew presses the ALT pb
  ALT engages.
- The flight crew performs a go-around
  SRS GA and GA TRK engage.

L2 **REVERSIONS**

G/S reverts to V/S / FPA, when one of the following occurs:

- LOC disengages
  A triple click aural warning sounds. V/S / FPA and HDG/TRACK engage. The pitch and roll bar flash for 10 s.
- The flight crew presses the APPR pb
  A triple click aural warning sounds. V/S / FPA and HDG/TRACK engage. The pitch and roll bar flash for 10 s.
- The flight crew presses the LOC pb
  A triple click aural warning sounds. V/S / FPA engages. The pitch bar flashes for 10 s.

L3 - The aircraft is above 700 ft RA, and the flight crew changes the approach on the FMS ARRIVAL page.
  A triple click aural warning sounds. V/S / FPA and HDG/TRACK engage. The pitch and roll bar flash for 10 s.

Intentionally left blank

LAND Mode

GENERAL

Applicable to: ALL

The LAND mode is a common mode: LAND tracks the LOC and G/S beams of the ILS(GLS) from 400 ft RA to approximately 60 ft RA.

ENGAGEMENT CONDITIONS

Applicable to: ALL

LAND automatically engages, when G/S and LOC are engaged, and the aircraft reaches 400 ft RA.
L3 The aircraft is below 400 ft for more than 1 s.

DISENGAGEMENT CONDITIONS

Applicable to: ALL

LAND automatically disengages, when the aircraft approximately reaches 60 ft RA: FLARE engages.
When LAND is engaged, no action on the AFS CP can disengage LAND.
The flight crew can only disengage LAND by performing a go-around. SRS GA and GA TRK will engage.

Intentionally left blank

FLARE Mode

GENERAL

Applicable to: ALL

The FLARE mode is a common mode:

- Lateral guidance: The FLARE mode reduces the slideslip angle, such that the aircraft will be aligned with the runway centerline at the aircraft touchdown
- Vertical guidance: The FLARE mode decreases the descent rate, in order to ensure a comfortable transition between the glide tracking, and the aircraft touchdown.

ENGAGEMENT CONDITIONS

Applicable to: ALL

FLARE engages, when LAND is engaged, and the aircraft approximately reaches 60 ft.

L3 Additional conditions must be met:

- The landing gear is down
- The aircraft is not in clean configuration.

DISENGAGEMENT CONDITIONS

Applicable to: ALL

FLARE automatically disengages, when the aircraft touches down. ROLL OUT engages.
The flight crew can only disengage FLARE by performing a go-around.

Intentionally left blank

ROLL OUT Mode

GENERAL

Applicable to: ALL

ROLL OUT is a common mode:

- Lateral guidance: The ROLL OUT mode guides the aircraft along the runway centerline
- Vertical guidance: The ROLL OUT mode lands the nose landing gear.

L3 The vertical speed is close to 2.5 ft/s.

ENGAGEMENT CONDITIONS

Applicable to: ALL

ROLL OUT engages when the aircraft touches down.

L2 This occurs, when one landing gear touches down.

DISENGAGEMENT CONDITIONS

Applicable to: ALL

ROLL OUT disengages, when one of the following occurs:

- All APs and FDs are disengaged

L13

Note: In automatic roll-out, the flight crew should disengage the AP(s) at low speed, as per procedures.
All APs (if still engaged), and FDs disengage when the aircraft exits the runway.
When the difference between the aircraft track and the runway track is more than 20 °: All APs (if still engaged), and FDs disengage.

- The flight crew engages a go-around

L3 - The APs are disengaged, and the flight crew presses the APPR pb.
This is applicable, if ROLL OUT is engaged for more than 10 s.

Intentionally left blank

F-LOC* Mode

GENERAL

Applicable to: ALL

The FLS Localizer capture (F-LOC*) mode captures the F-LOC beam.

ARMING AND DISARMING CONDITIONS

Applicable to: ALL

L2 F-LOC* and F-LOC modes arm (disarm) together and simultaneously. The arming is announced by F-LOC on the FMA .
For F-LOC arming conditions, *Refer to F-LOC Mode / Arming Conditions* .
For F-LOC disarming conditions, *Refer to F-LOC Mode / Disarming Conditions* .

ENGAGEMENT CONDITIONS

Applicable to: ALL

F-LOC* engages, when F-LOC is armed, and the aircraft reaches the capture zone, or the pre-capture zone of the F-LOC beam.
The capture zone is a zone available, when the F-LOC deviation is less than 2.3 dots.
The pre-capture zone is a zone available, when the F-LOC deviation is more than 2.3 dots.

L2 CAPTURE ZONE OF THE F-LOC BEAM

The aircraft reaches the capture zone of the F-LOC beam, when one of the following occurs:
- The F-LOC deviation is less than 2.3 dots, and:
  - The difference between the track and the QFU is less than 115 °, and
  - The roll order is such that F-LOC* will capture the F-LOC beam with a single turn.
- The F-LOC deviation is less than 1.3 dot, and the difference between the track and the QFU is less than 15 °.

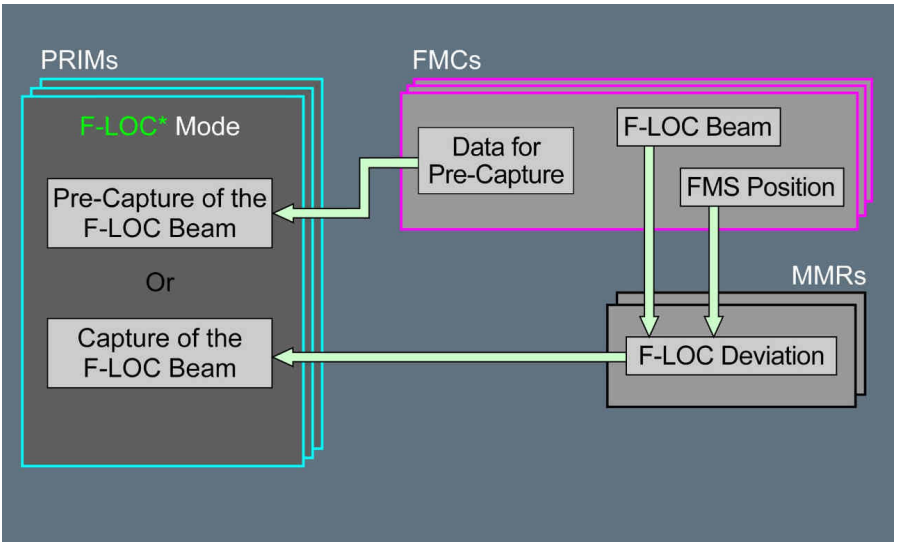
PRE-CAPTURE OF THE F-LOC BEAM

The aircraft reaches the pre-capture zone of the F-LOC beam, when all of the following conditions are met:
- The F-LOC deviation is more than 2.3 dots
- The difference between the track and the QFU is less than 115 °
- The roll order is such that F-LOC* will capture the F-LOC beam with a single turn.

When F-LOC is armed, and the aircraft reaches the pre-capture zone of the F-LOC beam, F-LOC* engages, and pre-captures the F-LOC beam, by using dedicated FMS data.

When the F-LOC deviation becomes less than 2.3 dots, F-LOC* no longer performs the pre-capture: F-LOC* no longer uses the dedicated FMS data for pre-capture. F-LOC* remains engaged, and performs the F-LOC capture by using the F-LOC deviation.

Pre-Capture and Capture of the F-LOC Beam



DISENGAGEMENT CONDITIONS

Applicable to: ALL

F-LOC* disengages, when another lateral mode engages.

L2 F-LOC* disengages, when one of the following occurs:

- The aircraft becomes established on the F-LOC beam

L3 F-LOC* is engaged for more than 10 s , and the F-LOC deviation becomes less than 0.2 dot.

L2 F-LOC engages.

- The flight crew presses the LOC pb , and neither F-G/S* nor F-G/S is engaged
  HDG / TRACK engages.

Note: *If F-G/S* or F-G/S was previously engaged, F-LOC* remains engaged, and a vertical mode reversion occurs.*

- The flight crew pulls the HDG/TRK knob
  HDG / TRACK engages.

  Note: *If F-G/S* or F-G/S was previously engaged, lateral and vertical mode reversions occur: Refer to DSC-22-FG-70-90-80-GDISE Reversions .*

L3 - The aircraft is above 700 ft RA , and the flight crew inserts a DIRECT TO
  NAV engages.

L2 - The flight crew performs a go-around
  SRS GA and GA TRK engage.

L2 REVERSIONS

F-LOC* reverts to HDG/TRACK, when one of the following occurs:

- The flight crew presses the APPR pb, and one of the following conditions is met:
  - F-G/S is armed
  - F-G/S* is engaged
  - F-G/S is engaged.

  A triple click aural warning sounds. The vertical approach mode disengages, and V/S / FPA engages. The pitch and roll bars flash for 10 s.
- F-G/S*, or F-G/S is engaged, and the flight crew pulls the HDG/TRK knob
  HDG/TRACK and V/S / FPA engage.
  A triple click aural warning sounds. The pitch and roll bars flash for 10 s.

L3 - The flight crew changes the approach on the FMS ARRIVAL page, and one of the following conditions is met:
  - F-G/S is armed
  - F-G/S* is engaged
  - F-G/S is engaged.

  HDG/TRACK and V/S / FPA engage.
  This scenario is applicable, if the aircraft is above 700 ft RA.
  A triple click aural warning sounds. The pitch and roll bars flash for 10 s.

Intentionally left blank

F-LOC Mode

GENERAL

Applicable to: ALL

The FLS Localizer track (F-LOC) mode tracks the F-LOC beam.

ARMING CONDITIONS

Applicable to: ALL

L3 In order to be able to arm F-LOC , all of the following conditions must be previously met:
- At least one FMS is operative
- At least one MMR is able to compute the F-LOC and F-G/S deviations

Note: If the NO FLS FOR THIS APPR message has appeared on the MFD , the MMR (s) will not be able to compute the F-LOC and F-G/S deviations.

- When both MMR s are operative, the runway headings of the NPA must be equal in both MMR s.

L2 F-LOC can only arm when:
- HDG / TRACK or NAV is engaged

L3 - The aircraft is above 400 ft RA .

L1 F-LOC arms, when:
- The flight crew has selected a VOR, NDB, RNV, or GPS approach in the FMS ARRIVAL page, and
- The flight crew presses the APPR pb , or the LOC pb .

For information on approach selection on the FMS ARRIVAL page, *Refer to FMS / Approach List* .

DISARMING CONDITIONS

Applicable to: ALL

L2 F-LOC disarms, when one of the following occurs:
- F-G/S is armed, and the flight crew presses the APPR pb
- F-G/S is not armed, and the flight crew presses the LOC pb

L3 - NAV arms
- The flight crew engages go-around

- The flight crew modifies the approach selection

  Note: *The flight crew can change the approach selection, only when the aircraft is above 700 ft RA.*

- The runway headings of the NPA are not equal in both MMRs.

ENGAGEMENT CONDITIONS

Applicable to: ALL

F-LOC engages, when F-LOC* is engaged, and the aircraft becomes established on the F-LOC beam.

L3 The aircraft becomes established on the F-LOC beam, when:
- F-LOC is engaged for more than 10 s, and
- The F-LOC deviation becomes less than 0.2 dot.

DISENGAGEMENT CONDITIONS

Applicable to: ALL

F-LOC disengages, when another lateral mode engages.

L2 F-LOC disengages, when one of the following occurs:
- The flight crew presses the LOC pb , and neither F-G/S* nor F-G/S is engaged
  HDG / TRACK engages.

  Note: *If F-G/S* or F-G/S was previously engaged, F-LOC remains engaged, and a vertical mode reversion occurs.*

- The flight crew pulls the HDG/TRK knob
  HDG / TRACK engages.

  Note: *If F-G/S* or F-G/S was previously engaged, lateral and vertical mode reversions occur: Refer to DSC-22-FG-70-90-80-GDISE Reversions .*

L3 - The aircraft is above 700 ft RA , and the flight crew inserts a DIRECT TO
NAV engages.

L2 - The flight crew performs a go-around
SRS GA and GA TRK engage.

L2 **REVERSIONS**

F-LOC reverts to HDG/TRACK, when one of the following occurs:

- The flight crew presses the APPR pb, and one of the following conditions is met:
  - F-G/S is armed
  - F-G/S* is engaged
  - F-G/S is engaged.

  A triple click aural warning sounds. The vertical approach mode disengages, and V/S / FPA engages. The pitch and roll bars flash for 10 s.
- F-G/S*, or F-G/S is engaged, and the flight crew pulls the HDG/TRK knob
  HDG/TRACK and V/S / FPA engage.
  A triple click aural warning sounds. The pitch and roll bars flash for 10 s.

L3 - The flight crew changes the approach on the FMS ARRIVAL page, and one of the following conditions is met:
  - F-G/S is armed
  - F-G/S* is engaged
  - F-G/S is engaged.

  HDG/TRACK and V/S / FPA engage.
  This scenario is applicable, if the aircraft is above 700 ft RA.
  A triple click aural warning sounds. The pitch and roll bars flash for 10 s.

Intentionally left blank

F-G/S* Mode

GENERAL

Applicable to: ALL

The FLS Glide Slope capture (F-G/S*) mode captures the F-G/S beam.

ARMING AND DISARMING CONDITIONS

Applicable to: ALL

L2 F-G/S* and F-G/S modes arm (disarm) together and simultaneously. The arming is announced by F-G/S on the FMA .
For F-G/S arming conditions, *Refer to F-G/S Mode / Arming Conditions* .
For F-G/S disarming conditions, *Refer to F-G/S Mode / Disarming Conditions* .

ENGAGEMENT CONDITIONS

Applicable to: ALL

F-G/S* engages, when the aircraft reaches the capture zone of the F-G/S beam, and:
- F-G/S is armed, and
- One of the following mode is engaged: LOC*, LOC, F-LOC*, or F-LOC.

L2 The aircraft reaches the capture zone of the F-G/S beam, when one of the following occurs:
- Passage far from the F-G/S beam:
  - The F-G/S deviation is less than 2 dots
  - The pitch order is such that F-G/S* will capture the F-G/S beam with a single resource.
- Passage near the F-G/S beam: The F-G/S deviation is less than a threshold depending on the radio altitude.
  This threshold is between 0.1 and 0.3 dot.

DISENGAGEMENT CONDITIONS

Applicable to: ALL

F-G/S* disengages when another lateral mode engages.

L2 F-G/S* disengages, when one of the following occurs:
- The aircraft becomes established on the F-G/S beam

L3 F-G/S is engaged for more than 15 s, and the F-G/S deviation becomes less than 0.3 dot.

L2 F-G/S engages.
- The flight crew pulls the V/S / FPA knob
  V/S / FPA engages.
- The flight crew pulls the ALT knob
  OP CLB or OP DES engages.
- The flight crew presses the ALT pb
  ALT engages.
- The flight crew performs a go-around
  SRS GA and GA TRK engage.

L2 **REVERSIONS**

F-G/S* reverts to V/S / FPA, when one of the following occurs:
- The flight crew presses the APPR pb
  A triple click aural warning sounds. V/S / FPA and HDG/TRACK engage. The pitch and roll bar flash for 10 s.
- The flight crew presses the LOC pb
  A triple click aural warning sounds. V/S / FPA engages. The pitch bar flashes for 10 s.
- The flight crew presses the HDG/TRK knob
  A triple click aural warning sounds. V/S / FPA and HDG/TRACK engage. The pitch and roll bar flash for 10 s.

L3 - The aircraft is above 700 ft RA, and the flight crew changes the approach on the FMS ARRIVAL page.
  A triple click aural warning sounds. V/S / FPA and HDG/TRACK engage. The pitch and roll bar flash for 10 s.

F-G/S Mode

GENERAL

Applicable to: ALL

The FLS Glide Slope track (F-G/S) mode tracks the F-G/S beam.

ARMING CONDITIONS

Applicable to: ALL

L3 In order to be able to arm F-G/S , all of the following conditions must be met:
- At least one FMS is operative
- At least one MMR is able to compute the F-LOC and F-G/S deviations

  Note: *If the NO FLS FOR THIS APPR message has appeared on the MFD , the MMR (s) will not be able to compute the F-LOC and F-G/S deviations.*

- When both MMR s are operative, the runway headings of the NPA must be equal in both MMR s.

L1 F-G/S arms, if the flight crew has selected a NPA on the FMS ARRIVAL page, and the flight crew presses the APPR pb .
L3 This is applicable if, the aircraft is above 400 ft RA .
L1 For information on approach selection on the FMS ARRIVAL page, *Refer to FMS / Approach List* .
L3 F-G/S cannot arm, if one of the following mode is engaged: SRS TO , RWY , RWY TRK , SRS GA , or GA TRK .

DISARMING CONDITIONS

Applicable to: ALL

L2 F-G/S disarms, when one of the following occurs:
- The flight crew presses the APPR pb, or the LOC pb
- LOC or F-LOC disarms
- LOC*, LOC, F-LOC*, or F-LOC disengages

L3 - The flight crew modifies the approach selection

  Note: *The flight crew can change the approach selection, only when the aircraft is above 700 ft RA.*

- The runway headings of the NPA are not equal in both MMRs.
- The F-LOC and F-G/S deviations become invalid

L2 - The flight crew engages a go-around.

ENGAGEMENT CONDITIONS

Applicable to: ALL

F-G/S engages, when F-G/S* is engaged, and the aircraft becomes established on the F-G/S beam.

L3 The aircraft becomes established on the F-G/S beam, when:
- F-G/S* is engaged for more than 15 s, and
- The F-G/S deviation becomes less than 0.3 dot.

DISENGAGEMENT CONDITIONS

Applicable to: ALL

F-G/S disengages when another lateral mode engages.

L2 F-G/S disengages, when one of the following occurs:
- The flight crew pulls the V/S / FPA knob
  V/S / FPA engages.
- The flight crew pulls the ALT knob
  OP CLB or OP DES engages.
- The flight crew presses the ALT pb
  ALT engages.
- The flight crew performs a go-around
  SRS GA and GA TRK engage.

L2 REVERSIONS

F-G/S reverts to V/S / FPA, when one of the following occurs:
- The flight crew presses the APPR pb
  A triple click aural warning sounds. V/S / FPA and HDG/TRACK engage. The pitch and roll bar flash for 10 s.
- The flight crew presses the LOC pb
  A triple click aural warning sounds. V/S / FPA engages. The pitch bar flashes for 10 s.
- The flight crew pulls the HDG/TRK knob
  A triple click aural warning sounds. V/S / FPA and HDG/TRACK engage. The pitch and roll bar flash for 10 s.

L3 - The aircraft is above 700 ft RA, and the flight crew changes the approach on the FMS ARRIVAL page.
  A triple click aural warning sounds. V/S / FPA and HDG/TRACK engage. The pitch and roll bar flash for 10 s.

LOC B/C* Mode

GENERAL

Applicable to: ALL

The Localizer Back Course capture (LOC B/C*) mode captures the localizer back course beam of the ILS.

ARMING AND DISARMING CONDITIONS

Applicable to: ALL

LOC B/C* arms, or disarms, when LOC B/C arms, or disarms: *Refer to LOC B/C Mode / Arming Conditions* , or *Refer to LOC B/C Mode / Disarrming Conditions* .

ENGAGEMENT CONDITIONS

Applicable to: ALL

LOC B/C* engages, when LOC B/C is armed, and the aircraft reaches the capture zone of the LOC B/C beam.

L2 CAPTURE ZONE OF THE LOC B/C BEAM

The aircraft reaches the capture zone of the LOC B/C beam, when one of the following occurs:

- The difference between the track and the QFU is less than 115 °, and:
  - The LOC B/C deviation is less than 2.3 dots, and
  - The roll order is such that LOC B/C* will capture the LOC B/C beam with a single turn.
- The difference between the track and the QFU is less than 15 °, and the LOC B/C deviation is less than 1.3 dot.

DISENGAGEMENT CONDITIONS

Applicable to: ALL

LOC B/C* disengages, when another lateral mode engages.

L2 LOC B/C* disengages, when one of the following occurs:
- The aircraft becomes established on the LOC B/C beam

L3 LOC B/C* is engaged for more than 10 s , and the LOC B/C deviation becomes less than 0.2 dot.

L2 LOC B/C engages.
- The flight crew presses the LOC pb , and no vertical approach mode is engaged
  HDG / TRACK engages.

  Note: *If a vertical approach mode was previously engaged, LOC B/C* remains engaged, and a vertical mode reversion occurs.*

- The flight crew pulls the HDG/TRK knob
  HDG / TRACK engages.

  Note: *If a vertical approach mode was previously engaged, lateral and vertical mode reversions occur: Refer to DSC-22-FG-70-90-120-GDISE Reversions .*

L3 - The aircraft is above 700 ft RA , and the flight crew inserts a DIRECT TO
  NAV engages.

L2 - The flight crew performs a go-around
  SRS GA and GA TRK engage.

L2 REVERSIONS

LOC B/C* reverts to HDG/TRACK, when one of the following occurs:
- The flight crew presses the APPR pb, and one of the following conditions is met:
  - F-G/S is armed
  - F-G/S* is engaged
  - F-G/S is engaged.

  A triple click aural warning sounds. The vertical approach mode disengages, and V/S / FPA engages. The pitch and roll bars flash for 10 s.
- The flight crew pulls the HDG/TRK knob, and F-G/S*, or F-G/S.
  HDG/TRACK and V/S / FPA engage.
  A triple click aural warning sounds. The pitch and roll bars flash for 10 s.

L3 - The flight crew changes the approach on the FMS ARRIVAL page, and one of the following conditions is met:
  - F-G/S is armed
  - F-G/S* is engaged
  - F-G/S is engaged.

  HDG/TRACK and V/S / FPA engage.
  This scenario is applicable, if the aircraft is above 700 ft RA.
  A triple click aural warning sounds. The pitch and roll bars flash for 10 s.

LOC B/C Mode

GENERAL

Applicable to: ALL

The Localizer Back Course track (LOC B/C) mode tracks the localizer back course beam of the ILS.

ARMING CONDITIONS

Applicable to: ALL

L3 In order to be able to arm LOC B/C , all of the following conditions must be previously met:
- At least one RA is operative
- At least one ILS receiver is operative
- When both ILS receivers are operative: The ILS frequency and course must be equal in both ILS receivers.

L2 LOC B/C can only arm when:
- HDG / TRACK or NAV is engaged

L3 - The aircraft is above 400 ft RA .

L1 LOC B/C arms, when:
- The flight crew has selected a BAC approach on the FMS ARRIVAL page, and
- The flight crew presses the APPR pb , or the LOC pb .

For information on approach selection on the FMS ARRIVAL page, *Refer to FMS / Approach List* .

DISARMING CONDITIONS

Applicable to: ALL

L2 LOC B/C disarms, when one of the following occurs:
- F-G/S is armed, and the flight crew presses the APPR pb
- F-G/S is not armed, and the flight crew presses the LOC pb

L3 - NAV arms
- The flight crew engages go-around
- The flight crew modifies the approach selection.

  Note: *The flight crew can change the approach selection, only when the aircraft is above 700 ft RA.*

- The ILS frequency and course are not equal in both ILS receivers.

ENGAGEMENT CONDITIONS

Applicable to: ALL

LOC B/C engages, when LOC B/C* is engaged, and the aircraft becomes established on the LOC B/C beam.

L3 The aircraft becomes established on the LOC B/C beam, when:
- LOC B/C is engaged for more than 10 s, and
- The LOC B/C deviation becomes less than 0.2 dot.

DISENGAGEMENT CONDITIONS

Applicable to: ALL

LOC B/C disengages, when another lateral mode engages.

L2 LOC B/C disengages, when one of the following occurs:
- The flight crew presses the LOC pb, and no vertical approach mode is engaged
  HDG/TRACK engages.
- The flight crew pulls the HDG/TRK knob, and no vertical approach mode is engaged
  HDG/TRACK engages.

L3 - The aircraft is above 700 ft RA, and the flight crew inserts a DIRECT TO
  NAV engages.

L2 - The flight crew performs a go-around
  SRS GA and GA TRK engage.

L2 **REVERSIONS**

LOC B/C reverts to HDG/TRACK, when one of the following occurs:

- The flight crew presses the APPR pb, and one of the following conditions is met:
  - F-G/S is armed
  - F-G/S* is engaged
  - F-G/S is engaged.

  A triple click aural warning sounds. The vertical approach mode disengages, and V/S / FPA engages. The pitch and roll bars flash for 10 s.
- The flight crew pulls the HDG/TRK knob, and F-G/S*, or F-G/S is engaged.
  HDG/TRACK and V/S / FPA engage.
  A triple click aural warning sounds. The pitch and roll bars flash for 10 s.

L3 - The flight crew changes the approach on the FMS ARRIVAL page, and one of the following conditions is met:
  - F-G/S is armed
  - F-G/S* is engaged
  - F-G/S is engaged.

  HDG/TRACK and V/S / FPA engage.
  This scenario is applicable, if the aircraft is above 700 ft RA.
  A triple click aural warning sounds. The pitch and roll bars flash for 10 s.

Intentionally left blank

General

GENERAL

Applicable to: ALL

When the flight crew initiates a go-around, the SRS GA vertical mode engages. In addition, one of the following occurs:

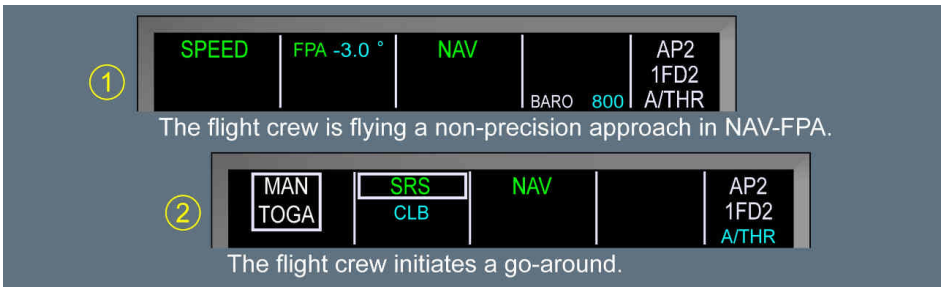
- If a lateral managed mode is engaged (except NAV mode), GA TRK engages, and NAV mode arms
  This occurs if the flight crew performs a go-around during a precision approach, or a non-precision approach with the FLS function.
  NAV automatically engages as soon as the aircraft reaches the capture zone of the flight plan active leg.

L2 *Note: If a HDG (TRK) was preset, NAV mode does not arm. GA TRK engages, until the flight crew pulls the HDG/TRK knob to follow the preset target.*

Example: Go-around during a precision approach

L1 - If NAV mode is engaged, it remains engaged
This occurs if the flight crew performs a go-around during a non-precision approach with NAV and V/S (FPA) guidance.

Example: Go-around during a non-precision approach in NAV-FPA

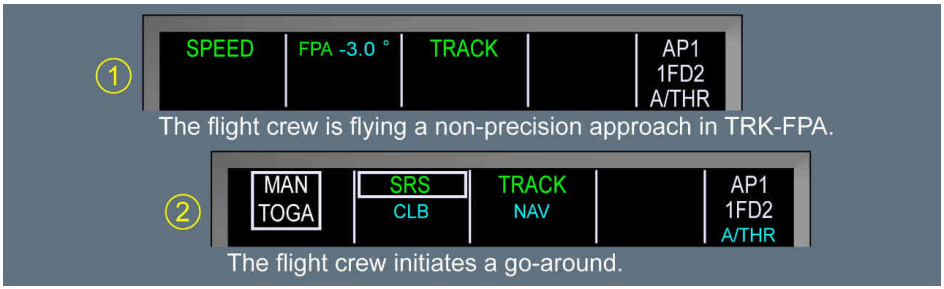


- If HDG (TRK) mode is engaged, it remains engaged, and NAV mode arms

This occurs if the flight crew performs a go-around during a non-precision approach with HDG (TRK) and V/S (FPA) guidance.
NAV automatically engages as soon as the aircraft reaches the capture zone of the flight plan active leg.

Example: Go-around during a non-precision approach in HDG-V/S

Example: Go-around during a non-precision approach in TRK-FPA



L12

Note: *If the flight crew initiates the go-around below 100 ft RA , GA TRK engages, and NAV mode arms, until 100 ft .*
Then, NAV automatically engages, if the aircraft is in the capture zone of the flight plan active leg.

In addition, at go-around engagement:
- The FMS flight phase becomes go-around
- If not previously engaged, the FD s automatically engage
- HDG-V/S is automatically selected, except if the TRK mode was engaged before go-around
  For more information, *Refer to DSC-22-FG-70-30-20 HDG-V/S / TRK-FPA Selection* .
- If previously displayed, the FPV(VV) disappears, except if the TRK mode was engaged before go-around.

The FMS flight phase changes from go-around to climb, when one of the following modes engages: Altitude acquire mode, altitude hold mode, OP CLB , CLB , V/S / FPA .

However, the FMS flight phase will change from climb to cruise, if ALT CRZ* or ALT CRZ engages. This occurs, when the aircraft approaches the AFS CP selected altitude, and the cruise altitude is the AFS CP selected altitude.

For more information on FMS flight phase transitions, *Refer to DSC-22-FMS-10-50-20 Flight Phases - Overview* .

When SRS GA engages, the speed target becomes managed. The managed speed target is the aircraft speed at SRS GA engagement.

L2 For more information on the managed speed target limits, *Refer to Speed/Mach Control / Managed Speed/Mach target* .

L1 When SRS GA disengages, the managed speed target will be the speed target provided by the FMS , in accordance with the FMS flight phase.

Note: *If the FMS flight phase is cruise, the SPD LIM, and SPD CSTR are still respected (when applicable).*

SRS GA Mode

GENERAL

Applicable to: ALL

The Speed Reference System (SRS) mode is a managed vertical mode. This mode is used during takeoff and during go-around. The present chapter deals with the SRS mode during go-around, also referred to as SRS GA mode. The FMA announces the SRS GA mode by SRS.
SRS GA controls the speed via the elevators, in order to steer the aircraft along a vertical path.

L2 The guidance law also includes:
- A flight path angle protection, that ensures a positive climb
- A pitch angle protection to reduce the aircraft nose-up (22.5 ° of maximum pitch attitude).

L1 The speed target is the memorized aircraft speed at SRS GA engagement.
L2 The lower limit of the target is the VAPP that the PRIMs memorize at 700 ft RA.

The higher limit of the target is the lowest value between:
- VLS + 25 kt (or VLS + 15 kt in engine-out)
- VMAX - 5 kt.

L1 *Note:* *At SRS GA engagement, the speed becomes managed.*

When SRS GA disengages, the managed speed target becomes green dot.

ENGAGEMENT CONDITIONS

Applicable to: ALL

SRS GA engages when all of the following conditions are met:
- The flight crew sets at least two thrust levers to TOGA
- The flap lever is not at the 0 detent
L2 - The aircraft is airborne, or on ground for less than 30 s.

L1 SRS GA mode can be engaged from whatever vertical mode (except SRS TO).

DISENGAGEMENT CONDITIONS

Applicable to: ALL

SRS GA disengages when one of the following occurs:

- OP CLB, or CLB is armed, and the aircraft reaches the GA acceleration altitude
  OP CLB, or CLB engages.
  The GA acceleration altitude is displayed on the G.A panel of the FMS PERF page.

L3 *Note: ALT CST* and ALT CST will not engage at the GA acceleration altitude, even if all of the following conditions are met:*

- *An altitude constraint associated to a waypoint has the same altitude than the GA acceleration altitude*
- *The AFS CP selected altitude is set above the GA acceleration altitude*
- *NAV armed or engaged.*

L1 - The aircraft reaches the capture zone of the AFS CP selected altitude
ALT* engages.
L3 This scenario is possible, if the aircraft is above 400 ft RA.
L1 - The flight crew presses the ALT knob
ALT engages.
L3 This scenario is possible, if the aircraft is above 100 ft RA.
L1 - The flight crew pulls the ALT knob
OP CLB or OP DES engages.
L3 This scenario is possible, if the aircraft is above 100 ft RA.
L1 - The flight crew pulls the V/S / FPA knob
V/S / FPA engages.
L3 This scenario is possible, if the aircraft is above 100 ft RA.
L2 - The AFS CP selected altitude is above, and the flight crew pulls the SPD/MACH knob.
OP CLB engages.
L3 This scenario is possible, if the aircraft is above 100 ft RA.

GA TRK Mode

GENERAL

Applicable to: ALL

GA TRK mode maintains the track the aircraft has at GA TRK engagement.

ENGAGEMENT CONDITIONS

Applicable to: ALL

GA TRK engages, when all of the following conditions are met:

L2 - The aircraft is airborne, or on ground for less than 30 s

L1 - The flap lever is not at the 0 detent

- The flight crew sets at least two thrust levers to TOGA
- NAV, HDG, or TRK is not engaged

L3 - SRS TO is not engaged.

L1 GA TRK simultaneously engages with SRS GA.

DISENGAGEMENT CONDITIONS

Applicable to: ALL

GA TRK disengages, when one of the following occurs:

- The flight crew pulls the HDG/TRK knob
  HDG/TRACK engages.
- NAV is armed, and the aircraft reaches the capture zone of the active leg
  NAV engages.

L2 - The flight crew performs a DIRECT TO.
NAV engages.

L3 GA TRK cannot be disengaged below 100 ft RA.

Intentionally left blank

General

GENERAL

Applicable to: ALL

The AP / FD TCAS mode is an AP / FD vertical mode, that provides vertical guidance in the case of a Resolution Advisory alert, generated by the Traffic Collision Avoidance System (TCAS).

L2 For more information on the TCAS , *Refer to 34 - SURVEILLANCE / TCAS* .

L1 When a Traffic Advisory is triggered, the AP / FD TCAS mode arms.

When a Resolution Advisory is triggered, the AP / FD TCAS mode engages to provide guidance in accordance with the Resolution Advisory order:

- The AP status does not change: Remains engaged or disengaged
- If the FD s are disengaged, they automatically engage.

When the "CLEAR OF CONFLICT" aural alert sounds, the AP / FD TCAS mode disengages. The AP/FD provides guidance toward the AFS CP selected altitude at the previous ATC clearance.

AP/FD TCAS MODE AVAILABILITY

Applicable to: ALL

The AP/FD TCAS mode is available, when all of the following conditions are met:

- TCAS 1 or TCAS 2 is available
- TCAS is in TA/RA mode
- At least one AP, or one FD, is available
- The AP/FD TCAS mode is not failed (i.e. the ECAM did not trigger the AUTO FLT TCAS MODE FAULT alert).

When the AP/FD TCAS mode is available, the AP/FD TCAS mode can arm or engage.

Intentionally left blank

Arming and Disarming Conditions

ARMING CONDITIONS (WHEN A TRAFFIC ADVISORY IS TRIGGERED)

Applicable to: ALL

L2 To arm, the AP / FD TCAS mode must be available. For more information, *Refer to DSC-22-FG-70-110-10 AP/FD TCAS Mode Availability* .

L1 The AP / FD TCAS mode arms, when
- A Traffic Advisory (TA) alert is triggered, or
- An intruder enters within the TA range.

L2 This usually occurs at the end of a Resolution Advisory, when the "CLEAR OF CONFLICT" aural alert sounds.

L1 The AP / FD TCAS mode arms, even if both AP s, and both FD s are disengaged. In this case, the AP s and FD s remain disengaged. For more information, *Refer to DSC-22-FG-70-110-40-GNTA Introduction* .

DISARMING CONDITIONS

Applicable to: ALL

The AP/FD TCAS mode disarms, when one of the following occurs:
- The intruder becomes white on the ND, or
- The AP/FD TCAS mode engages upon a Resolution Advisory alert, or

L2 - The TA ONLY mode of the TCAS is selected, or
- The STANDBY mode of the TCAS is selected, or
- The AP/FD TCAS mode fails (i.e the ECAM triggers the AUTO FLT TCAS MODE FAULT alert).

Intentionally left blank

Engagement and Disengagement Conditions

ENGAGEMENT CONDITIONS (WHEN A RESOLUTION ADVISORY IS TRIGGERED)

Applicable to: ALL

L2 To engage, the AP/FD TCAS mode must be available. For more information, *Refer to DSC-22-FG-70-110-10 AP/FD TCAS Mode Availability* .

L1 The AP / FD TCAS mode engages, when a Resolution Advisory is triggered.
The AP / FD TCAS mode engages, even if both AP s, and both FD s are disengaged. In this case, the FD s automatically engage. For more information, *Refer to DSC-22-FG-70-110-40-GNRA Introduction* .

L2 *Note:* *When the AP / FD TCAS mode engages, the triple click aural alert does not sound, and the FD pitch bar does not flash.*

DISENGAGEMENT CONDITIONS

Applicable to: ALL

The AP / FD TCAS mode automatically disengages, when the "CLEAR OF CONFLICT" aural alert sounds.
Then the AP / FD engages in a vertical mode that leads the aircraft toward the latest target altitude set on the AFS CP . For more information, *Refer to DSC-22-FG-70-110-40-GNCOC Introduction* .

L2 The AP / FD TCAS mode also automatically disengages, if one of the following occurs:
- The TA ONLY mode of the TCAS is selected, or
- The STANDBY mode of the TCAS is selected, or
- The ECAM triggers the AP / FD AUTO FLT TCAS MODE FAULT alert, or
- The flight crew engages another AP / FD vertical mode (e.g. in the case of go-around).

Intentionally left blank

Normal Operations

WHEN A TRAFFIC ADVISORY IS TRIGGERED

Applicable to: ALL

When a Traffic Advisory (TA) alert is triggered, the TCAS mode arms.

CONSEQUENCE ON AP AND FD

When the AP/FD TCAS mode arms, the AP and FDs engagement status does not change.

CONSEQUENCE ON AP/FD LATERAL MODE

When the AP/FD TCAS mode arms, any engaged(armed) AP/FD lateral mode remains engaged(armed).

CONSEQUENCE ON AP/FD VERTICAL MODE

When the AP/FD TCAS mode arms, any armed(engaged) AP/FD vertical mode remains armed(engaged).
The FMA displays TCAS on the third line of the second column. If another AP/FD vertical mode is armed, the FMA displays both modes.

WHEN A RESOLUTION ADVISORY IS TRIGGERED

Applicable to: ALL

At occurrence of any preventive or corrective Resolution Advisory (RA), the AP/FD TCAS mode engages. It provides vertical guidance in accordance with the TCAS vertical speed orders.

CONSEQUENCE ON AP AND FD

When the AP/FD TCAS mode engages:
- The AP engagement status does not change
- If both FDs are disengaged, the FDs automatically engage.

CONSEQUENCE ON AP/FD LATERAL MODE

When the AP/FD TCAS mode engages, any engaged(armed) AP/FD lateral mode remains engaged(armed).
If both APs and both FDs are disengaged, when the AP/FD TCAS mode engages, HDG automatically engages. The heading target is the aircraft heading at HDG engagement.

CONSEQUENCE ON AP/FD VERTICAL MODE

GUIDANCE

Depending on the Resolution Advisory (RA) and the AFS CP selected altitude, the AP/FD TCAS mode uses the guidance law of one of the following modes: V/S, altitude acquire, or altitude hold.

V/S guidance

The AP/FD TCAS mode uses the guidance law of the V/S mode if:
- ALT(ALT CRZ) is not armed, or
- The capture(hold) of the AFS CP selected altitude is not compatible with the RA order.

The vertical speed target is one of the following values:
- The aircraft vertical speed at the engagement of the AP/FD TCAS mode, if a preventive RA is triggered, or
- The limit between the green and red area of the vertical speed scale, plus(minus) 200 ft/min if the aircraft should climb(descend).
  If the Resolution Advisory order changes, the AP/FD TCAS mode follows the new target.

L2 In AP/FD TCAS mode, the load factor authority of the guidance law is increased, and can reach ±0.3 g. The AP/FD TCAS mode ensures that the aircraft speed remains between VLS - 5 kt and VMAX.

L1 Altitude acquire(hold) guidance

The AP/FD TCAS mode uses the guidance law of the ALT(ALT CRZ)(ALT*)(ALT CRZ*) mode if:
- ALT(ALT CRZ) is armed
- The capture(hold) of the AFS CP selected altitude is compatible with the RA order.

L2 For more information, See Capture of the selected altitude in TCAS mode.

L1 **AP/FD VERTICAL MODE ENGAGED AT OCCURRENCE OF THE RA**

When the AP/FD TCAS mode engages, any engaged AP/FD vertical mode disengages.

L2 *Note: If G/S(F-G/S) is engaged, when the AP/FD TCAS mode engages:*
- *G/S(F-G/S) disengages*
- *The APPR pb comes off, and the LOC pb comes on.*

L1 **AP/FD VERTICAL MODE ARMED AT OCCURRENCE OF THE RA**

When the AP/FD TCAS mode engages, any armed AP/FD vertical mode disarms, except ALT(ALT CRZ) if the altitude capture is compatible with the RA order.

L2 *Note: If G/S(F-G/S) is armed, when the AP/FD TCAS mode engages:*
- *G/S(F-G/S) disarms*
- *The APPR pb comes off, and the LOC pb comes on.*

Capture of the Selected Altitude in TCAS mode

If ALT(ALT CRZ) is armed, when the AP/FD TCAS mode engages:
- ALT(ALT CRZ) remains armed if the capture of the AFS CP selected altitude is compatible with the Resolution Advisory order, and if the selected level is reached before the clear of conflict.

L3 If ALT(ALT CRZ) is armed, and ALT capture conditions occur during the Resolution Advisory, the AP/FD TCAS mode captures the AFS CP selected altitude (without ALT* indicated on the FMA).

L2 This can occur when the TCAS triggers a preventive RA "MONITOR VERTICAL SPEED", or a corrective RA "ADJUST VERTICAL SPEED, ADJUST".

L3 However, if the vertical speed order of the Resolution Advisory is zero, ALT(ALT CRZ) disarms.

L2 - ALT(ALT CRZ) disarms, if the capture of the AFS CP selected altitude is not compatible with the Resolution Advisory order.

White Box on FMA

When a vertical mode disarms at TCAS mode engagement, the FMA displays a white box for 10 s.

CONSEQUENCE ON THE FLYING REFERENCE

If the flying reference is TRK-FPA, when the AP/FD TCAS mode engages, the flying reference automatically becomes HDG-V/S.
When the AP/FD TCAS mode disengages (e.g. at the CLEAR OF CONFLICT), the FMA displays the TRK FPA DESELECTED message for 10 s on the third line.

CONSEQUENCE ON A/THR AND SPEED/MACH CONTROL

When the AP/FD TCAS mode engages:
- If the A/THR is disconnected, it becomes armed or active, depending on the thrust lever position
- If the A/THR is armed, it remains armed
- If the A/THR is active, it remains active.

A/THR ACTIVE

When the AP/FD TCAS mode engages, if the A/THR becomes(remains) active, the SPEED/MACH mode engages.

The speed/Mach control becomes selected, and the speed/Mach target becomes the aircraft speed/Mach at the occurrence of the Resolution Advisory (RA).

L2 If a new RA order occurs, the speed/Mach target changes, and becomes the aircraft speed/Mach at the occurrence of the new RA.

L1 **A/THR ARMED**

When the AP/FD TCAS mode engages, if the A/THR becomes(remains) armed, the thrust target does not change.
The FMA displays the A/THR message, in accordance with the thrust lever position (e.g. MAN THR, MAN TOGA).

L2 *Note: If the flight crew sets the thrust levers to the CL detent, the A/THR activates. The SPEED/MACH mode engages. The speed/Mach control becomes selected, and the speed/Mach target becomes the aircraft speed/Mach at the A/THR activation.*

L1 LVR CLB Message on the FMA

In the case of AP/FD TCAS mode engagement when the A/THR is armed (e.g. Resolution Advisory order before the thrust reduction altitude), the LVR CLB message may flash on the FMA:

- If the vertical speed order of the resolution advisory is above 500 ft/min, the LVR CLB message is inhibited
  However, if the speed becomes greater than VFE - 20 kt, the LVR CLB message flashes on the FMA.
- If the vertical speed order of the Resolution Advisory is equal to, or below 500 ft/min, the LVR CLB message flashes on the FMA.

WHEN CLEAR OF CONFLICT

Applicable to: ALL

When the "CLEAR OF CONFLICT" aural alert sounds, the AP/FD TCAS mode automatically disengages. The AP/FD provides guidance toward the previous AFS CP selected altitude.

CONSEQUENCE ON AP/FD LATERAL MODE

When the AP/FD TCAS mode disengages, any engaged(armed) AP/FD lateral mode remains engaged(armed).

CONSEQUENCE ON AP / FD VERTICAL MODE

When the AP / FD TCAS mode disengages, one of the following modes engages: V/S , ALT* , ALT , ALT CRZ* , or ALT CRZ :

- In the case of an altitude capture or hold during TCAS mode engagement (*Refer to DSC-22-FG-70-110-40-GNRA Consequence on AP and FD*), the TCAS mode may revert to ALT* (ALT CRZ*), or ALT (ALT CRZ) when clear of conflict.
- In all other cases, the TCAS mode reverts to V/S mode when clear of conflict.

TCAS MODE REVERSION TO V/S

When the AP / FD TCAS mode reverts to V/S when clear of conflict, all of the following occurs:

- ALT or ALT CRZ arms

L3 However, ALT does not arm in the following cases:

- A preventive Resolution Advisory occurred, when one of the following modes was engaged: G/S* , G/S , F-G/S* , or F-G/S
- The AFS CP selected altitude is above the aircraft altitude.

L1
- A triple click aural alert sounds, and the pitch bar flashes for 10 s
- The vertical speed target depends on whether a preventive Resolution Advisory occurred, or a corrective Resolution Advisory occurred.

Vertical Speed Target - A Preventive Resolution Advisory Occurred

The vertical speed target remains the vertical speed target at the triggering of the Resolution Advisory.

Vertical Speed Target - A Corrective Resolution Advisory Occurred

The vertical speed target becomes:

- 500 ft/min , if the aircraft is at, or above 30 000 ft , and the AFS CP selected altitude is above the aircraft
- ± 1 000 ft/min , in all other cases.
  V/S leads the aircraft toward the AFS CP selected altitude.

TCAS MODE REVERSION TO ALT (ALT CRZ)(ALT*)(ALT CRZ*)

If ALT (ALT CRZ) is armed, when the AP / FD TCAS mode disengages:

- ALT* (ALT CRZ*) engages, if the aircraft is within the capture zone of the AFS CP selected altitude
- ALT (ALT CRZ) engages, if the aircraft altitude is equal to the AFS CP selected altitude.
- In all other cases, V/S engages.

Intentionally left blank

Inhibition Conditions

INHIBITION CONDITIONS

Applicable to: ALL

The AP / FD TCAS mode arming and engagement are inhibited when the TCAS is in Traffic Advisory only (TA ONLY) mode or in Standby (STBY) mode.

L2 For more information on the manual or automatic selection of the TA ONLY mode, *Refer to DSC-34-20-40-10-20 TA ONLY Mode* .

For more information on the selection of the STBY mode, *Refer to DSC-34-20-40-10-20 Standby Mode* .

If the TA ONLY(STBY) mode of the TCAS is automatically or manually selected during a Traffic Advisory, the AP / FD TCAS mode automatically disarms.

If the TA ONLY(STBY) mode of the TCAS is automatically or manually selected during a Resolution Advisory, the AP / FD TCAS mode automatically disengages.

When the AP / FD TCAS mode disengages, all of the following simultaneously occurs:

1. The AP / FD TCAS mode reverts to V/S
   A triple click aural alert sounds and the FD pitch bar flashes for 10 s
   L3 If the Resolution Advisory order was to descend, the vertical speed target becomes 0 ft/min .
   If not, the vertical speed target remains equal to the vertical speed target at the TCAS mode engagement.
2. L2 The AP / FD lateral mode remains engaged
3. The FMA displays the TCAS RA INHIBITED message on the second and third columns of the third line.

Intentionally left blank

Takeoff

INTRODUCTION

Applicable to: ALL

For scenario examples on takeoff:

- *Refer to DSC-22-FG-70-120-20 Takeoff with NAV*
- *Refer to DSC-22-FG-70-120-20 Takeoff with HDG/TRK Preset* .

TAKEOFF WITH NAV

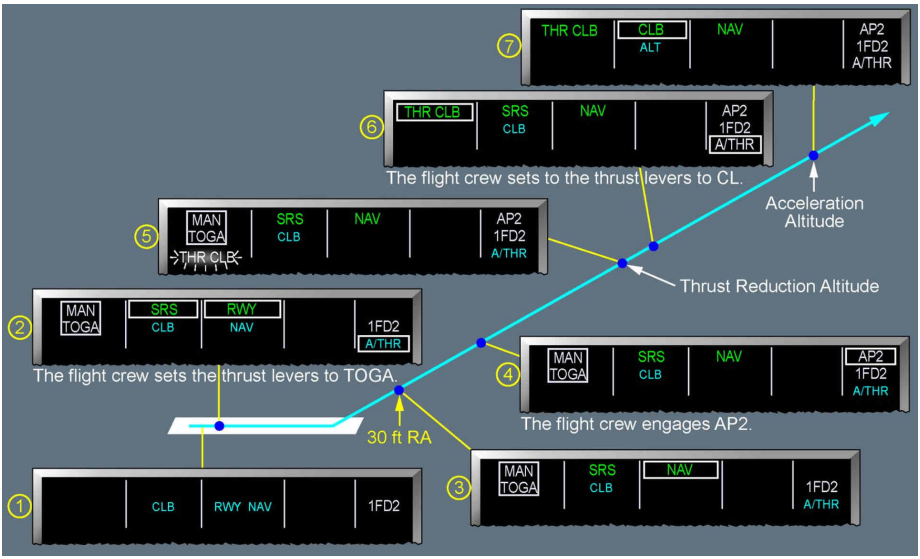
Applicable to: ALL

The aircraft is on ground, and:

- FDs are engaged
- A runway and a SID are selected in the flight plan
- V2 is inserted in the APPR panel of the FMS PERF page
- TOGA is selected in the APPR panel of the FMS PERF page
- The AFS CP selected altitude is set above the acceleration altitude
- The slats are extended.

These settings cause NAV and CLB arming. The aircraft approaches the runway threshold, and the LOC signal is available: RWY arms.
The aircraft is at the runway threshold, and the flight crew sets the thrust levers to TOGA: SRS TO and RWY engage, MAN TOGA appears on the FMA. At least five seconds after liftoff, the flight crew can engage one AP. At 30 ft RA, RWY disengages, and NAV engages. When the aircraft reaches the thrust reduction altitude, LVR CLB flashes. The flight crew sets the thrust levers to CL: MAN TOGA disappears, THR CLB engages. At the acceleration altitude, SRS TO disengages, and CLB engages.
From liftoff to the acceleration altitude, the managed speed target is V2 + 10 kt. At the acceleration altitude, the managed speed target becomes the applicable FMS speed target (e.g. CLB SPD LIM, ECON speed).

Takeoff with NAV



TAKEOFF WITH HDG/TRK PRESET

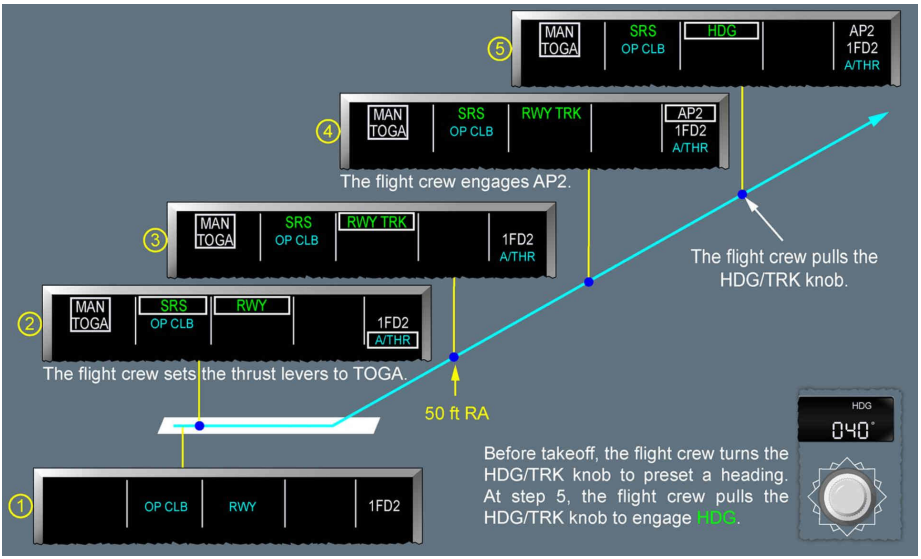
Applicable to: ALL

The aircraft is on ground, and:
- FDs are engaged
- A runway is selected in the flight plan
- V2 is inserted in the APPR panel of the FMS PERF page
- TOGA is selected in the APPR panel of the FMS PERF page
- The AFS CP selected altitude is set above the acceleration altitude
- The flight crew selects a heading (or track) preset by turning the HDG/TRK knob on the AFS CP
- The slats are extended.

These settings cause OP CLB arming. The HDG/TRK window displays the heading (or track). The display remains, as long as RWY, RWY TRK, and HDG (or TRACK) are engaged.
The aircraft approaches the runway threshold, and the LOC signal is available: RWY arms.
The aircraft is at the runway threshold, and the flight crew sets the thrust levers to TOGA: SRS TO and RWY engage, MAN TOGA appears on the FMA. At least five seconds after liftoff, the flight crew can engage one AP. At 50 ft RA, RWY disengages, and RWY TRK engages. The flight crew pulls the HDG/TRK knob: HDG engages (HDG-V/S is selected).
At the thrust reduction altitude, THR CLB engages. At the acceleration altitude, OP CLB engages.

From liftoff to the acceleration altitude, the managed speed target is V2 + 10 kt. At the acceleration altitude, the managed speed target becomes the applicable FMS speed target (e.g. CLB SPD LIM, ECON speed).

Takeoff with HDG/TRK Preset



Intentionally left blank

Climb with OP CLB Mode

INTRODUCTION

Applicable to: ALL

For scenario examples on climb with OP CLB mode:

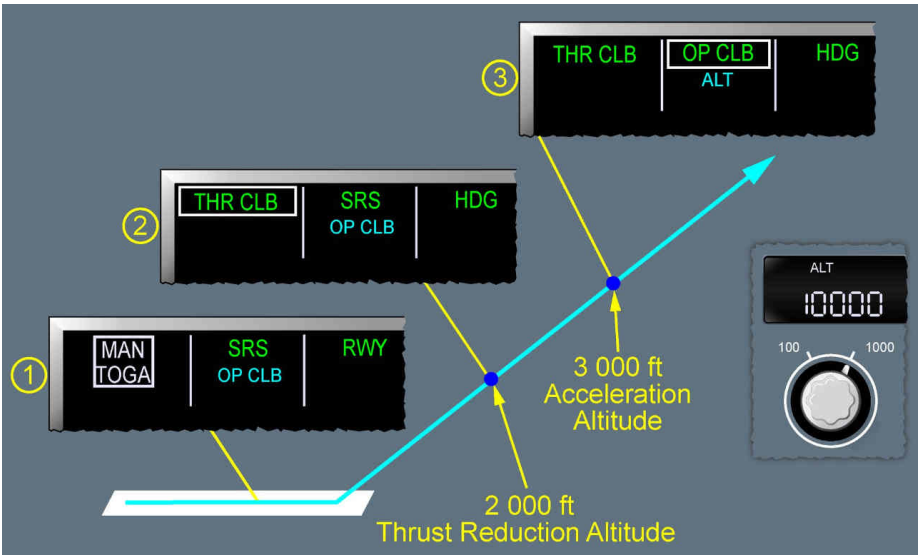
- *Refer to DSC-22-FG-70-120-40 At the Acceleration Altitude*
- *Refer to DSC-22-FG-70-120-40 The Flight Crew Pulls the ALT Knob*
- *Refer to DSC-22-FG-70-120-40 NAV Disengages .*

AT THE ACCELERATION ALTITUDE

Applicable to: ALL

On ground, with NAV not armed, OP CLB arms. OP CLB automatically engages at the acceleration altitude.

At the Acceleration Altitude

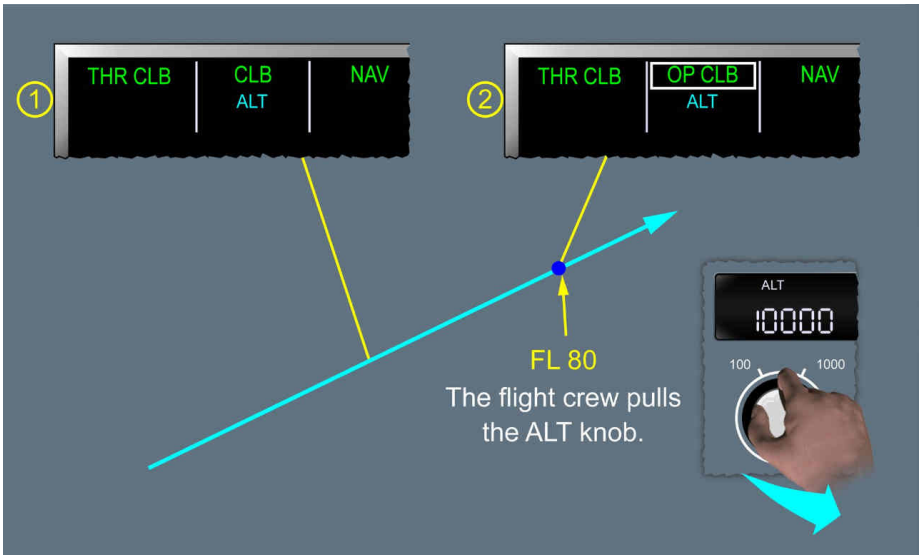


THE FLIGHT CREW PULLS THE ALT KNOB

Applicable to: ALL

CLB is engaged, and the flight crew pulls the ALT knob: OP CLB engages.

The Flight Crew Pulls the ALT Knob



NAV DISENGAGES

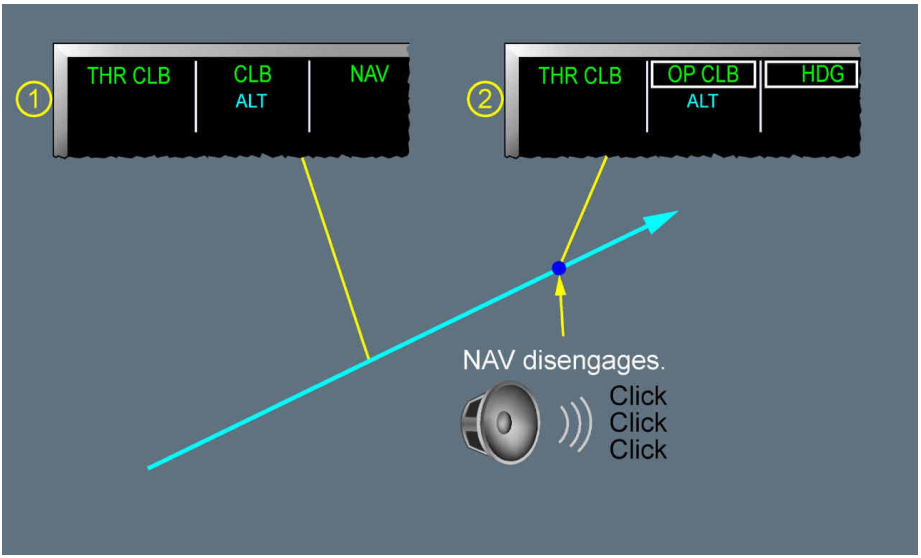
Applicable to: ALL

CLB and NAV are engaged.
If NAV disengages: CLB automatically disengages, and OP CLB engages.

However, if NAV has disengaged after:
- The aircraft has reached a flight plan discontinuity, or
- The next altitude target was an altitude constraint, and the flight crew has engaged HDG/TRACK mode.

Then, the scenario is a reversion: A triple click aural warning sounds.

NAV disengages



Intentionally left blank

Climb with CLB Mode

INTRODUCTION

Applicable to: ALL

For scenario examples on climb with CLB mode:

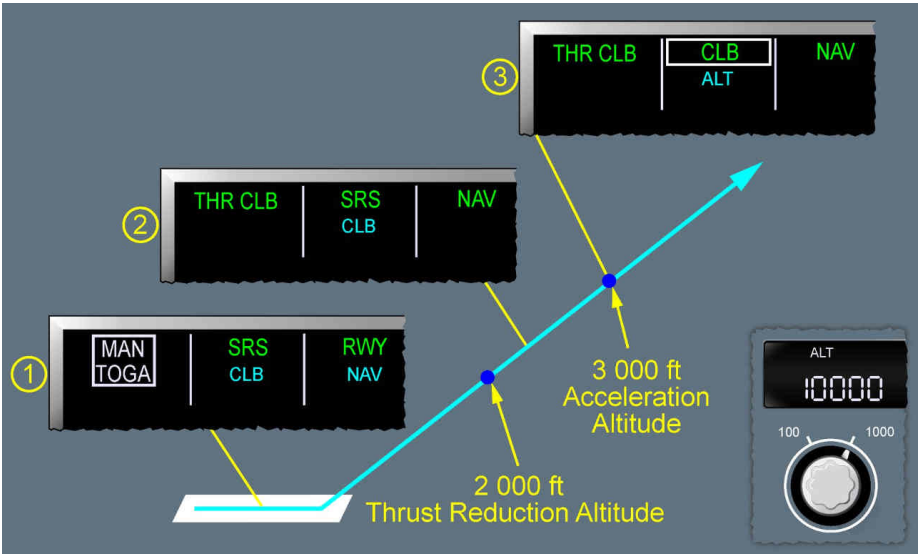
- *Refer to DSC-22-FG-70-120-50 At the Acceleration Altitude*
- *Refer to DSC-22-FG-70-120-50 Climbing toward an Altitude Constraint .*

AT THE ACCELERATION ALTITUDE

Applicable to: ALL

On ground, with NAV armed, CLB arms. CLB automatically engages at the acceleration altitude.

At the Acceleration Altitude

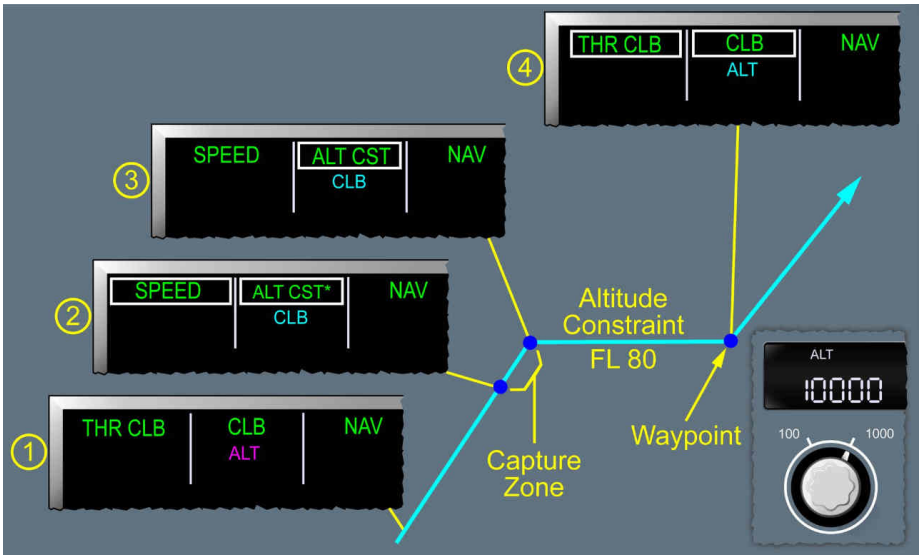


CLIMBING TOWARD AN ALTITUDE CONSTRAINT

Applicable to: ALL

When an altitude constraint is defined at a waypoint, CLB remains engaged until reaching the altitude constraint. CLB will reengage when the aircraft sequences the waypoint.

Climbing toward an Altitude Constraint



Altitude Acquire and Altitude Hold

INTRODUCTION

Applicable to: ALL

For scenario examples on altitude acquire and altitude hold:

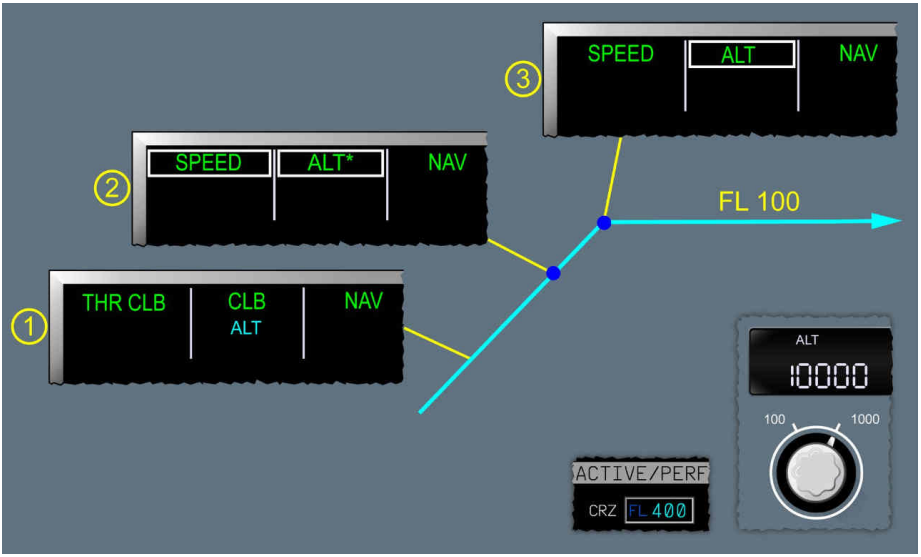
- *Refer to DSC-22-FG-70-120-60 CLB and ALT - Example 1*
- *Refer to DSC-22-FG-70-120-60 CLB and ALT - Example 2*
- *Refer to DSC-22-FG-70-120-60 CLB and ALT CST*
- *Refer to DSC-22-FG-70-120-60 CLB and ALT CRZ*
- *Refer to DSC-22-FG-70-120-60 OP CLB and ALT*
- *Refer to DSC-22-FG-70-120-60 OP CLB and ALT CRZ .*

CLB AND ALT - EXAMPLE 1

Applicable to: ALL

The vertical guidance is managed, and the aircraft climbs toward the AFS CP selected altitude.

CLB and ALT - Example 1



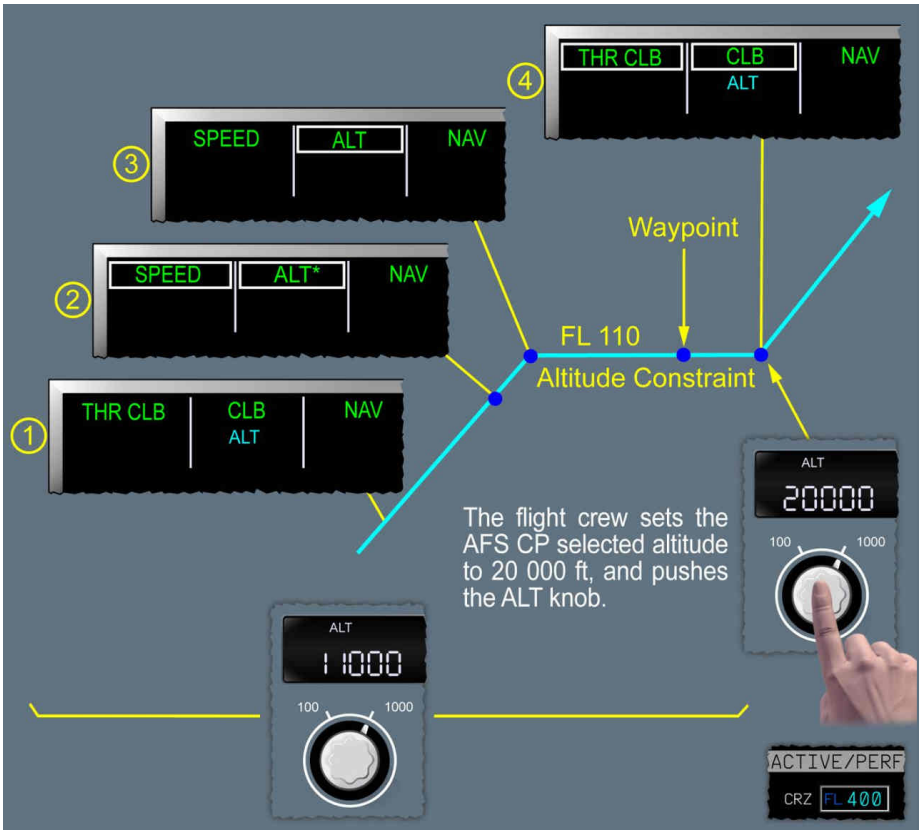
CLB AND ALT - EXAMPLE 2

Applicable to: ALL

The vertical guidance is managed, and:

- The aircraft climbs toward an altitude constraint, and
- The AFS CP selected altitude is equal to the altitude constraint.

CLB and ALT - Example 2



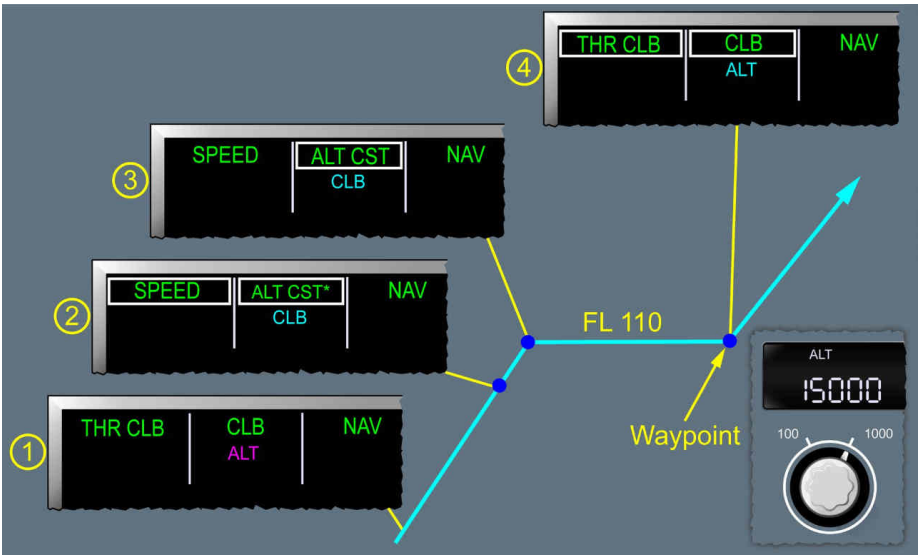
CLB AND ALT CST

Applicable to: ALL

The vertical guidance is managed, and:

- The aircraft climbs toward an altitude constraint, and
- The AFS CP selected altitude is above the altitude constraint.

CLB and ALT CST

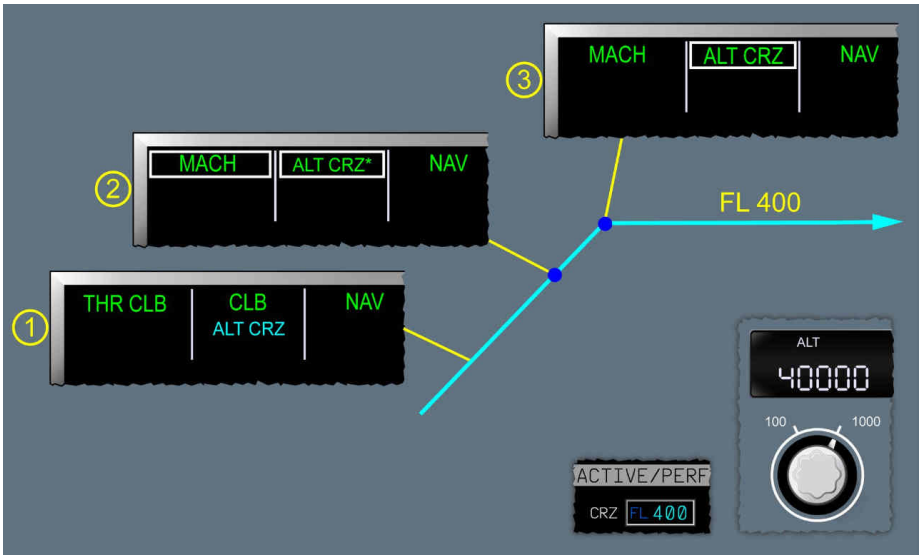


CLB AND ALT CRZ

Applicable to: ALL

The vertical guidance is managed, and the aircraft climbs toward the cruise altitude. The AFS CP selected altitude is equal to the cruise altitude.

CLB and ALT CRZ

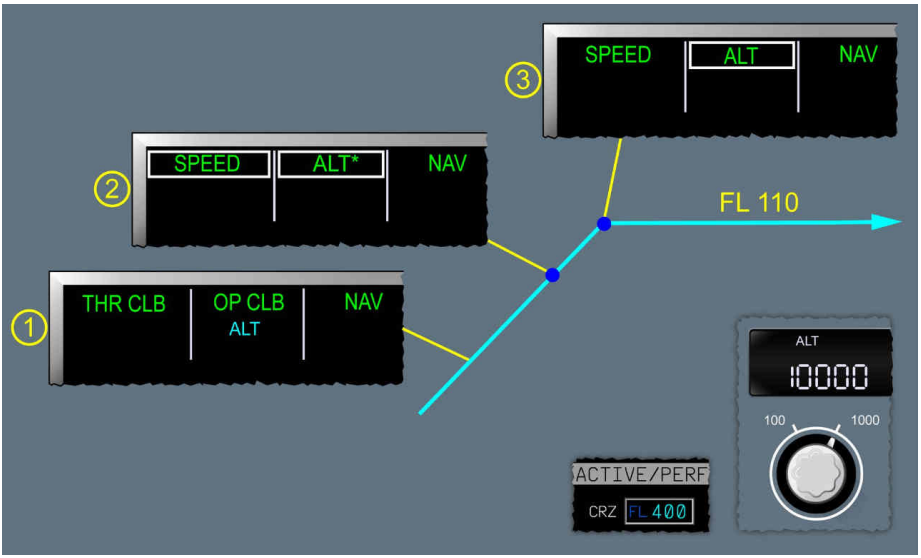


OP CLB AND ALT

Applicable to: ALL

OP CLB is engaged, and the aircraft climbs toward the AFS CP selected altitude.

OP CLB and ALT

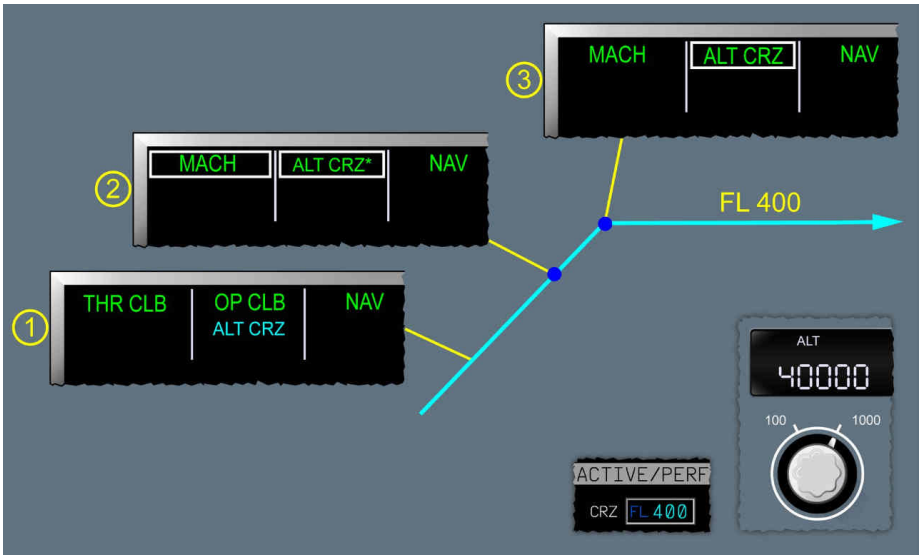


OP CLB AND ALT CRZ

Applicable to: ALL

OP CLB is engaged, and the aircraft climbs toward the cruise altitude. The AFS CP selected altitude is equal to the cruise altitude.

OP CLB and ALT CRZ



Approach and Landing

INTRODUCTION

Applicable to: ALL

For scenario examples on approaches:

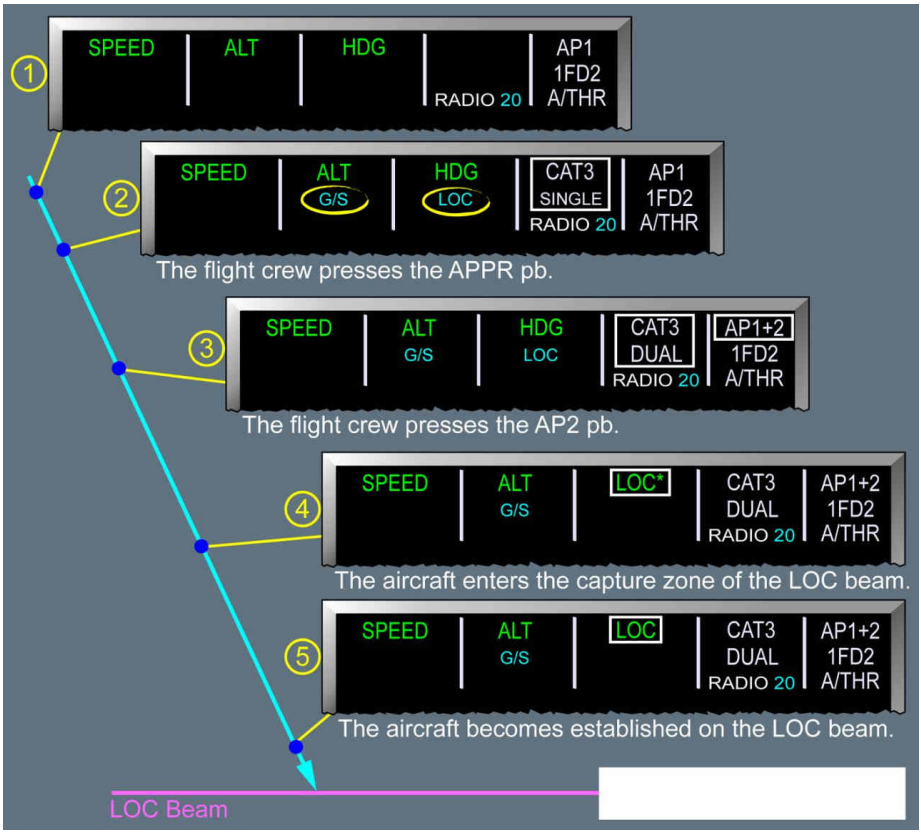
- *Refer to DSC-22-FG-70-120-90 ILS Approach and Autoland*
- *Refer to DSC-22-FG-70-120-90 VOR Approach Flown with FLS Function*
- *Refer to DSC-22-FG-70-120-90 LOC only Approach Flown with FLS Function*

ILS APPROACH AND AUTOLAND

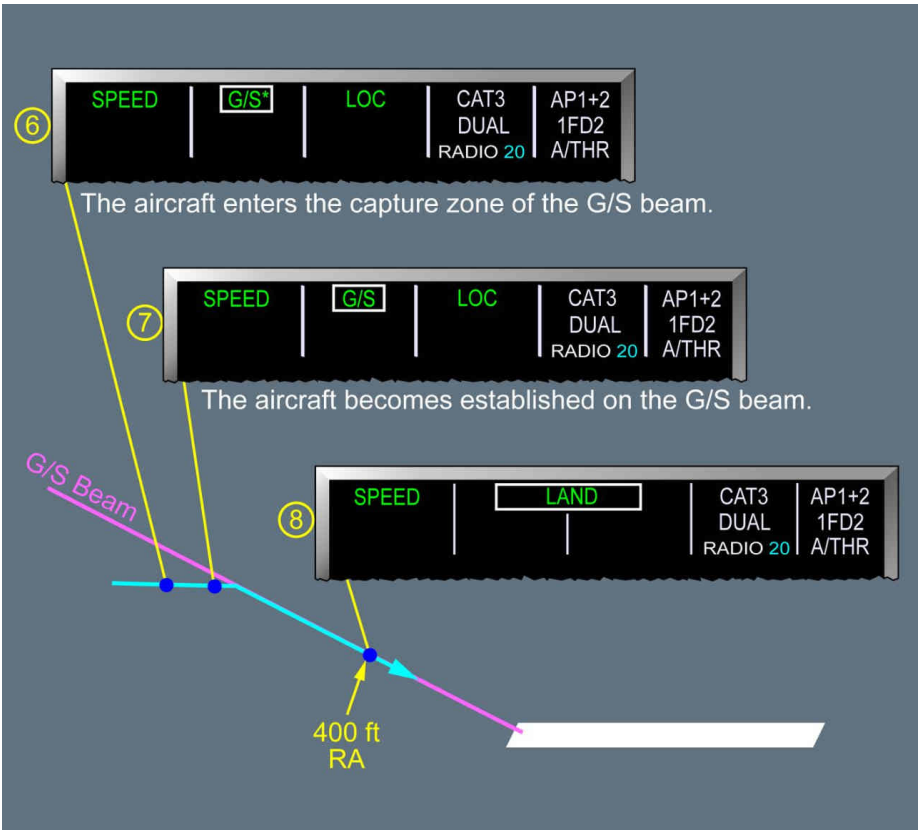
Applicable to: ALL

The flight crew has selected an ILS approach on the FMS ARRIVAL page.
AP1 is engaged. The flight crew has selected a heading, so as to converge toward the LOC beam.

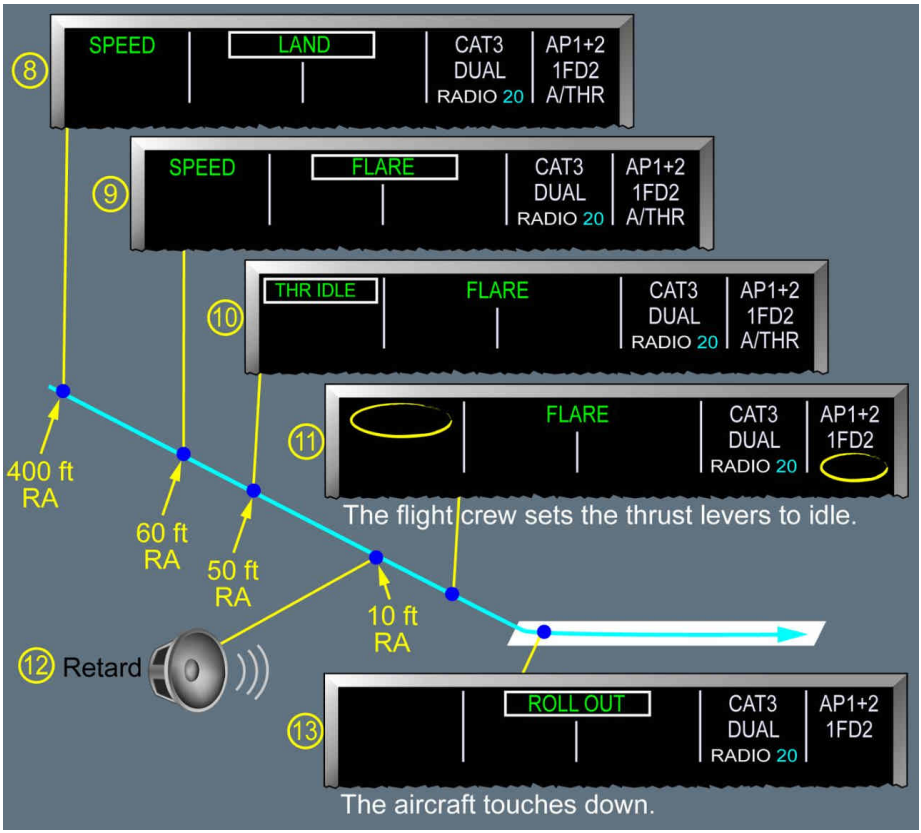
ILS Approach and Autoland - Step 1 to 5



ILS Approach and Autoland - Step 6 to 8



ILS Approach and Autoland - Step 8 to 12

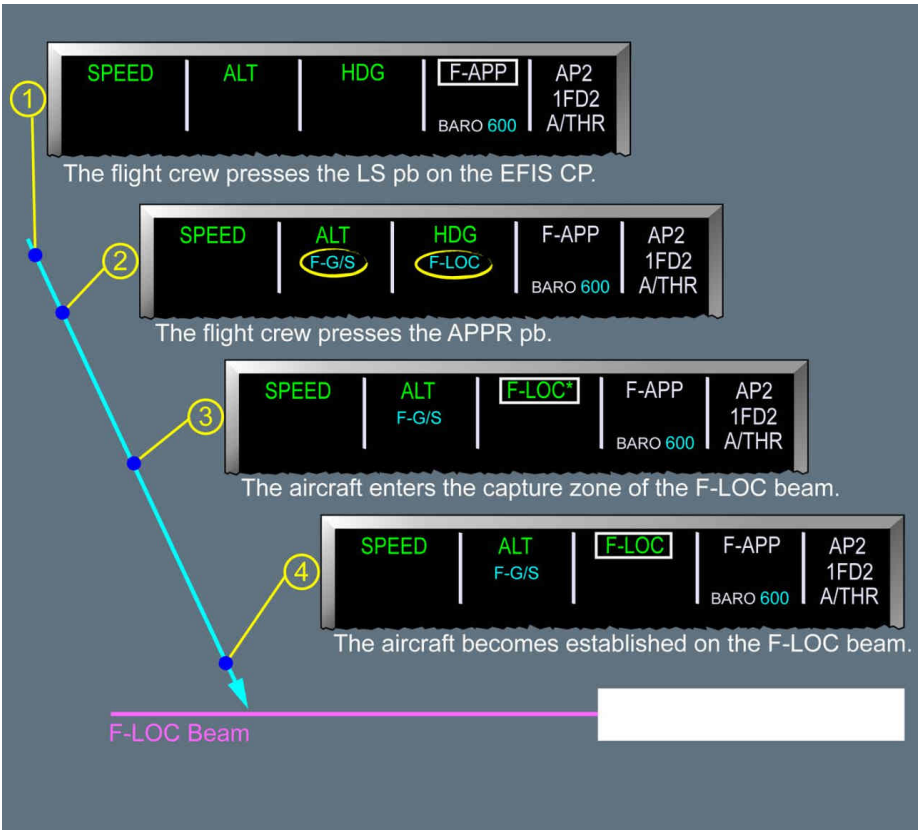


VOR APPROACH FLOWN WITH FLS FUNCTION

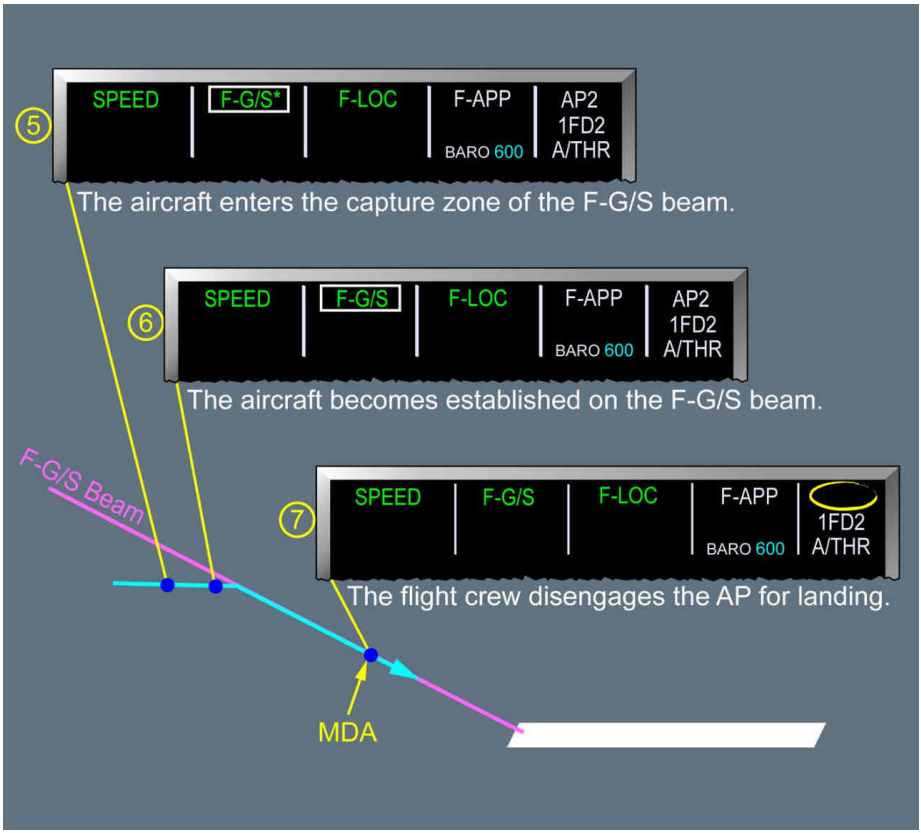
Applicable to: ALL

The flight crew has selected a VOR approach on the FMS ARRIVAL page. The FMS approach phase is activated. AP2 is engaged.
The flight crew has selected a heading, so as to converge toward the F-LOC beam.

VOR Approach Flown with FLS Function - Step 1 to 4



VOR Approach Flown with FLS Function - Step 5 to 7

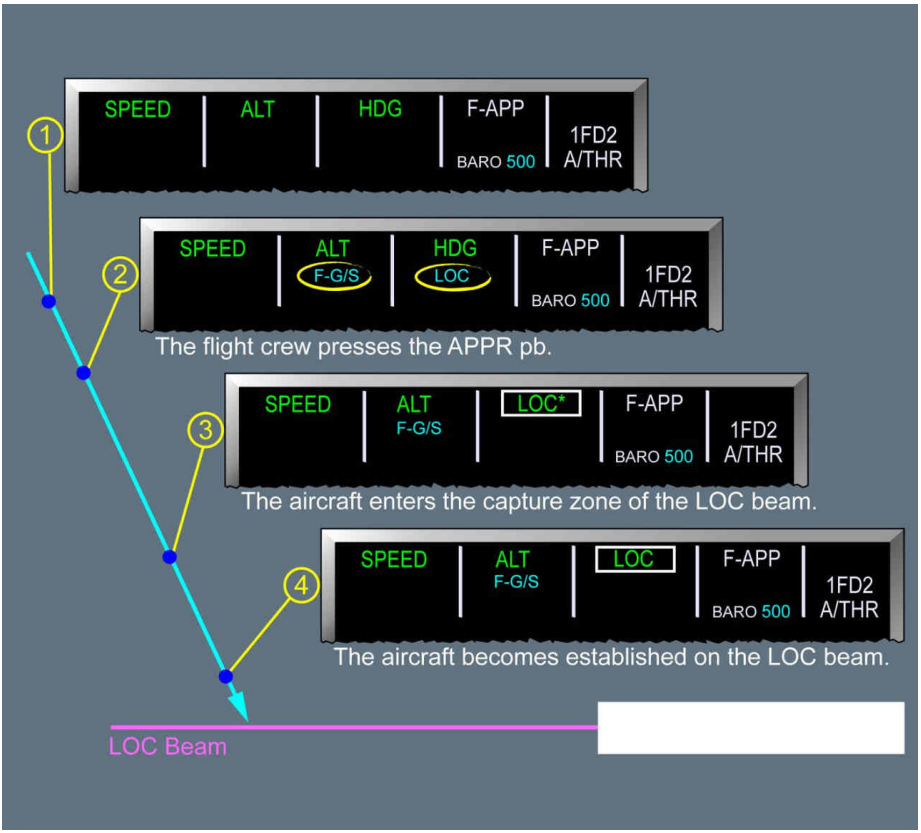


LOC ONLY APPROACH FLOWN WITH FLS FUNCTION

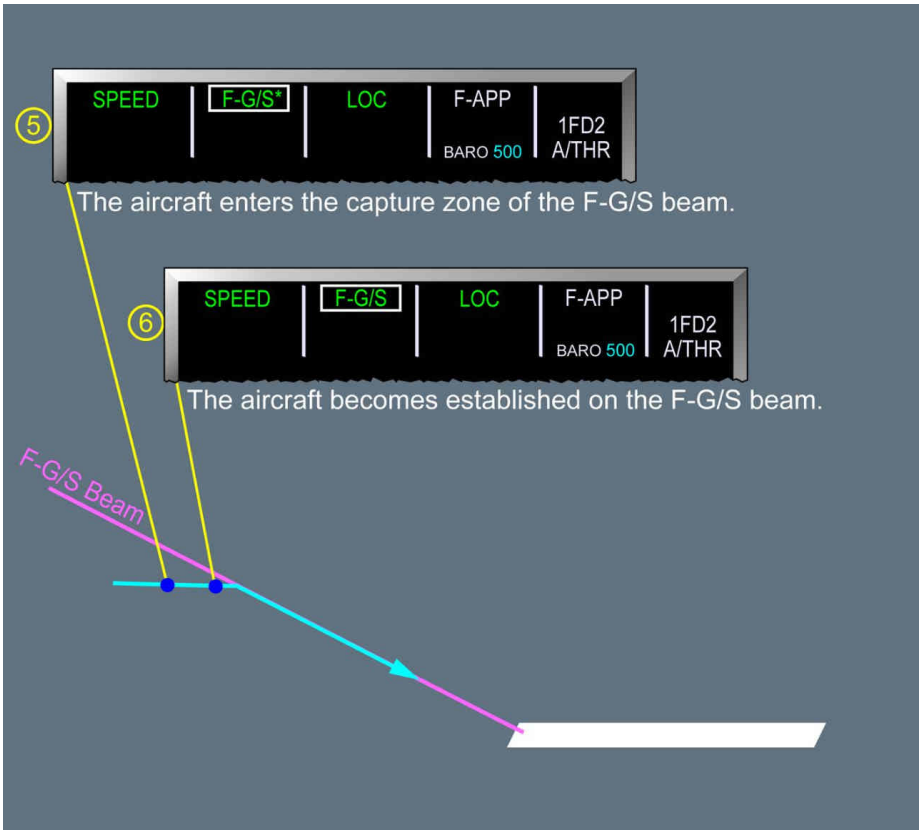
Applicable to: ALL

The flight crew has selected a LOC approach on the FMS ARRIVAL page. The FMS approach phase is activated. AP2 is engaged.
The flight crew has selected a heading, so as to converge toward the LOC beam.

LOC only Approach Flown with FLS Function - Step 1 to 4



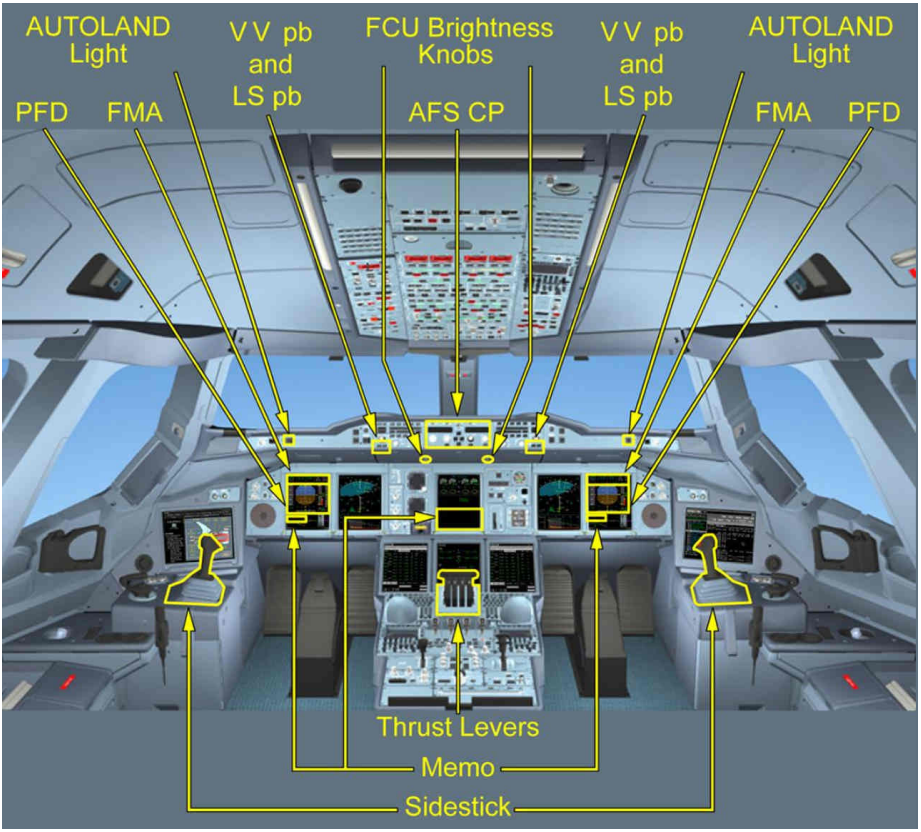
LOC only Approach Flown with FLS Function - Step 5 to 7



COCKPIT VIEW

Applicable to: ALL

Cockpit View



Intentionally left blank

OVERVIEW

Applicable to: ALL

AFS CP

SPD/MACH CONTROL

Applicable to: ALL

SPD /MACH Control

SPD/MACH pb

L13

If the speed (Mach) target is selected:
Pressing the SPD/MACH pb changes the speed target to the corresponding Mach target, and vice versa.

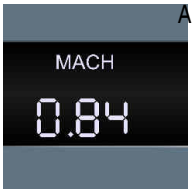
Note: *If the speed or Mach is managed:*
Pressing the SPD/MACH pb will take effect when the speed (Mach) becomes selected.

SPD/ MACH WINDOW

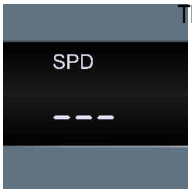
L13

A speed target is selected.

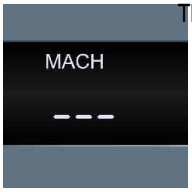
Note: 1. At the aircraft power-up, the SPD/MACH window displays 100 kt.
2. If APs, FDs, and A/THR are off, the SPD/MACH will display the current aircraft speed target.



A Mach target is selected.



The speed target is managed.



The Mach target is managed.

Note: At the speed/Mach crossover altitude, the managed speed target automatically changes to a managed Mach target. The display on the SPD/MACH window changes from SPD to MACH (and vice versa in descent).

SPD/MACH knob

- When turned, preselects a speed or Mach target

Note: *When the SPD/MACH window is dashed, and if the flight crew begins to turn the knob without pulling it, the window displays:*
- *The current aircraft speed, if SRS TO, or SRS GA is engaged, or*
- *The managed speed/Mach target, in all other cases.*

Then, turning the knob would change the value. If there is no action on the knob for 45 s, the dashes reappear.

- When pulled, activates the selected speed or Mach target
- When pushed, the speed or Mach becomes managed.

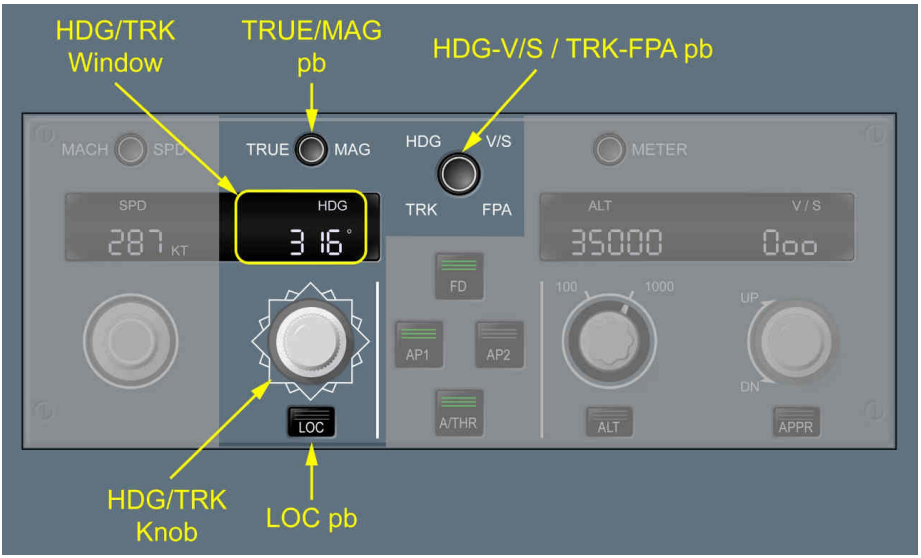
L3 One entire rotation of the knob equals 32 kt (1 kt per click), or 0.32 Mach (0.01 Mach per click).

The selection has a range of:
- 100 kt to 399 kt for the speed
- M 0.01 toM 0.99 for the Mach.

LATERAL CONTROL

Applicable to: ALL

Lateral Control



TRUE/MAG pb

When pressed, changes the TRUE North reference to Magnetic (MAG) North reference, and vice versa.

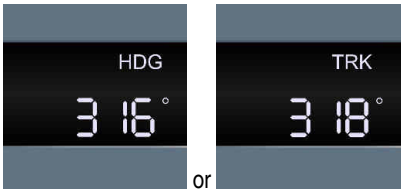
The North reference is magnetic, unless the aircraft is in the polar zone.

When the aircraft reaches the polar zone:

- The North reference automatically changes from MAG to TRUE in the ADIRSs
- The following messages ask the flight crew to change from MAG to TRUE North reference:
  - The SELECT TRUE NORTH REF memo appears on the ND
  - The NAV EXTREME LATITUDE triggers.

HDG / TRK WINDOW

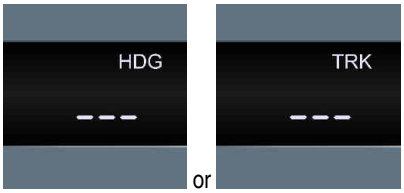
L13



or

- A heading/track target is selected, or
- A HDG / TRK preset is defined, or
  (For more information, *Refer to DSC-22-FG-70-30-20 HDG/TRK Preset* .)
- No AP , and no FD is engaged.

Note: *At the aircraft power-up, the HDG / TRK window displays the current aircraft heading.*



or

The lateral guidance is managed.

Note: *The HDG / TRK window displays TRUE , at the top left corner of the HDG / TRK window, if TRUE is selected with the TRUE/MAG pb .*

HDG/TRK knob

- When turned, preselects a heading or track target

Note: *When the HDG/TRK window is dashed, and if the flight crew begins to turn the knob without pulling it, the window displays the current aircraft heading/track. Then, turning the knob would change the value. If there is no action on the knob for 45 s, the dashes reappear. However, if a HDG/TRK preset is defined, the display of the value remains permanently.*

- When pulled, activates the selected heading or track target
- When pushed, a managed lateral mode arms or engages.

L3 One entire rotation of the knob equals 32 ° (1 ° per click).
The selection has a range of 0° to 359°.

LOC pb

L12

: When pressed, arms the:

- LOC mode, if the flight crew has selected an ILS , a GLS , or a LOC only approach on the FMS ARRIVAL page

  Note: *If the flight crew has manually-tuned an ILS(GLS) on the FMS POSITION NAVAIDS page:*
  - *The approach selected on the FMS ARRIVAL page is disregarded*
  - *The LOC mode arms to fly the LOC of the manually tuned ILS(GLS).*

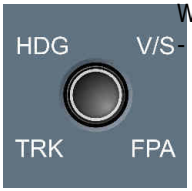
- F-LOC mode, if the flight crew has selected a VOR, NDB, RNV, or GPS approach on the FMS ARRIVAL page
- LOC B/C mode, if one of the following conditions is met:
  - The flight crew has selected a BAC approach (i.e. LOC B/C approach) on the FMS ARRIVAL page
  - The flight crew has selected a LOC only approach on the FMS ARRIVAL page, and entered a back course on the FMS POSITION NAVAIDS page
  - The flight crew has selected an ILS approach on the FMS ARRIVAL page, deselected the G/S on the FMS POSITION NAVAIDS page, and entered a back course on the FMS POSITION NAVAIDS page.

  Note: *If the flight crew has selected an ILS with a back course on the FMS POSITION NAVAIDS page:*
  - *The approach selected on the FMS ARRIVAL page is disregarded*
  - *The LOC B/C mode arms to fly the back course LOC .*

When pressed again, disarms or disengages the LOC, LOC B/C, or F-LOC mode.

For more information on the arming conditions of the approach modes:
- *Refer to LOC Mode / Arming Conditions*
- *Refer to G/S Mode / Arming Conditions*
- *Refer to F-LOC Mode / Arming Conditions*
- *Refer to F-G/S Mode / Arming Conditions*
- *Refer to LOC B/C Mode / Arming Conditions .*

HDG-V/S / TRK-FPA pb



When pressed, selects either:

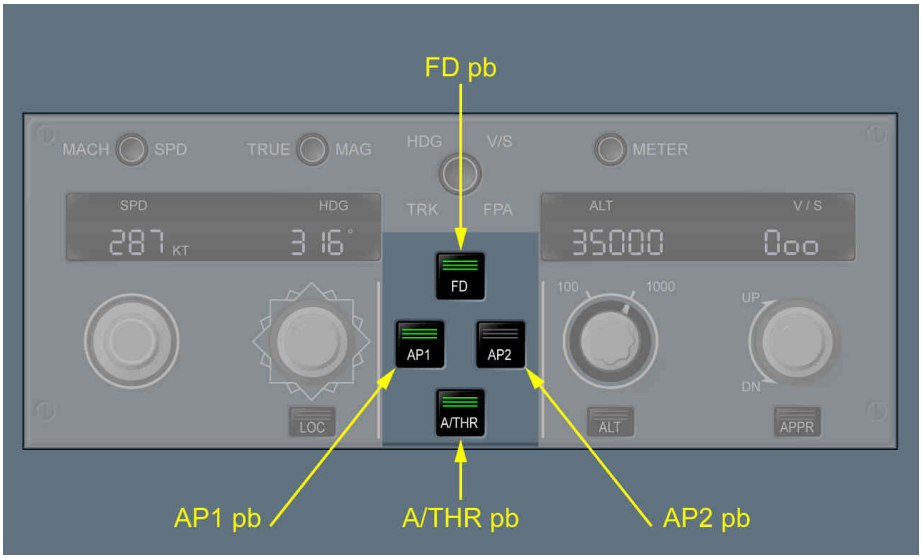
- HDG-V/S: Heading (HDG) is associated with Vertical Speed (V/S)
  If the VV pb is pressed on the EFIS CP , the associated PFD displays the Velocity Vector (VV) in black.
  For more information on the VV, *Refer to DSC-31-20-20-100 Flight Path Vector(Velocity Vector)* .
- TRK-FPA: Track (TRK) is associated with Flight Path Angle (FPA)
  The PFD s display the Flight Path Vector (FPV) in green.
  For more information on the FPV, *Refer to DSC-31-20-20-100 Flight Path Vector(Velocity Vector)* .

For more information on HDG-V/S / TRK-FPA selection, *Refer to AP/FD Modes / HDG-V/S / TRK-FPA Selection* .

AP, FD AND A/THR CONTROL

Applicable to: ALL

AP , FD and A/THR Control



FD pb

The FDs are not engaged.

L12

When pressed, engages FD1 and FD2.

Note: *If only one FD is engaged, the FD pb is also illuminated.*

AP1(2) pb

The AP1(2) is not engaged.

When pressed, engages AP1(2).

A/THR pb

The A/THR is disconnected.

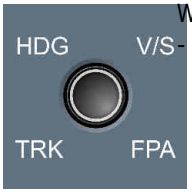
When pressed, arms or activates the A/THR.

VERTICAL CONTROL

Applicable to: ALL

Vertical Control

HDG-V/S / TRK-FPA pb



When pressed, selects either:

- HDG-V/S: Heading (HDG) is associated with Vertical Speed (V/S)
  If the VV pb is pressed on the EFIS CP , the associated PFD displays the Velocity Vector (VV) in black.
  For more information on the VV, *Refer to DSC-31-20-20-100 Flight Path Vector(Velocity Vector)* .
- TRK-FPA: Track (TRK) is associated with Flight Path Angle (FPA)
  The PFD s display the Flight Path Vector (FPV) in green.
  For more information on the FPV, *Refer to DSC-31-20-20-100 Flight Path Vector(Velocity Vector)* .

For more information on HDG-V/S / TRK-FPA selection, *Refer to AP/FD Modes / HDG-V/S / TRK-FPA Selection* .

METER pb

When pressed, displays the current and target altitudes in meters (in addition to feet) on the PFDs.
When pressed again, clears the meter display from the PFDs.

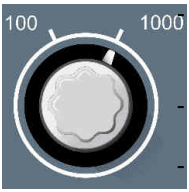
ALT WINDOW

L13

Displays the altitude set by the flight crew with the ALT knob.

Note: *1. The window never displays dashes.*
2. At the aircraft power-up, the ALT window displays the current aircraft altitude, rounded to the nearest hundred.

ALT knob



When turned, sets the target altitude on the AFS CP .
The outer knob has two positions: 100 and 1000, to set the target altitude in increments of 100 ft or 1 000 ft .

- When pulled, activates the selected target altitude on the AFS CP . The FMS vertical profile is disregarded.
- When pushed, the altitude target becomes managed. The FMS vertical profile is respected, or the AFS CP target altitude is respected, if applicable (*Refer to AP/FD Modes / Altitude Acquire and Altitude Hold / General* .

ALT pb

When pressed, the aircraft immediately starts to level-off.

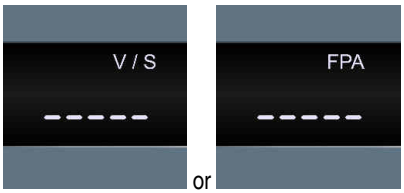
Note: *The ALT pb also comes on, when the aircraft maintains a selected or managed altitude.*

V/S / FPA WINDOW

or

- A V/S / FPA target is selected, or
- No AP, and no FD is engaged.

L13



- The vertical profile is managed, or
- A selected vertical mode, different than V/S or FPA, is engaged.

Note: *At the aircraft power-up, the V/S / FPA window displays dashes.*

V/S / FPA knob

- When turned, preselects a vertical speed or flight path angle target

Note: *When the V/S / FPA window is dashed, and if the flight crew turns the knob without pulling it, the window displays the current V/S / FPA aircraft. Then, turning the knob would change the value. If there is no action for 45 s, the dashes reappear.*

- When pulled, activates the selected vertical speed or flight path angle target.

Note: *When pushed: There is no effect.*

L3 One entire rotation equals 1 600 ft/min in vertical speed (100 ft/min per 2 clicks), or 3.2 ° in flight path angle (0.1 ° per click).

The selection has a range of:
- –6 000 ft/min to +6 000 ft/min for the vertical speed
- –9.9 ° to + 9.9 ° for the flight path angle.

APPR PB

L12

Enables the aircraft to fly:
- An ILS approach, or
- A GLS approach, or
- A NPA with the FLS function.

When pressed, arms the:
- LOC and G/S modes, if the flight crew has selected an ILS(GLS) approach on the FMS ARRIVAL page

  Note: *If the flight crew has manually-tuned an ILS(GLS) on the FMS POSITION NAVAIDS page:*
  - *The approach selected on the FMS ARRIVAL page is automatically disregarded*
  - *The LOC and G/S modes arm to fly the manually-tuned ILS(GLS).*

- F-LOC and F-G/S modes, if the flight crew has selected a VOR, NDB, RNV, or GPS approach on the FMS ARRIVAL page
- LOC and F-G/S modes, if:
  - The flight crew has selected an ILS approach on the FMS ARRIVAL page, and deselected the G/S on the FMS POSITION NAVAIDS page, or
  - The flight crew has selected a LOC only approach on the FMS ARRIVAL page.
- LOC B/C and F-G/S modes, if one of the following conditions is met:
  - The flight crew has selected a BAC approach (i.e. LOC B/C approach) on the FMS ARRIVAL page
  - The flight crew has selected a LOC only approach on the FMS ARRIVAL page, and entered a back course on the FMS POSITION NAVAIDS page
  - The flight crew has selected an ILS approach on the FMS ARRIVAL page, deselected the G/S on the FMS POSITION NAVAIDS page, and entered a back course on the FMS POSITION NAVAIDS page.

When pressed again, disarms or disengages the approach modes.

For more information on the arming conditions of the approach modes:
- *Refer to LOC Mode / Arming Conditions*
- *Refer to G/S Mode / Arming Conditions*
- *Refer to F-LOC Mode / Arming Conditions*

- *Refer to F-G/S Mode / Arming Conditions*
- *Refer to LOC B/C Mode / Arming Conditions* .

VV PB

Applicable to: ALL

The Captain's (First Officer's) PFD displays the Velocity Vector (VV).

The Captain's (First Officer's) PFD does not display the VV.

When TRK-FPA is selected, both PFD s automatically display the Flight Path Vector (FPV).

L3 When TRK-FPA is selected, pressing the VV pb has no effect: Both PFD s continue to display the FPV , and the VV light remains on.

L1 When HDG-V/S is selected, the PFD s do not automatically display the VV. However, the Captain (First Officer) can display the VV on their PFD by pressing the VV pb .

The PFD s no longer display the FPV (VV), when:

- The flight crew changes from TRK-FPA to HDG-V/S
  For more information on HDG-V/S / TRK-FPA selection, *Refer to AP/FD Modes / HDG-V/S / TRK-FPA Selection* .
- The flight crew performs a go-around.

LS PB

Applicable to: ALL

L12

The Captain's (First Officer's) PFD displays the following landing system data in accordance with the approach selected on the FMS ARRIVAL page: Deviation scales, deviation signals, course pointer, information.
For information on the landing system data, *Refer to PFD / Approach Guidance* .
If the flight crew selected an NPA on the FMS ARRIVAL page, and the FMS flight phase is descent or approach, the Captain's (First Officer's) FMA displays the FLS capability.
However, the FLS capability will not appear, if the NO FLS FOR THIS APPR message appeared on the MFD .

Note: *1. If the direct distance to the destination airport is more than 300 nm , only the deviation scales appear.*
2. The LS light automatically comes on when LOC , LOC B/C or F-LOC arms.

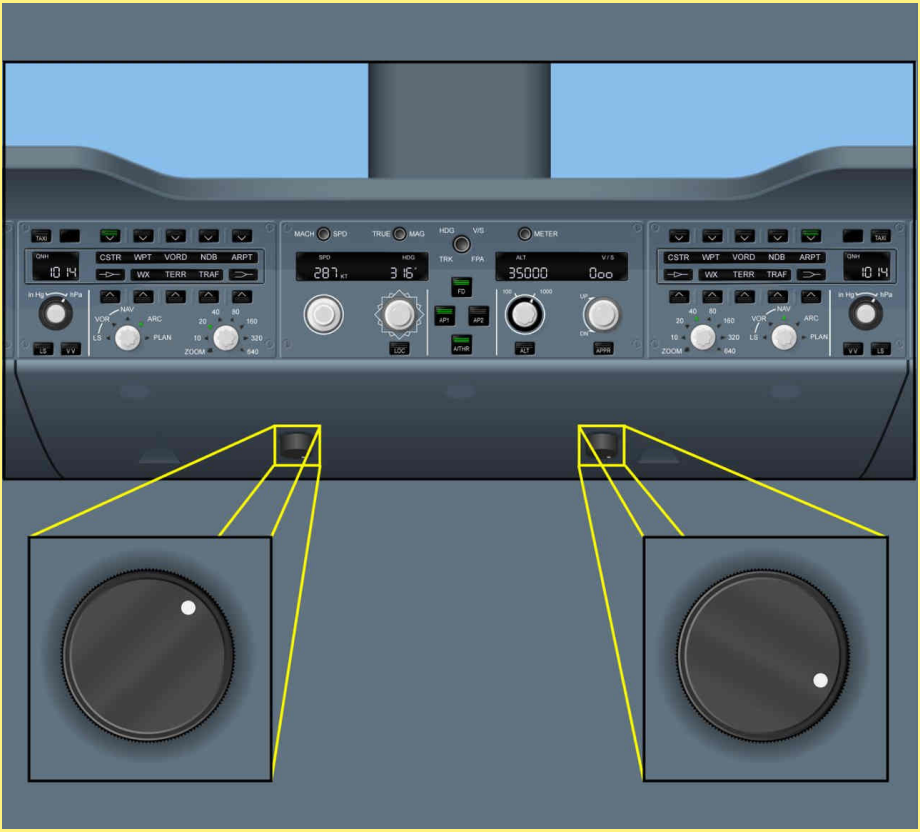
The Captain's (First Officer's) PFD does not display the landing system data.

Intentionally left blank

FCU BRIGHTNESS KNOBS

Applicable to: ALL
Impacted DU: 00017142 FCU Brightness Knobs

FCU Brightness Knobs



THE LEFT KNOB

Controls the brightness of the FCU windows.
When completely turned clockwise: Switches off the FCU.

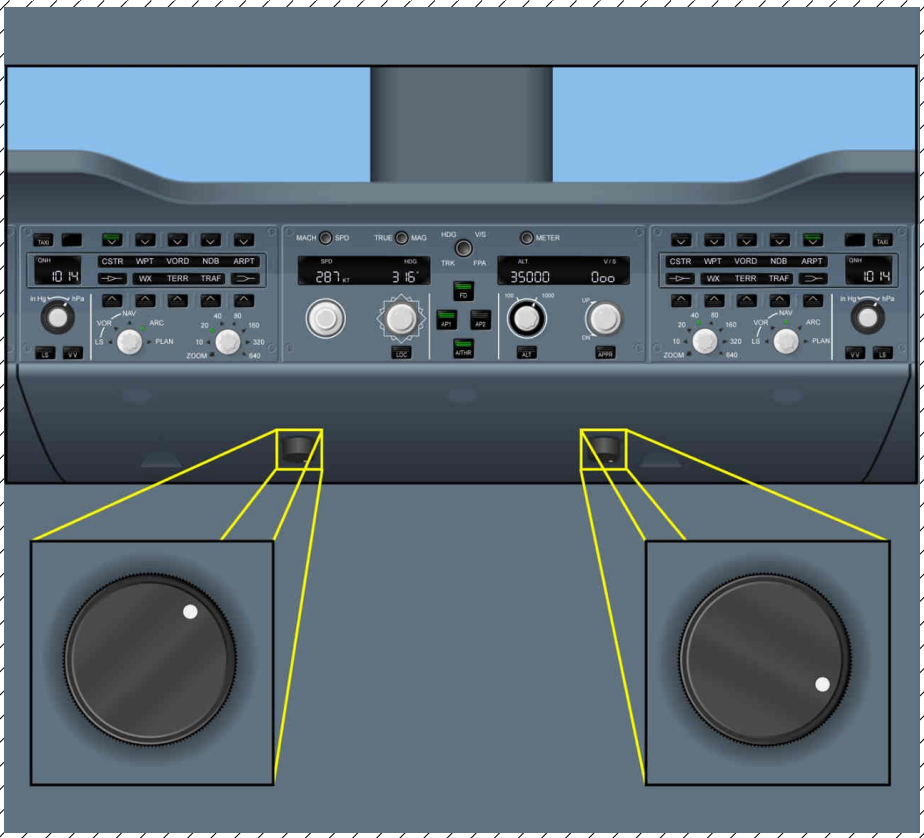
L2 When the FCU is switched off:
- The EFIS CPs and the AFS CP are electrically shutoff.
- The CDS & AUTO FLT FCU SWITCHED OFF alert triggers.

L1 *Note: If the FCU is inadvertently switched off, when adjusting the brightness, wait 3 s to switch back to on the FCU.*

FCU BRIGHTNESS KNOBS

Applicable to: ALL
Impacted by TDU: 00022764 FCU Brightness Knobs

FCU Brightness Knobs



THE LEFT KNOB

Controls the brightness of the FCU windows.
When completely turned clockwise: Switches off the FCU.

L2 When the FCU is switched off:
- The EFIS CPs and the AFS CP are electrically shutoff.
- The CDS & AUTO FLT FCU SWITCHED OFF alert triggers.

L1 **THE RIGHT KNOB**

Controls the brightness of the FCU labels.

Intentionally left blank

MFD - FCU BACKUP

Applicable to: ALL

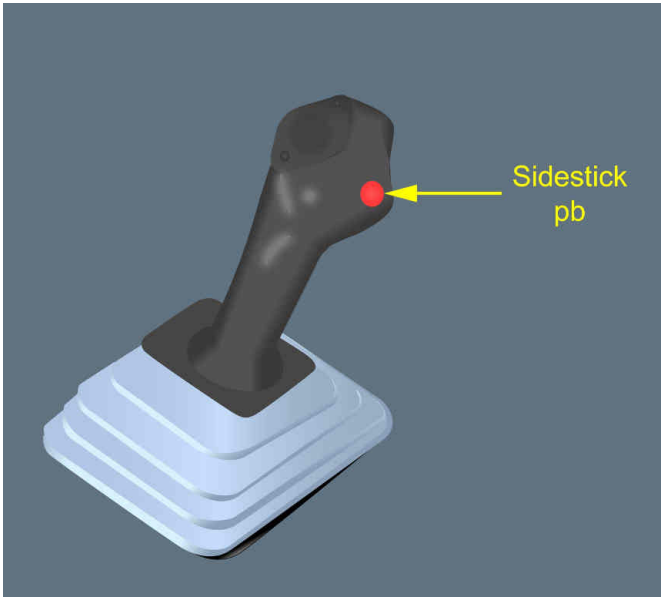
Refer to DSC-22-FG-90-10-GCONT Control of the FCU Backup .

Intentionally left blank

SIDESTICK

Applicable to: ALL

Sidestick



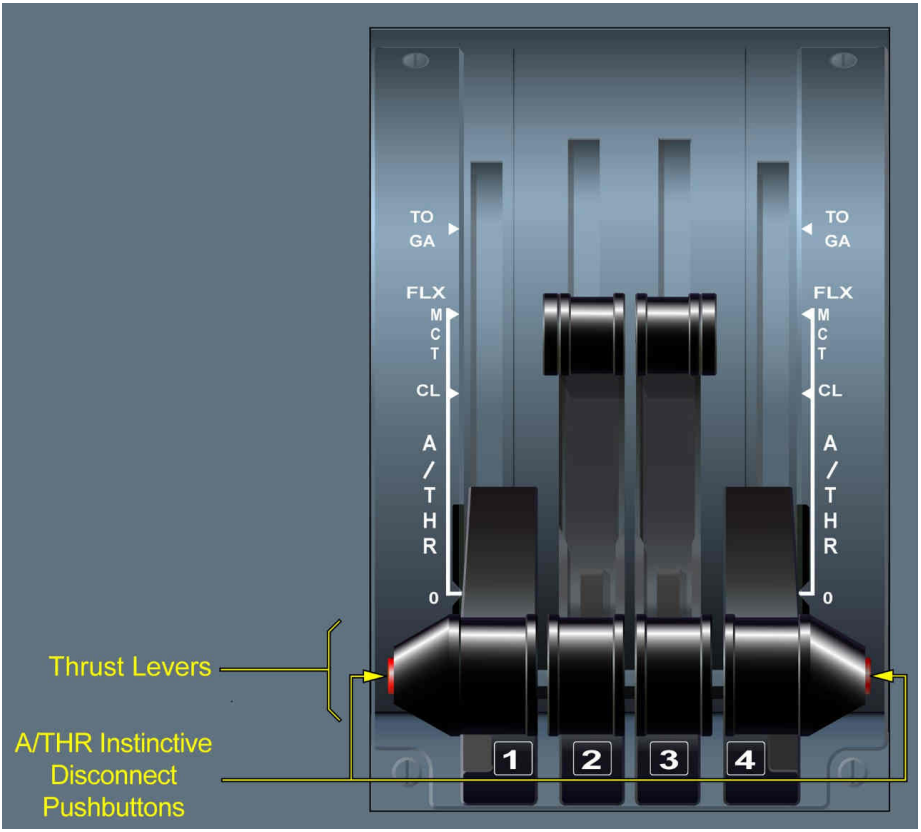
When at least one AP is engaged, the sidesticks are locked in the neutral position.
The flight crew presses the sidestick pushbutton to disengage all AP (s) engaged.
All AP (s) engaged will also disengage, if the flight crew applies a force above a given threshold on the sidestick.
For more information on AP manual disengagement, *Refer to AP Manual Disengagement* .
For information on AP disconnection annunciations and warnings, *Refer to AP Disengagement Annunciations and Warnings* .
When no AP is engaged, the sidesticks are not locked.

Intentionally left blank

THRUST LEVERS

Applicable to: ALL

Thrust Levers



A/THR INSTINCTIVE DISCONNECT PUSHBUTTON

Pressing on one A/THR instinctive disconnect pushbutton disconnects the A/THR .

L13

CAUTION	If the flight crew presses, and holds one A/THR instinctive disconnect pushbutton for more than 15 seconds, the A/THR will be disconnected for the remainder of the flight. All A/THR modes, including A.FLOOR will be lost. The A/THR will be recovered at the next aircraft power-up. The A/THR will be recovered, when one of the following occurs: - Five seconds after all engines shutdown - After power-up of all PRIMS and all FADECs.

L2 If the flight crew presses on one A/THR instinctive disconnect pushbutton when an AUTO BRK landing mode is armed (active), the AUTO BRK mode disarms (deactivates).

L1 **THRUST LEVERS**

The flight crew uses the thrust levers to:

- Arm, activate or disconnect the A/THR
  For information on A/THR arming, *Refer to DSC-22-FG-50-30-GAARM Introduction* .
  For information on A/THR activation, *Refer to DSC-22-FG-50-30-GAACT Introduction* .
- Control the thrust, when the A/THR is disconnected.
  For information on manual thrust control, *Refer to Engines / Thrust Control in Manual Mode* .

For information on standard and non-standard A/THR disconnection, *Refer to DSC-22-FG-50-40-A A/THR Disconnection* .

FMA

Applicable to: ALL

The Flight Mode Annunciator (FMA) is located on the upper part of the PFD . The FMA can display:

- The autobrake modes: *Refer to Landing Gear / AUTO BRK Mode Annunciation on the FMA*
- The A/THR messages and modes
- The AP / FD modes
- The approach capability
- The minimum decision height/altitude, or the decision height
- The AP , FD , and A/THR engagement status
- The messages from: FMS , flight guidance, and flight controls.

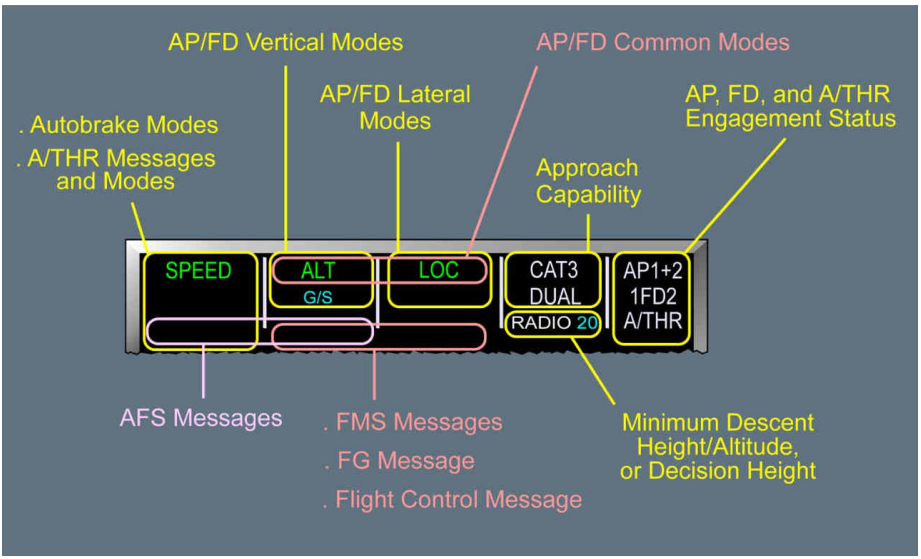
A white box appears for 10 s around the annunciation of:

- An A/THR mode engagement
- An AP / FD mode engagement

L3 Following an AP / FD TCAS mode engagement, the white box may extend to the second line to highlight any change of the status of the AP / FD vertical armed mode.

L1 - The approach capability (or the change of the approach capability)
- An AP , FD , or A/THR engagement status change.

FMA



A/THR MESSAGES AND MODES (COLUMN 1)

FIRST AND SECOND LINES

Display	Meaning	For display conditions:
MAN TOGA	The A/THR is armed, and the engines apply maximum thrust.	*Refer to A/THR Arming / FMA Display .*
MAN FLX +45	The A/THR is armed, and the engines apply flexible thrust, with FLEX temperature set to 45 ° .	
MAN DTO	The A/THR is armed, and the engines apply derated thrust.	
MAN MCT	The A/THR is armed, and the engines apply maximum continuous thrust.	
MAN THR	The A/THR is armed, and the engines apply a thrust defined by the thrust lever positions.	

These messages appear with a permanent white box.

FIRST AND SECOND LINES

Display	Meaning	For display conditions:
THR CLB	The A/THR is active, and the engines apply climb thrust.	*Refer to DSC-22-FG-50-50-A THRUST Mode Operation .*
THR DCLB*	The A/THR is active, and the thrust goes toward derated climb thrust.	
THR DCLB1	The A/THR is active, and the engines apply derated climb thrust, with the derated climb level set to 1.	
NOISE N1 82%	The A/THR is active, and the engines apply noise thrust, with 82% N1 target.	
THR CLB*	The A/THR is active, and the engines apply a thrust that converges toward climb thrust.	
THR DES	The A/THR is active, and the engines apply a thrust slightly highest than idle thrust.	
THR IDLE	The A/THR is active, and the engines apply idle thrust.	
THR MCT	The A/THR is active, and the operative engines apply maximum continuous thrust.	
THR LVR	The A/THR is active, and the engines apply a thrust defined by the thrust level positions.	
SPEED or MACH	The A/THR is active, and controls a speed target, or a Mach target.	*Refer to DSC-22-FG-50-50-B SPEED/MACH Mode .*
A.FLOOR with a flashing amber box	The A/THR is active, and the engines apply maximum thrust. *Note:* *The α-floor conditions are met.*	*Refer to DSC-22-FG-50-50-C ALPHA FLOOR .*
TOGA LK with a flashing amber box	The A/THR is active, and the engines apply maximum thrust. *Note:* *The α-floor conditions are no longer met.*	

THIRD LINE

Display	Meaning	For display conditions:
LVR ASYM flashing	The A/THR is armed or active, and one thrust lever is on the CL (FLX-MCT) detent, and at least one thrust lever is out the CL (FLX-MCT) detent. Note: *All the engines are operative.*	*Refer to DSC-22-FG-50-30-GAACT Effect of thrust lever movement when the A/THR is active .*
THR LK flashing	The thrust is frozen after an A/THR involuntary disconnection.	*Refer to DSC-22-FG-50-40-A THRUST LOCK Function .*
LVR CLB flashing	Requests to set the thrust levers to the CL detent.	*Refer to DSC-22-FG-50-30-GAACT Effect of thrust lever movement when the A/THR is active .*
LVR MCT flashing	Requests to set the thrust levers to the FLX-MCT detent.	

AFS MESSAGES (LINE 3)

FIRST AND SECOND COLUMNS

Display	Meaning	For more information:
SPD SEL : 220	The flight crew has preselected 220 kt on the CLB or CRZ panel of the FMS PERF page. Note: *The selected speed target is taken into account, when the next FMS flight phase engages (climb, or cruise).*	*Refer to DSC-22-FMS-20-30-22FMS502BC PERF page .*
MACH SEL : .82	The flight crew has preselected M 0.82 on the CRZ panel of the FMS PERF page. Note: *The selected Mach target is taken into account, when the cruise flight phase engages.*

AP / FD COMMON MODES (COLUMN 2 AND 3)

FIRST LINE

Display	Meaning	For display conditions:
LAND	The Land mode is engaged.	*Refer to LAND Mode / Engagement Conditions .*
FLARE	The Flare mode is engaged.	*Refer to FLARE Mode / Engagement Conditions .*
ROLL OUT	The Roll Out mode is engaged.	*Refer to ROLL OUT Mode / Engagement Conditions .*

APPROACH CAPABILITY (COLUMN 4)

FIRST AND SECOND LINES

Display	Meaning	Display Conditions:
RAW ONLY	The non-precision approach capability is RAW ONLY.	*Refer to LIM-22-20 Required Conditions for F-APP, F-APP + RAW, or RAW ONLY Capability .*
F-APP +RAW	The non-precision approach capability is F-APP +RAW.	
F-APP	The non-precision approach capability is F-APP.	
CAT1	The precision approach capability is CAT1.	The LOC and G/S modes are armed, or engaged, and: - The following equipment is available: • One PRIM • The AFS CP , or the AFS CP backup • The EFIS CP , or the EFIS CP backup. • One MMR • Two ADR s • Two IRS s • Two angles of attack - The flight control law is: Normal, alternate 1A, or alternate 1B.
CAT2	The precision approach capability is CAT2.	*Refer to LIM-22-30 Required Equipment for CAT II, or CAT III Operation .*
CAT3 SINGLE	The precision approach capability is CAT3 SINGLE.	
CAT3 DUAL	The precision approach capability is CAT3 DUAL.	
AUTO LAND	The precision approach capability is GLS CAT 1 Autoland.	*Refer to LIM-22-30 Required Equipment for GLS CAT I Automatic Approach and Automatic Landing .*

MINIMUM DESCENT HEIGHT/ALTITUDE, OR DECISION HEIGHT (COLUMN 4)

THIRD LINE

Display	Meaning	For more information:
BARO XXXXX	Minimum descent height/altitude, as entered on the FMS PERF page - APPR panel.	*Refer to DSC-22-FMS-20-30-22FMS502BC PERF page .*
RADIO XXX	Decision height, as entered on the FMS PERF page - APPR panel.	
NO DH	No BARO or RADIO value is entered on the FMS PERF page.	

AP , FD , AND A/THR ENGAGEMENT STATUS (COLUMN 5)

FIRST LINE

DISPLAY	MEANING	For display conditions:
AP1+2	The AP 1 and AP 2 are engaged.	*Refer to Engagement Conditions / Engagement of both APs .*
AP1	The AP 1 is engaged.	*Refer to Engagement Conditions / Engagement of one AP .*
AP2	The AP 2 is engaged.	

SECOND LINE

DISPLAY	MEANING	For display conditions:
1FD2	FD 1 and FD 2 are engaged.	*Refer to FD Engagement Conditions .*
1FD1	FD 1 is engaged on both sides.	
2FD2	FD 2 is engaged on both sides.	

THIRD LINE

DISPLAY	MEANING	For display conditions:
A/THR	The A/THR is active.	*Refer to A/THR Arming Conditions .*
A/THR	The A/THR is armed.	*Refer to A/THR Activation Conditions .*

FMS MESSAGES (LINE 3)

SECOND AND THIRD COLUMNS

Display	Meaning	For display conditions:
CHECK APPR SEL	Check the approach selection.	*Refer to Message .*
CHECK EO SPD SETTING	Check the engine-out speed setting.	*Refer to Message .*
CHECK SPD MODE	Check the speed mode.	*Refer to Message .*
EXTEND SPD BRK	Extend the speed brakes.	*Refer to Message .*
RETRACT SPD BRK	Retract the speed brakes.	*Refer to Message .*
SET HOLD SPD	Set the hold speed.	*Refer to Message .*
T/D REACHED	The top of descent is reached.	*Refer to Message .*

FG MESSAGE (LINE 3)

SECOND AND THIRD COLUMNS

L123

Display	Meaning	Display Conditions
DISCONNECT AP FOR LDG (pulses 9 s , and then remains steady)	The flight crew must disconnect the AP for landing.	The aircraft reaches the minimum decision height/altitude - 50 ft , when: - One AP is engaged - The flight crew has selected a non-precision approach on the FMS ARRIVAL page - The FMS flight phase is approach. Note: *If the flight crew has not entered the minimum decision height/altitude on the FMS PERF page - APPR panel, the message will appear at 350 ft plus the landing elevation.* The message disappears, when the flight crew disengages the AP .
TCAS RA INHIBITED	The AP / FD TCAS mode is disengaged because the TA ONLY or the STDBY mode of the TCAS is selected.	*Refer to AP/FD TCAS Mode / Inhibitions Conditions* .
TRK FPA DESELECTED	The flight reference TRK-FPA changed to HDG-V/S following AP / FD TCAS mode engagement.	*Refer to AP/FD TCAS Mode / Normal Operations / When a RA is triggered / Consequence on the Flying Reference* .

FLIGHT CONTROL MESSAGE (LINE 3)

SECOND AND THIRD COLUMNS

Display	Meaning	Display conditions:
USE MAN PITCH TRIM (pulses 9 s , and then remains steady)	The autotrim is lost: The flight crew must use the pitch trim sw , as required.	The flight controls are in direct law. For more information on the reconfiguration to direct law, *Refer to DSC-27-10-40 Reconfiguration Control Laws* .

Intentionally left blank

PFD

Applicable to: ALL

For guidance indications on PFD , *Refer to PFD / Guidance* .

Intentionally left blank

AUTOLAND LIGHT

Applicable to: ALL

L123

The AUTOLAND light flashes, when the aircraft is in autoland below 200 ft RA , and the required conditions to perform an autoland are no longer met.
For required conditions to perform an autoland, *Refer to AUTOLAND Alert* .

Note: *The flight crew can press the AUTOLAND light to check that the light is operative: As long as the AUTOLAND light is pressed, the AUTOLAND light flashes.*

Intentionally left blank

MEMO

Applicable to: ALL

AP OFF	Both AP s are disengaged, after the flight crew has pressed the sidestick pushbutton. Appears on the PFD s and on the EWD . For information on AP disengagement annunciations and warnings, *Refer to AP Disengagement Annunciation and Warnings* .
A/THR OFF	The A/THR is disconnected, after the flight crew has voluntary disconnected the A/THR by: - Pressing one A/THR instinctive disconnect pushbutton, or - Setting the thrust levers at the idle detent when the altitude is below 50 ft RA . Appears on the PFD s and on the EWD . For more information, *Refer to A/THR Disconnection Annunciations and Warnings* .

Intentionally left blank

OVERVIEW

Applicable to: ALL

Each MFD can display the FCU backup. The flight crew can access to the FCU backup via the MFD system menu.

The FCU backup has two pages:
- The AFS CP page presents the AFS CP backup
  The AFS CP page enables to recover all the AFS CP controls and indicators.
- The Captain (First Officer) EFIS CP page presents the Captain (First Officer) EFIS CP backup.
  The Captain (First Officer) EFIS CP page enables to recover all the Captain (First Officer) EFIS CP controls and indicators. However, the OANS, and the ETACS are not available.

IF ONE CONTROL PANEL OF THE FCU IS FAILED

If the AFS CP fails:
- The AUTO FLT AFS CTL PNL FAULT alert triggers
- The AFS CP backup automatically activates
- On the AFS CP page:
  - The AFS CP BACKUP button turns on in green
  - The last valid selections and values of the AFS CP are recovered.

If the Captain (First Officer) EFIS CP fails:
- The CDS CAPT (F/O) EFIS CTL PNL FAULT alert triggers
- The Captain (First Officer) EFIS CP backup automatically activates
- On the Captain (First Officer) EFIS CP page:
  - The EFIS CP BACKUP button turns on in green
  - The last valid selections and values of the Captain (First Officer) EFIS CP are recovered.

If both EFIS CPs fail:
- The CDS CAPT+F/O EFIS CTL PNL FAULT alert triggers
- The Captain and First Officer EFIS CP backups automatically activate
- On both EFIS CP pages:
  - The Captain and First Officer EFIS CP BACKUP buttons turn on in green
  - The last valid selections and values of the EFIS CPs are recovered.

When the flight crew selects the FCU backup via the MFD system menu, the page corresponding to the activated backup automatically appears.

Note: If both AFS CP backup and EFIS CP backup are activated on one MFD, the AFS CP backup page has priority to appear.

IF THE FLIGHT CREW DETECTS A FAILURE ON THE FCU

If the flight crew detects a failure on the FCU, the flight crew can activate the corresponding backup, by clicking on the corresponding button: AFS CP BACKUP button, or Captain (First Officer) EFIS CP BACKUP button. The activation will turn the corresponding Control Panel into blank. The AFS CP backup page or the Captain (First Officer) EFIS CP backup page displays the last selections of the corresponding Control Panel.

L2 WHEN THE AFS CP BACKUP, OR THE CAPTAIN (FIRST OFFICER) EFIS CP BACKUP IS NOT ACTIVATED

When the FCU is operative, the flight crew can also access to the FCU backup. In accordance with changes on the FCU, the following indications are continuously updated:

- Speed/Mach, heading/track, altitude, and vertical speed/flight path angle targets on the AFS CP page
- ND mode, ND range, and the barometric setting on the EFIS CP page.

CONTROL OF THE FCU BACKUP

Applicable to: ALL

The AFS CP page and the EFIS CP page work as the AFS CP and the EFIS CP. The AFS CP page and the EFIS CP page recover all the EFIS CP anc AFS CP controls and indicators. However, on the EFIS CP page, the OANS, and the ETACS are not available.
The flight crew performs the selections on the FCU backup via the KCCU.

AFS CP PAGE

On the AFS CP page, the flight crew uses the KCCU wheel to select the targets: Speed/Mach, heading/track, altitude, and vertical speed/flight path angle. For these selections, the numeric keys of the keyboard are not available.
A selection on the Captain (First Officer) AFS CP page is automatically updated on the First Officer (Captain) AFS CP page.
In the following graphic, the AFS CP backup is activated:

WARNINGS DURING APPROACH

Applicable to: ALL

AUTOLAND WARNING

When the aircraft is in autoland below 200 ft RA, the AUTOLAND light flashes, if one of the following occurs:

- The last AP disengages

  Note: In the flight crew quickly presses on the sidestick pushbutton two times, the AUTOLAND light appears furtively.

- Above 100 ft RA, during a CAT 2 or CAT 3 ILS approach:
  - The glide signal of the ILS transmitter fails, or
  - The glide deviation is excessive.

  L3 The glide deviation becomes excessive, when the glide deviation is one gradation away from the center of the scale.

L1 - Above 15 ft RA, during a CAT 2 or CAT 3 ILS approach:
  - The LOC signal of the ILS transmitter fails, or
  - The LOC deviation is excessive.

  L3 The LOC deviation becomes excessive, when the LOC deviation is one quarter gradation away from the center of the scale.

L1 - One radio altimeter is failed, and the values provided by the two remaining radio altimeters differ by more than 15 ft

The AUTOLAND light stops flashing, when:
- LAND, FLARE or ROLL OUT disengages, or
- The flight crew disengages the AP(s).

- A long flare is detected.

L3 A long flare is detected, when FLARE is engaged for 13 s.

L1 When the AUTOLAND light flashes, the flight crew must discontinue the autoland.

WARNING OF EXCESSIVE LOC OR G/S DEVIATION

When the aircraft is in LOC, LAND, or FLARE with CAT 2 or CAT 3 below 1 000 ft, the LOC and/or G/S scale may flash on the PFD, and on the ND (in ROSE-LS mode):

- The LOC scale flashes, if the LOC deviation is more than one quarter dot for more than two seconds.

L2 This is applicable, if the aircraft is above 15 ft RA.

L1 - The G/S scale flashes, if the G/S deviation is more than one dot for more than two seconds.

L2 This is applicable, if the aircraft is above 100 ft RA.

WARNING ASSOCIATED WITH PRECISION APPROACH CAPABILITY, OR FLS CAPABILITY

A triple click aural warning sounds, if:
- The FLS capability downgrades, or
- The precision approach capability, monitored by the aircraft, downgrades.

FAILURE OF LOC AND/OR G/S RECEIVER

IMPACT ON PFD AND ND (IN ROSE-LS MODE)

The LOC flag appears instead of the LOC scale on the CAPT's side (F/O's side), if:
- The CAPT (F/O) has pressed the LS pb
- The LOC receiver on the same side is failed.

The G/S flag appears instead of the G/S scale on the CAPT's side (F/O's side), if:
- The CAPT (F/O) has pressed the LS pb
- The G/S receiver on the same side is failed.

IMPACT ON AP AND FD s

FD Bars

The roll (pitch) bar flashes on the PFD 1(2), when:
- The LOC (G/S) of the ILS 1(2) receiver fails
- One of the following mode is engaged: LOC*, LOC, LOC B/C*, LOC B/C, LAND, FLARE
- L3 The aircraft is above 15 ft RA.

L1 The roll (pitch) bar stops flashing, when the approach mode disengages.

AP and FD Engagement Status

The AP (if engaged) automatically disengage, if both ILS receivers fail, or both MMRs fail, when:
- The aircraft is above 100 ft RA, and
- One of the following occurs:
  - LOC or LOC B/C is armed, or
  - LOC*, LOC, LOC B/C*, LOC B/C, LAND, FLARE or ROLL OUT is engaged.

If the FDs were engaged, HDG/TRACK and V/S / FPA engages. A triple click aural warning sounds. The FD bars flash for 10 s.

FAILURE OF FLS FUNCTION WITHIN MMR

IMPACT ON PFD AND ND (IN ROSE-LS MODE)

The F-LOC flag appears instead of the F-LOC scale on the CAPT's side (F/O's side), if:
- The CAPT (F/O) has pressed the LS pb
- The FLS function within the MMR of the same side is failed.

The F-G/S flag appears instead of the F-G/S scale on the CAPT's side (F/O's side), if:
- The CAPT (F/O) has pressed the LS pb
- The FLS function within the MMR of the same side is failed.

IMPACT ON AP AND FD s

FD Bars

The FD bars flash on the PFD 1(2), when:
- The FLS function within the MMR 1(2)
- One of the following mode is engaged: F-LOC*, F-LOC, F-G/S*, F-G/S
- The aircraft is above 15 ft RA. L3

The FD bars stop flashing, when the approach mode disengages. L1

AP and FD Engagement Status

The AP (if engaged) automatically disengage, if the FLS function within both MMRs fails, or both MMRs fail, when:
- F-LOC or F-G/S is armed
- F-LOC*, F-LOC, F-G/S*, or F-G/S is engaged.

If the FDs were engaged, HDG/TRACK and V/S / FPA engages. A triple click aural warning sounds. The FD bars flash for 10 s.

FAILURE OF LOC OR G/S TRANSMITTER

IMPACT ON PFD AND ND (IN ROSE-LS MODE)

If the LOC transmitter fails:
- The LOC index disappears
- The LOC scales flash.

This can only occur, if the aircraft is between 15 ft and 200 ft RA, and LOC, LAND, or FLARE is engaged. L3

L1 If the G/S transmitter fails:
- The G/S index disappears
- The G/S scales flash.

L3 This can only occur, if the aircraft is between 100 ft and 200 ft RA, and G/S, LAND, or FLARE is engaged.

L1 **IMPACT ON AP AND FD s**

FD Bars

The FD bars flash on both PFDs, when:
- The ILS transmitter fails
- One of the following mode is engaged: LOC*, LOC, LOC B/C*, LOC B/C, LAND, FLARE

L3 - The aircraft is above 15 ft RA.

L1 The FD bars stop flashing, when the approach mode disengages.

AP and FD Engagement Status

The AP (if engaged) automatically disengages, if the ILS transmitter fails when:
- The aircraft is above 200 ft RA, and
- LOC*, LOC, LOC B/C* or LOC B/C is engaged.

L2 The ILS transmitter failure must be confirmed 7 s.

L1 If the FDs were engaged, HDG/TRACK and V/S / FPA engages. A triple click aural warning sounds. The FD bars flash for 10 s.

FAILURE OF THREE FMC s

If three FMCs are failed, the F-LOC and F-G/S deviations are no longer available.

IMPACT ON PFD AND ND (IN ROSE-LS MODE)

If three FMCs fail:
- The LOC flag appears instead of the F-LOC deviation, and the F-LOC scale.
- The G/S flag appears instead of the F-G/S deviation, and the F-G/S scale.

IMPACT ON AP AND FD s

FD Bars

The FD bars flash on both PFDs, when:
- The three FMCs are failed
- One of the following mode is engaged: F-LOC*, F-LOC, F-G/S*, F-G/S

L3 - The aircraft is above 15 ft RA.

L1 The FD bars stop flashing, when the approach mode disengages.

AP and FD Engagement Status

The AP (if engaged) automatically disengages, if three FMCs fail when:
- The aircraft is above 200 ft RA, and
- F-LOC*, F-LOC, F-G/S* or F-G/S is engaged.

L2 The triple FMC failure must be confirmed 7 s.

L1 If the FDs were engaged, HDG/TRACK and V/S / FPA engages. A triple click aural warning sounds. The FD bars flash for 10 s.

Intentionally left blank

Overview

OVERVIEW

Applicable to: ALL

This chapter provides the specific actions to perform in the case of failure occurring during a CAT I GLS, CAT II ILS, or CAT III ILS approach. These actions are only related to the automatic approach and landing management. They provide additional material to the ECAM procedures.
In the case of multiple failures, the flight crew must apply the most limiting specific actions.

The failures and associated specific actions are presented in accordance with:
- The altitude: *Refer to Which Altitude?*
- The failure: *Refer to Which Failure?* .

Intentionally left blank

Which Altitude?

OVERVIEW

Applicable to: ALL

This chapter illustrates the failures and associated specific actions, in accordance with the altitude:

- *Refer to DSC-22-FG-90-40-20 Failures Occurring above 1000 ft during a CAT I GLS Approach*
- *Refer to DSC-22-FG-90-40-20 Failures Occurring above 1000 ft during a CAT II ILS or CAT III ILS Approach*
- *Refer to DSC-22-FG-90-40-20 Failures Occurring below 1000 ft during Automatic Approach and Automatic Landing .*

FAILURES OCCURRING ABOVE 1000 FT DURING A CAT I GLS APPROACH

Applicable to: ALL

The following table illustrates the specific actions to perform, in accordance with the failure occurring above 1 000 ft .
In the case of multiple failures, the most limiting applies.

Failure occurring above 1 000 ft	Actions to perform
Loss of AUTO LAND capability	Try to recover.
Nose wheel steering failure	Disengage the AP at nose landing gear touch down.
Alpha floor activation	Check speed. Disengage and reengage A/THR mode (TOGA LK should disappear from FMA).
One engine failure	Apply the standard one engine inoperative procedure (*Refer to PRO-ABN-ECAM-10-70-30 ENG 1(2)(3)(4) SHUT DOWN*).
Two engine failure on the same side	Apply the standard two engine inoperative on the same side procedure (*Refer to PRO-ABN-ECAM-10-70-272 ENG TWO ENGs OUT ON SAME SIDE*).
Two engine failure on the opposite side	Apply the standard two engine inoperative on the opposite side procedure (*Refer to PRO-ABN-ECAM-10-70-273 ENG TWO ENGs OUT ON OPPOSITE SIDE*).
CHECK ATT flag on both PFD s	**CAUTION** Do not make any switching below 1 000 ft . Check aircraft attitude with standby horizon. Use the ATT HDG selector to try to recover valid data.
ATT flag on one PFD HDG flag on one ND and one PFD	**CAUTION** Do not make any switching below 1 000 ft . Use the ATT HDG selector to try to recover valid data.
CHECK HDG flag on both ND s and both PFD s	**CAUTION** Do not make any switching below 1 000 ft . Check heading with the standby compass. Use the ATT HDG selector to try to recover valid data.
SPD flag on one PFD	**CAUTION** Do not make any switching below 1 000 ft . Use the AIR DATA selector to try to recover valid data.
AP OFF warning	Try to reengage autopilot.

FAILURES OCCURRING ABOVE 1000 FT DURING A CAT II ILS OR CAT III ILS APPROACH

Applicable to: ALL

The following table illustrates the specific actions to perform, in accordance with the failure occurring above 1 000 ft.
In the case of multiple failures, the most limiting apply.

Failure occurring above 1 000 ft	Actions to perform
Capability downgrading	Try to recover. ● **If no recovery:** Revert to the available capability, or CAT I ILS minima (if applicable).
Failure leading to slats/flaps less than CONF 3	Revert to CAT I ILS minima.
Nose wheel steering failure	● **When flying a CAT III ILS approach without DH:** Revert to CAT III ILS with DH set to 50 ft. Disengage the AP at nose landing gear touch down. ● **When flying a CAT III ILS approach with DH:** Revert to CAT III single minima. Disengage the AP at nose landing gear touch down. ● **When flying a CAT II ILS approach:** Disengage the AP at nose landing gear touch down.
Anti-skid failure	● **When flying a CAT III ILS approach without DH:** Revert to CAT III single minima. Disengage the AP at touchdown. Brake manually. ● **When flying a CAT III ILS approach with DH:** Revert to CAT III single minima. Brake manually.
Alpha floor activation	Check speed. Disengage and reengage A/THR mode (TOGA LK should disappear from FMA).
One engine failure	● **When flying a CAT III ILS approach:** Revert to CAT III single minima. *Note: CAT III dual capacity can be recovered provided the APU is running, and one APU generator is connected to the electrical network.*
Two engine failure on the same side	Revert to CAT I ILS minima.
Two engine failure on the opposite side	● **When flying a CAT III ILS approach:** Revert to CAT II ILS minima.
RA flag on both PFDs	Revert to CAT I ILS minima.

Continued on the following page

FAILURES OCCURRING ABOVE 1000 FT DURING A CAT II ILS OR CAT III ILS APPROACH (Cont'd)

Failure occurring above 1 000 ft	Actions to perform
CHECK ATT flag on both PFDs	**CAUTION** Do not make any switching below 1 000 ft. Check aircraft attitude with standby horizon. Use the ATT HDG selector to recover valid data. ● **If the flag disappears:** ● **When flying a CAT III ILS approach:** A CAT III single approach is still possible. ● **When flying a CAT II ILS approach:** A CAT II ILS approach is still possible. ● **If the flag persists:** Revert to CAT I ILS minima.
ATT flag on one PFD HDG flag on one ND and one PFD	**CAUTION** Do not make any switching below 1 000 ft. Use the ATT HDG selector to recover valid data. ● **If the flag disappears:** ● **When flying a CAT III ILS approach:** A CAT III single approach is still possible. ● **When flying a CAT II ILS approach:** A CAT II ILS approach is still possible. ● **If the flag persists:** Revert to CAT I ILS minima.
CHECK HDG flag on both NDs and both PFDs	**CAUTION** Do not make any switching below 1 000 ft. Check heading with standby compass. Use the ATT HDG selector to recover valid data. ● **If the flag disappears:** ● **When flying a CAT III ILS approach:** A CAT III single approach is still possible. ● **When flying a CAT II ILS approach:** A CAT II ILS approach is still possible. ● **If the flag persists:** Revert to CAT I ILS minima.
SPD flag on one PFD	**CAUTION** Do not make any switching below 1 000 ft. Use the AIR DATA selector to recover valid data. ● **If the flag disappears:**

Continued on the following page

FAILURES OCCURRING ABOVE 1000 FT DURING A CAT II ILS OR CAT III ILS APPROACH (Cont'd)

Failure occurring above 1 000 ft	Actions to perform
	● **When flying a CAT III ILS approach:** A CAT III single approach is still possible. ● **When flying a CAT II ILS approach:** A CAT II ILS approach is still possible. ● **If the flag persists:** Revert to CAT I ILS minima.
AP OFF warning	Try to reengage autopilot. ● **If not successful:** Revert to CAT I ILS minima.
A/THR OFF	● **When flying a CAT III ILS approach:** Try to reengage the A/THR. ● **If not successful:** Revert to CAT II ILS minima, and control the thrust manually.

FAILURES OCCURRING BELOW 1000 FT DURING AUTOMATIC APPROACH AND AUTOMATIC LANDING

Applicable to: ALL

Refer to Which Failure? / Overview .

Intentionally left blank

Which Failure?

OVERVIEW

Applicable to: ALL

This chapter lists the specific actions to perform in accordance with failure:
- During a CAT II approach: *Refer to DSC-22-FG-90-40-30-GFAI1 Failures and Associated Actions during a CAT II Approach with or without Automatic Landing*
- During a CAT III approach with DH: *Refer to DSC-22-FG-90-40-30-GFAI2 Failures and Associated Actions during CAT III Approach with DH*
- During a CAT III approach without DH: *Refer to DSC-22-FG-90-40-30-GFAI3 Failures and Associated Actions during a CAT III Approach without DH .*

FAILURES AND ASSOCIATED ACTIONS DURING A CAT I GLS APPROACH WITH AUTOMATIC LANDING

Applicable to: ALL

In the case of multiple failures, the flight crew must apply the most limiting specific actions.

LOSS OF AUTO LAND CAPABILITY ON FMA

- **If AUTO LAND not displayed on FMA above 1 000 ft:**
  Try to recover.
- **If AUTO LAND disappears on FMA between 1 000 ft and DH:**
  Go around if insufficient visual references.
- **If AUTO LAND disappears on FMA below DH:**
  Land manually.

NOSE WHEEL STEERING FAILURE

Disconnect autopilot at nose landing gear touch down or when the failure occurs during landing roll.

Continued on the following page

FAILURES AND ASSOCIATED ACTIONS DURING A CAT I GLS APPROACH WITH AUTOMATIC LANDING (Cont'd)

ALPHA FLOOR ACTIVATION

- **If activation occurs above 1 000 ft:**
  Check speed.
  Disengage and re-engage A/THR mode (TOGA LK should disappear from FMA).
- **If activation occurs below 1 000 ft:**
  Go around if insufficient visual references.

Note: Alpha floor protection is inhibited below 100 ft at landing.

ONE ENGINE FAILURE

Note: Automatic approach, landing and roll out have been demonstrated in CONF 3 and CONF Full with one engine inoperative prior to initiating the approach.

- **If failure occurs between 1 000 ft and DH:**
  Go around if insufficient visual references.
- **If failure occurs below DH:**
  Land.

TWO ENGINE FAILURE

- **If two engine failure on the same side:**
  - **If failure occurs between 1 000 ft and 500 ft:**
    Go around, if the visual references are insufficient .
  - **If failure occurs below 500 ft:**
    Land.
- **If two engine failure on opposite sides:**
  - **If failure occurs between 1 000 ft and DH:**
    Go around, if the visual references are insufficient .
  - **If failure occurs below DH:**
    Land.

Continued on the following page

FAILURES AND ASSOCIATED ACTIONS DURING A CAT I GLS APPROACH WITH AUTOMATIC LANDING (Cont'd)

RED "RA" FLAG ON BOTH PFDs

- **If warning appears between 1 000 ft and DH:**
  Go around if insufficient visual references.
- **If warning appears below DH:**
  Land.

Note: 1. AP/FD may not be available in APPR mode.
2. The red "RA" flag is displayed on both PFDs when none of the three radio heights can be displayed.

AMBER "CHECK ATT" ON BOTH PFDs

CAUTION	Do not make any switching below 1 000 ft.

- **If alert appears above 1 000 ft:**
  Check aircraft attitude with standby horizon.
  Use switching to recover valid data.
- **If alert appears between 1 000 ft and DH:**
  Go around if insufficient visual references using standby horizon.
- **If alert appears below DH:**
  Land.

RED "ATT" ON ONE PFD

CAUTION	Do not make any switching below 1 000 ft.

- **If warning appears above 1 000 ft:**
  Use switching to recover valid data.
- **If warning appears between 1 000 ft and DH:**
  Go around if insufficient visual references.
- **If warning appears below DH:**
  Land.

Continued on the following page

FAILURES AND ASSOCIATED ACTIONS DURING A CAT I GLS APPROACH WITH AUTOMATIC LANDING (Cont'd)

AMBER "CHECK HDG" ON BOTH NDs AND BOTH PFDs

CAUTION	Do not make any switching below 1 000 ft.

- **If alert appears above 1 000 ft:**
  Check heading with standby compass.
  Use switching to recover valid data.
- **If alert appears between 1 000 ft and DH:**
  Go around if insufficient visual references.
- **If alert appears below DH:**
  Land.

RED "HDG" ON ONE ND AND ONE PFD

CAUTION	Do not make any switching below 1 000 ft.

- **If warning appears above 1 000 ft:**
  Use switching to try to recover valid data.
- **If warning appears between 1 000 ft and DH:**
  Go around if insufficient visual references.
- **If warning appears below DH:**
  Land.

RED "SPD" ON ONE PFD

CAUTION	Do not make any switching below 1 000 ft.

- **If warning appears above 1 000 ft:**
  Use switching to try to recover valid data.
- **If warning appears between 1 000 ft and DH:**
  Go around if insufficient visual references.
- **If warning appears below DH:**
  Land.

Continued on the following page

FAILURES AND ASSOCIATED ACTIONS DURING A CAT I GLS APPROACH WITH AUTOMATIC LANDING (Cont'd)

AP OFF WARNINGS

- **If warning appears above 1 000 ft:**
  Try to reengage autopilot.
- **If warning appears between 1 000 ft and DH:**
  Manually go around if insufficient visual references.
- **If warning appears below DH:**
  Land manually.

"AUTOLAND" WARNING

- **If warning appears below DH:**
  Land manually.

LOC OR G/S EXCESSIVE DEVIATION ON PFD

- **If alert appears above DH:**
  Monitor GLS tracking.
- **If alert appears below DH:**
  Land manually.

NO "LAND" AT 350 FT

Perform a manual landing if sufficient visual references, or go around.

INCORRECT SELECTED COURSE AT 350 FT

Continue and disengage autopilot at 160 ft at the latest.

Note: Selected course deviation is considered incorrect when above 5 °.

NO "FLARE" AT 30 FT

Disengage autopilot and land manually.

FAILURES AND ASSOCIATED ACTIONS DURING A CAT II APPROACH WITH OR WITHOUT AUTOMATIC LANDING

Applicable to: ALL

In the case of multiple failures, the flight crew must apply the most limiting specific actions.

LOSS OF CAT2 CAPABILITY ON FMA

- **If CAT II not displayed on FMA above 1 000 ft:**
  Try to recover.
  - **If no recovery:**
    Revert to CAT I minima.
- **If CAT II disappears on FMA between 1 000 ft and DH:**
  Go around if insufficient visual references.
- **If CAT II disappears on FMA below DH:**
  Land manually.

FAILURE LEADING TO SLATS/FLAPS LESS THAN CONF 3

Revert to CAT I minima.

NOSE WHEEL STEERING FAILURE

Disconnect autopilot at nose landing gear touch down or when the failure occurs during landing roll.

ALPHA FLOOR ACTIVATION

- **If activation occurs above 1 000 ft:**
  Check speed.
  Disengage and re-engage A/THR mode (TOGA LK should disappear from FMA).
- **If activation occurs below 1 000 ft:**
  Go around if insufficient visual references.

Note: *Alpha floor protection is inhibited below 100 ft at landing.*

Continued on the following page

FAILURES AND ASSOCIATED ACTIONS DURING A CAT II APPROACH WITH OR WITHOUT AUTOMATIC LANDING (Cont'd)

ONE ENGINE FAILURE

Note: Automatic approach, landing and roll out have been demonstrated in CONF 3 and CONF Full with one engine inoperative prior to initiating the approach.

- **If failure occurs between 1 000 ft and DH:**
  Go around if insufficient visual references.
- **If failure occurs below DH:**
  Land.

TWO ENGINE FAILURE

- **If two engine failure on the same side:**
  - **If failure occurs above 1 000 ft:**
    Revert to CAT I.
  - **If failure occurs between 1 000 ft and 500 ft:**
    Go around, if the visual references are insufficient .
  - **If failure occurs below 500 ft:**
    Land.
- **If two engine failure on opposite sides:**
  - **If failure occurs between 1 000 ft and DH:**
    Go around, if the visual references are insufficient .
  - **If failure occurs below DH:**
    Land.

Continued on the following page

FAILURES AND ASSOCIATED ACTIONS DURING A CAT II APPROACH WITH OR WITHOUT AUTOMATIC LANDING (Cont'd)

"RA" FLAG ON BOTH PFDs, AND ON THE HUD (IF DEPLOYED)

- **If warning appears above 1 000 ft:**
  Revert to CAT I minima.
- **If warning appears between 1 000 ft and DH:**
  Go around if insufficient visual references.
- **If warning appears below DH:**
  Land.

Note: *1. AP/FD may not be available in APPR mode.*
2. The "RA" flag is displayed on both PFDs, and on the HUD (if deployed), when none of the three radio heights can be displayed.

AMBER "CHECK ATT" ON BOTH PFDs

CAUTION	Do not make any switching below 1 000 ft.

- **If alert appears above 1 000 ft:**
  Check aircraft attitude with standby horizon.
  Use switching to recover valid data.
  - **If alert disappears:**
    A CAT II approach is still possible.
  - **If alert persists:**
    Revert to CAT I minima.
  - **If alert appears between 1 000 ft and DH:**
    Go around if insufficient visual references using standby horizon.
  - **If alert appears below DH:**
    Land.

Continued on the following page

FAILURES AND ASSOCIATED ACTIONS DURING A CAT II APPROACH WITH OR WITHOUT AUTOMATIC LANDING (Cont'd)

RED "ATT" ON ONE PFD

CAUTION	Do not make any switching below 1 000 ft.

- **If warning appears above 1 000 ft:**
  Use switching to recover valid data.
  - **If warning disappears:**
    A CAT II approach is still possible.
  - **If warning persists:**
    Revert to CAT I minima.
- **If warning appears between 1 000 ft and DH:**
  Go around if insufficient visual references.
- **If warning appears below DH:**
  Land.

AMBER "CHECK HDG" ON BOTH NDs AND BOTH PFDs

CAUTION	Do not make any switching below 1 000 ft.

- **If alert appears above 1 000 ft:**
  Check heading with standby compass.
  Use switching to recover valid data.
  - **If alert disappears:**
    A CAT II approach is still possible.
  - **If alert persists:**
    Revert to CAT I minima.
  - **If alert appears between 1 000 ft and DH:**
    Go around if insufficient visual references.
  - **If alert appears below DH:**
    Land.

Continued on the following page

FAILURES AND ASSOCIATED ACTIONS DURING A CAT II APPROACH WITH OR WITHOUT AUTOMATIC LANDING (Cont'd)

RED "HDG" ON ONE ND AND ONE PFD

CAUTION	Do not make any switching below 1 000 ft.

- **If warning appears above 1 000 ft:**
  Use switching to recover valid data.
  - **If warning disappears:**
    A CAT II approach is still possible.
  - **If warning persists:**
    Revert to CAT I minima.
  - **If warning appears between 1 000 ft and DH:**
    Go around if insufficient visual references.
  - **If warning appears below DH:**
    Land.

RED "SPD" ON ONE PFD

CAUTION	Do not make any switching below 1 000 ft.

- **If warning appears above 1 000 ft:**
  Use switching to recover valid data.
  - **If warning disappears:**
    A CAT II approach is still possible.
  - **If warning persists:**
    Revert to CAT I minima.
- **If warning appears between 1 000 ft and DH:**
  Go around if insufficient visual references.
- **If warning appears below DH:**
  Land.

Continued on the following page

FAILURES AND ASSOCIATED ACTIONS DURING A CAT II APPROACH WITH OR WITHOUT AUTOMATIC LANDING (Cont'd)

AP OFF WARNINGS

- **If warning appears above 1 000 ft:**
  Try to reengage autopilot.
  - **If unsuccessful:**
    Revert to CAT I minima.
- **If warning appears between 1 000 ft and DH:**
  Go around if insufficient visual references.
- **If warning appears below DH:**
  Land.

"AUTOLAND" WARNING

- **If warning appears between 200 ft and DH:**
  Go around if insufficient visual references.
- **If warning appears below DH:**
  Land manually.

LOC OR G/S EXCESSIVE DEVIATION ON PFD

- **If alert appears above 200 ft:**
  Monitor ILS tracking.
- **If alert appears between 200 ft and DH:**
  Go around if insufficient visual references.
- **If alert appears below DH:**
  Land manually.

NO "LAND" AT 350 FT

Perform a manual landing if sufficient visual references, or go around.

Continued on the following page

FAILURES AND ASSOCIATED ACTIONS DURING A CAT II APPROACH WITH OR WITHOUT AUTOMATIC LANDING (Cont'd)

INCORRECT SELECTED COURSE AT 350 FT

Continue and disengage autopilot at 80 ft at the latest.

Note: Selected course deviation is considered incorrect when above 5 °.

NO "FLARE" AT 30 FT

Disengage autopilot and land manually.

FAILURES AND ASSOCIATED ACTIONS DURING CAT III APPROACH WITH DH

Applicable to: ALL

In the case of multiple failures, the flight crew must apply the most limiting specific actions.

CAPABILITY DECREASE

- **If alert appears above 1 000 ft:**

  Try to recover.

  - **If unsuccessful:**

    Revert to the available capability.

  - **If alert appears below 1 000 ft:**

    Go around if insufficient visual references.

Note: 1. Capability decrease is inhibited below 200 ft.
2. This procedure does not apply in case of autothrust loss.

FAILURE LEADING TO SLATS/FLAPS LESS THAN CONF 3

Revert to CAT I minima.

Continued on the following page

FAILURES AND ASSOCIATED ACTIONS DURING CAT III APPROACH WITH DH (Cont'd)

NOSE WHEEL STEERING FAILURE

Disengage autopilot at nose landing gear touch down or when the failure occurs during landing roll.

- **If failure occurs above 350 ft:**
  Revert to CAT III single minima.
- **If failure occurs between 350 ft and 200 ft:**
  Go around if insufficient visual references.
- **If failure occurs below 200 ft:**
  Continue standard CAT III procedure.

ANTI-SKID FAILURE

Brake manually.

Note: *Autobrake is inoperative.*

- **If failure occurs above 350 ft:**
  Revert to CAT III single minima.
- **If failure occurs between 350 ft and 200 ft:**
  Go around if insufficient visual references.
- **If failure occurs below 200 ft:**
  Land if sufficient visual references at 50 ft for a CAT III single.

ALPHA FLOOR ACTIVATION

- **If activation occurs above 1 000 ft:**
  Check speed.
  Disengage and re-engage autothrust mode (TOGA LK should disappear from FMA).
- **If activation occurs between 1 000 ft and 100 ft:**
  Go around if insufficient visual references.

Note: *Alpha floor protection is inhibited below 100 ft at landing.*

Continued on the following page

FAILURES AND ASSOCIATED ACTIONS DURING CAT III APPROACH WITH DH (Cont'd)

ONE ENGINE FAILURE

Note: Automatic Approach, Landing and Roll Out have been demonstrated in CONF 3 and CONF Full with one engine inoperative prior to initiating the approach.

- **If failure occurs above 1 000 ft:**
  Revert to CAT III single minima.

  Note: CAT III dual capacity can be recovered provided APU is running and one APU generator is connected to the electrical network.

- **If failure occurs between 1 000 ft and 200 ft:**
  Go around if insufficient visual references.

- **If failure occurs below 200 ft:**
  Land.

TWO ENGINE FAILURE

- **If two engine failure on the same side:**
  - **If failure occurs above 1 000 ft:**
    Revert to CAT I.
  - **If failure occurs between 1 000 ft and 500 ft:**
    Go around, if the visual references are insufficient.
  - **If failure occurs below 500 ft:**
    Land.
- **If two engine failure on opposite sides:**
  - **If failure occurs above 1 000 ft:**
    Revert to CAT II minima.
  - **If failure occurs between 1 000 ft and DH:**
    Go around, if the visual references are insufficient.
  - **If failure occurs below DH:**
    Land.

Continued on the following page

FAILURES AND ASSOCIATED ACTIONS DURING CAT III APPROACH WITH DH (Cont'd)

AUTO CALL OUT RA FAILURE

- **If failure appears between 1 000 ft and 200 ft:**
  Go around if insufficient visual references.
- **If failure appears below 200 ft:**
  Continue standard CAT III approach.

"RA" FLAG ON BOTH PFDs, AND ON THE HUD (IF DEPLOYED)

- **If warning appears above 1 000 ft:**
  Revert to CAT I minima.
- **If warning appears between 1 000 ft and DH:**
  Go around if insufficient visual references.
- **If warning appears below DH:**
  Land.

Note: *1. AP/FD may not be available in APPR mode.*
2. The "RA" flag is displayed on both PFDs, and on the HUD (if deployed), when none of the three radio heights can be displayed.

Continued on the following page

FAILURES AND ASSOCIATED ACTIONS DURING CAT III APPROACH WITH DH (Cont'd)

AMBER "CHECK ATT" ON BOTH PFDs

CAUTION	Do not make any switching below 1 000 ft.

- **If alert appears above 1 000 ft:**
  Check aircraft attitude with standby horizon.
  Use switching to recover valid data.
  - **If alert disappears:**
    A CAT III single approach is still possible.
  - **If alert persists:**
    Revert to CAT I minima.
- **If alert appears between 1 000 ft and 200 ft:**
  Go around if insufficient visual references using standby horizon.
- **If alert appears below 200 ft:**
  Continue standard CAT III approach.

RED "ATT" ON ONE PFD

CAUTION	Do not make any switching below 1 000 ft.

- **If warning appears above 1 000 ft:**
  Use switching to recover valid data.
  - **If warning disappears:**
    A CAT III single approach is still possible.
  - **If warning persists:**
    Revert to CAT I minima.
- **If warning appears between 1 000 ft and 200 ft:**
  Go around if insufficient visual references.
- **If warning appears below 200 ft:**
  Continue standard CAT III approach.

Continued on the following page

FAILURES AND ASSOCIATED ACTIONS DURING CAT III APPROACH WITH DH (Cont'd)

AMBER "CHECK HDG" ON BOTH ND_S AND BOTH PFD_S

CAUTION	Do not make any switching below 1 000 ft.

- **If alert appears above 1 000 ft:**
  Check heading with standby compass.
  Use switching to recover valid data.
  - **If alert disappears:**
    A CAT III single approach is still possible.
  - **If alert persists:**
    Revert to CAT I minima.
- **If alert appears between 1 000 ft and 200 ft:**
  Go around if insufficient visual references.
- **If alert appears below 200 ft:**
  Continue standard CAT III approach.

RED "HDG" ON ONE ND AND ONE PFD

CAUTION	Do not make any switching below 1 000 ft.

- **If warning appears above 1 000 ft:**
  Use switching to recover valid data.
  - **If warning disappears:**
    A CAT III single approach is still possible.
  - **If warning persists:**
    Revert to CAT I minima.
- **If warning appears between 1 000 ft and 200 ft:**
  Go around if insufficient visual references.
- **If warning appears below 200 ft:**
  Continue standard CAT III approach.

Continued on the following page

FAILURES AND ASSOCIATED ACTIONS DURING CAT III APPROACH WITH DH (Cont'd)

RED "SPD" ON ONE PFD

CAUTION	Do not make any switching below 1 000 ft.

- **If warning appears above 1 000 ft:**
  Use switching to recover valid data.
  - **If warning disappears:**
    A CAT III single approach is still possible.
  - **If warning persists:**
    Revert to CAT I minima.
- **If warning appears between 1 000 ft and 200 ft:**
  Go around if insufficient visual references.
- **If warning appears below 200 ft:**
  Continue standard CAT III approach.

"AP OFF" WARNINGS

- **If warning appears above 1 000 ft:**
  Try to reengage autopilot.
  - **If unsuccessful:**
    Revert to CAT I minima.
- **If warning appears between 1 000 ft and DH:**
  Go around if insufficient visual references.
- **If warning appears below DH:**
  Land.

Continued on the following page

FAILURES AND ASSOCIATED ACTIONS DURING CAT III APPROACH WITH DH (Cont'd)

A/THR OFF

- **If alert appears above 1 000 ft:**
  Try to re-engage autothrust.
  - **If unsuccessful:**
    Revert to CAT II minima and control thrust manually.
- **If alert appears between 1 000 ft and 200 ft:**
  Go around if insufficient visual reference.
- **If alert appears below 200 ft:**
  Continue and control thrust manually.

  Note: A go around must be performed if unsufficient visual references at 50 ft for a CAT III single approach.

LOC OR G/S EXCESSIVE DEVIATION ON PFD

- **If alert appears above 200 ft:**
  Monitor ILS tracking.
- **If alert appears between 200 ft and DH:**
  Go around if insufficient visual references.
- **If alert appears below DH:**
  Land manually.

"AUTOLAND" WARNING

- **If warning appears between 200 ft and DH:**
  Go around if insufficient visual references.
- **If warning appears below DH:**
  Land manually.

NO "LAND" AT 350 FT

Perform a manual landing if sufficient visual references, or go around.

Continued on the following page

FAILURES AND ASSOCIATED ACTIONS DURING CAT III APPROACH WITH DH (Cont'd)

INCORRECT SELECTED COURSE AT 350 FT

Go around if insufficient visual references.
Disengage autopilot at 50 ft at the latest.

Note: Selected course deviation is considered incorrect when above 5 °.

NO "FLARE" AT 30 FT

- **If unsufficient visual references:**
  Go around.
- **If sufficient visual references:**
  Disengage autopilot.
  Land manually.

FAILURES AND ASSOCIATED ACTIONS DURING A CAT III APPROACH WITHOUT DH

Applicable to: ALL

In the case of multiple failures, the flight crew must apply the most limiting specific actions.

CAPABILITIES DECREASE

- **If alert appears above 1 000 ft:**
  Try to recover.
  - **If unsuccessful:**
    Revert to the available capability.
- **If alert appears below 1 000 ft:**
  Go around if insufficient visual references.

Note: 1. Capability decrease is inhibited below 200 ft.
2. This procedure does not apply in case of autothrust loss.

Continued on the following page

FAILURES AND ASSOCIATED ACTIONS DURING A CAT III APPROACH WITHOUT DH (Cont'd)

FAILURE LEADING TO SLATS/FLAPS LESS THAN CONF 3

Revert to CAT I minima.

NOSE WHEEL STEERING FAILURE

Disengage autopilot at nose landing gear touch down or when the failure occurs during landing roll.

- **If failure occurs above 350 ft:**
  Revert to CAT III with DH set to 50 ft.
- **If failure occurs between 350 ft and 200 ft:**
  Go around if insufficient visual references.
- **If failure occurs below 200 ft:**
  Continue.

ANTI-SKID FAILURE

Disengage autopilot at touch down or when the failure occurs during landing roll.
Brake manually.

Note: *Autobrake is inoperative.*

- **If failure occurs above 350 ft:**
  Revert to CAT III single minima.
- **If failure occurs between 350 ft and 200 ft:**
  Go around if insufficient visual references.
- **If failure occurs below 200 ft:**
  Continue.

Continued on the following page

FAILURES AND ASSOCIATED ACTIONS DURING A CAT III APPROACH WITHOUT DH (Cont'd)

ALPHA FLOOR ACTIVATION

- **If activation occurs above 1 000 ft:**

  Check speed.

  Disengage and re-engage autothrust mode (TOGA LK should disappear from FMA).

- **If activation occurs between 1 000 ft and 100 ft:**

  Go around if insufficient visual references.

Note: Alpha floor protection is inhibited below 100 ft at landing.

ONE ENGINE FAILURE

Note: Automatic Approach, Landing and Roll Out have been demonstrated in CONF 3 and CONF Full with one engine inoperative prior to initiating the approach.

- **If failure occurs above 1 000 ft:**

  Revert to CAT III single minima.

  Note: CAT III dual capacity can be recovered provided APU is running and one APU generator is connected to the electrical network.

- **If failure occurs between 1 000 ft and 200 ft:**

  Go around if insufficient visual references.

- **If failure occurs below 200 ft:**

  Land.

Continued on the following page

FAILURES AND ASSOCIATED ACTIONS DURING A CAT III APPROACH WITHOUT DH (Cont'd)

TWO ENGINE FAILURE

- **If two engine failure on the same side:**
  - **If failure occurs above 1 000 ft:**
    Revert to CAT I.
  - **If failure occurs between 1 000 ft and 500 ft:**
    Go around.
  - **If failure occurs below 500 ft:**
    Land.
- **If two engine failure on opposite sides:**
  - **If failure occurs above 1 000 ft:**
    Revert to CAT II minima.
  - **If failure occurs between 1 000 ft and 200 ft:**
    Go around.
  - **If failure occurs below 200 ft:**
    Land.

AUTO CALL OUT RA FAILURE

- **If failure appears between 1 000 ft and 200 ft:**
  Go around if insufficient visual references.
- **If failure appears below 200 ft:**
  Land.

Continued on the following page

FAILURES AND ASSOCIATED ACTIONS DURING A CAT III APPROACH WITHOUT DH (Cont'd)

"RA" FLAG ON BOTH PFDs, AND ON THE HUD (IF DEPLOYED)

- **If warning appears above 1 000 ft:**
  Revert to CAT I minima.
- **If warning appears below 1 000 ft:**
  Go around if insufficient visual references.

Note: *1. AP/FD may not be available in APPR mode.*
2. The "RA" flag is displayed on both PFDs, and on the HUD (if deployed), when none of the three radio heights can be displayed.

AMBER "CHECK ATT" ON BOTH PFDs

CAUTION	Do not make any switching below 1 000 ft.

- **If alert appears above 1 000 ft:**
  Check A/C attitude with standby horizon.
  Use switching to recover valid data.
  - **If alert disappears:**
    A CAT III single approach is still possible.
  - **If alert persists:**
    Revert to CAT I minima.
- **If alert appears between 1 000 ft and 200 ft:**
  Go around if insufficient visual references using standby horizon.
- **If warning appears below 200 ft:**
  Land.

Continued on the following page

FAILURES AND ASSOCIATED ACTIONS DURING A CAT III APPROACH WITHOUT DH (Cont'd)

RED "ATT" ON ONE PFD

CAUTION	Do not make any switching below 1 000 ft.

- **If warning appears above 1 000 ft:**
  Use switching to recover valid data.
  - **If warning disappears:**
    A CAT III single approach is still possible.
  - **If warning persists:**
    Revert to CAT I minima.
- **If warning appears between 1 000 ft and 200 ft:**
  Go around if insufficient visual references.
- **If warning appears below 200 ft:**
  Land.

AMBER "CHECK HDG" ON BOTH NDs AND BOTH PFDs

CAUTION	Do not make any switching below 1 000 ft.

- **If alert appears above 1 000 ft:**
  Check heading with standby compass.
  Use switching to recover valid data.
  - **If alert disappears:**
    A CAT III single approach is still possible.
  - **If alert persists:**
    Revert to CAT I minima.
- **If alert appears between 1 000 ft and 200 ft:**
  Go around if insufficient visual references.
- **If alert appears below 200 ft:**
  Land.

Continued on the following page

FAILURES AND ASSOCIATED ACTIONS DURING A CAT III APPROACH WITHOUT DH (Cont'd)

RED "HDG" ON ONE ND AND ONE PFD

CAUTION	Do not make any switching below 1 000 ft.

- **If warning appears above 1 000 ft:**
  Use switching to recover valid data.
  - **If warning disappears:**
    A CAT III single approach is still possible.
  - **If warning persists:**
    Revert to CAT I minima.
- **If warning appears between 1 000 ft and 200 ft:**
  Go around if insufficient visual references.
- **If warning appears below 200 ft:**
  Land.

RED "SPD" ON ONE PFD

CAUTION	Do not make any switching below 1 000 ft.

- **If warning appears above 1 000 ft:**
  Use switching to recover valid data.
  - **If warning disappears:**
    A CAT III single approach is still possible.
  - **If warning persists:**
    Revert to CAT I minima.
- **If warning appears between 1 000 ft and 200 ft:**
  Go around if insufficient visual references.
- **If warning appears below 200 ft:**
  Land.

Continued on the following page

FAILURES AND ASSOCIATED ACTIONS DURING A CAT III APPROACH WITHOUT DH (Cont'd)

"AP OFF" WARNINGS

- **If warning appears above 1 000 ft:**
  Try to reengage autopilot.
  - **If unsuccessful:**
    Revert to CAT I minima.
- **If warning appears below 1 000 ft:**
  Go around manually if insufficient visual references.

A/THR OFF

- **If alert appears above 1 000 ft:**
  Try to reengage autothrust.
  - **If unsuccessful:**
    Revert to CAT II minima and control thrust manually.
- **If alert appears between 1 000 ft and 200 ft:**
  Go around if unsufficient visual references.
- **If alert appears below 200 ft:**
  Land.

LOC OR G/S EXCESSIVE DEVIATION ON PFD

- **If alert appears above 200 ft:**
  Monitor ILS tracking.
- **If alert appears below 200 ft:**
  Go around if insufficient visual references.

"AUTOLAND" WARNING

Go around if insufficient visual references.

Continued on the following page

FAILURES AND ASSOCIATED ACTIONS DURING A CAT III APPROACH WITHOUT DH (Cont'd)

NO "LAND" AT 350 FT

Perform a manual landing if sufficient visual references, or go around.

INCORRECT SELECTED COURSE AT 350 FT

Go around if unsufficient visual references.
Disengage autopilot at 50 ft at the latest.

Note: Selected course deviation is considered incorrect when above 5 °.

NO "FLARE" AT 30 FT

- **If unsufficient visual references:**
  Go around.
- **If sufficient visual references:**
  Disengage autopilot.
  Land manually.

HOW TO DEFINE A HDG/TRK PRESET FOR TAKEOFF OR GO-AROUND

Applicable to: ALL

HOW TO DEFINE A HDG/TRK PRESET FOR TAKEOFF

- **Before takeoff, and up to 30 ft RA**

  Turn the HDG/TRK knob.

  This action defines a HDG/TRK preset. NAV disarms. The preset value remains displayed on the HDG/TRK window (even when RWY TRK engages at 50 ft RA).
  When the flight crew pulls the HDG/TRK knob (at least 5 s after liftoff), HDG or TRACK engages. The aircraft follows the preset target.

HOW TO DEFINE A HDG/TRK PRESET FOR GO-AROUND

- **LOC*, LOC, F-LOC*, F-LOC, LAND, FLARE, ROLL OUT or GA TRK is engaged**

  Turn the HDG/TRK knob.

  This action defines a HDG/TRK preset. The preset value remains displayed on the HDG/TRK window, as long as one of the above modes is engaged.
  After go-around engagement, HDG/TRACK will engage, when the flight crew pulls the HDG/TRK knob.

L3 *This is applicable, if the flight crew pulls the HDG/TRK knob above 100 ft RA.*

L1 *When the HDG or TRACK engages, the heading/track target is the HDG/TRK preset.*

OVERVIEW

Applicable to: ALL

The Flight Management System (FMS) provides:
- Flight planning and navigation information
- Performance calculation, and optimization
- Long-term guidance targets
- Information display on the MFD, ND, and PFD.

FLIGHT PLANNING

The flight crew can create a complete flight plan (**lateral** and **vertical**) in the FMS .
The flight crew first selects or creates a basic flight plan, and then inserts fuel, load, and wind information. When all necessary data is added, the FMS computes and displays the track, speed, altitude, time, wind, and fuel predictions that are associated with the flight plan.
The flight crew can modify the flight plan at any time. These modifications are called **flight plan revisions** .
Refer to Flight Planning

NAVIGATION

The FMS tunes the radio navigation aids, and computes the aircraft position and position accuracy.

PERFORMANCE CALCULATION AND OPTIMIZATION

The FMS provides optimization and flight phase-related performance data.

LONG-TERM GUIDANCE TARGETS

The FMS sends targets to the FG to guide the aircraft along the inserted flight plan.

INFORMATION DISPLAY

FMS information appears on the: Multi-Function Displays (MFDs), Navigation Displays (NDs), and Primary Flight Displays (PFDs).
The MFDs and the NDs are interactive display units, that are used to enter or modify data, via the Keyboard and Cursor Control Units (KCCUs).

Intentionally left blank

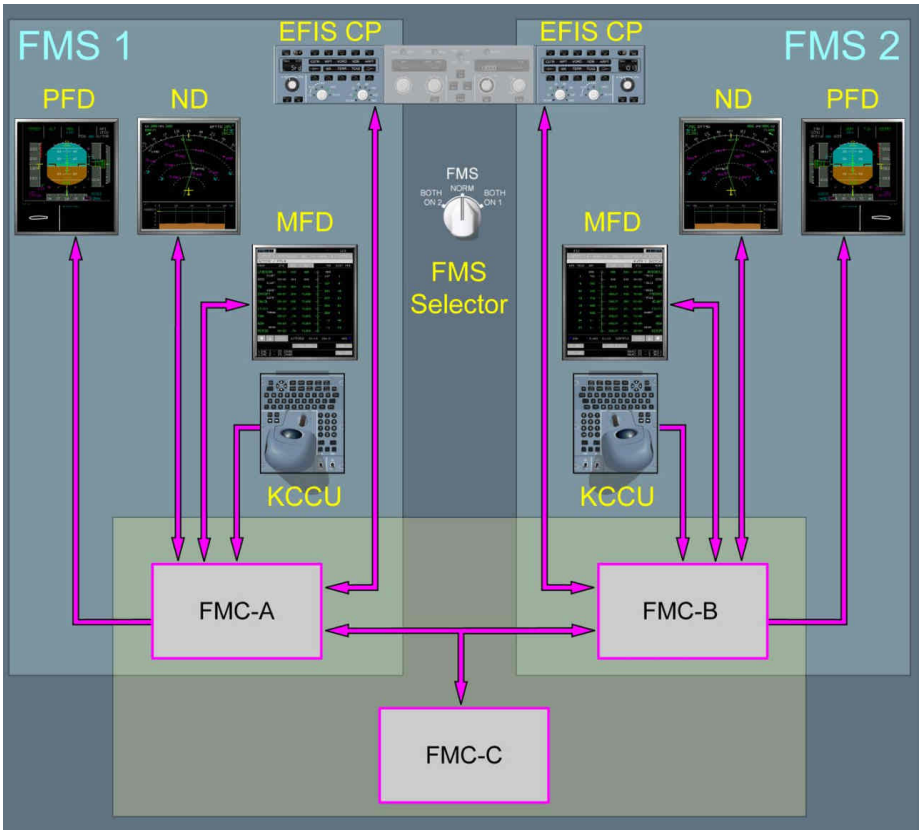
ARCHITECTURE

Applicable to: ALL

There are two flight management systems:
- The FMS 1, on the Captain's side
- The FMS 2, on the First Officer's side.

Each FMS uses:
- A computer, called the Flight Management Computer (FMC)
- The following cockpit interfaces:
  - One Multi Function Display (MFD)
  - One Navigation Display (ND)
  - One Primary Flight Display (PFD)
  - One EFIS Control Panel (EFIS CP)
  - One Keyboard and Cursor Control Unit (KCCU).

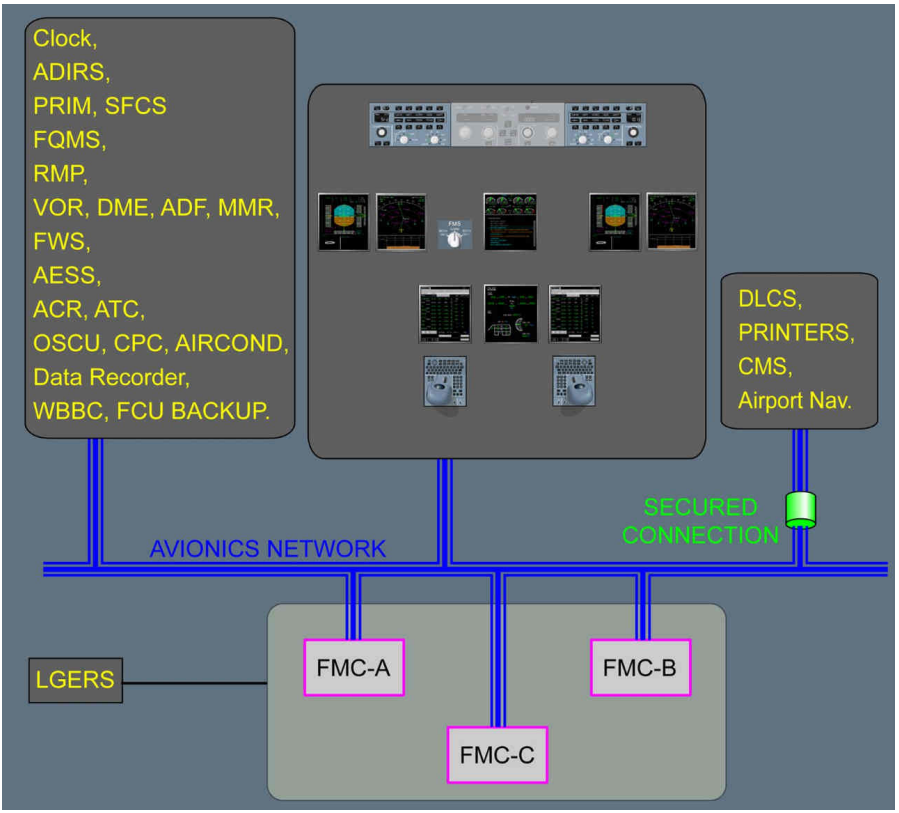
FMS Architecture



L2 PERIPHERAL SYSTEMS

The FMC interferes also with the following peripheral systems via the Avionics Network or other classic connections:

Peripheral Systems



CLOCK

FMS receives: Aircraft UTC time.

ADIRS

FMS receives: Position data for aircraft position computation.
FMS transmits: Reference position for IRS alignment.

PRIM

FMS receives: Data from the flight guidance and flight envelope system and from external systems (example: Anti Ice).
FMS transmits: Data for flight guidance and flight envelope systems.

SFCS (SLATS AND FLAPS CONTROL)

FMS receives: Flap setting for flight plan predictions computation.

FQMS (FUEL QUANTITY MANAGEMENT)

FMS receives: Weight, CG and fuel data for FMS predictions update.
FMS transmits: Weight, CG and fuel data for FQMS initialization.

RMP

FMS transmits: Data for VOR , DME , ADF and MMR tuning.

VOR , DME , ADF

FMS receives: Radio position data for FMS aircraft position computation.

MMR

FMS receives: GPS position.

FWS

FMS transmits: Data for warnings computation.

AESS

FMS transmits: Navigation and flight plan data.

ACR (AVIONICS COMMUNICATION ROUTER)

FMS receives: Uplinked messages from the company ground station.
FMS transmits: Messages and aircraft parameters to downlink to the company ground station.

ATC

FMS receives: Uplinked messages from the ATC ground center to be loaded in the FMS .
FMS transmits: Report message to downlink to the ATC ground center.

OSCU (OXYGEN SYSTEM CONTROL)

FMS transmits: Number of passengers and destination airfield elevation for oxygen control.

CPCS (CABIN PRESSURE CONTROL)

FMS transmits: Vertical flight plan data for cabin pressurization.

AIR COND

FMS transmits: Number of passengers for temperature control and fresh air supply.

DATA RECORDER

FMS transmits: All FMS data that is exchanged via the AFDX network is recorded by the Data Recorder.

WBBC

FMS receives: Weight and CG for FMS predictions update (backup of the FQMS).

FCU BACKUP

FMS receives: Display mode, range and options parameters.

DLCS (DATA LOADING)

FMS receives: Software and Databases to be loaded in the FMS .

PRINTERS

FMS transmits: FMS data to be printed.

CMS (MAINTENANCE)

FMS transmits: All FMS maintenance messages.

AIRPORT NAVIGATION

FMS transmits: Airport (origin and arrival) and runway data.

LGERS (LANDING GEAR EXTENSION/RETRACTION)

FMS receives: Discrete telling whether the aircraft is on ground or not.

FMC

There are three FMC s:
- FMC -A
- FMC -B
- FMC -C.

In normal operation:
- FMC -A provides data to FMS 1
- FMC -B provides data to FMS 2
- FMC -C is the standby computer.

Of the two active FMC s, one FMC is the “master”, the other is the “slave”. This depends on which Autopilot (AP) is active, and on the selected position of the FMS Source Select sw .
The two active FMC s independently calculate data, and they exchange, compare, and synchronize this data.
The standby FMC does not perform any calculation.

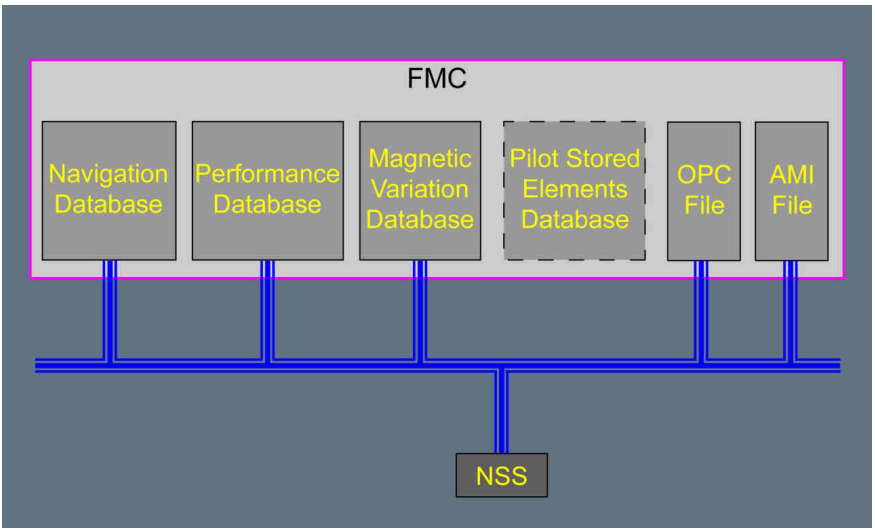
Refer to More Information on the FMS Modes of Operation

FMC DATABASES

Each FMC has four databases:
- Navigation database
- Performance database
- Magnetic variation database
- Pilot-stored elements database.

L3 Some FMS data can be customized, using the following two files:
- Operational Program Configuration file (OPC -file)
- Airline Modifiable Information file (AMI -file).

FMC Databases



L2 NAVIGATION DATABASE

The navigation database provides standard navigation data: NAVAIDS , waypoints, airports, runways, airways, holding patterns, company routes, terminal area procedures (SID , STAR , APPROACH), MSA , and MORA .
This data is stored for two successive 28–day cycles.

L3 The operator defines, obtains, updates, loads, and uses this data.

L2 The ACFT STATUS panel of the DATA / STATUS page displays the validity (starting and expiration dates) of the database.

L3 The part number of the navigation database is also displayed on the ACFT STATUS panel of the DATA / STATUS page.

L2 *Refer to STATUS page*

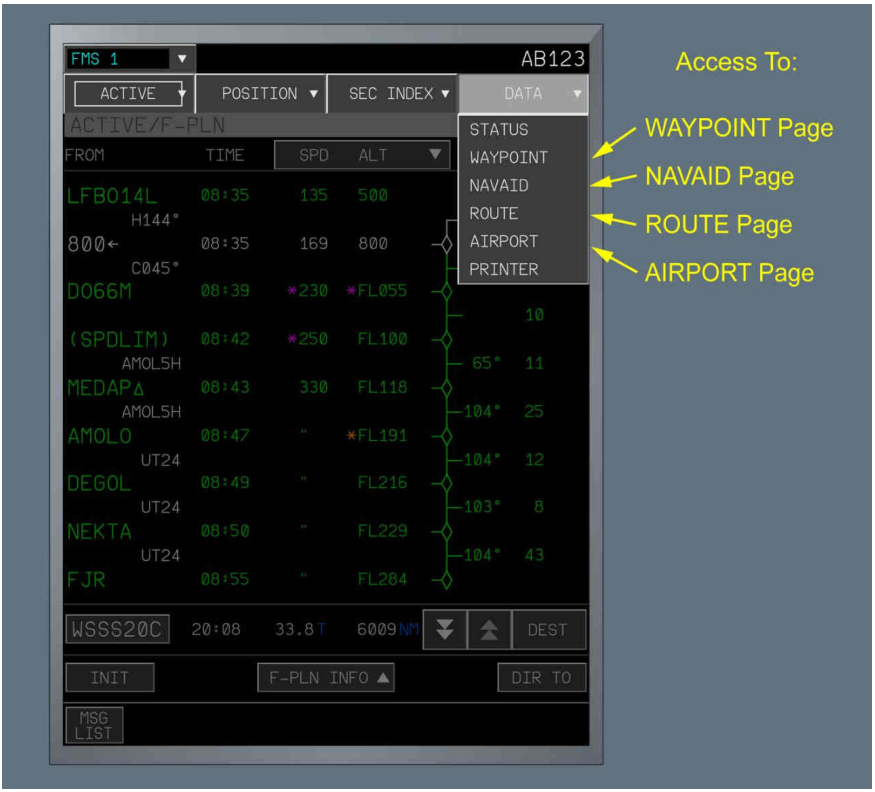
If the aircraft clock date does not match the database cycle, the white message “CHECK DATABASE CYCLE” is displayed in the FMS message zone on the MFD .

DATA PAGES

The flight crew can consult the waypoints, NAVAIDS , routes and airports (with runways), that are stored in the navigation database, on the DATA pages. The DATA pages are accessed via the DATA menu on the General Menu Bar.

Refer to DATA / WAYPOINT page
Refer to DATA / NAVAID page
Refer to DATA / ROUTE page
Refer to DATA / AIRPORT page

DATA Menu



L2 PERFORMANCE DATABASE

The performance database is used for the computation of FMS performance parameters, flight plan predictions and optimization.

L3 It includes the engine model, aerodynamic model, and performance model.

The Operator cannot modify this database.

The FMS P/N panel of the STATUS page displays the part number of the performance database.

Refer to STATUS page

L2 MAGNETIC VARIATION DATABASE

The magnetic variation database provides magnetic variation data, used to compute local magnetic variation declination.

L3 The aircraft manufacturer updates this database.
The FMS P/N panel of the STATUS page displays the part number of the magnetic variation database.
Refer to STATUS page

L2 PILOT-STORED ELEMENTS DATABASE

The pilot-stored elements database stores the waypoints, NAVAIDS , runways, and routes created by the flight crew. The contents of this database are limited to:
- 50 waypoints
- 20 NAVAIDS
- 10 runways
- 5 routes (with a maximum size of 30 flight plan elements per route).

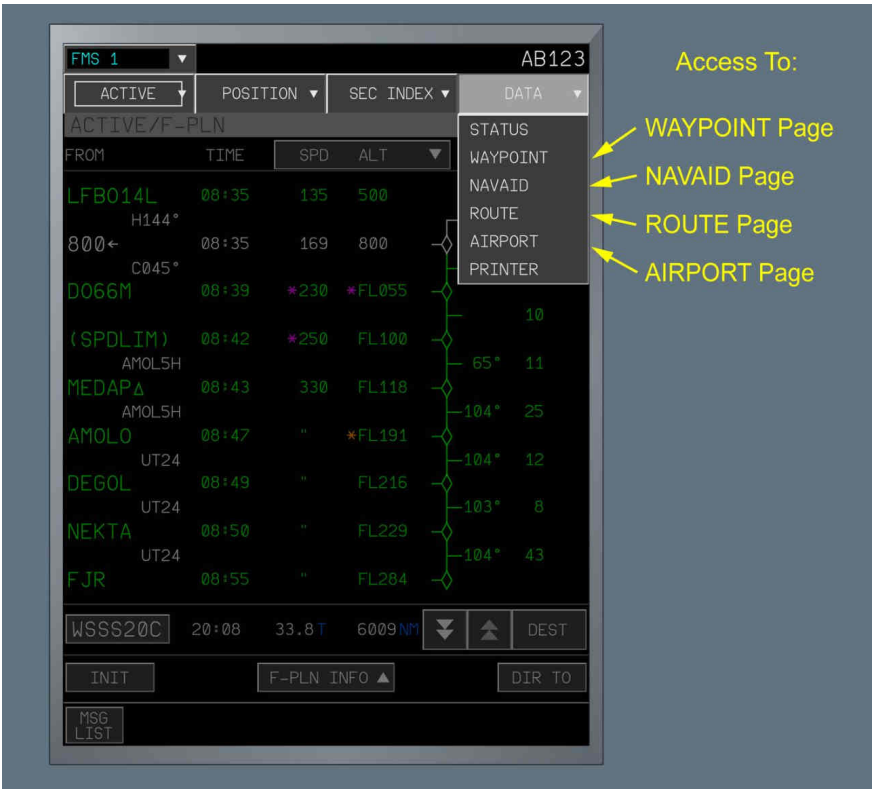
The pilot-stored elements can be deleted:
- Manually: At any time, with the DELETE ALL function on the ACFT STATUS panel of the STATUS page
- Automatically: After each flight (This is an optional feature that Operators can activate via the AMI -file).

All the pilot-stored elements are deleted when all FMC s are shut down.
The ACFT STATUS panel of the STATUS page displays the number and types of pilot-stored elements.
Refer to STATUS page

DATA PAGES

The flight crew can create waypoints, NAVAIDS , routes and airports/runways, that will be stored in the pilot-stored elements database, on the DATA pages. The DATA pages are accessed via the DATA menu on the General Menu Bar.
Refer to DATA / WAYPOINT page
Refer to DATA / NAVAID page
Refer to DATA / ROUTE page
Refer to DATA / AIRPORT page

DATA Menu



L3 OPERATIONAL PROGRAM CONFIGURATION FILE (OPC -FILE)

The Operational Program Configuration (OPC) file is also called the FMS Options Configuration File.

The aircraft manufacturer manages the contents of the OPC file.

The OPC file provides a set of operational high-level software options. Operators select these options, and load the OPC file into the FMC . This then automatically activates the correct options for use by the FMS .

An example of these options include: Weight Unit (lb/kg), FLS (Yes/No), AOC (Yes/No), FANS (Yes/No), ND Interactivity (Yes/No).

The FMS P/N panel of the STATUS page displays the part number of the OPC file.

Refer to STATUS page

L3 AIRLINE MODIFIABLE INFORMATION FILE (AMI -FILE)

The Airline Modifiable Information (AMI) file is also called the FMS Airline Configuration File. The AMI file provides the following set of FMS data, that Operators can customize:

- Software Options: DIR TO default option (with abeam/without abeam), Default Intercept Angle Value...
- Airline Policy Values (e.g. THR RED altitude, ACC altitude...)
- Fuel Policy Values (e.g. Taxi Fuel, Route Reserve %...)
- AOC Policy Values (e.g. AOC Flight-plan request (Yes/No), AOC Performance Data request (Yes/No)...)
- FANS Policy Values (e.g. ATC Free Text (Yes/No)...)
- OIS Policy Values: (e.g. OIS Flight-plan request (Yes/No), OIS Performance Data request (Yes/No)...)

An operator can define one or more AMI s for all of its fleet, as needed.
The FMS P/N panel of the STATUS page displays the part number of the AMI file.
Refer to STATUS page

L3 NSS

The Data Loading Configuration Software (DLCS) on the Network Server System (NSS) is used to load all the databases (except the pilot-stored elements database), and the configuration files into the FMC.

MFD

The MFD displays FMS textual data. There are more than 50 FMS pages that provide information on the flight plan, aircraft position and flight performance. The MFD is interactive: The flight crew can navigate through the pages, and can consult, enter or modify the data via the KCCU .
Refer to MFD

KCCU

The flight crew uses the Keyboard and Cursor Control Unit (KCCU) to:
- Navigate through the FMS pages on the MFD
- Enter and modify data on the MFD FMS pages
- Perform some flight-plan revisions on the lateral ND .

Refer to KCCU

PFD AND ND/VD (EFIS)

The ND , VD and the PFD display graphical and textual information related to flight management. The ND displays the lateral and the VD the vertical parts of the flight plan.
On the lateral part of the ND , the flight crew can make some FMS lateral flight plan modifications via the KCCU . The VD is not interactive.
Refer to ND
Refer to VD
Refer to PFD

EFIS CP

With the EFIS CP , the flight crew controls the graphical and textual FMS data that appear on the ND .
Refer to EFIS CP

FMS selector

The FMS selector allows the flight crew to link all flight management interfaces on both sides with the FMC on Captain's side (when selecting BOTH ON 1), or the FMC on First Officer's side (when selecting BOTH ON 2).
Refer to FMS selector

Aircraft Position

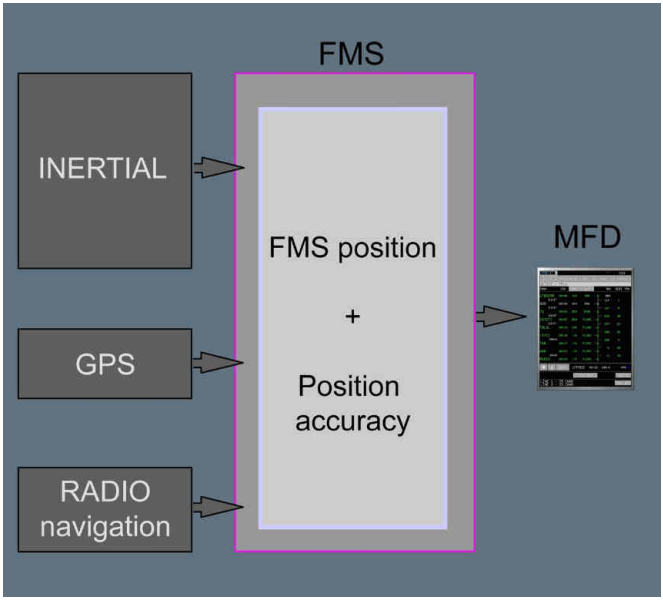
AIRCRAFT POSITION COMPUTATION - INTRODUCTION

Applicable to: ALL

Each FMS computes its aircraft position and the position accuracy, using three types of sources:
- Inertial
- Global Positioning System (GPS)
- Radio navigation.

The POSITION pages on the MFD display all the information about the FMS position and position accuracy.

FMS POSITION COMPUTATION



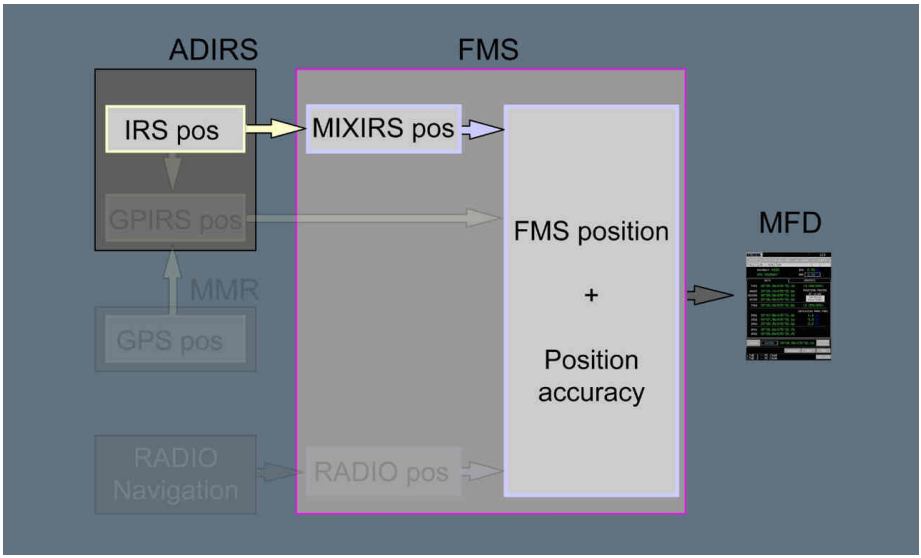
L2 If the GPS data is valid and accurate, the FMS uses only the GPS and inertial sources to compute the aircraft position.

If the GPS data is not valid or not accurate, the FMS uses:
- A combination of the radio navigation and inertial sources, or
- The inertial source only, if the radio navigation data is not accurate, or not available.

POSITION COMPUTATION - INERTIAL

Applicable to: ALL

INERTIAL POSITIONS



IRS POSITION

Each of the three ADIRSs has its IRS position. The three IRS positions are sent to both FMSs.

L2 ALIGNMENT OF THE IRS

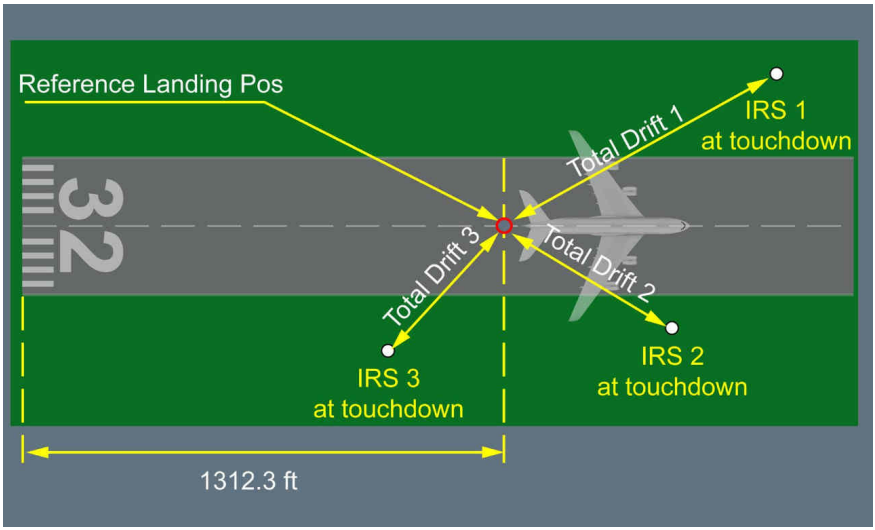
If the GPS position is available and accurate, the three IRSs take the GPS position as the alignment reference point.
The flight crew can change this reference point manually, by entering the coordinates in the Align On Other Reference window on the POSITION / IRS page.
If the GPS position is not available or not accurate, the IRS alignment cannot start, and the ALIGN IRS message appears in the FMS message zone. In this case, the flight crew must enter the alignment reference point, by entering the coordinates on the Align On Other Reference window on the POSITION / IRS page.

L3 A standard alignment takes 10 min. A fast alignment takes 30 s. A fast alignment occurs, if a pre-aligned IRS position is updated with a new position.

L2 AVERAGE DRIFT COMPUTATION

At the end of the flight, each FMC computes an average drift for each IRS position. The three drift values appear on the POSITION / IRS page. After each flight, the flight crew uses the average drift values to check the IRS performance.
The Average Drift = Total Drift / Time since last alignment.
The Total Drift is: The difference between the IRS position at landing and the reference landing position. The reference landing position is the position of the destination runway threshold, plus a shift of 1 315 ft on the runway axis.

TOTAL DRIFT

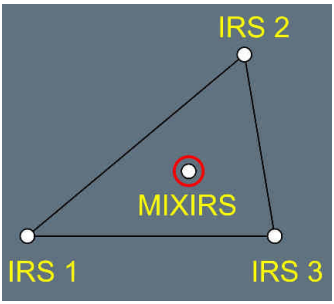


Note: The Average Drift is equal to the Total Drift, if the time since last alignment is less than one hour.

MIX IRS POSITION

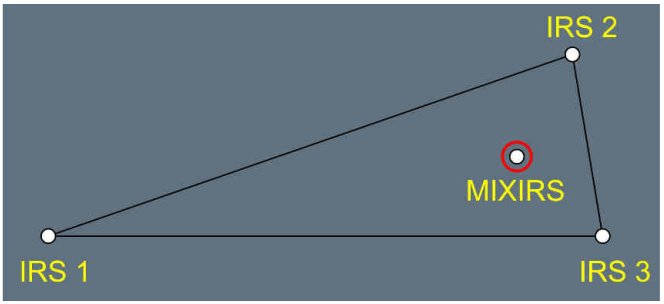
Each active FMS receives the IRS position from the three ADIRSs, and computes a weighted average. This weighted average is referred to as the MIX IRS position. The FMS uses the MIX IRS position to compute the aircraft position.

MIX IRS position



L2 If an IRS position drifts abnormally, the FMS reduces the influence (weight factor) of the drifting IRS on the MIX IRS position.

MIX IRS with a drifting IRS position



If one of the IRS positions is not valid, it is not used to compute the MIX IRS position. In such a case:

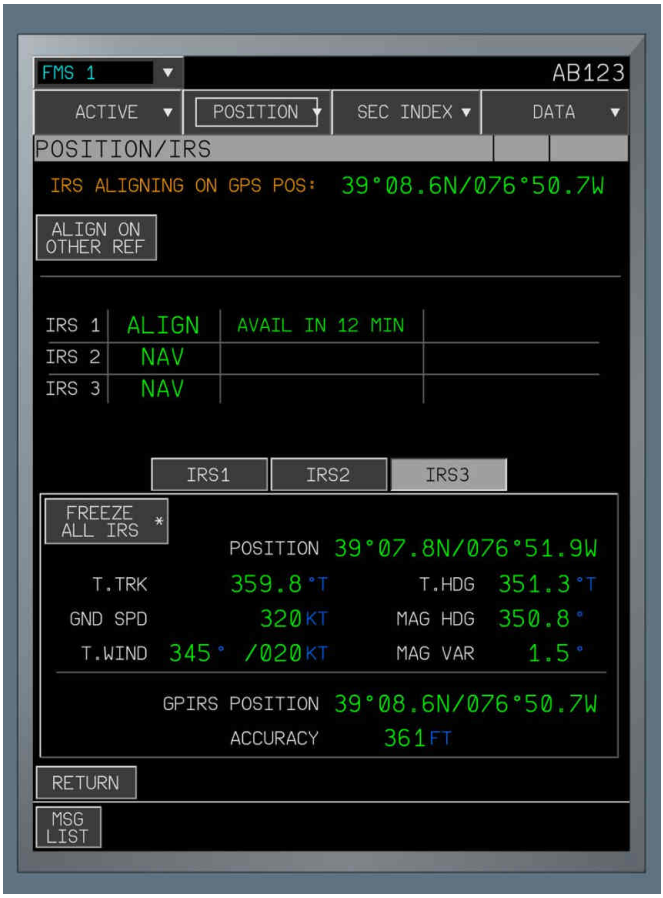
- Each FMS uses only the IRS position from the onside ADIRS
- If the onside IRS position is not valid, the FMS uses the IRS 3 position
- If neither the onside IRS nor the IRS 3 positions are valid, the FMS uses the offside IRS position.

CONTROLS AND INDICATORS

The POSITION / IRS page displays information about all three IRS positions and their alignment status.

Refer to POSITION / IRS page

POSITION / IRS Page



The POSITION / MONITOR page displays the MIX IRS position.
Refer to POSITION / MONITOR page

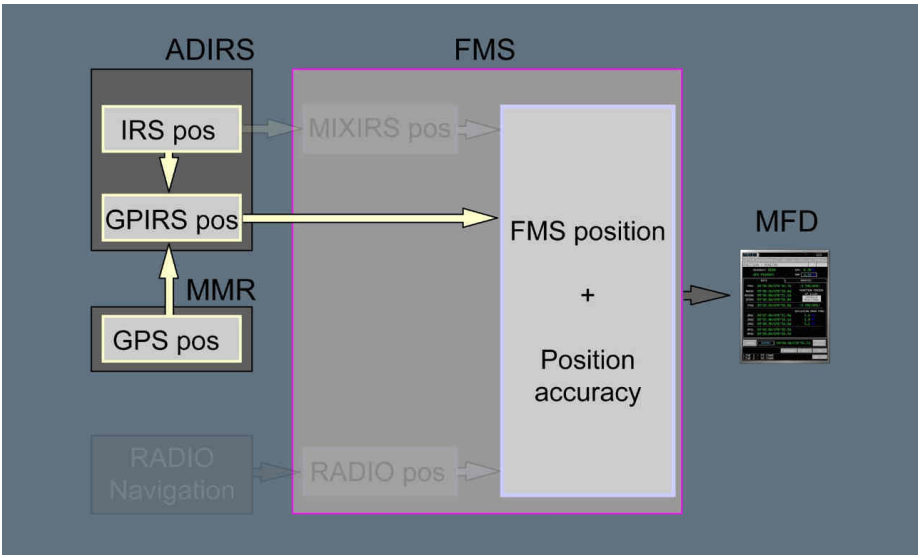
ON THE ECAM:
IRS IN ALIGN

POSITION COMPUTATION - GPS

Applicable to: ALL

GPS POSITIONS



GPS POSITION

The Multi Mode Receiver (MMR) sends the GPS position to the ADIRS , to compute the GPIRS position.

Note: *The ADIRS send also the pure GPS position to the FMS . It is used for display purposes only on the POSITION / MONITOR and POSITION / GPS page.*
Refer to POSITION / MONITOR page
Refer to POSITION / GPS page

GPIRS POSITION

Each ADIRS computes a hybrid position, composed of the GPS and IRS position. The hybrid position is referred to as the GPIRS position.
Each FMS uses the onside GPIRS position to compute the FMS position (for example: FMS 1 uses GPIRS 1).

L2 If the onside GPIRS position is not valid or integer, the FMS uses:
- The GPIRS 3 position, or
- The offside GPIRS position, if the GPIRS 3 position is not valid.

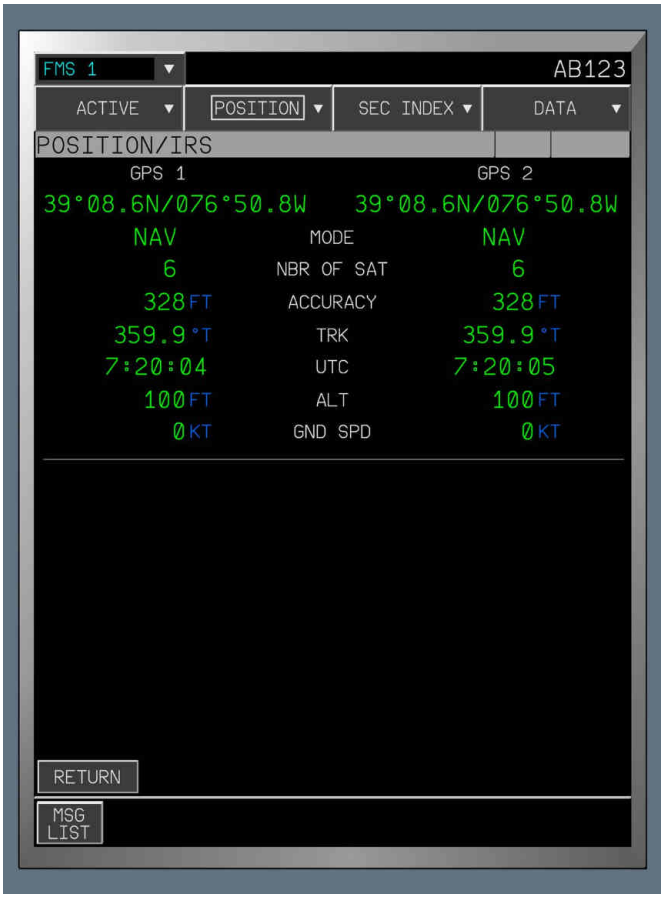
DESELECT GPS

The flight crew can deselect the GPS source on the Selected For FMS Navigation panel of the POSITION / NAVAIDS page. When the GPS source is deselected, the GPIRS position is no longer used to compute the FMS position.
Refer to POSITION / NAVAIDS page

CONTROLS AND INDICATORS

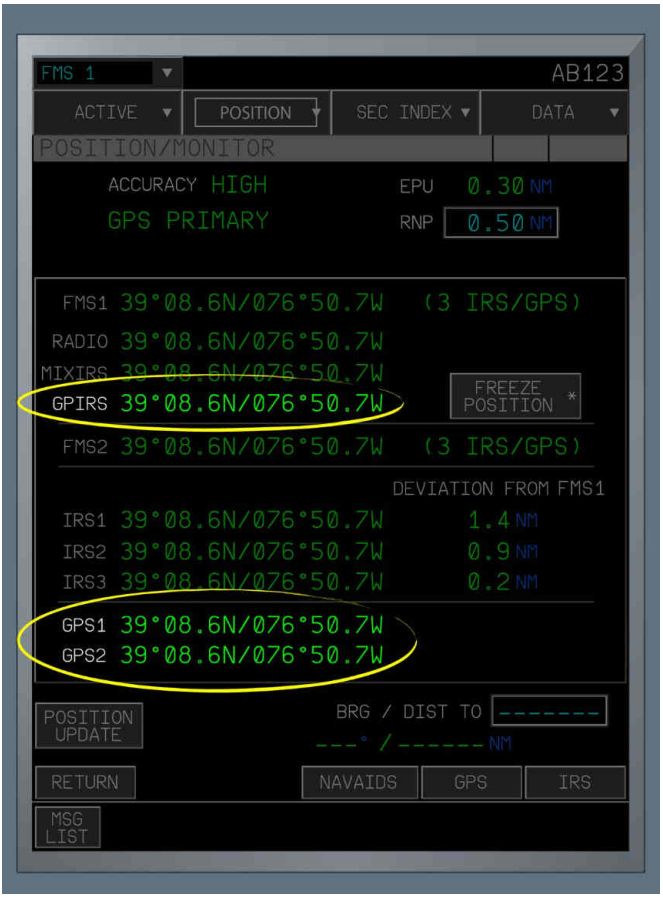
The POSITION / GPS page displays information on the GPS position.
Refer to POSITION / GPS page

POSITION / GPS Page



The POSITION / MONITOR page displays the GPIRS and the GPS position.
Refer to POSITION / MONITOR page

POSITION / MONITOR Page



ASSOCIATED MESSAGES

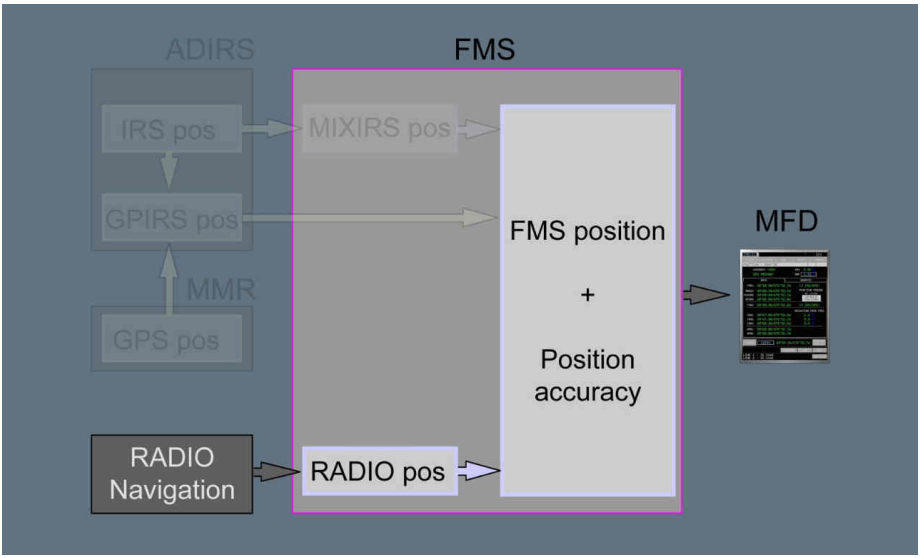
ON THE MFD MESSAGE AREA:

Refer to GPS DESELECTED
Refer to GPS PRIMARY
Refer to GPS PRIMARY LOST

POSITION COMPUTATION - RADIO NAVIGATION

Applicable to: ALL

RADIO POSITION



RADIO POSITION

Each FMS computes the radio position, using the data from its onside Radio Navigation Aids (NAVAID S) receivers.

The FMS can compute two different radio positions:
- DME / DME , or
- VOR / DME

Note: When the FMS navigation mode is not IRS / GPS (Refer to FMS Navigation Modes), during an ILS approach, the radio position is updated with the LOCalizer signal (LOC). The associated radio positions are referred to as DME / DME - LOC , and VOR / DME - LOC .

L2 If one or more onside NAVAIDS receivers fail, the FMS can use the offside NAVAIDS to compute the DME / DME or VOR / DME radio position.

L1 *Refer to Radio Navigation Tuning*

L2 **DESELECT NAVAIDS**

The flight crew can deselect up to 6 NAVAIDS on the POSITION / NAVAIDS page. When a NAVAID is deselected, the FMS can no longer use it to compute the radio position, nor for display on the ND .
Refer to POSITION / NAVAIDS page

CONTROLS AND INDICATORS

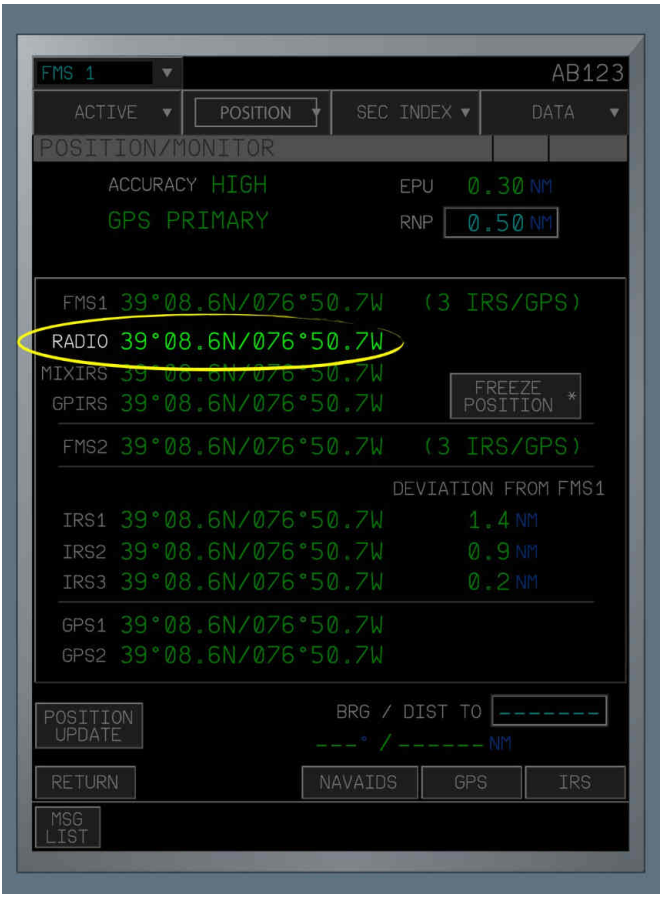
The POSITION / NAVAIDS page displays information about:
- The radio position
- The radio navigation mode
- The NAVAIDS used to compute the radio position.

Refer to POSITION / NAVAIDS page

POSITION / NAVAIDS Page

The POSITION / MONITOR page displays the radio position.
Refer to POSITION / MONITOR page

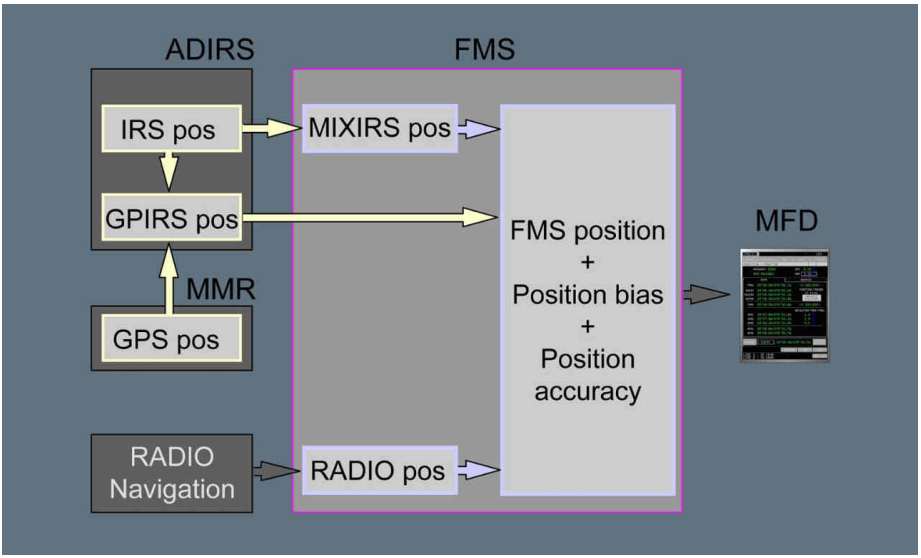
POSITION / MONITOR Page



POSITION COMPUTATION - FMS POSITION

Applicable to: ALL

FMS POSITION



FMS POSITION AND NAVIGATION MODES

Each FMS computes its FMS position from its MIX IRS position and the GPIRS or radio position, depending on which source provides the most accurate data.

L2 *Note: The FMS aircraft position computation is based on the inertial position. This computation is not possible if the inertial position is not valid. In this case, all FMS navigation and flight planning functions are no longer available.*

L1 The FMS uses four main navigation modes, that correspond to the combination of sources that are used to compute the aircraft position. The navigation modes are, in decreasing order of priority:

- Inertial - GPS (IRS/GPS)
- Inertial - DME/DME (IRS/DME/DME)
- Inertial - VOR/DME (IRS/VOR/DME)
- Inertial only (IRS)

L2 FMS POSITION UPDATES

If the navigation mode is not IRS/GPS, three FMS position updates may occur:

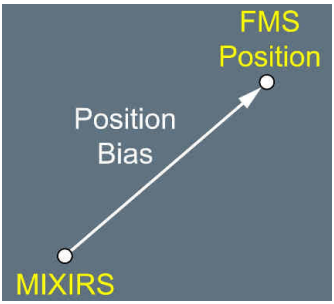
- At takeoff:
  An automatic position update on the runway threshold (plus possible takeoff shift entered by the flight crew on the Takeoff tab panel of PERF page).
- During an ILS approach:

  A temporary lateral update by the LOCalizer signal (LOC), creating three special navigation modes, listed in decreasing order of priority:
  - Inertial - DME/DME - LOC (IRS/DME/LOC)
  - Inertial - VOR/DME - LOC (IRS/VOR/LOC)
  - Inertial only - LOC (IRS/LOC)
- At any time:
  A manual position update, via the POSITION UPDATE function on the POSITION / MONITOR page.

POSITION BIAS

The FMS continuously memorizes the difference between the MIX IRS and the FMS position. This difference is referred to as the position bias.

POSITION BIAS



L2 If the FMS loses all radio and GPIRS positions, the new FMS position will be computed by taking the MIXIRS plus the last memorized position bias. The position bias does not change until the GPIRS or radio position is restored.

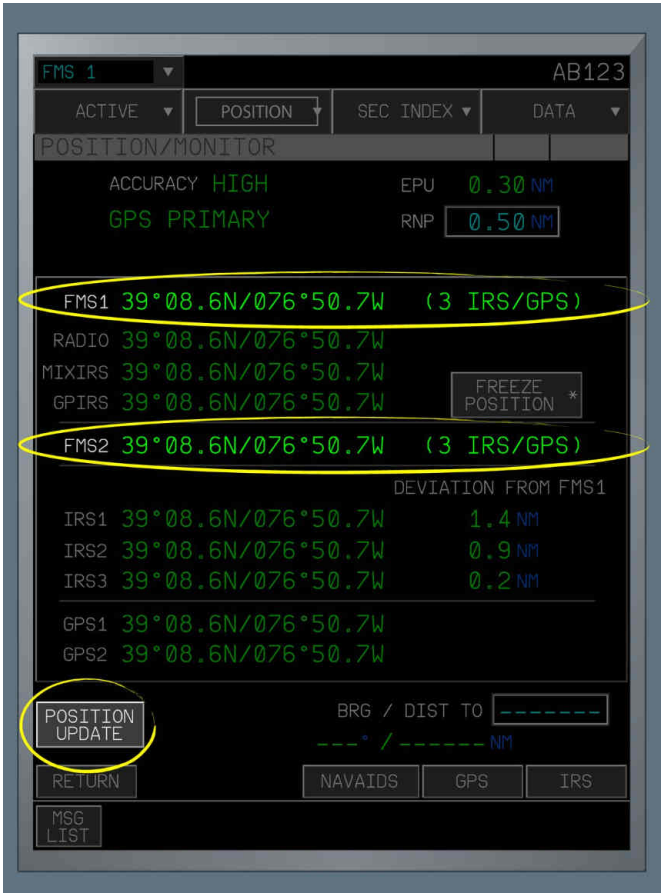
L1 Manually updating the FMS position also updates the position bias.

CONTROLS AND INDICATORS

The POSITION / MONITOR page displays the FMS position and navigation modes. The flight crew can also make a position update on this page.

Refer to POSITION / MONITOR page

POSITION / MONITOR Page



ASSOCIATED MESSAGES

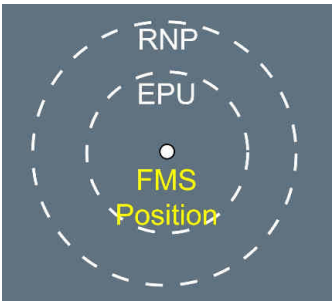
ON THE MFD MESSAGE AREA:

Refer to CHECK IRS1(2)(3) / FMS POSITION

POSITION ACCURACY

Applicable to: ALL

EPU - RNP



ESTIMATED POSITION UNCERTAINTY (EPU)

The FMS continuously computes the Estimated Position Uncertainty (EPU). It is used, together with the Required Navigation Performance, RNP, to define the aircraft navigation accuracy.

L2 The EPU represents the radius (in nautical miles) of the circle around the FMS computed position in which the real aircraft position lies 95 % of the time.

L3 EPU AND NAVIGATION MODE

After the IRS alignment on ground, the EPU is set to 0.2 nm. The EPU then depends on the FMS navigation mode:

Inertial-GPS:

The EPU is the greater of the two following values:

- The distance between the FMS position and the GPIRS position, or
- The GPS position uncertainty.
  The GPS position uncertainty computation is based on the GPS integrity (or Figure of Merit if the GPS integrity is not available) and the ground speed.

Inertial-Radio:

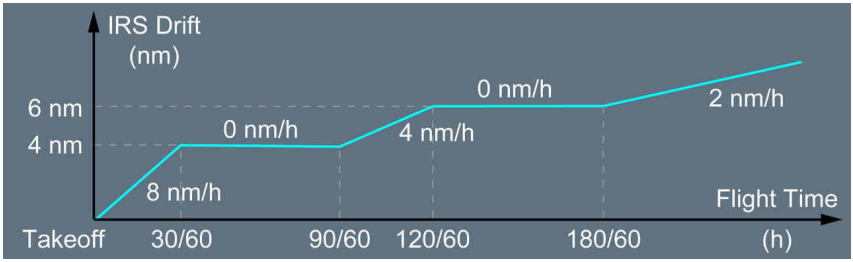
The EPU is the greater of the two following values:

- The distance between the FMS position and the radio position, or
- The radio position uncertainty.
  The radio position uncertainty computation is based on the distance and angle between the aircraft position and the NAVAIDS, and on the aircraft altitude and groundspeed.

Inertial Only:

The figure shows the mean inertial EPU evolution as a function of the time:

EPU Inertial Only



EPU AND POSITION UPDATE

After a manual or automatic position update on ground, the EPU is set to 0.2 nm.
After a position update in flight, the new EPU depends on the navigation mode:

Inertial-GPS:

The EPU = (distance between the update position and the GPIRS position) + GPS position uncertainty.

Inertial-Radio:

The EPU = (distance between the update position and the radio position) + radio position uncertainty.

Inertial Only:

The EPU = (distance between the update position and the FMS position) + previous EPU.

REQUIRED NAVIGATION PERFORMANCE (RNP)

The RNP value, together with the EPU , are used by the FMS to define the navigation class (*Refer to Evaluation of Navigation Accuracy*).
The FMS has a default RNP value.

L2 The following table gives the FMS default RNP values:

L12

En route	2 nm
Oceanic	2 nm
Takeoff area	1 nm
Terminal area	1 nm
GPS approach	0.3 nm

Continued on the following page

Continued from the previous page

Precision approach	0.5 nm
Non-precision approach	0.5 nm
VOR / RNAV approach using specified NAVAIDS for position updating	Max (0.5 nm , radio position uncertainty)

L3 The default values are defined in the Navigation Policy of the OPC file:

L1 A terminal area procedure may have an associated specific RNP value, defined in the navigation database. If this procedure is entered, this RNP value overwrites the default FMS value.
The flight crew can manually overwrite the FMS default or terminal area procedure value.

L2 When the flight crew enters a RNP value that is greater than the existing navigation database value, the message " PROC RNP is XX.XX " appears in the FMS message zone on the MFD . If no navigation database value exists, and the flight crew-entered value is greater than the area default value, the message " AREA RNP is XXXX " appears in the FMS message zone on the MFD .
Both messages can also appear when the navigation database value or area default value becomes less than the flight crew -entered value, when the flight area changes.

Note: The RNP shall be in accordance with the specified RNP values of the navigation and approach charts (if an RNP is specified).

EVALUATION OF NAVIGATION ACCURACY

NAVIGATION ACCURACY: HIGH, LOW

The FMS continuously compares the actual EPU with the current RNP and defines the navigation accuracy as:
- HIGH, if the EPU is less than, or equal to, the RNP
- LOW, if the EPU is greater than the RNP.

L2 If the navigation mode is not IRS/GPS:
- The message NAV ACCUR DOWNGRADED will appear on the MFD, when the navigation accuracy changes from HIGH to LOW
- The message NAV ACCUR UPGRADED will appear on the MFD, when the navigation accuracy changes from LOW to HIGH.

L1 GPS PRIMARY

The aircraft is in GPS PRIMARY, when the two following conditions are met:
- The navigation mode is IRS/GPS and
- The navigation accuracy is HIGH.

If at least one of the conditions is no longer met, the aircraft is no longer in GPS PRIMARY: The GPS PRIMARY LOST message appears on the MFD and ND.

Note: During a non-precision approach, that is flown with the FLS function, the GPS PRIMARY LOST condition degrades the FLS capability. The triple-click aural warning is generated.

When both conditions become valid again, the message GPS PRIMARY appears on the MFD and ND.

CONTROLS AND INDICATORS

The POSITION / MONITOR page displays the navigation class and the GPS PRIMARY status.
Refer to POSITION / MONITOR page

AIRCRAFT POSITION AND POSITION ACCURACY MONITORING

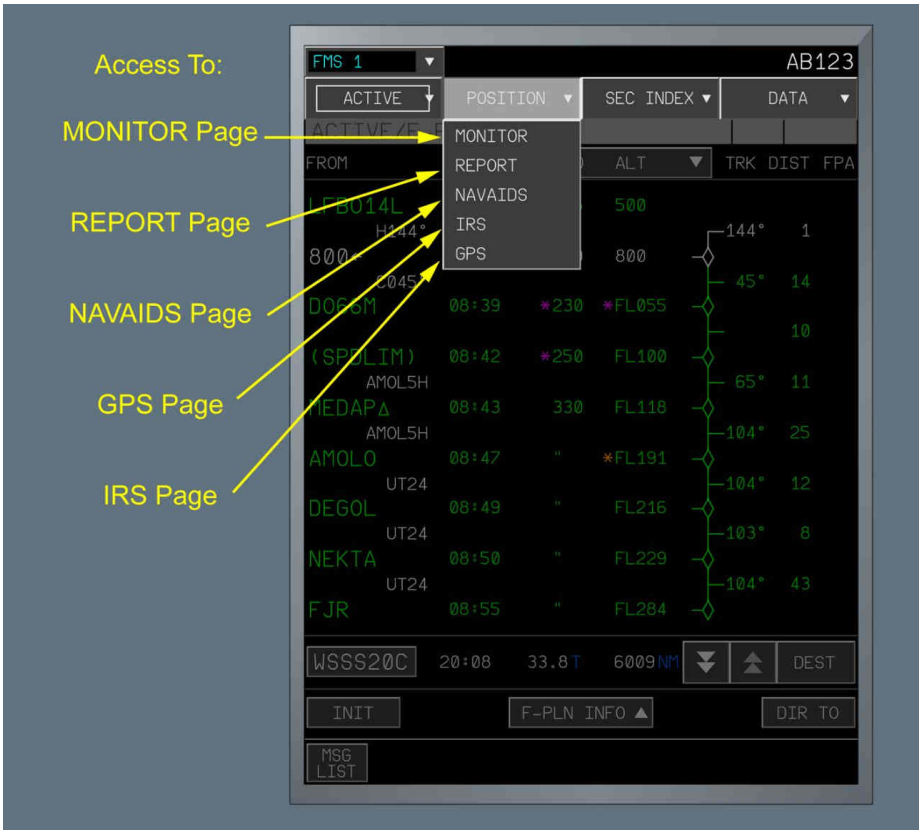
Applicable to: ALL

All information on the aircraft positions, navigation modes, and position accuracy is available on 5 specific position pages on the MFD :

- POSITION / MONITOR (*Refer to Page)*
- POSITION / REPORT (*Refer to Page)*
- POSITION / NAVAIDS (*Refer to Page)*
- POSITION / GPS (*Refer to Page)*
- POSITION / IRS (*Refer to Page)*

These pages are accessed via the POSITION menu on the General Menu bar.

POSITION Menu



Radio Navigation Tuning

DESCRIPTION

Applicable to: ALL

The FMS automatically tunes:
- The NAVAIDS used for the radio position computation (*Refer to Radio Position*)
- The NAVAIDS for display on the ND
- The NAVAIDS of the landing system.

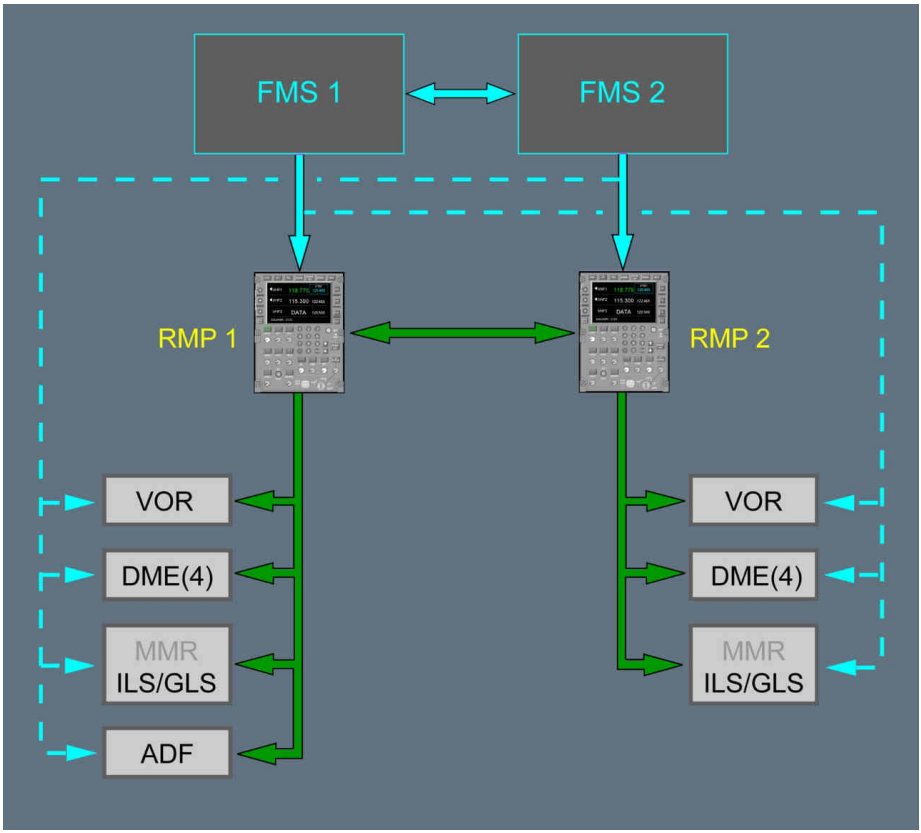
The NAVAIDS that are displayed on the ND , and the landing system NAVAIDS, can also be tuned manually on the POSITION / NAVAIDS page. (*Refer to Page*)
Manual tuning always has priority over automatic tuning.

L2 *Note:* *In case of a triple FMC failure, the flight crew can manually tune the NAVAIDS that are displayed on the ND , and the landing system NAVAIDS, via the Radio Management Panel (RMP).*
Refer to More information on the Standby Radio Navigation

L1 In dual and independent FMS modes, each FMS tunes its onside NAVAIDS. On each side, the FMS can tune:
- 1 VOR
- 4 DME s
- 1 ILS or GLS

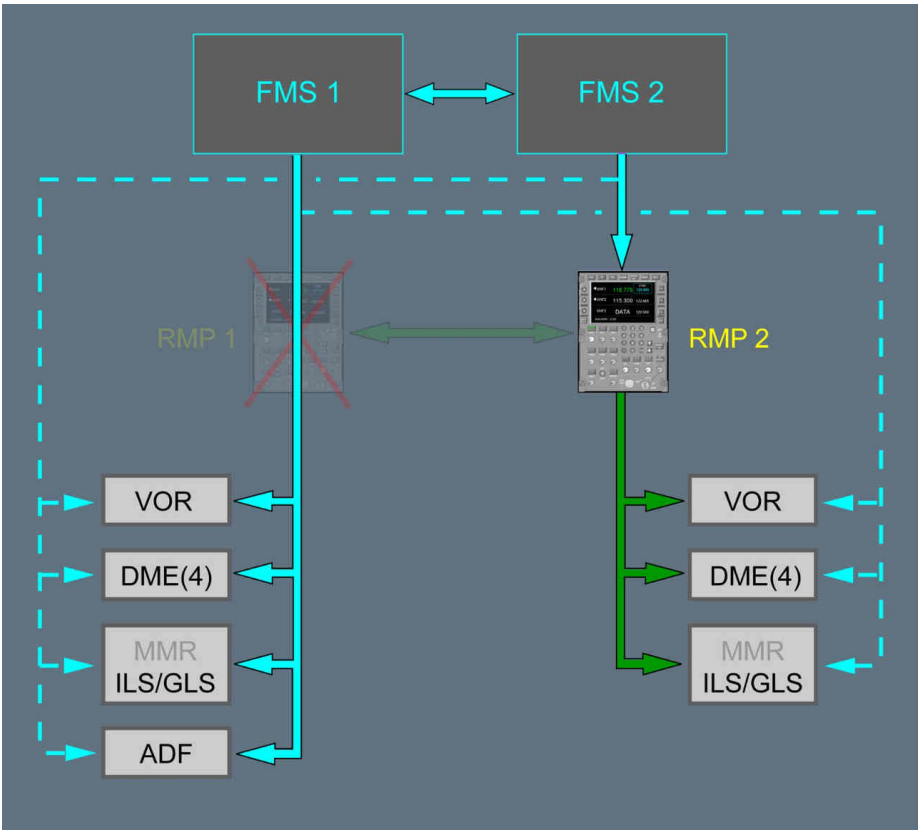
FMS 1 can tune 1 ADF .

Radio Navigation Tuning



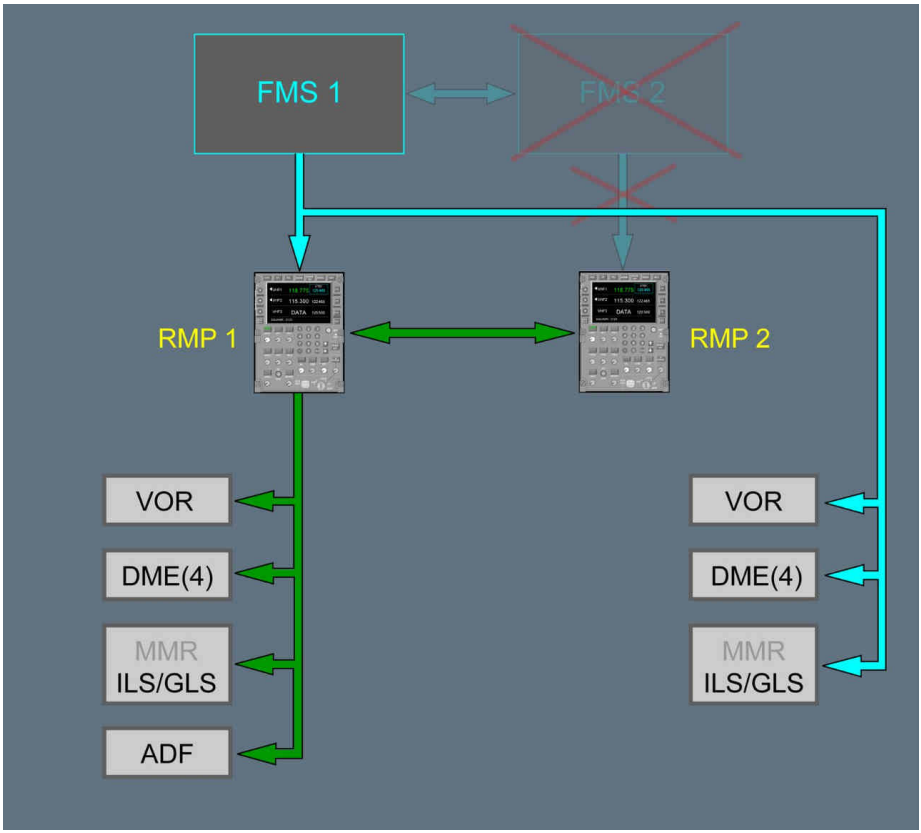
L2 The tuning of the onside NAVAIDS passes through the onside RMP , to synchronize the NAVAIDS tuning between the FMS and the RMP .
If at least one of the RMP s is in NAV mode, the FMS tuning of the NAVAIDS is interrupted on both sides. The RMP then tunes automatically the NAVAIDS previously tuned by the FMS .
If an RMP fails, the tuning information is still sent from the FMS to its onside NAVAIDS.

RMP Failure



In single FMS mode, or in case of communication failure between an FMS and its onside RMP , the available FMS will tune both side NAVAIDS.

Single FMS Mode



Note: *The onside NAVAIDS are tuned via the onside RMP , the offside NAVAIDS via a direct FMS -NAVAIDS connection.*

L3 NAVAIDS TUNING AND FMS SELECTOR

The position of the FMS Selector determines whether FMS 1 or FMS 2 tunes the NAVAIDS on both sides:

- NORM: The NAVAIDS are tuned, depending on the FMS operational mode:
  - DUAL and INDEPENDENT mode: Each active FMC tunes its onside NAVAIDS
  - SINGLE mode: The valid FMC tunes the NAVAIDS on both sides.
- BOTH ON CAPT : FMS 1 tunes the NAVAIDS on both sides
- BOTH ON F/O : FMS 2 tunes the NAVAIDS on both sides.

VOR TUNING

In normal operation, each FMS can tune one VOR. The FMS uses the same VOR for display on the ND as the one to compute the aircraft radio position.

L3 The VOR that will be tuned, is selected in accordance with the following order of priority:

1. The NAVAID manually selected by the flight crew
2. The NAVAID specified for the approach, in case of RNAV, VOR and VOR/DME approaches and the TO waypoint of the flight plan is one of the approach waypoints.
3. The NAVAID specified for the active leg
4. The NAVAID required to compute the aircraft radio position
5. The TO waypoint, if it is a NAVAID
6. Any down path waypoint, if it is a NAVAID
7. The FROM waypoint, if it is a NAVAID
8. The NAVAID nearest to the aircraft's present position.

DME TUNING

In normal operation, each FMS can tune four DME s at the same time.

L3 - One DME for display
  This DME can be manually or automatically tuned.
  The same order of priority for VOR tuning applies to DME tuning.
  If a VOR / DME is tuned to compute the aircraft radio position. The same VOR / DME will also be used for display on the ND .
- Two DME s to compute the DME / DME aircraft radio position. These NAVAIDS are automatically tuned, *Refer to Radio Position Computation* .
- One DME associated with ILS / DME .

ILS/GLS TUNING

In normal operation, each FMS can tune one ILS/GLS.

L3 The ILS/GLS that will be tuned, is selected in accordance with the following order of priority:
- The ILS/GLS manually selected by the flight crew
- The ILS/GLS associated with the takeoff runway, selected on the ACTIVE/F-PLN/DEPARTURE page, if the active flight phase is PREFLIGHT or TAKEOFF
- The ILS/GLS associated with the approach, selected on the ACTIVE/F-PLN/ARRIVAL page, if the active flight phase is CLB, CRZ, DES, APPR or GO AROUND, and the direct distance to the destination airport is less than 300 nm.

ADF (NDB) TUNING

In normal operation, FMS 1 can tune one NDB.

L3 The NDB that will be tuned, is selected in accordance with the following order of priority:
- The NDB manually selected by the flight crew
- The NDB specified for the approach, when an NDB approach is selected, and the TO waypoint of the flight plan is one of the approach waypoints
- The TO waypoint, if it is an NDB
- The FROM waypoint, if it is an NDB.

RADIO NAVIGATION TUNING - CONTROLS AND INDICATORS

Applicable to: ALL

CONTROLS AND INDICATORS

ON THE MFD

The POSITION / NAVAIDS page displays information on the automatically-tuned NAVAIDS . It is also the interface for manual tuning.

INTRODUCTION

Applicable to: ALL

When a flight is scheduled to cross high latitude areas (beyond 60 ° of latitude), the flight crew must take various precautions, regarding the ADIRS, FG, FMS, and EFIS.

These precautions are based on:
- The change from MAG to TRUE heading (track) reference, due to the airway reference changes in high latitude, or due to the IRS, unable to provide magnetic heading
- Some particularities due to the pole overfly.

ADIRS

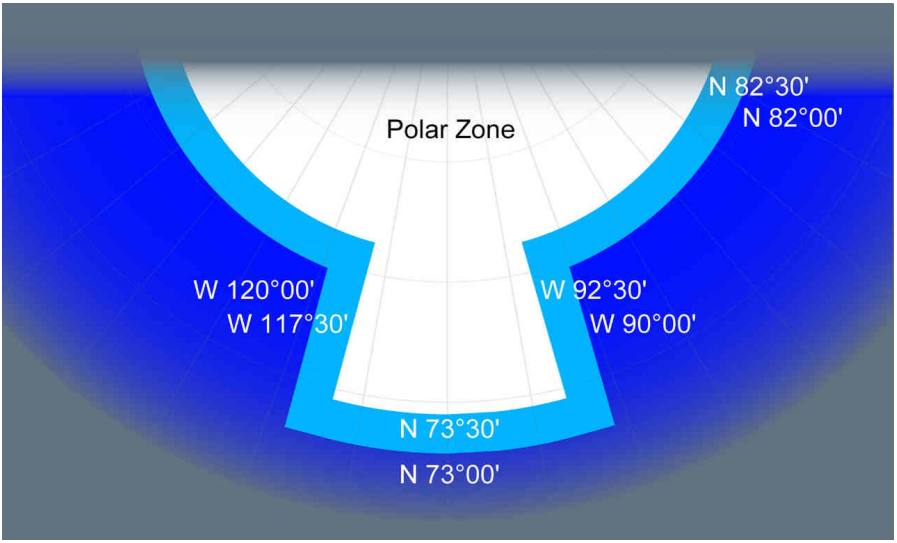
Applicable to: ALL

IRS ALIGNMENT

Up to latitude 73 °N(S), the flight crew can align the IRS without any particular procedures.
Between 73 °N(S) and 82 °N(S), the required alignment time is greater.
Beyond 82 °N(S), no IRS alignment is possible.

TRUE/MAG REFERENCE

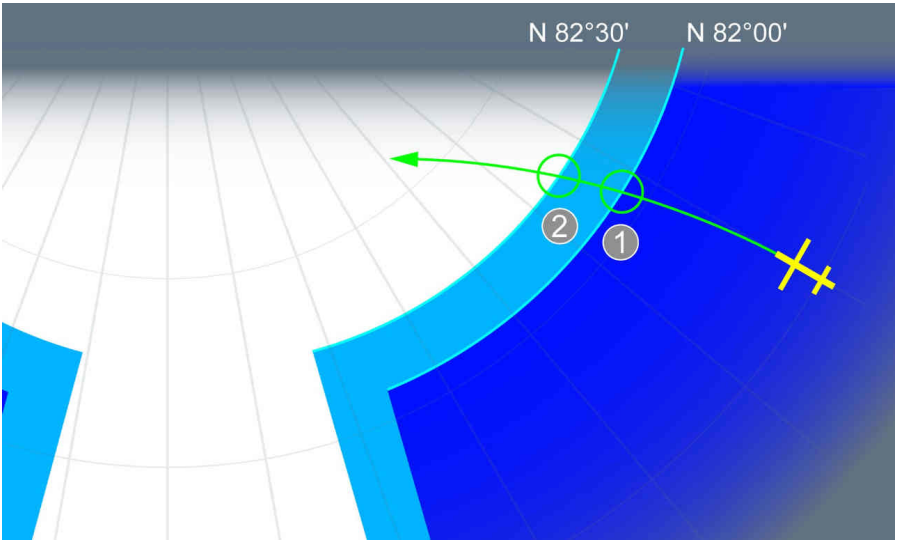
The ADIRS are able to provide TRUE heading (track), regardless of the aircraft latitude.
The ADIRS are able to provide MAG heading (track) between latitudes 82 °30' N and 60 °30' S, except in the vicinity of the magnetic pole:



Note: *1. The latitude and longitude values, given in this diagram, are average values. In reality, the polar area involves different hysteresis, combined with the track angle penetration of the aircraft in the zone.*

2. Although located outside the above polar zone, Thule is TRUE oriented.

The flight crew selects the TRUE reference by pressing the TRUE/MAG pb, or the change is done automatically when the aircraft enters the polar zone with MAG still selected. In this case, the following messages and cautions are displayed:



- When in 1, MFD and ND display SELECT TRUE NORTH REF
- When in 2, and MAG reference is still selected, the following events will occur:
  - The IRSs automatically revert from MAG to TRUE
  - An indication TRUE appears on the ND and PFD heading scales. The GRID track information appears on the ND.
  - An amber caution is triggered on the ECAM:
    NAV EXTREME LATITUDE
    NORTH REF SEL.....TRUE
  - The autopilot may disconnect, and the caution NAV CAPT AND F/O HDG DISCREPANCY (associated with a CHECK HDG message on the PFD and ND) may be triggered (this happens when the IRS do not reach the polar zone simultaneously).

Note: The messages and cautions are triggered as soon as the first IRS reaches the polar zone. When the flight crew has cleared the messages, the messages are not displayed again when the other two IRS enter the polar zone.

FLIGHT GUIDANCE

Applicable to: ALL

- When the flight crew manually changes the heading reference from MAG to TRUE or vice versa, there is no discontinuity in the lateral guidance, whether the mode is NAV or HDG/TRACK.
- When an automatic TRUE/MAG switching occurs when entering the polar zone, the autopilot may disengage, due to the fact that the automatic switching does not occur simultaneously for the 3 IRS.
- If TRUE is selected, only CAT 1 ILS approaches may be flown.

FLIGHT MANAGEMENT

Applicable to: ALL

The FMS provides a MIXIRS position, and as a result the FMS aircraft position, regardless the latitude.

AIRPORT NORTH REFERENCE

A takeoff with TRUE reference is very rare. During the preflight phase, if the cockpit north reference is TRUE, the following indications remind the flight crew of this selection:
- The ND and MFD display CHECK NORTH REF, if the departure airport north reference is MAG
- The TRUE label above the PFD/ND heading scales pulses for 10 s at slat extension
- The TRUE NORTH REF memo on the ECAM pulses for 10 s at engine start, or at slat extension.

Before approach, if the cockpit north reference is TRUE, the following indications remind the flight crew of this selection:
- The ND and MFD display CHECK NORTH REF, when the aircraft reaches the arrival area (approximately 25 nm from destination) and the destination airport north reference is MAG
- The TRUE label above the PFD/ND heading scales and the TRUE NORTH REF memo on the ECAM pulse for 10 s at slat extension.

FMS TRACK AND BEARING

The FMS computes the tracks, bearings, and radials according to the TRUE/MAG cockpit selection. If the selection is TRUE, the unit of the track, bearing, and radial figures and entry fields becomes °T.

When the flight crew wants to create a PBD, PB/PB waypoint or define a radial (DIRECT TO with INTCPT), the entry rule is as follows:

- If the flight crew inserts the figure with its reference (M for magnetic, or T for true), the FMS considers the entered reference
- If the flight crew inserts the figure without its reference, the FMS considers the cockpit TRUE/MAG selection.

CONTROLS AND INDICATORS

Applicable to: ALL

ON THE PFD/ND

TRUE REFERENCE INDICATION AND GRID TRACK

When the TRUE reference is selected:

- The PFD and ND display the TRUE label above the heading scales

- The ISIS display the TRU label

- The EWD displays TRUE NORTH REF.

There is no specific indication, when the MAG reference is selected.

GRID TRACK INDICATION

The ND displays the grid track when reaching latitude 65° in all ND modes, except in PLAN mode.

ADF BEARING DISPLAY

The ADF needle represents the relative bearing between the aircraft and the NDB.
The ADF relative bearing information is thus independent of the TRUE/MAG selection, and the needle is always pointing in the same direction whatever the selection is.

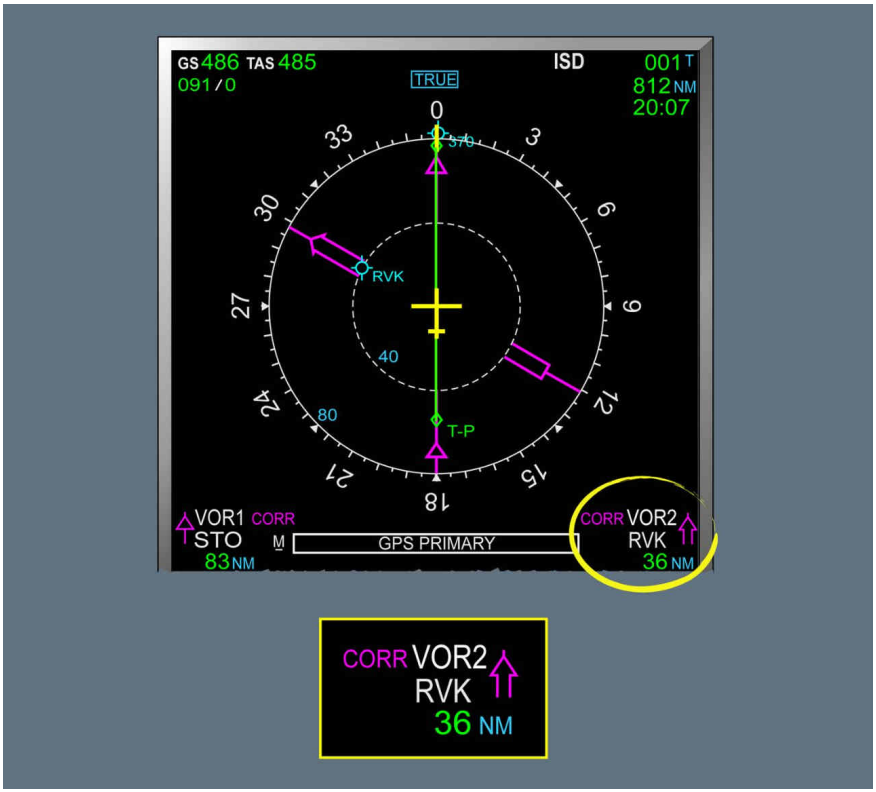
VOR BEARING DISPLAY

The VOR bearing is measured by the VOR, at the VOR location:

- It is a TRUE bearing if the VOR station is TRUE referenced
- It is a MAG bearing if the VOR station is MAG referenced.

When the ND display mode is ARC or ROSE-NAV, the flight crew can simultaneously display the VOR data and the FMS flight plan data. It is important that the FMS and the VOR raw data have the same north reference.

Therefore, if the aircraft north reference and the VOR station north reference are not the same, the VOR raw bearing is corrected with the magnetic variation at the aircraft present position. In this case, the VOR needles appear in magenta, and the ND displays CORR next to the VOR1(2) label.



For all other ND display modes (ROSE-VOR, ROSE-LS), the VOR raw data is not corrected. If the VOR station reference and the aircraft north reference are not the same, the ND displays the VOR station north reference (MAG, TRUE) next to the VOR identifier.

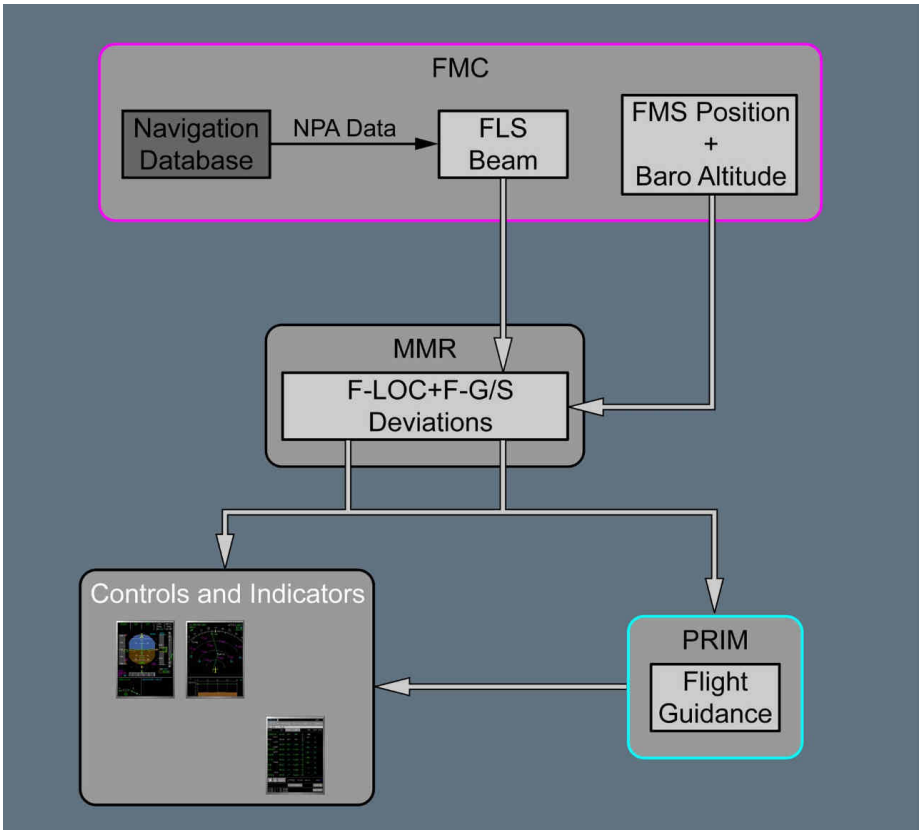
FLS Function within FMS

GENERAL

Applicable to: ALL

The FLS (FMS Landing System) function provides the flight crew with cockpit indications and guidance to fly a VOR , VOR / DME , or RNAV approach (including GPS approach) in an ILS look alike way.
The FMS computes a final approach path, called the FLS beam, and sends it to the MMR .
The MMR computes the deviations between the aircraft position and the FLS beam.
The MMR sends these pseudo LOC and G/S deviations (now called F-LOC , and F-G/S) to the PRIM for flight guidance, and to the PFD and ND for display.

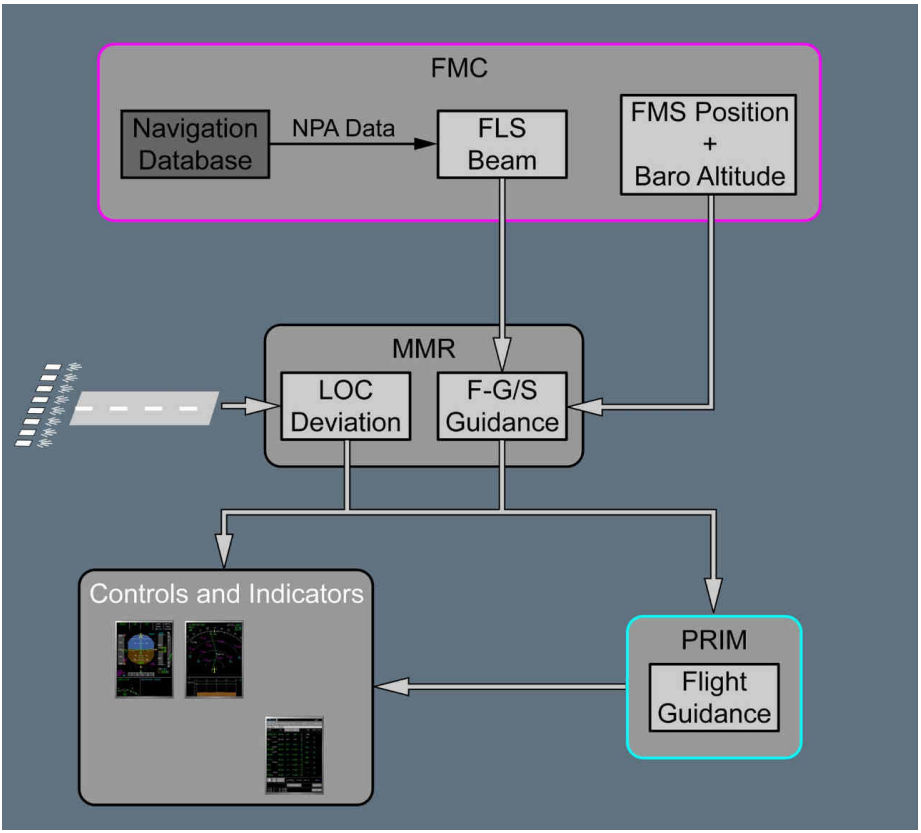
FLS



The flight crew can also use the FLS function to fly an ILS approach with glideslope out, or a LOC only (or LOC B/C) approach.

In this case, the flight guidance uses:
- The ILS LOC beam (LOC) for lateral guidance,
- The FLS G/S beam (F-G/S) for vertical guidance.

Mix LOC/FLS



L13

Note: *The FLS function is only available for approaches, that are stored in the navigation database.*
The FLS function is not available for IGS without G/S , SDF , and LDA approaches.

FLS BEAM COMPUTATION

Applicable to: ALL

FLS BEAM COMPUTATION

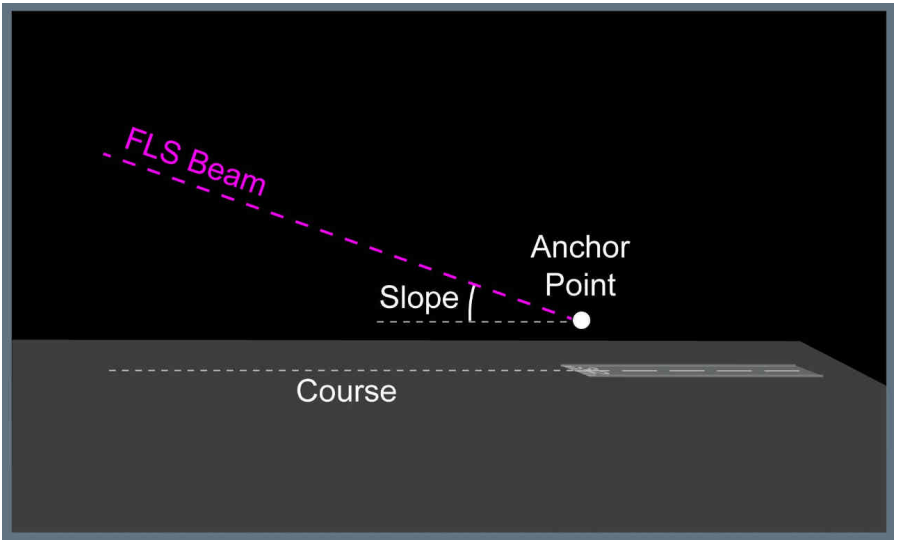
The FMS computes an FLS beam, when the flight crew:
- Inserts a VOR, RNV, GPS, LOC, or BAC approach (on the ARRIVAL page), or
- Inserts an ILS approach (on the ARRIVAL page), and deselects the glideslope (on the POSITION / NAVAIDS page).

The FLS beam represents the final approach leg of the non precision approach (NPA).

The FLS beam is defined by:
- An anchor point
- A course
- A slope.

The FLS beam can be captured up to 100 nm from the destination.

FLS Beam



CAUTION	The FLS beam is a virtual beam of 100 nm and may interfere with terrain obstacles outside the published approach. The obstacle clearance outside the published approach is the responsibility of the flight crew.

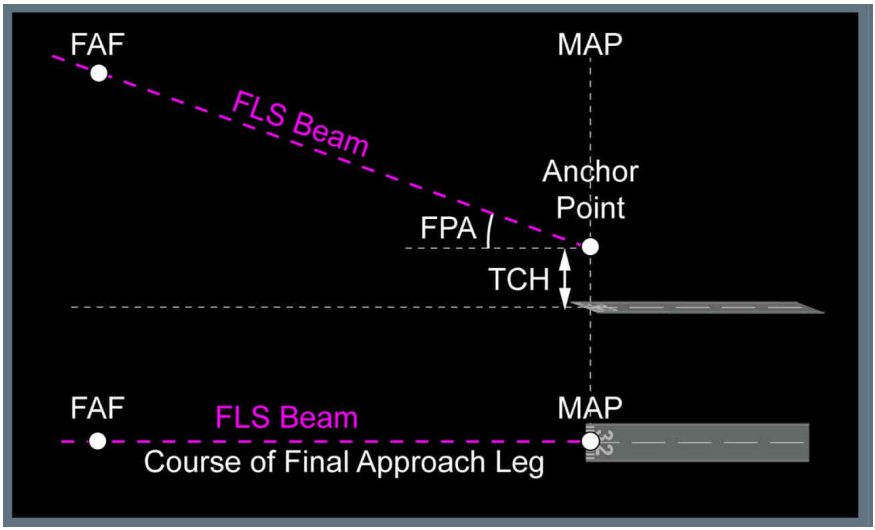
L2 The layout of the FLS beam is based on the relative position of the Missed Approach Point (MAP) to the runway threshold.

MAP IS ON THE RUNWAY THRESHOLD

When the MAP of the selected approach is defined on the runway threshold (+/- 0.14 nm):

- The anchor point is located on the runway threshold, at the Threshold Crossing Height, TCH (or threshold height + 50 ft if no threshold crossing height is stored in the database).
  The ident of the anchor point is the ICAO code of the airport, followed by the threshold runway identifier (e.g. LFBO33L)
- The course of the FLS beam is the course of the final approach leg
- The slope of the FLS beam is the Flight Path Angle (FPA), stored with the runway threshold in the navigation database.

MAP on Runway Threshold



MAP IS BEFORE THE RUNWAY THRESHOLD

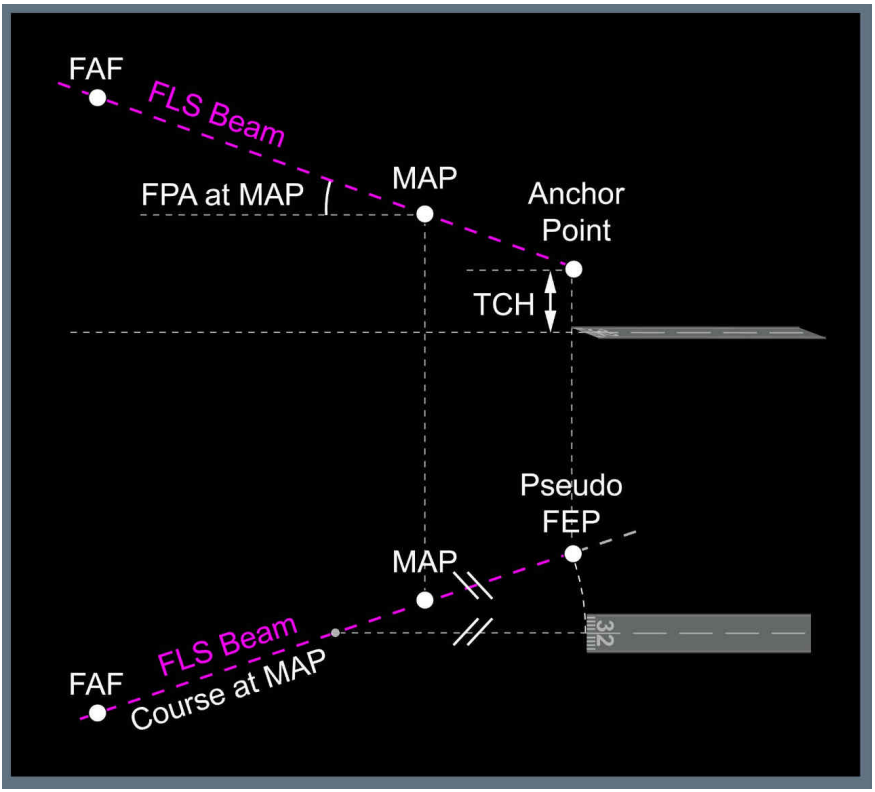
When the MAP of the selected approach is before the runway threshold:

- The anchor point is located on a pseudo final end point (that is computed by the FMS) at the Threshold Crossing Height, TCH (or threshold height + 50 ft if no threshold crossing height is stored in the database).
  The ident of the anchor point is EPxxx, where EP stands for End Point, and xxx is the threshold runway identifier (e.g. EP33L)

L3 *Note: When the anchor point is closer than 0.1 nm to the runway threshold, the ident of the anchor point is the ICAO code of the airport, followed by the threshold runway identifier (e.g. LFBO33L).*

L2 - The course of the FLS beam is the course that is stored with the MAP in the navigation database
- The slope of the FLS beam is the Flight Path Angle (FPA) stored with the MAP in the navigation database.

MAP before Runway Threshold



MAP IS BEYOND THE RUNWAY THRESHOLD

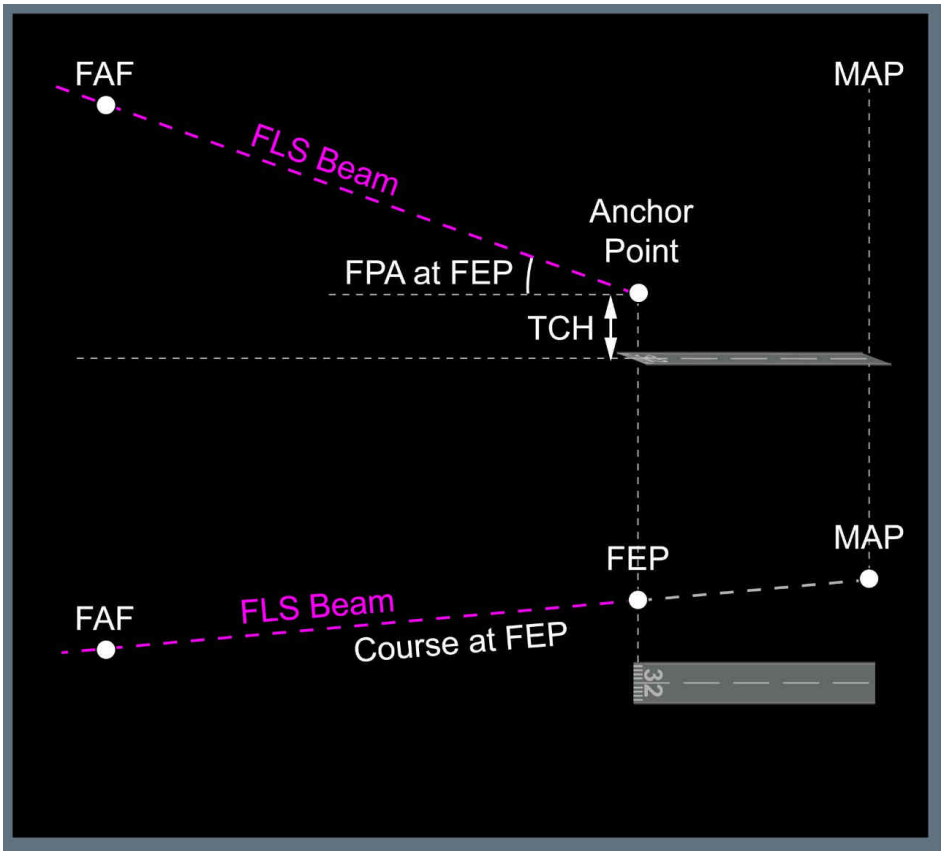
When the MAP of the selected approach is beyond the runway threshold:

- The anchor point is located on the final end point (that is stored in the navigation database) at the Threshold Crossing Height, TCH (or threshold height + 50 ft if no threshold crossing height is stored in the database).
  The ident of the anchor point is the ident of the final end point (e.g. EP33L)

L3 *Note: When the anchor point is closer than 0.1 nm to the runway threshold, the ident of the anchor point is the ICAO code of the airport, followed by the threshold runway identifier (e.g. LFBO33L).*

L2
- The course of the FLS beam is the course that is stored with the final end point in the navigation database
- The slope of the FLS beam is the Flight Path Angle (FPA) stored with the final end point in the navigation database.

MAP beyond Runway Threshold



NO FLS BEAM COMPUTED

The FMS does not compute the FLS beam:

- For IGS without G/S, SDF and LDA approaches, or
- If the angle between the course of the final approach leg and the runway course is more than 50 °C.

In these cases, the FLS function is not available: the FMS Message Area displays the NO FLS FOR THIS APPR message.

BARO CORRECTION OF THE FLS BEAM

When the baro setting is STD , the computation of the FLS beam and the F-G/S deviation is based on the QNH, that is entered on the APPR panel of the PERF page. (*Refer to PERF page*)
If no QNH is entered, a QNH of 1 013 hPa is considered for the computation of the FLS beam. However, in that case, no F-G/S deviation is computed.
When the baro setting is QNH, the computation of the FLS beam and the F-G/S deviation is based on the current QNH.

COLD WEATHER CORRECTION OF THE FLS BEAM

When the temperature at destination (that is entered on the APPR panel of the PERF page) is below the ISA temperature, the computation of the FLS beam and the F-G/S deviation is corrected with the entered temperature.
If no temperature is entered, the ISA temperature is considered at destination.

Note: *The temperature correction is only done for the computation of the FLS beam and the F-G/S deviation and does not change the barometric aircraft altitude on the PFD .*

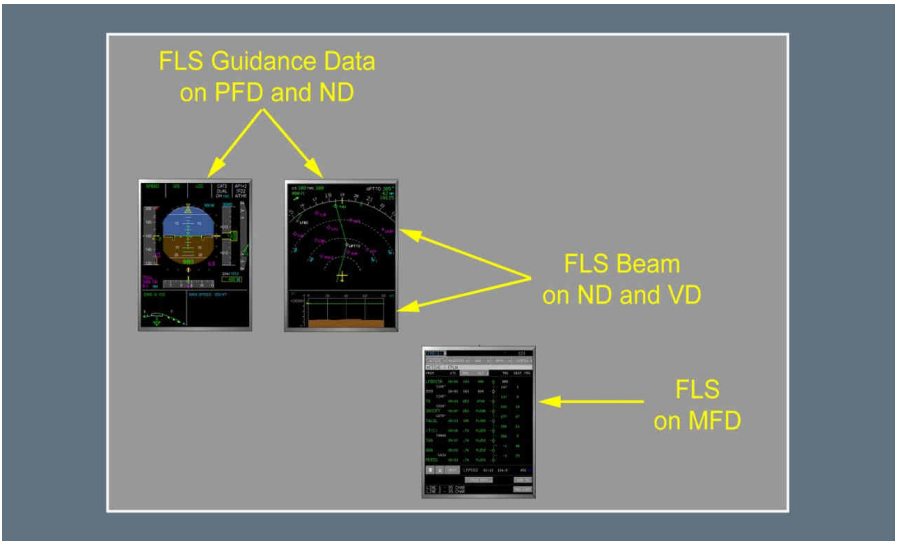
L2 For more information on the cold weather display of the VD, *Refer to DSC-31-20-40-20-GVERT Cold Weather*

CONTROLS AND INDICATORS

Applicable to: ALL

CONTROLS AND INDICATORS

FLS Controls and Indicators



FLS BEAM ON ND/VD

FLS Beam

L2 The FMS sends the FLS beam to the ND and VD .

L1 The ND and VD display the FLS beam as a magenta dotted line (with a length of 80 nm).

L2 When the anchor point is a published point that is stored in the navigation database, it is displayed in green. This indicates that the anchor point is a flight plan waypoint.
When the anchor point is a pseudo end point that is computed by the FMS, it is displayed in magenta. This indicates that the anchor point is a virtual point.
Refer to FLS Beam and Anchor Point Computation

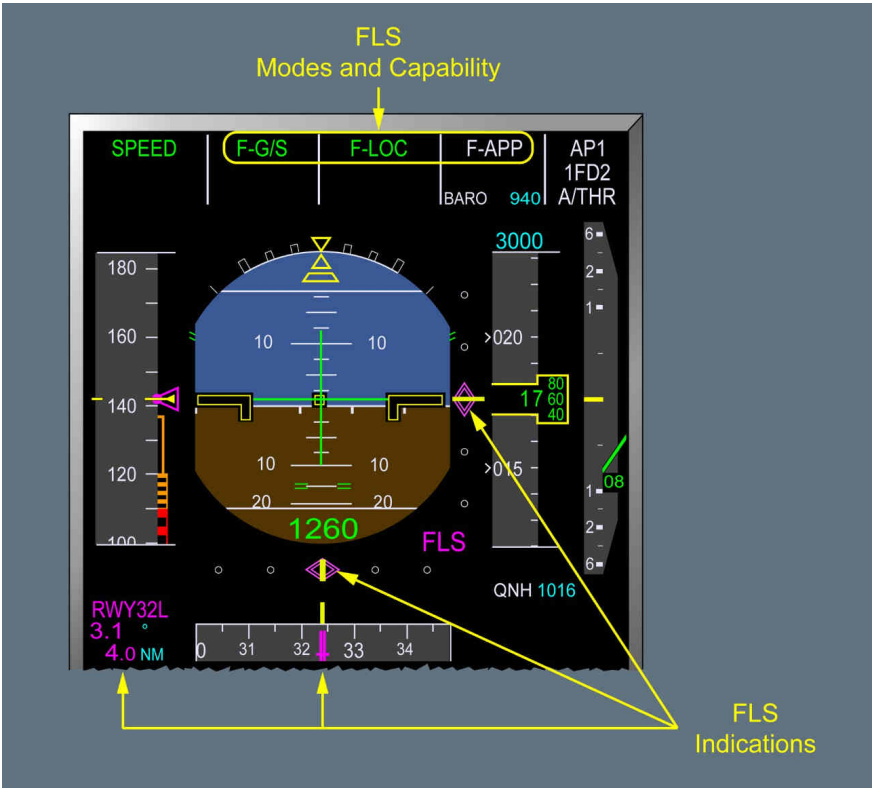
L1 The FLS beam appears when:
- The flight crew has selected an NPA for the active flight plan,
- The flight crew has pressed the LS pb on the EFIS CP , and
- The flight crew has selected an ND range that is less than or equal to:
  - 80 nm in ARC or PLAN mode, or
  - 160 nm in ROSE-NAV mode.

Note: The FLS beam is displayed on the VD only when the vertical cut is defined along the flight plan (or along the LS axis).

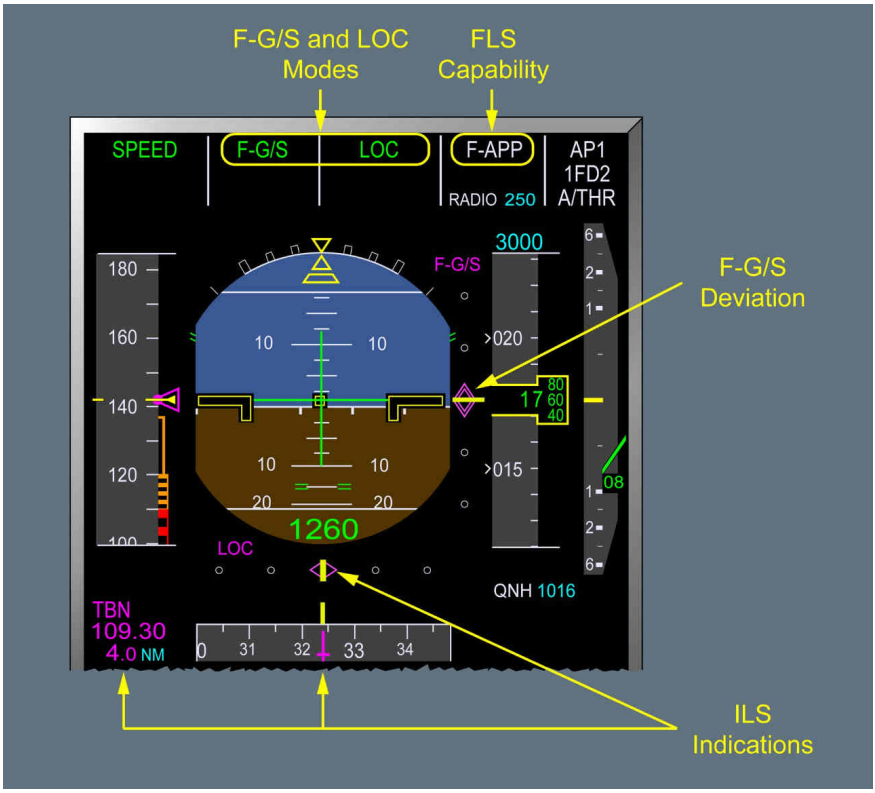
FLS GUIDANCE DATA ON PFD / ND

ON THE PFD

FLS on PFD



MIX LOC/FLS on PFD



The PFD displays:

The FLS Modes and Capability on the FMA

The FMA displays:
- The modes F-LOC , F-LOC* , F-LOC , F-G/S , F-G/S* , and F-G/S , when applied
- The FLS capability: F-APP, F-APP+RAW, RAW ONLY.

L2 The flight guidance (PRIM) sends the modes and FLS capability to the FMA .

L1 For more information on the FMA modes, *Refer to DSC-22-FG-80-80-F Overview*

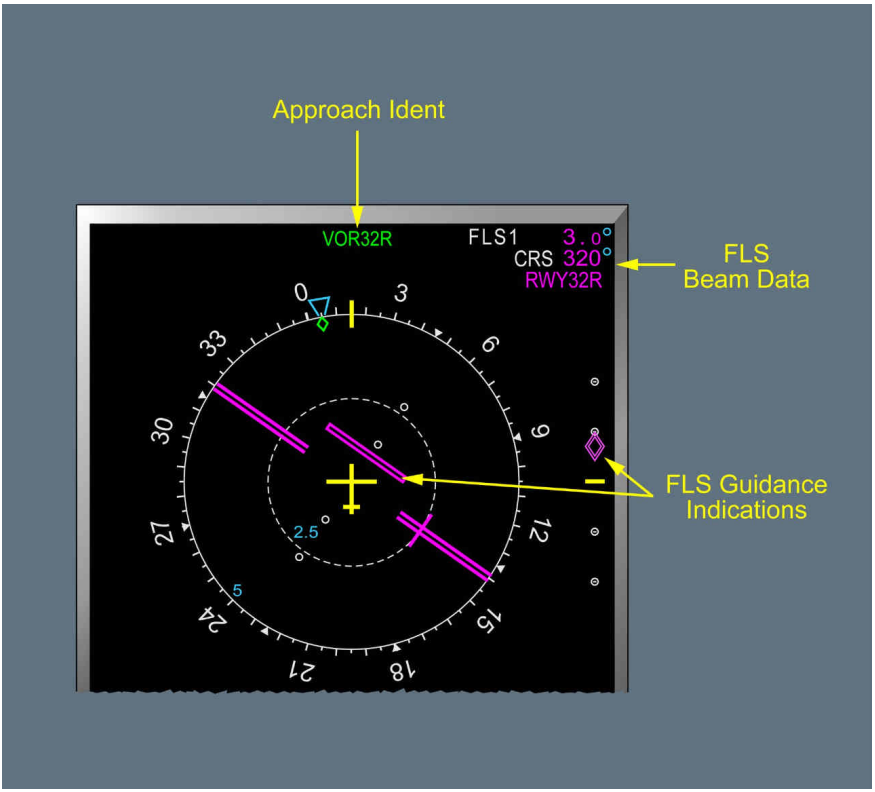
The FLS Indications

L2 The MMR sends the FLS indications to the PFD .

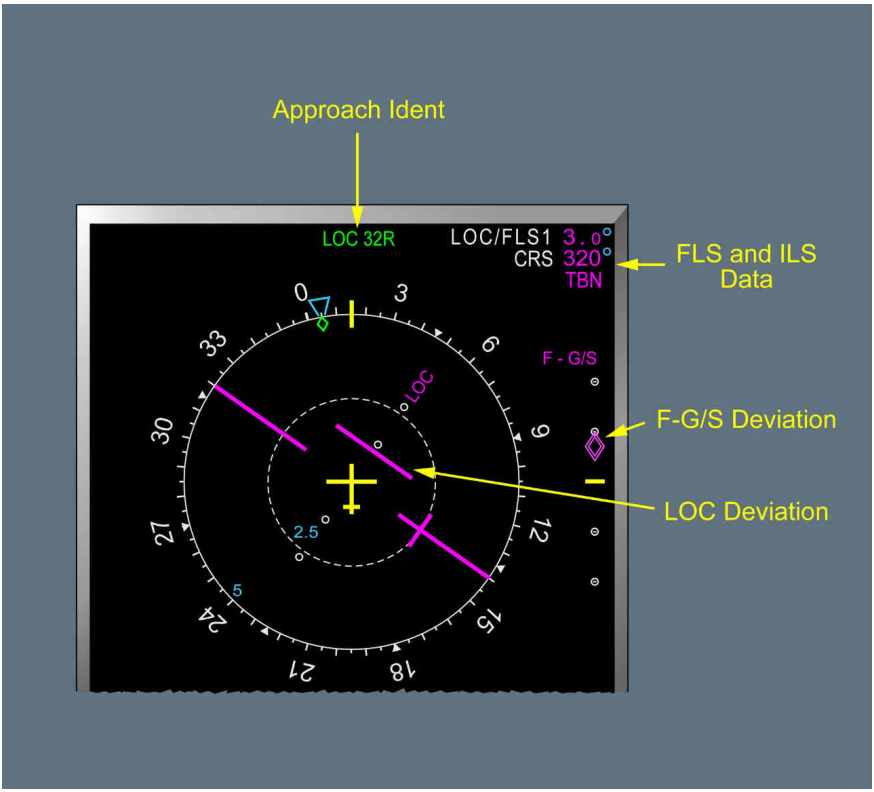
L1 For more information on the non precision approach PFD indications, *Refer to DSC-31-20-20-110-10 VOR, VOR/DME, or RNAV Approach*

ON THE ND

FLS in ROSE-LS mode



Mix LOC/FLS in ROSE-LS mode



In ROSE-LS mode, the ND displays:

Approach Ident

Indicates the ident of the selected non-precision approach.

FLS Beam Data

Indicates:

- The active landing system: FLS1, FLS2, LOC/FLS1, LOC/FLS2
  Indicates whether the FLS data is computed by MMR 1, or by MMR 2.
  MMR 1 sends the FLS data to the F/O 's ND , and MMR 2 to the captain's ND .
- The FLS beam slope,

- The FLS beam course,
- The anchor point ident.
  When the approach is flown in mix LOC/ FLS , this label displays the ILS ident.

FLS Guidance Indications

Indicates:

- The course of the FLS beam and the F-LOC deviation
  When the approach is flown in mix LOC/ FLS , the label LOC (or B/C) is displayed next to the deviation bar.
- The F-G/S deviation
  When the approach is flown in mix LOC/ FLS , the label F-G/S is displayed above the deviation scale.

L2 The MMR sends the guidance indications to the ND .

FLS ON MFD

The flight crew selects the non-precision approach on the ARRIVAL page. (*Refer to Page*)
When the flight crew has selected an ILS approach on the ARRIVAL page, he can deselect the glide slope (in order to fly the approach in mix LOC/FLS) on the POSITION / NAVAIDS page. (*Refer to Page*)
The flight crew enters the QNH, and temperature (OAT) at destination on the APPR panel of the PERF page. (*Refer to Page*)

General

FLIGHT PLANNING - INTRODUCTION

Applicable to: ALL

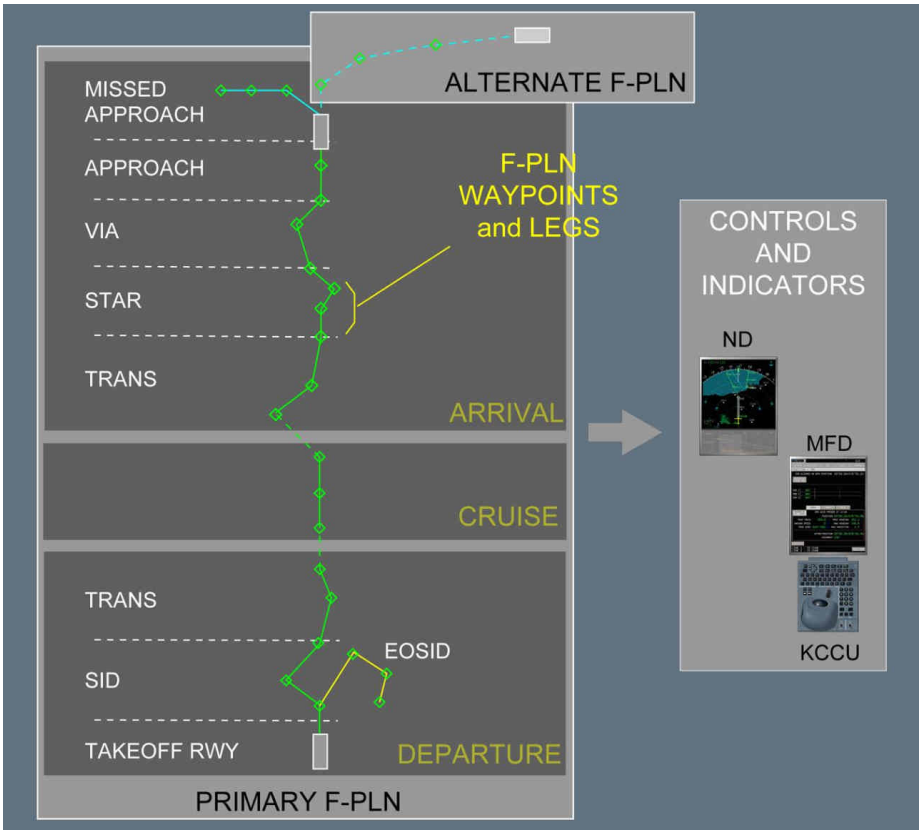
A major purpose of the Flight Management System (FMS) is to help the flight crew with flight planning.
The flight crew can enter the **flight plan** in the FMS . This flight plan includes the intended **lateral** and **vertical** trajectory.
When all of the necessary data is entered, the FMS computes and displays the track, speed, altitude, time, and fuel **predictions** that are associated with the flight plan.
The flight crew can change the flight plan at any time. These changes are called **lateral revisions** , if the change is made to the lateral part of the trajectory, and **vertical revisions** , if the change is made to the vertical part of the trajectory.
The FMS can simultaneously memorize four flight plans: one **active** and three **secondary** flight plans. The FMS uses the active flight plan for lateral and vertical long-term guidance, and for radio navigation auto-tuning. The flight crew can use the secondary flight plans as a draft to compare predictions, to anticipate a diversion, or to store company, ATC , and OIS flight plans.
Refer to Lateral Flight Plan
Refer to Vertical Flight Plan

LATERAL FLIGHT PLAN

Applicable to: ALL

The lateral part of the flight plan, called the lateral flight plan, has the following elements:

Lateral Flight Plan



PRIMARY FLIGHT PLAN

The primary flight plan is the flight plan from the origin to the destination airport. It has the following elements: Departure, Cruise, and Arrival.

DEPARTURE

The Departure has the following elements:

- The Takeoff Runway
- The Standard Instrumental Departure (SID)
  The SID is the central part of the departure procedure.
- The departure transition (TRANS)
  The departure transition is the possible trajectory between the last point of the SID and the first en-route waypoint.

These elements can be inserted or changed with the DEPARTURE lateral revision.
Refer to DEPARTURE revision

CRUISE

The Cruise part of the lateral flight plan includes all the en-route waypoints.
These elements can be inserted with the AIRWAYS, or INSERT NEXT WAYPOINT lateral revision.
Refer to AIRWAYS revision
Refer to INSERT NEXT WAYPOINT revision

ARRIVAL

The Arrival has the following elements:

- The arrival transition (TRANS)
  The arrival transition is the possible trajectory between the last en-route waypoint and the first waypoint of the STAR .
- The Standard Arrival (STAR)
  The STAR is the central part of the arrival procedure.
- The VIA
  The VIA is the possible trajectory between the last waypoint of the STAR and the first waypoint of the approach.
- Approach and missed approach
  The approach part includes the runway for landing at the primary destination airport, and the approach, and missed approach procedure.

  Note: The destination of the primary flight plan will be further called: the primary destination.

These elements are inserted or changed with the ARRIVAL lateral revision.
Refer to ARRIVAL revision

ALTERNATE FLIGHT PLAN

The alternate flight plan is the diversion flight plan from the destination airport to the alternate destination airport. It has the same elements as the primary flight plan: Departure, Cruise and Arrival.

Note: The destination of the alternate flight plan will be further called: the alternate destination.

The alternate destination is inserted with the ALTERNATE lateral revision.
Refer to ALTERNATE function
The Departure, Cruise and Arrival elements are inserted with DEPARTURE, AIRWAYS, INSERT NEXT WAYPOINT, and ARRIVAL lateral revisions.
Refer to DEPARTURE function
Refer to AIRWAYS function
Refer to INSERT NEXT WAYPOINT function
Refer to ARRIVAL function

The flight plan is defined by waypoints, and legs between the waypoints.

FLIGHT PLAN WAYPOINTS

There are four different types of flight plan waypoints:

- Navigation database waypoints
  These waypoints are part of the navigation database, and are inserted in the flight plan by the flight crew as part of a company route, or independently via a lateral flight plan revision. (example: DVL, TOU, LFBO)
- Flight crew created waypoints:

  The flight crew can insert the following self-created waypoints
  - Latitude/Longitude waypoints
  - Place/Distance waypoints
  - Place/Bearing/Distance waypoints
  - Place-Bearing/Place-Bearing waypoints
  - Latitude/Longitude crossing waypoints
  - Radial intercept waypoints
  - Circle intercept waypoints
  - Abeam waypoints

L2 The Latitude/Longitude, Place/Distance, and Place/Bearing/Distance waypoints, created by the flight crew, are stored in the pilot stored elements database.
The other flight crew created waypoints are not stored in the pilot stored database, so that they are only memorized until they are sequenced.
Refer to Pilot stored elements database

L1 - FMS created waypoints
For certain flight plan revisions, the FMS inserts a waypoint, to indicate a revision in the flight plan.
(example: T-P, IN-BND, OUT-BND)
- Pseudo waypoints
Pseudo waypoints are reference points, indicating a vertical flight plan event. They do not influence the lateral flight plan.
(example: (T/C), (SPD), (T/D))

L2 **WAYPOINT SEQUENCING**

In flight, and in the lateral managed mode, a flight plan waypoint is sequenced when the aircraft flies over (or passes nearby) the waypoint.

FROM, TO AND NEXT WAYPOINT

The FROM waypoint of the flight plan is the last sequenced waypoint.

Note: The FROM waypoint is the aircraft present position (P.POS) when the aircraft is in a flight plan discontinuity, and the next flight plan is not activated.
(link to flight plan discontinuity)

The TO waypoint is the next waypoint that will be sequenced.
The NEXT waypoint is the waypoint that will be sequenced after the TO waypoint.

FLIGHT PLAN LEGS

The FMS links the flight plan waypoints with flight plan legs.

There are many different types of flight plan legs, including:
- Course-to-a-fix leg
- Heading leg
- MANUAL leg.
- Holding pattern leg
- Direct leg, etc ...

Most of the leg types cannot be manually created by the flight crew. They are part of the inserted flight plan elements (company route, departure, arrival, holding pattern, airways, etc ...), that are stored in the navigation database.
The flight crew can manually create a holding pattern leg with the HOLD lateral revision. (*Refer to Revision*)

The flight crew can manually create a direct leg:
- Between the aircraft present position, and a waypoint, NAVAID , or airport, with the DIRECT TO lateral revision. (*Refer to Revision*)
- Between a waypoint of the flight plan and another waypoint, NAVAID , or airport, with the INSERT NEXT WAYPOINT lateral revision. (*Refer to Revision*)
- Between two waypoints of the flight plan, by clearing the discontinuity in between with the DELETE lateral revision. (*Refer to Revision*)

ACTIVE LEG

The leg that is actually flown (between the aircraft present position and the TO waypoint), is called the active leg.

FLIGHT PLAN DISCONTINUITY

The flight plan has a discontinuity if no leg is defined between two waypoints.

L2 *Note: For flight plan predictions computation, the system assumes that the aircraft will fly a direct leg between the waypoints that define the discontinuity.*
When the aircraft moves into a flight plan discontinuity, the NAV mode automatically switches to the HDG (TRK) mode. The flight plan FROM waypoint reverts to P.POS.

MANUAL LEG

A manual leg is a constant course, heading, or track leg, without termination point. The leg has to be terminated manually by the flight crew (this explains the term manual leg).
The flight crew cannot manually insert a manual leg, except when using the DIRECT TO — COURSE OUT revision. (*Refer to Revision)* . A manual leg is part of a departure, or arrival procedure.

L2 When the aircraft flies a manual leg, the NAV mode remains engaged. For predictions computation, the FMS assumes that the aircraft will fly a direct leg from its current position to the next waypoint.

Note: The use of the DES mode is not recommended on a manual leg.

L1

CAUTION	Before flying the manual leg, the VD display assumes that the aircraft will fly a direct leg from the starting point of the manual leg, to the next waypoint.

LATERAL FLIGHT PLAN REVISIONS

The flight crew can change the lateral flight plan. A change to the lateral flight plan is called a lateral revision.
Refer to Lateral Revisions

CONTROLS AND INDICATORS

ON THE MFD

The F-PLN page displays textual lateral flight plan data, including:
- All flight plan waypoints and legs
- The track and distance between two waypoints, and the distance to the destination

F-PLN Page

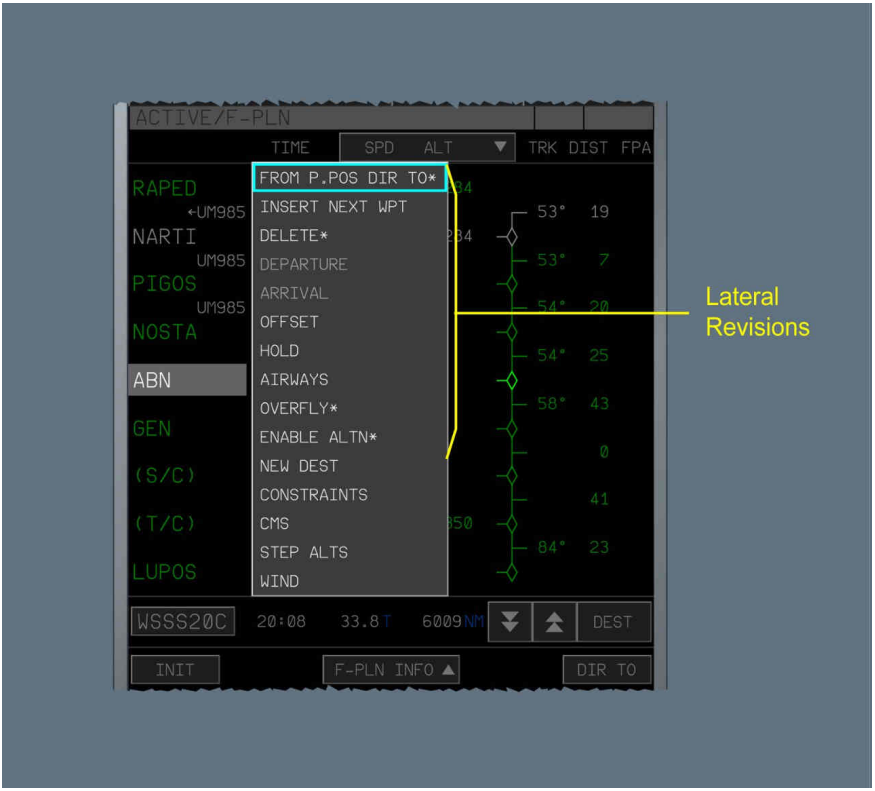
The flight plan waypoints are displayed in green (or cyan for the missed approach and alternate flight plan waypoints). The flight plan leg idents are displayed in white. The lateral distance and track predictions are displayed in green (or cyan for the missed approach and alternate flight plan waypoints).

Note: *All data relating to the active leg and the TO waypoint are displayed in white.*

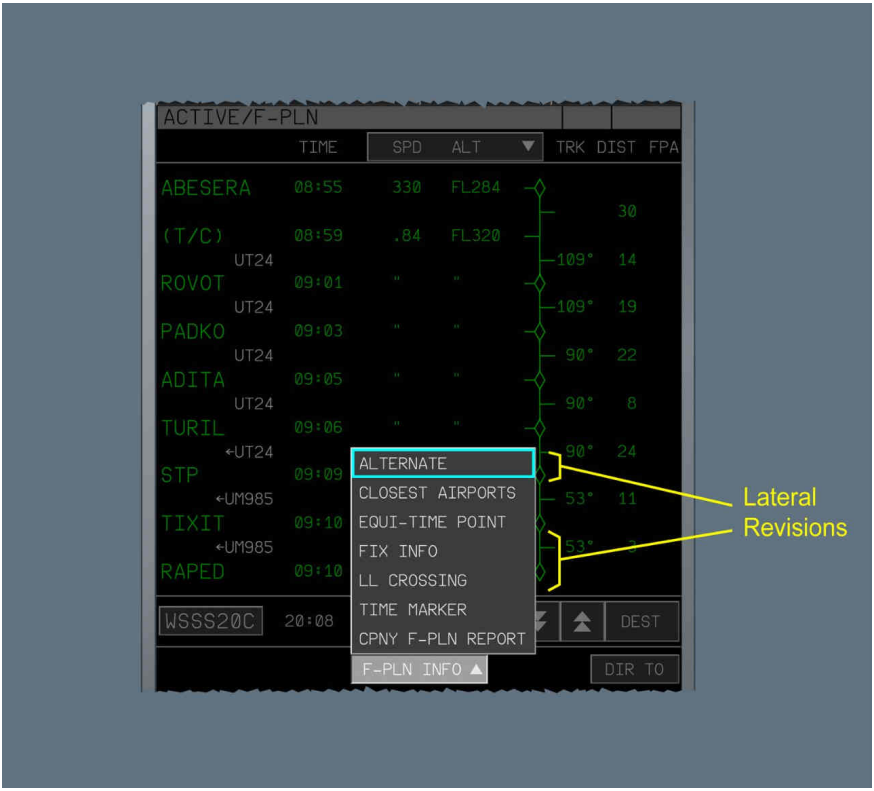
Refer to F-PLN Page

All lateral flight plan revisions can be accessed through the F-PLN page, via the waypoint revisions, or the F-PLN INFO menu.

Waypoint Revisions Menu



F-PLN INFO Menu



ON THE ND

The lateral ND displays graphical and textual flight plan data. The flight crew can control the display of this data via the EFIS CP .
The flight crew can perform three lateral revisions via the lateral ND : DIRECT TO, DELETE and INSERT WAYPOINT.
Refer to Interactive ND

VERTICAL FLIGHT PLAN

Applicable to: ALL

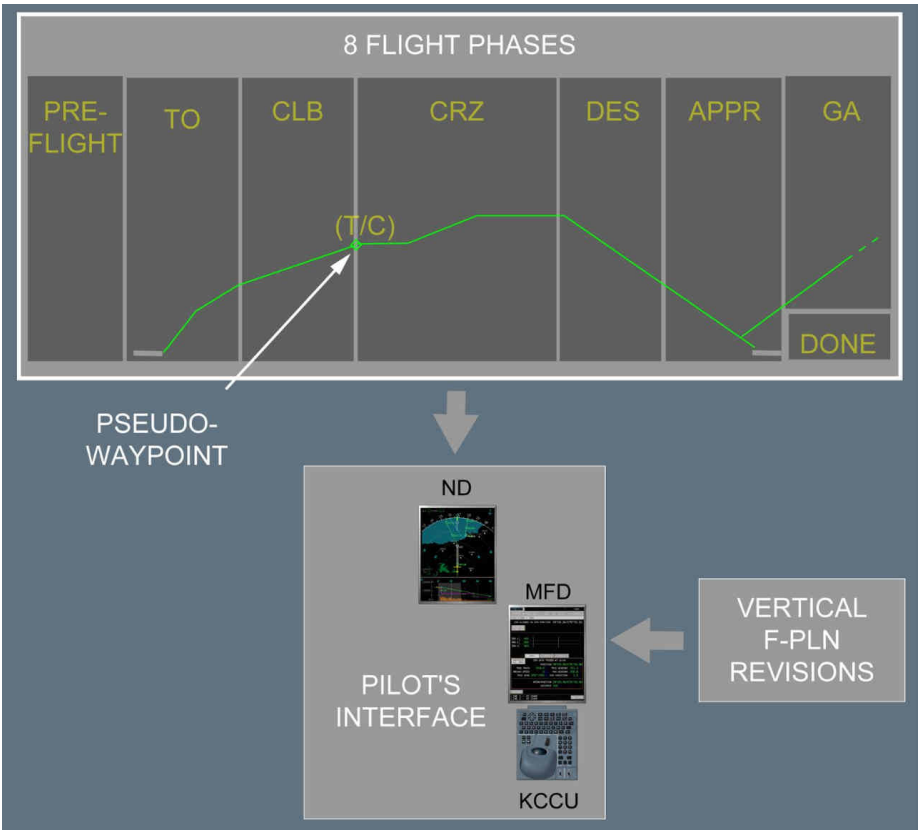
The vertical part of the flight plan, called the vertical flight plan, includes all data required to compute the altitude, speed and time predictions, that build up the vertical profile of the flight plan.
This data is called up from the navigation database or is entered manually by the flight crew.

There are four types of vertical data:

- Overall flight plan data:
  - Cost Index (CI)
  - Cruise flight level, and cruise temperature (CRZ FL , CRZ TEMP)
  - Fuel and load data (ZFW , ZFWCG , Block Fuel)
- Flight phase related performance data:
  - Takeoff thrust setting (TOGA, FLEX, DERATED)
  - Thrust reduction and acceleration altitude
  - Climb, cruise, descent and approach speeds
  - Pressure and temperature at destination.
- Vertical constraints data:
  - Speed limits and constraints
  - Altitude constraints
  - Time constraints
  - Step climb and step descent constraints.
- Wind data:
  Climb, cruise, descent, approach and alternate flight plan winds.

The overall flight plan and flight phase related performance data are described in the Performance chapter. The vertical constraints and wind data are described in the Vertical Revisions chapter.

Vertical Flight Plan



FLIGHT PHASES

When all necessary vertical data is entered, the FMS builds up a vertical profile, divided into eight flight phases: PREFLIGHT, CLIMB, CRUISE, DESCENT, APPROACH, GO AROUND, and DONE.

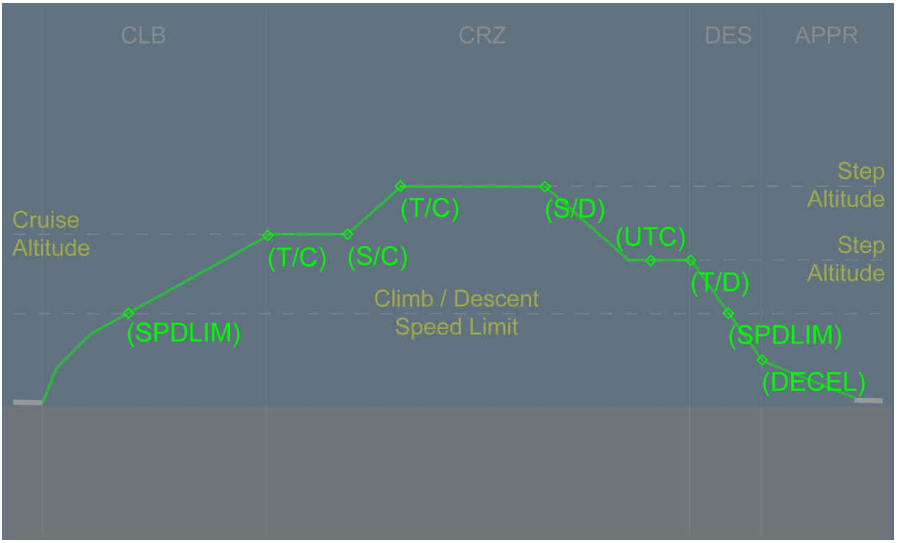
L2 *Note: The FMS flight phases are different from the flight phases used by other aircraft systems.*

L1 For each flight phase, the FMS computes the optimum speed or Mach profile. The FMS switches automatically from one flight phase to another if the transition conditions are fulfilled.
The speed profiles and flight phase switching conditions are described in the performance chapter, *Refer to Flight Phases and Speed Profile .*

PSEUDO-WAYPOINTS

The vertical flight plan is indicated with pseudo-waypoints. Each pseudo-waypoint represents a vertical profile event. As the vertical profile is a result of the FMS predictions computation, the position along the flight plan of the pseudo-waypoints can move after a data change, or flight plan revision.

Pseudo-waypoints



On the MFD , the pseudo-waypoints are displayed between brackets on the F-PLN page. Each pseudo waypoint has time, speed, altitude and wind predictions.
On the ND (lateral and vertical), the pseudo-waypoints are indicated with their dedicated symbols.
(*Refer to Vertical Flight Plan - Controls and Indicators*)

SPEED LIMIT (SPD LIM)

The point where the aircraft will cross the climb or descent speed limit altitude.

L2 The flight crew defines the climb and descent speed limit on the SPD panel of the VERT REV page. (*Refer to SPD Panel*)

L1 TOP OF CLIMB (T/C)

The point where the aircraft will reach the cruise altitude (or the descent path, if this is reached before cruise altitude), or the step climb altitude, if there is one.

L2 The flight crew can change the cruise flight level on the PERF page (link to PERF page), and can define a climb step on the STEP ALTs panel on the VERT REV page. (*Refer to STEP ALTs Panel*)

L1 **STEP CLIMB (S/C) OR (OPT)**

The point where the step climb is planned to begin.

Note: *If the step climb is defined at a waypoint, the step climb pseudo waypoint is displayed on the line below that waypoint on the F-PLN page.*
if the step climb start waypoint is an optimum start point, the pseudo-waypoint is (OPT).

L2 The flight crew defines a climb step on the STEP ALTs panel on the VERT REV page. (*Refer to STEP ALTs Panel*)

L1 **STEP DESCENT (S/D)**

The point where the step descent is planned to begin.

Note: *On the F-PLN page, the step descent pseudo waypoint is displayed on the line below the flight plan start waypoint.*

L2 The flight crew defines a descent step on the STEP ALTs panel on the VERT REV page. (*Refer to STEP ALTs Panel*)

L1 **TIME MARKER (UTC)**

The point where the aircraft will be at the entered UTC time.

L2 The flight crew enters a time marker on the LL XING - TIIME MKR page. (*Refer to Page*)

L1 **TOP OF DESCENT (T/D)**

The point where the descent is planned to begin.

DECELERATION POINT (DECEL)

The point where the aircraft will decelerate for descent and landing.

VERTICAL FLIGHT PLAN REVISIONS

The flight crew can change the vertical flight plan. A change to the vertical flight plan is called a vertical revision.
Refer to Vertical Revisions

CONTROLS AND INDICATORS

ON THE MFD

The F-PLN page displays the textual vertical data, associated with the entered lateral flight plan.
The F-PLN displays, for each lateral flight plan waypoint:

- The time prediction, in Universal Time Coordinates (UTC)
- The speed prediction (SPD)
- The altitude prediction (ALT)
- The wind data (WIND)

A flight plan leg, that is part of the arrival procedure, can also have an associated Flight Path Angle (FPA).

F-PLN Page

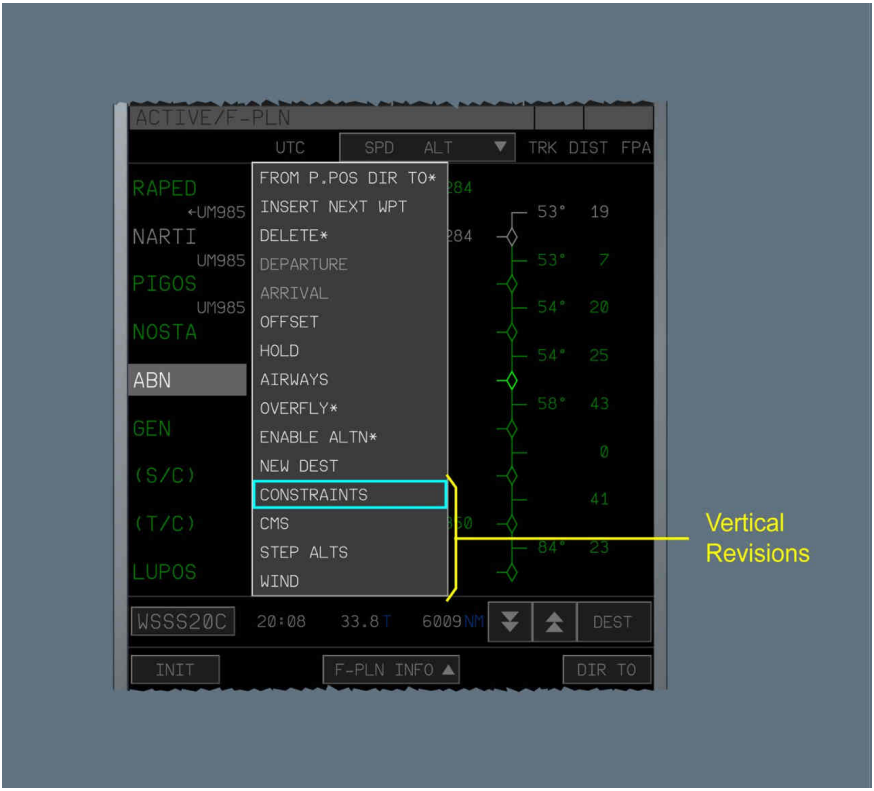
F-PLN Page - WIND predictions

The F-PLN page also displays the pseudo-waypoints, and the speed and altitude symbols.
A pseudo-waypoint is displayed between brackets, and has time, speed, altitude, and wind predictions.
A speed, or altitude constraint is indicated with a star next to the speed, or altitude prediction.

Pseudo-waypoint and Constraint Symbol

Refer to Page
All vertical flight plan revisions can be accessed through the F-PLN page, via the waypoint revisions menu, or by clicking directly on the time, speed, altitude, or wind prediction.

Waypoint Revisions Menu



ON THE ND

The lateral ND displays pseudo-waypoints, and speed and altitude constraints. The flight crew can control the display of this data via the EFIS CP .
The VD displays the profile of the vertical flight plan in relation to weather, terrain and safety altitudes data.
No vertical flight plan revisions are possible via the ND or VD .

Intentionally left blank

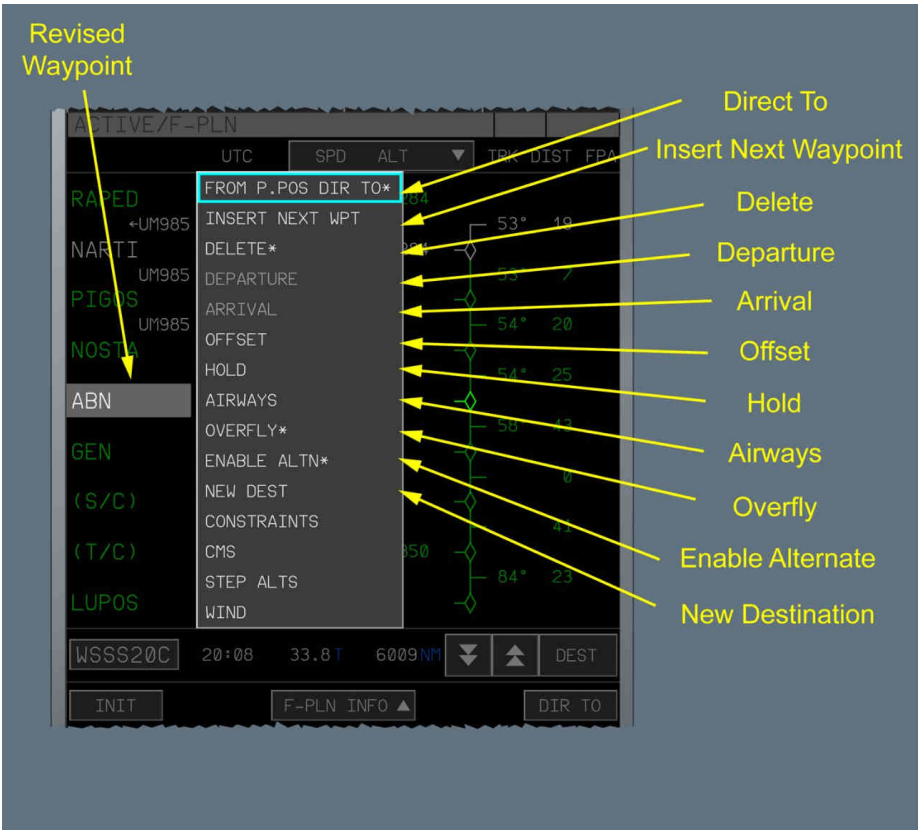
Lateral Flight Plan Revisions

LATERAL REVISIONS - INTRODUCTION

Applicable to: ALL

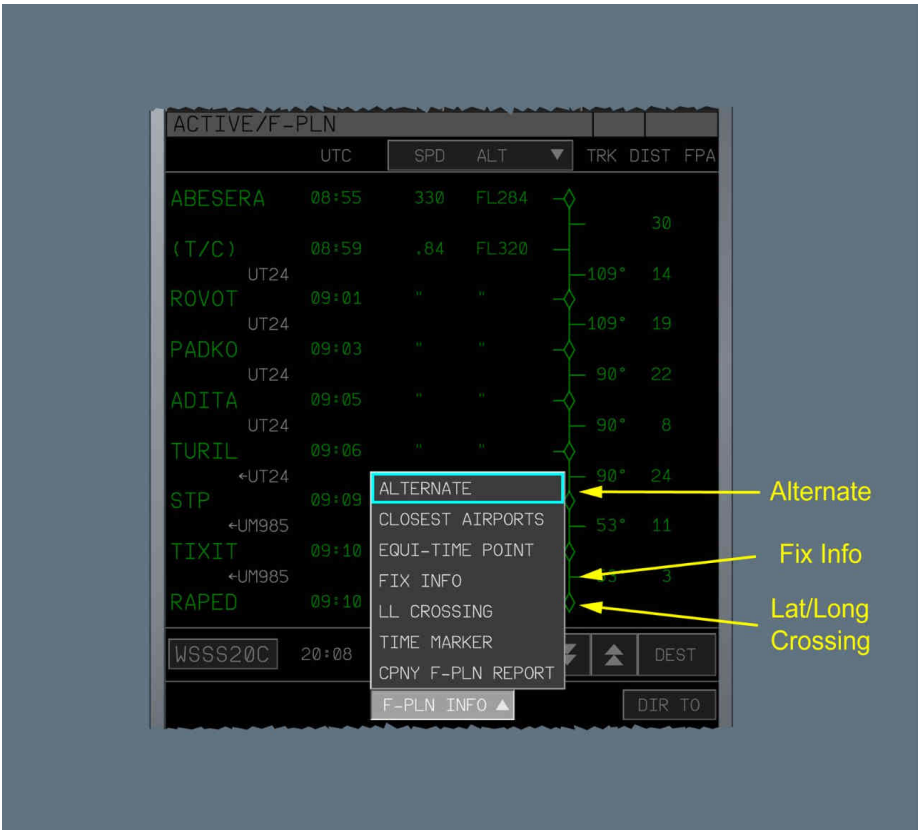
A change to the lateral flight plan is called a lateral revision.
All lateral revisions can be reached via the F-PLN page on the MFD .
The starting point for most lateral revisions is a waypoint on the flight plan, called the revised waypoint. Clicking on the revised waypoint, opens the waypoint revisions menu. The upper part of the waypoint revisions menu displays the lateral revisions, indicated in the following illustration:

Waypoint Revisions Menu



Other lateral revisions are not related to a specific waypoint, but to the entire flight plan. They are accessed through the F-PLN INFO menu on the F-PLN page. The global lateral flight plan revisions are indicated in the following illustration:

F-PLN INFO Menu



The direct to (DIR TO), insert next waypoint (INSERT NEXT WPT), and delete (DELETE) revisions can also be performed via the interactive lateral ND . Clicking on the revised waypoint, on the flight plan on the lateral ND , opens the waypoint revisions menu with the three lateral revisions.

LATERAL REVISION AND SECONDARY FLIGHT PLAN

All lateral revisions (except fix info) are available on the active and secondary flight plans.

DIRECT TO (DIR TO)

Applicable to: ALL

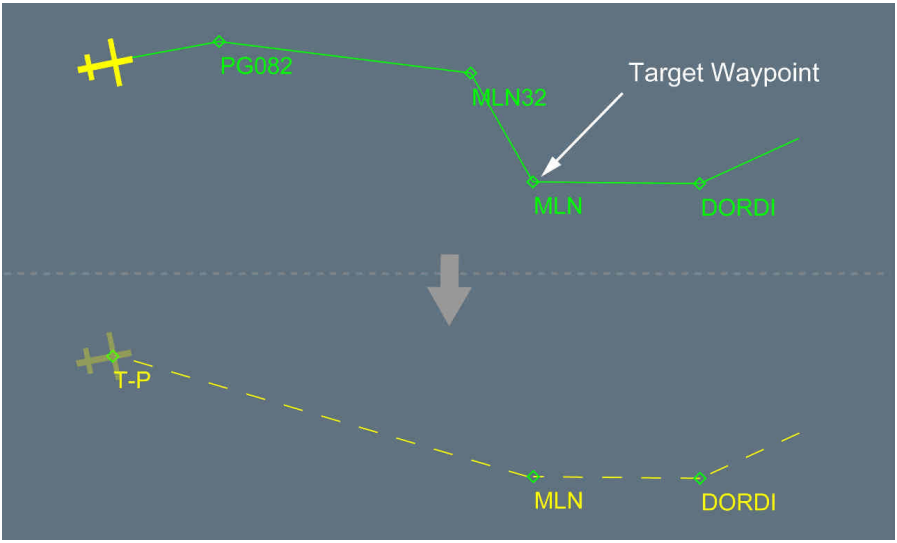
PURPOSE

The flight crew uses the direct to (DIR TO) revision to create a direct (great circle) leg from the aircraft present position to:

- A flight plan waypoint
- Any navigation database waypoint, airport, or NAVAID
- A latitude/longitude (LL), place/bearing/distance (PBD), or place-bearing/place-bearing (PB / PB) waypoint.

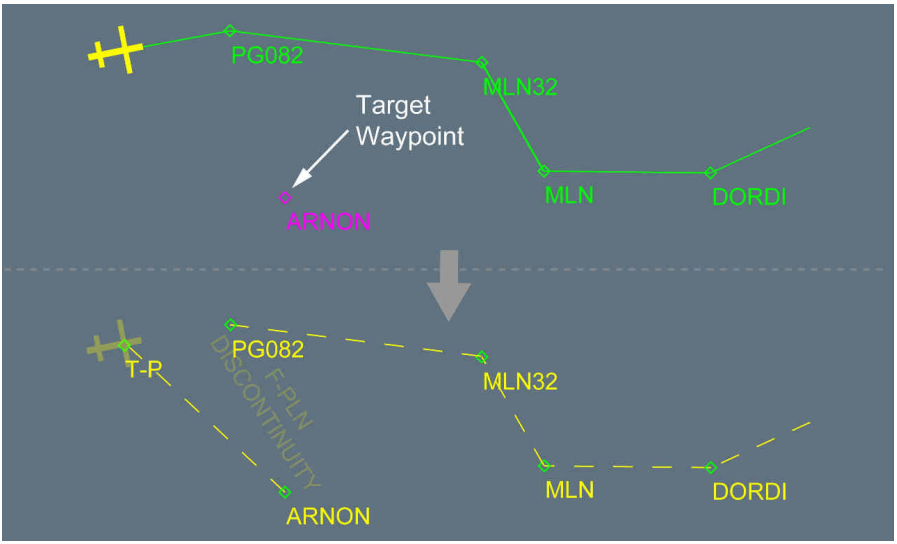
A DIR TO a flight plan waypoint creates a direct leg between the aircraft present position and the selected target waypoint. The flight plan waypoints between the aircraft present position and the selected target waypoint are deleted.

DIR TO a Flight Plan Waypoint



A DIR TO any other waypoint, that is not on the flight plan, creates a direct leg between the aircraft present position and the selected target waypoint, and a flight plan discontinuity between the target waypoint and the former TO waypoint.

DIR TO a Waypoint that is not in the Flight Plan



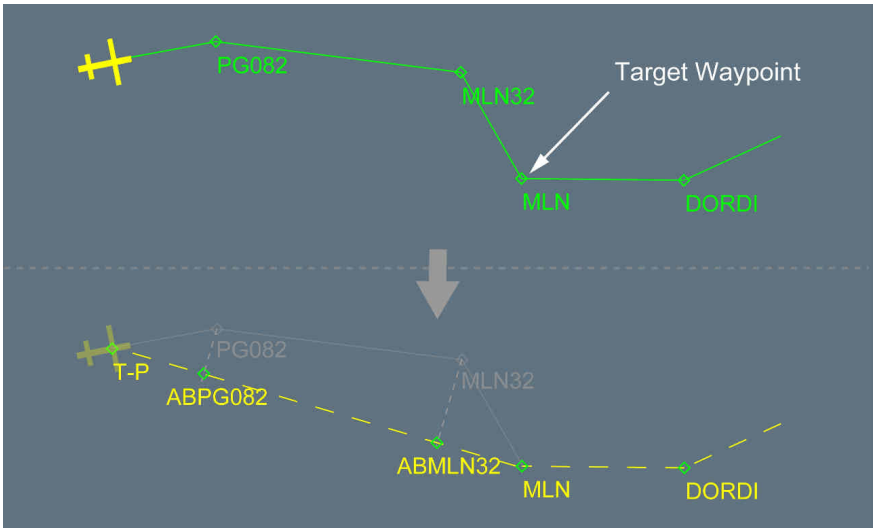
If the lateral mode is HDG / TRACK or LOC, the NAV mode engages automatically when the DIR TO is inserted.

The flight crew has three options for creating the direct leg:
- DIR TO with abeam points (DIRECT WITH ABEAM), or
- DIR TO with inbound course (CRS IN), or
- DIR TO with outbound course (CRS OUT).

DIRECT WITH ABEAM

This option creates abeam waypoints along the direct leg. Abeam waypoints are the projections of the flight plan waypoints on the direct leg, that are between the aircraft present position and the selected target waypoint. The initial flight plan waypoints are deleted.

DIRECT WITH ABEAM



L2 Abeam waypoints are part of the flight plan, but are not stored in the pilot-stored elements database. This means that the abeam waypoints can be used for every flight plan revision (except AIRWAYS), until they are sequenced. As soon as they are sequenced, they are no longer memorized by the FMS .

L3 When a latitude/longitude crossing, circle/radial intercept, or abeam waypoint is projected, it is recomputed, using the initial latitude/longitude, and reference fix waypoint.
Speed, altitude, and time constraints are not transferred to the abeam waypoint.
Wind data is transferred, when the distance between the abeam and the initial waypoint is less than 100 nm .

L1 **CRS IN**

This option creates a direct leg from the aircraft present position to intercept an inbound course (selected by the flight crew) of the target waypoint.
The track of the direct leg is the current aircraft track.

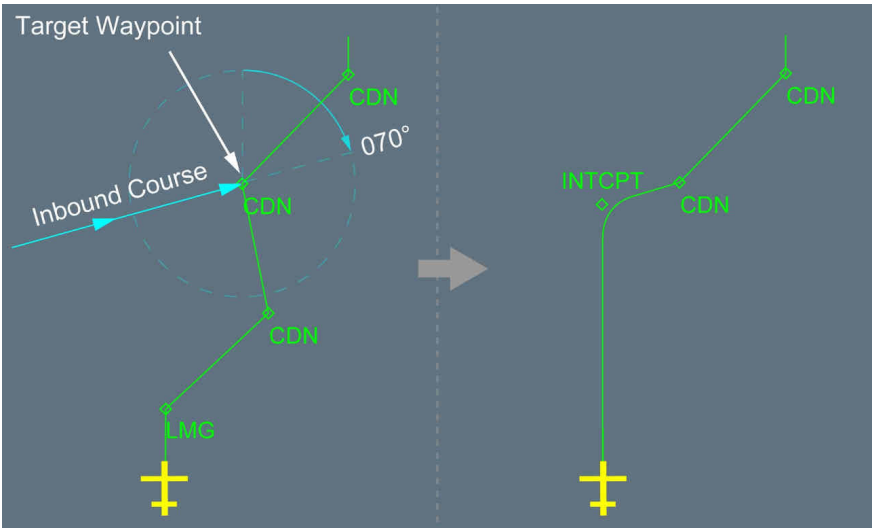
If the angle between the direct leg and the inbound course is less than 160 ° :
- An intercept point (INTCPT) is computed
- The lateral HDG mode is engaged and NAV is armed.

Note: - *The INTCPT waypoint is recomputed, when the flight crew changes the aircraft track.*
- *The NAV mode engages automatically, when INTCPT is sequenced.*

If the angle between the direct leg and the inbound course is more than 160 ° :
- No intercept point (INTCPT) is computed, and
- The lateral HDG mode is engaged, and NAV is armed.

Note: *NAV mode does not engage if the angle between the direct leg, and the inbound course remains more than 160 ° .*

CRS IN



L2 When the flight crew inserts a DIR TO - CRS IN, the ADJUST DESIRED TRK OR HDG message is displayed. (*Refer to Message)*

This message informs the flight crew that it is possible to adjust the aircraft heading/track:
- To enable the computation of the INTCPT (if, after the heading/track change, the intercept angle becomes less than 160 °), or
- To change the position of the INTCPT (if it was previously computed).

L1 **CRS OUT**

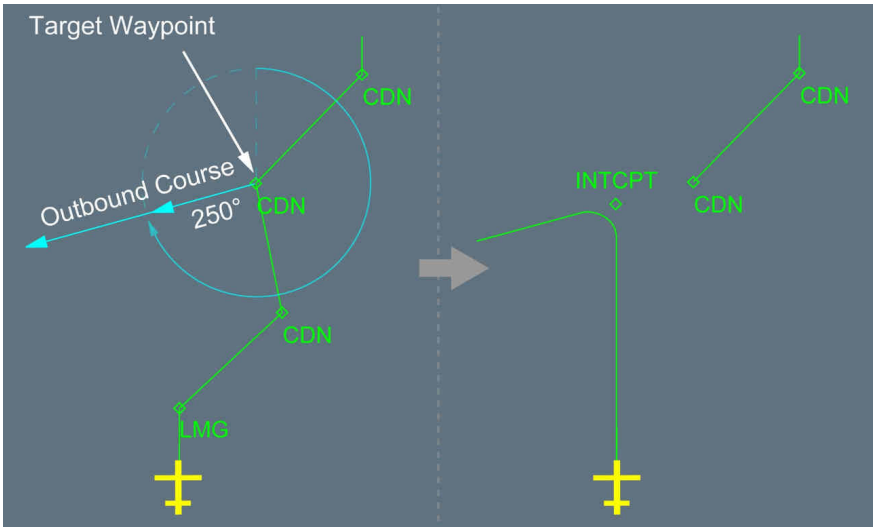
This option creates a direct leg from the aircraft present position to intercept an outbound course (selected by the flight crew) of the target waypoint.

The track of the direct leg is the current aircraft track.

If the direct leg is not parallel with the outbound course:
- An intercept point (INTCPT) is computed,
- The lateral HDG mode is engaged and NAV is armed.

Note:
- *The INTCPT waypoint is recomputed when the flight crew changes the aircraft track.*
- *The NAV mode engages automatically when INTCPT is sequenced.*
- *When the INTCPT is sequenced, the aircraft is on the selected outbound course leg, which is a MANUAL leg. (Refer to Manual Leg)*

CRS OUT



L2 When the flight crew inserts a DIR TO - CRS OUT, the ADJUST DESIRED TRK OR HDG message is displayed. (*Refer to Message)*
This message informs the flight crew that it is possible to adjust the aircraft heading/track, to change the position of the INTCPT (if it was previously computed).

DIR TO REVISION AND SECONDARY FLIGHT PLAN

The DIR TO revision is not available on the secondary flight plans.

DIR TO REVISION AND TEMPORARY FLIGHT PLAN

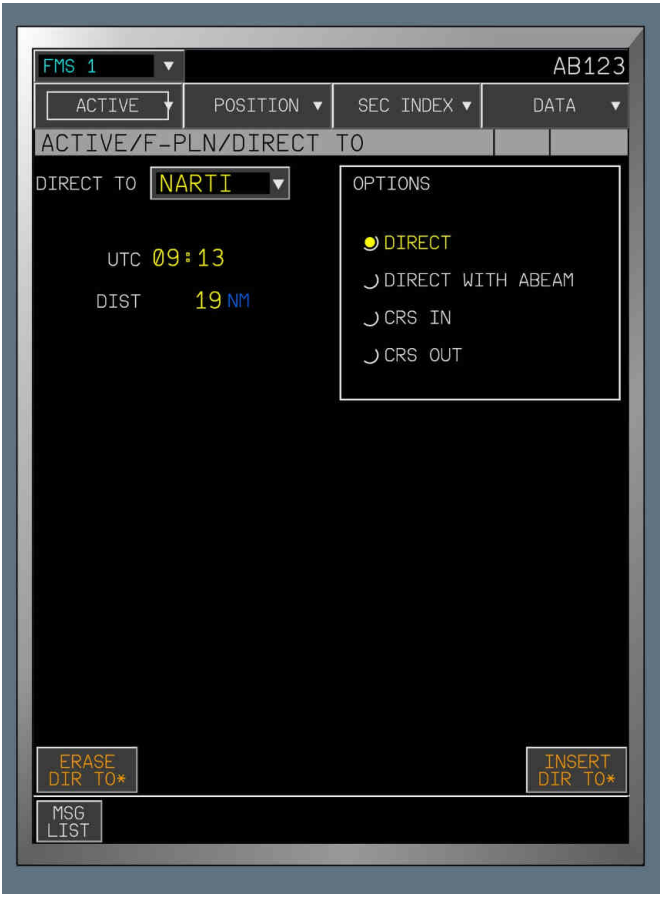
The DIR TO revision creates a temporary flight plan.
No other revisions can be made on this temporary flight plan.

CONTROLS AND INDICATORS

ON THE MFD

The flight crew can insert a DIR TO leg on the ACTIVE / F-PLN / DIRECT TO page.

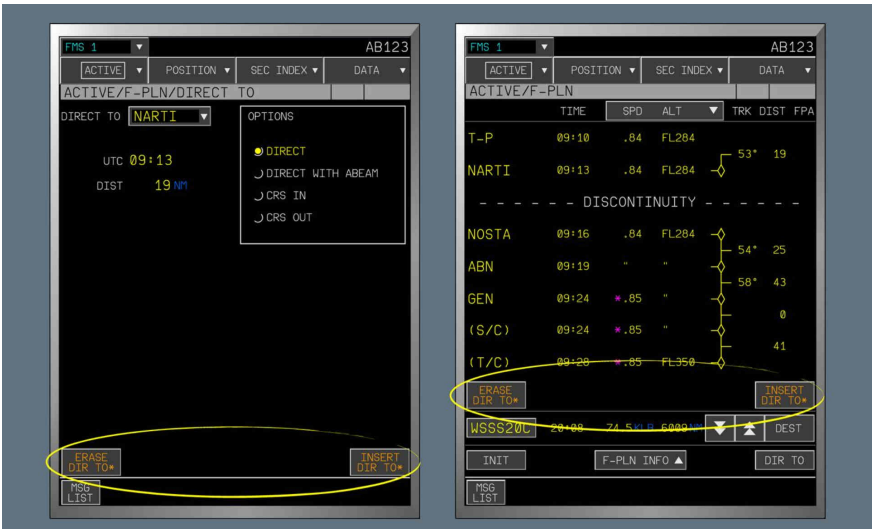
DIRECT TO Page



Refer to DIRECT TO page

The temporary flight plan created by the DIR TO revision can be inserted on the DIRECT TO, or ACTIVE / F-PLN page.

INSERT/ERASE DIRECT TO



Refer to F-PLN page

The abeam waypoints of a DIRECT WITH ABEAM are not displayed in the temporary flight plan. The ABEAM PTS indicator is displayed between the turning point (T-P) and the target waypoint. When the temporary flight plan is inserted, the indicator disappears and the abeam waypoints appear.

DIRECT WITH ABEAM

ASSOCIATED MESSAGES

Refer to ADJUST DESIRED TRK OR HDG

INSERT NEXT WAYPOINT (INSERT NEXT WPT)

Applicable to: ALL

PURPOSE

The flight crew uses the insert next waypoint (INSERT NEXT WPT) revision to insert a waypoint after the revised waypoint.

The flight crew can insert:

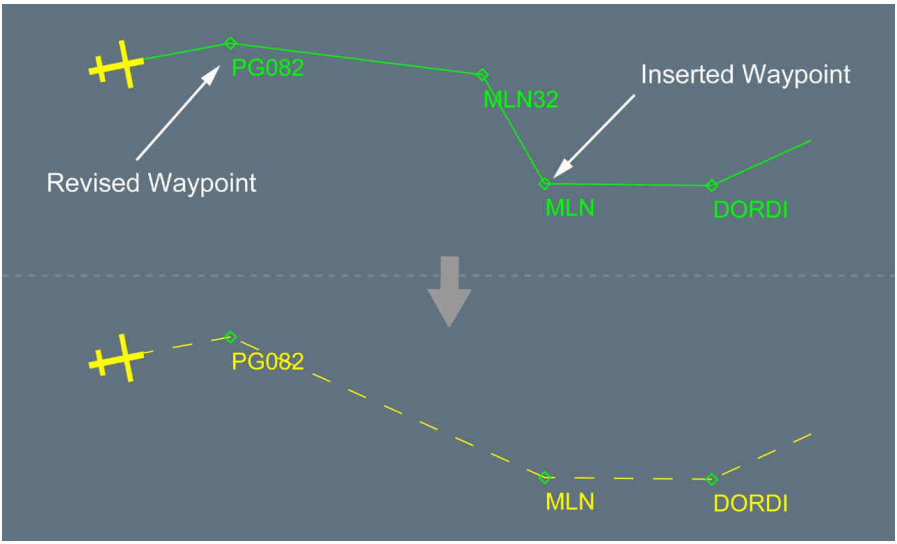
- A flight plan waypoint
- Any navigation database waypoint, airport, or NAVAID
- A latitude/longitude (LL), a place/bearing/distance (PBD), a place-bearing/place-bearing (PB/PB), or a place/distance (PD) waypoint.

L2 *Note:*

- *A PD waypoint, with a negative distance (example: LMG/-15), is inserted "before" the revised waypoint*
- *The "place" waypoint needs to be the revised waypoint*
- *The distance of the PD waypoint is limited so that the PD cannot be before (after) the waypoint that precedes (follows) the revised waypoint.*

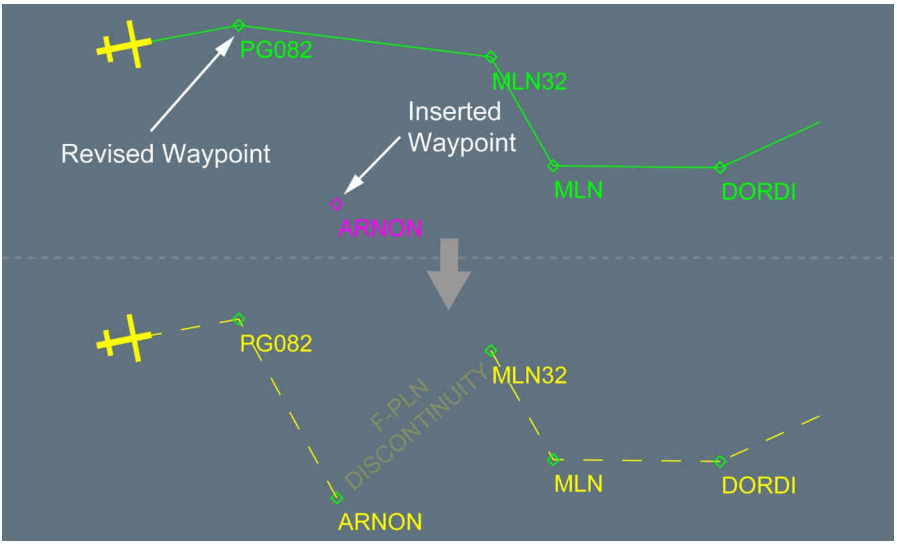
L1 If the flight crew inserts a flight plan waypoint, a direct leg is created between the revised waypoint and the inserted waypoint. All waypoints between the revised waypoint, and the inserted waypoint are deleted.

Insertion of a Flight Plan Waypoint



If the flight crew inserts a waypoint that is not in the flight plan, a direct leg is created between the revised waypoint and the inserted waypoint.

Insertion of a Waypoint



L2 The flight crew can insert a waypoint on any waypoint of the flight plan. To insert a waypoint on the FROM waypoint, the flight crew must first engage the HDG/TRK mode.

INSERT NEXT WAYPOINT REVISION AND SECONDARY FLIGHT PLAN

The INSERT NEXT WPT revision is available on the active (or temporary) flight plan, and on the secondary flight plans.

INSERT NEXT WAYPOINT REVISION AND TEMPORARY FLIGHT PLAN

The INSERT NEXT WPT revision creates a temporary flight plan.

CONTROLS AND INDICATORS

ON THE MFD

The INSERT NEXT WPT revision is the second revision in the waypoint revisions menu on the ACTIVE (or SEC) / F-PLN page.
When the fight crew selects the INSERT NEXT WPT revision, the Insert Next Waypoint window appears on the flight plan page.
Refer to Insert Next Waypoint Window

Insert Next Waypoint

DELETE

Applicable to: ALL

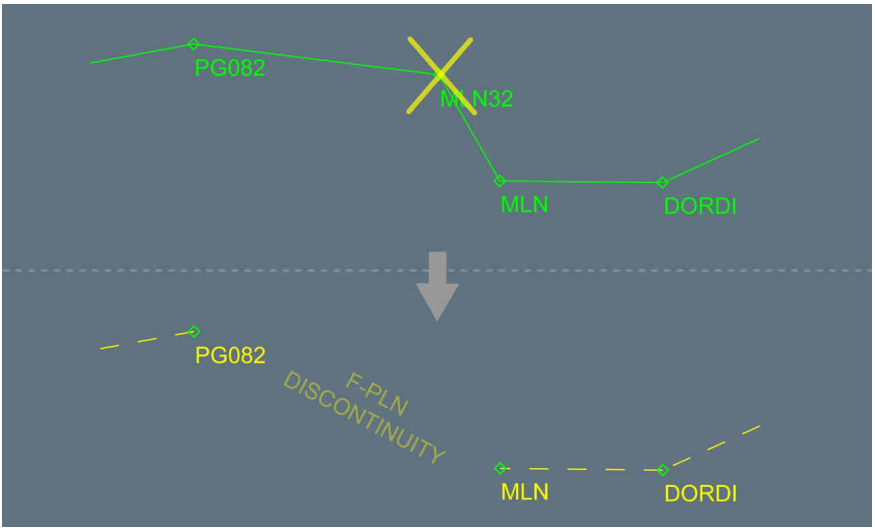
PURPOSE

The flight crew uses the delete revision (DELETE) to delete a flight plan waypoint or discontinuity.

DELETION OF A WAYPOINT

Deletion of a waypoint removes the waypoint from the flight plan and inserts a discontinuity in its place.

Deletion of a Waypoint



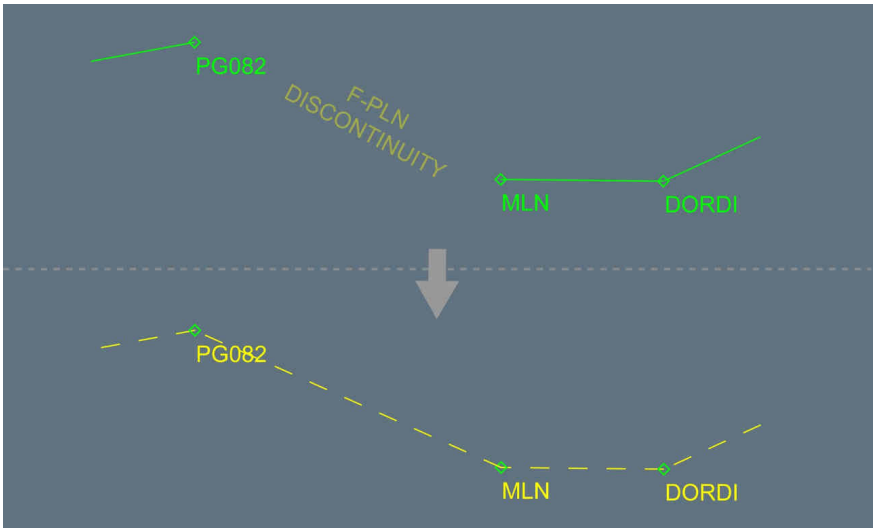
L2 In NAV mode, the flight crew can delete any waypoint on the flight plan, except the FROM and TO waypoint. To delete the FROM and TO waypoint, the flight crew should select the HDG/TRACK mode first.

L3 *Note:*
- *Deletion of the T-P, when an offset or holding pattern is active, removes the offset or the holding pattern from the flight plan.*
- *Deletion of a holding fix, removes the holding pattern from the flight plan, but does not create a discontinuity.*

L1 ## DELETION OF A DISCONTINUITY

Deletion of a discontinuity removes the discontinuity from the flight plan and replaces it with a direct leg, between the waypoint that was before the discontinuity and the waypoint that was after the discontinuity.

Deletion of a Discontinuity



L2 The flight crew can delete any discontinuity in the flight plan, except a discontinuity following P.POS, or a manual leg.

DELETE REVISION AND SECONDARY FLIGHT PLAN

The delete revision is available on the active (or temporary), and secondary flight plans.

DELETE REVISION AND TEMPORARY FLIGHT PLAN

Deletion of a waypoint, or discontinuity, creates a temporary flight plan.

CONTROLS AND INDICATORS

The flight crew can delete a waypoint via the MFD or on the lateral ND . However, a discontinuity can be deleted via the MFD only.

ON THE MFD

The delete revision is the third revision (DELETE) in the waypoint revisions menu on the ACTIVE (or SEC) / F-PLN page.

Delete Revision

L2 For the waypoints that cannot be deleted, the delete revision is inhibited in the waypoint revisions menu.

L1 **ON THE ND**

The delete revision is the third revision in the waypoint revisions menu for a waypoint on the active (or temporay), and secondary flight plan.
For more information on the Interactive ND - DELETE Revision, *Refer to DELETE Revision*

DEPARTURE

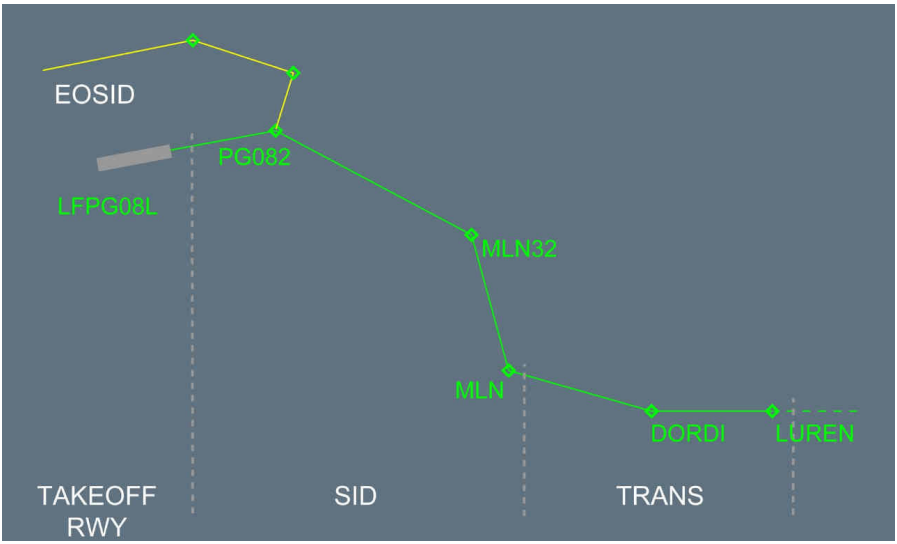
Applicable to: ALL

PURPOSE

The flight crew uses the departure revision (DEPARTURE) to insert, or change, the three following elements of the departure procedure:

- The takeoff runway (and Engine Out Standard Instrument Departure (EOSID))
- The Standard Instrument Departure (SID)
- The departure transition (TRANS).

Departure Procedure



The three above-mentioned elements are part of the navigation database. (*Refer to Navigation Database)*

The flight crew selects a compatible runway, SID , and TRANS . The FMS will link the elements accordingly, starting with the takeoff runway, up to the en-route waypoints.

The flight crew can choose to have no SID and/or no TRANS , by selecting the NONE option. This option is selected automatically if, for the selected takeoff runway, no SID and/or TRANS are available in the database.

If the flight crew chooses to have no SID , the FMS inserts a flight plan leg after the takeoff runway axis. The leg stops at 1 500 ft MSL , and is followed by a discontinuity.

Note: When a flight plan has a DEPARTURE procedure (RWY+SID+TRANS), and the flight crew changes the RWY, the FMS may automatically change or delete some elements of the SID. As a result, if the flight crew changes the RWY, they should check all of the elements of the DEPARTURE procedure, and correct them, if necessary.

L3 HOW THE FMS LINKS THE DIFFERENT DEPARTURE ELEMENTS

The FMS searches for a waypoint of the next element (for example, the TRANS), that is identical to the last waypoint of the previous element (for example, the SID). The FMS links the two elements (the SID and TRANS) at the common waypoint, and ignores all the waypoints of the next element (the TRANS) before the common point.
If no common waypoint is found between the departure procedure and the en-route flight plan, a discontinuity is inserted between them.

L2 DEPARTURE REVISION AND SECONDARY FLIGHT PLAN

The DEPARTURE function is available on the active (or temporary), and secondary flight plans.

DEPARTURE REVISION AND TEMPORARY FLIGHT PLAN

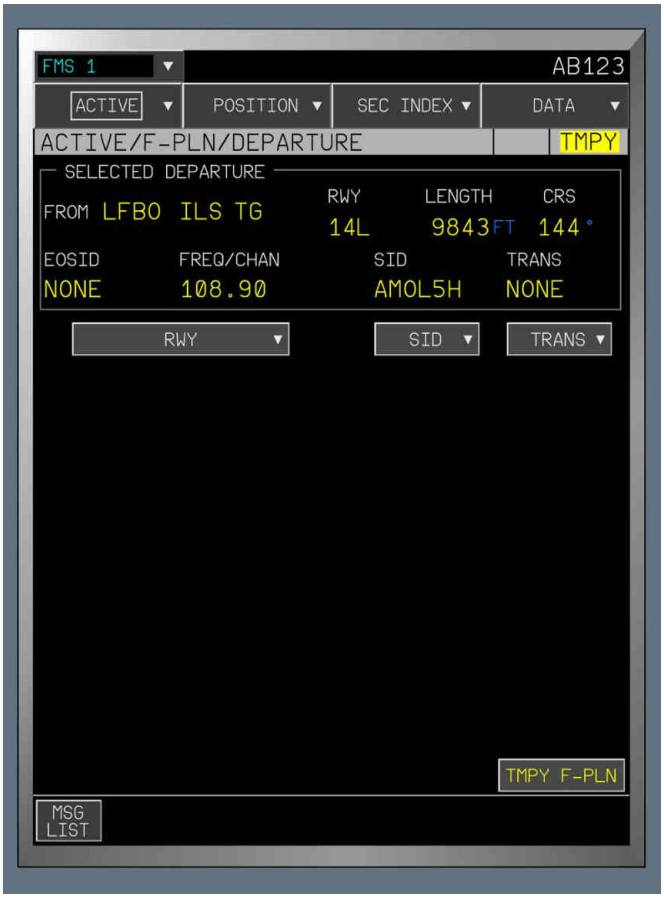
The insertion of the entire departure procedure, or a change to an element of the departure procedure, creates a temporary flight plan. In both cases, the entire departure revision is considered as a single lateral flight plan revision.

CONTROLS AND INDICATORS

ON THE MFD

The flight crew can insert, or change, the departure procedure on the ACTIVE (or SEC) / F-PLN / DEPARTURE page.

DEPARTURE Page



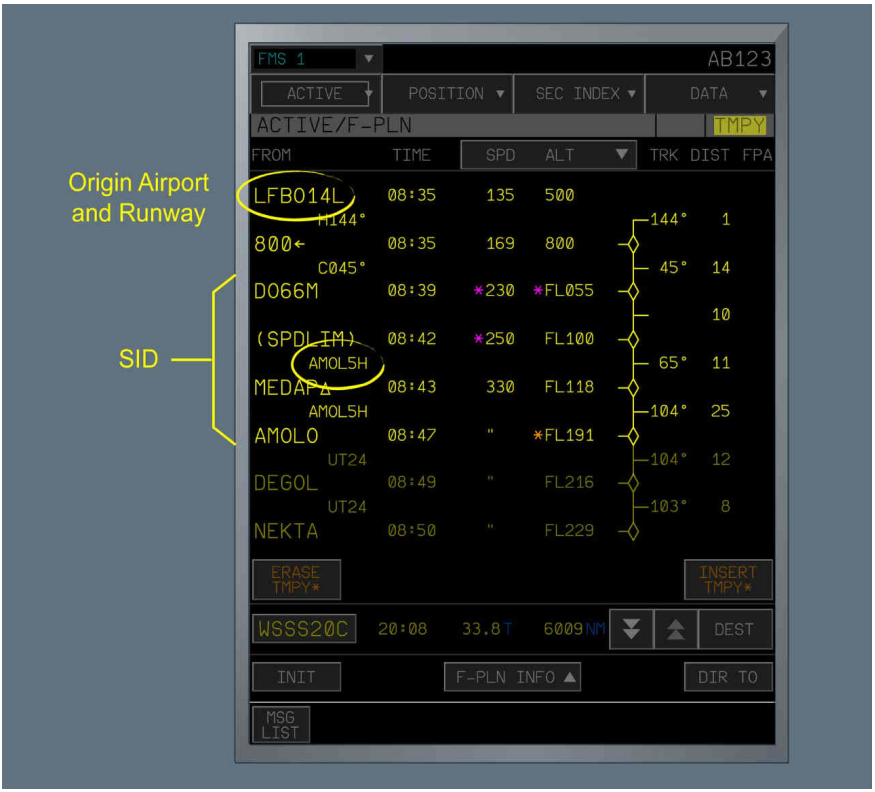
Refer to DEPARTURE page

The flight crew can access the DEPARTURE page via the F-PLN page, by selecting the DEPARTURE revision in the waypoint revisions menu for the primary (or alternate) origin airport.

The flight crew checks the result of the departure selection on the ACTIVE (or SEC) / F-PLN page.

Refer to F-PLN page

F-PLN Page



ON THE ND

The departure procedure is displayed graphically on the ND .

ARRIVAL

Applicable to: ALL

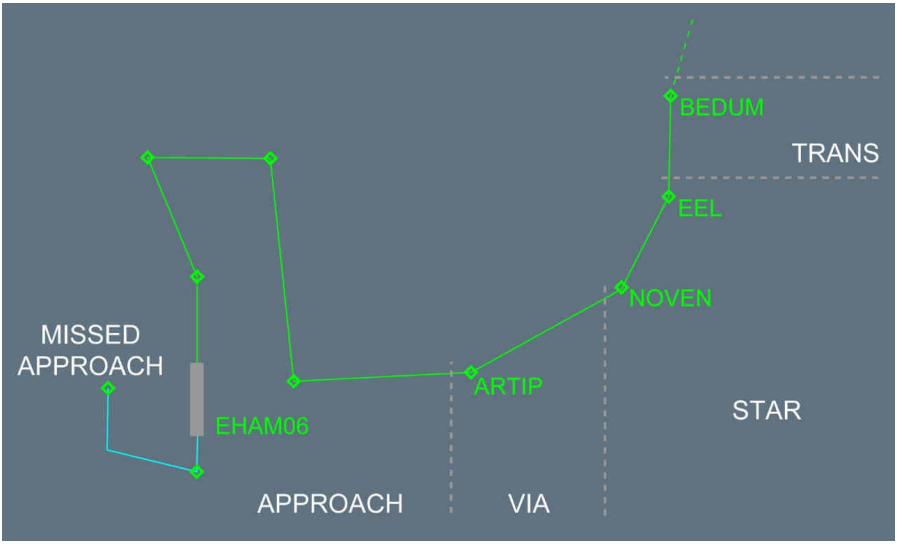
PURPOSE

The flight crew uses the arrival revision (ARRIVAL) to insert, or change, the following four elements of the arrival procedure:

- The final approach (APPR), including the landing runway and missed approach
- The approach via (VIA)

- The standard arrival (STAR)
- The arrival transition (TRANS).

Arrival Procedure



The four above-mentioned elements are part of the navigation database. (*Refer to Navigation Database)*
The flight crew selects a compatible approach: STAR , VIA, and TRANS . The FMS will link the elements accordingly, starting with the en-route waypoints, up to the landing runway.
The flight crew can choose to have no STAR , no VIA and/or no TRANS , by selecting the NONE option. This option is selected automatically if, for the selected landing runway, no STAR , VIA and/or TRANS are available in the database.

Note: *When a flight plan has an ARRIVAL procedure (APPROACH+VIA+STAR+TRANS), and the flight crew changes the APPROACH, the FMS may automatically change or delete some elements of the VIA or STAR. As a result, if the flight crew changes the APPROACH, they should check all of the elements of the ARRIVAL procedure, and correct them, if necessary.*

L3 HOW THE FMS LINKS THE DIFFERENT ARRIVAL ELEMENTS

The FMS searches for a waypoint of the next element (for example, the STAR), that is identical to the last waypoint of the previous element (for example, the TRANS). The FMS links the

two elements (the STAR and the TRANS) at the common waypoint, and disregards all the waypoints of the next element (the STAR) before the common point.
If no common waypoint is found between two elements, a discontinuity is inserted between them.

L2 **ARRIVAL REVISION AND SECONDARY FLIGHT PLAN**

The ARRIVAL revision is available on the active (or temporary), and secondary flight plans.

ARRIVAL REVISION AND TEMPORARY FLIGHT PLAN

The selection of the entire arrival procedure, or a change to an element of the arrival procedure, creates a temporary flight plan. In both cases, the entire arrival revision is considered as a single lateral flight plan revision.

CONTROLS AND INDICATORS

ON THE MFD

The flight crew can insert, or change, the arrival procedure on the ACTIVE (or SEC) / F-PLN / ARRIVAL page.

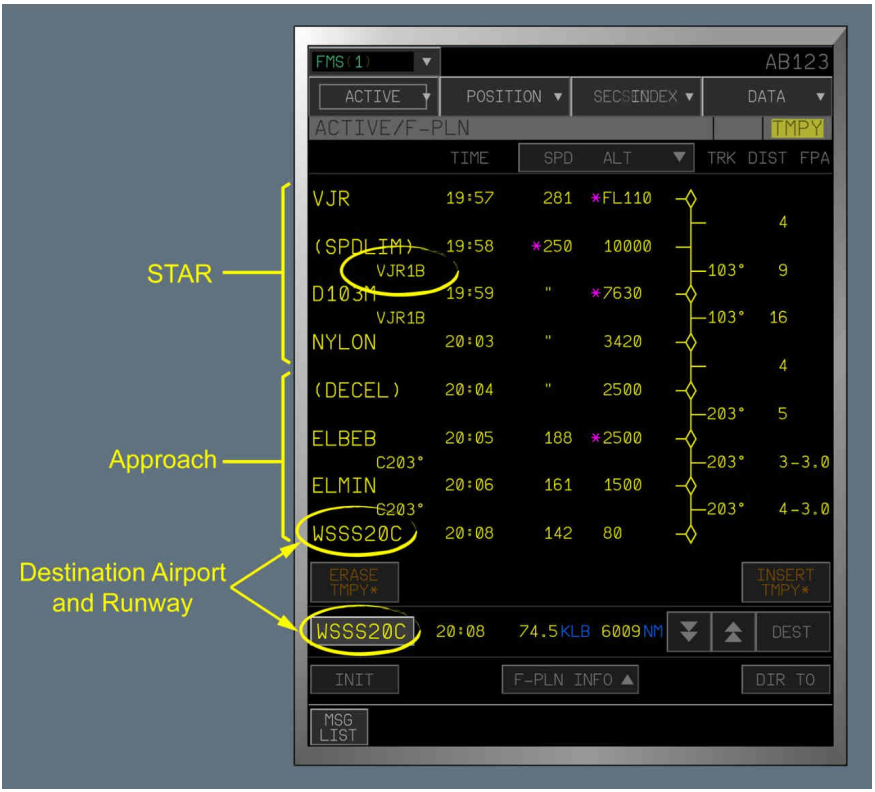
ARRIVAL Page

Refer to ARRIVAL page

The flight crew can access the ARRIVAL page via the F-PLN page, by selecting the ARRIVAL revision in the waypoint revisions menu of the primary (or alternate) destination airport, or by clicking directly on the destination airport of the destination zone, at the bottom of the F-PLN page.

The flight crew can check the result of the arrival selection on the ACTIVE (or SEC) / F-PLN page.

F-PLN Page



Refer to F-PLN page

ON THE ND

The arrival procedure is displayed graphically on the ND .

OFFSET

Applicable to: ALL

PURPOSE

The flight crew uses the offset revision (OFFSET) to create a parallel path from the original lateral flight plan. The offset is defined by:

- The start waypoint

L2 The start waypoint on the flight plan is where the aircraft leaves the original flight plan to join the offset path. The start waypoint may be the aircraft's present position.

L1 - The end waypoint

L2 The end waypoint on the flight plan is the first point where the aircraft is back on the original flight path.

L1 - The lateral offset distance

L2 The lateral offset distance is the lateral distance between the offset path and the original flight plan.

L1 - The offset side

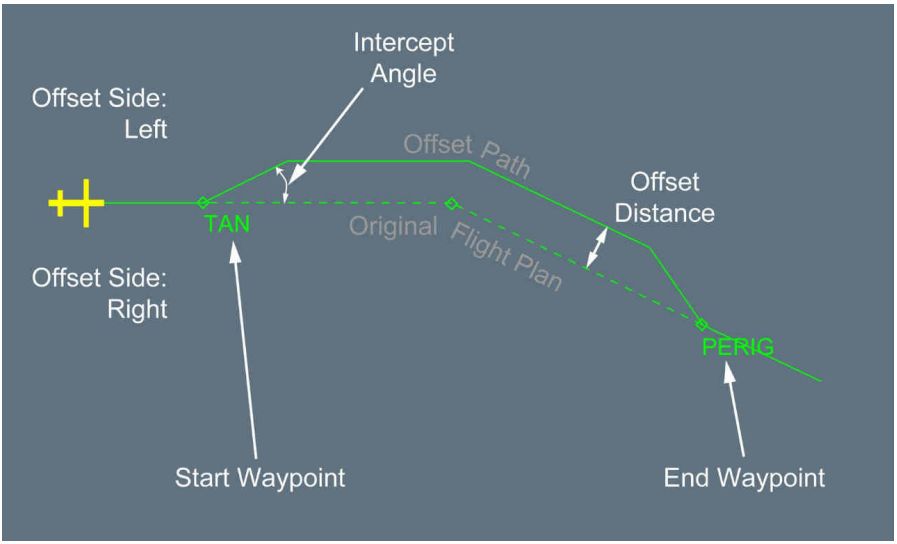
L2 The offset side indicates whether the offset path is to the left or to the right of the original flight plan.

L1 - The intercept angle

L2 The offset intercept angle is the angle between the original flight plan, and the transition trajectory from the original flight plan to the offset path (or vice versa).

L1 *Note: The transition trajectory between the original flight plan and the offset path can be along more than one flight plan leg, if necessary.*

Offset Revision



The flight crew can create only one offset path in the flight plan.
The flight crew can change or delete an existing offset, even if the aircraft is already flying the offset trajectory.

Note: An existing offset path can be deleted automatically, after a flight plan revision that makes the offset path no longer possible. (example: Deletion of the start and end waypoint)

L2 **OFFSET REVISION AND SECONDARY FLIGHT PLAN**

The offset revision is available on the active (or temporary), and secondary flight plans.

OFFSET REVISION AND TEMPORARY FLIGHT PLAN

The insertion of an offset path, or a change of an existing offset path, creates a temporary flight plan.

CONTROLS AND INDICATORS

ON THE MFD

The flight crew can enter, change, or delete the offset path on the ACTIVE (or SEC) / F-PLN / OFFSET page.

OFFSET Page

Refer to OFFSET page

The flight crew can access the OFFSET page via the F-PLN page, by selecting the OFFSET revision in the waypoint revisions menu.

On the F-PLN page, a left or right arrow next to the leg data indicates that there is a left or right side offset defined on the leg. When the aircraft is currently flying the offset, the MFD page title displays OFFSET NNX, where NN is the lateral offset distance, and X is the offset side (example: OFFSET 10R).

F-PLN Page

ON THE ND

The ND always displays both the offset path (solid line) and the original flight plan (dashed line). If the aircraft is currently flying the offset, the ND displays OFST XNN in the bottom left corner, where X is the offset side and NN the lateral offset distance.

Note: *This label is not displayed, if the FMS MORA is displayed on the ND .*

HOLD

Applicable to: ALL

PURPOSE

The flight crew uses the hold revision to:
- Insert a holding pattern in the flight plan
- Change an already existing holding pattern.

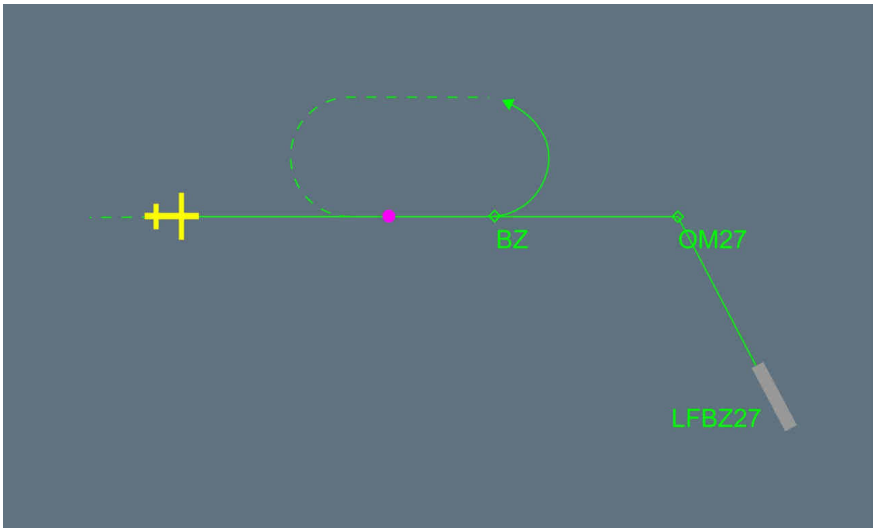
The FMS has three types of holding pattern, based on three different ways to exit the hold:
- Hold to Fix (HF)
- Hold to Altitude (HA)
- Hold with Manual termination (HM).

HF , and HA are always part of a departure or arrival procedure, and cannot be created by the flight crew. A HM may be part of an arrival procedure, or can be created by the flight crew at any waypoint of the flight plan.

Note: *The term "hold fix" represents the entry and exit waypoint of the holding pattern.*

HOLD TO FIX (HF)

Hold To Fix

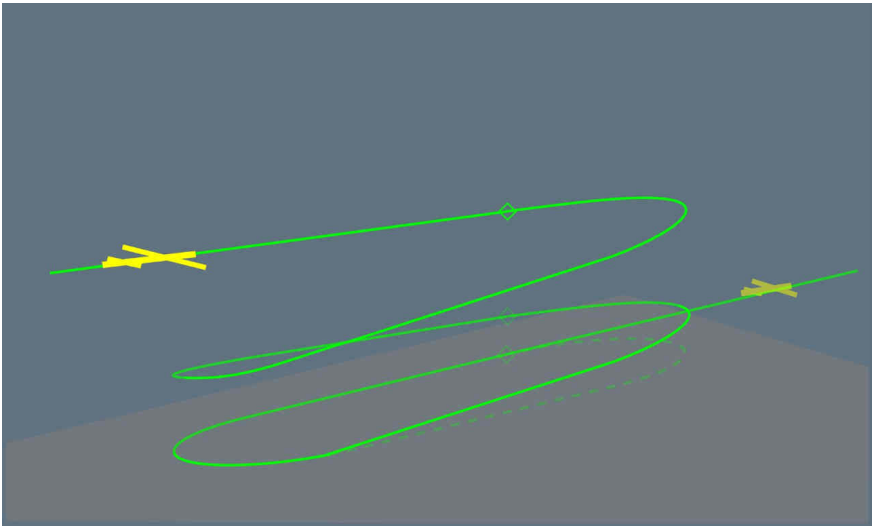


The aircraft flies the holding pattern one time, and exits it automatically at the hold fix.

The HF is part of a navigation database departure, or arrival procedure, and cannot be created by the flight crew.
The flight crew can remove the holding pattern from the flight plan, by deleting the hold fix.

HOLD TO ALTITUDE (HA)

Hold To Altitude



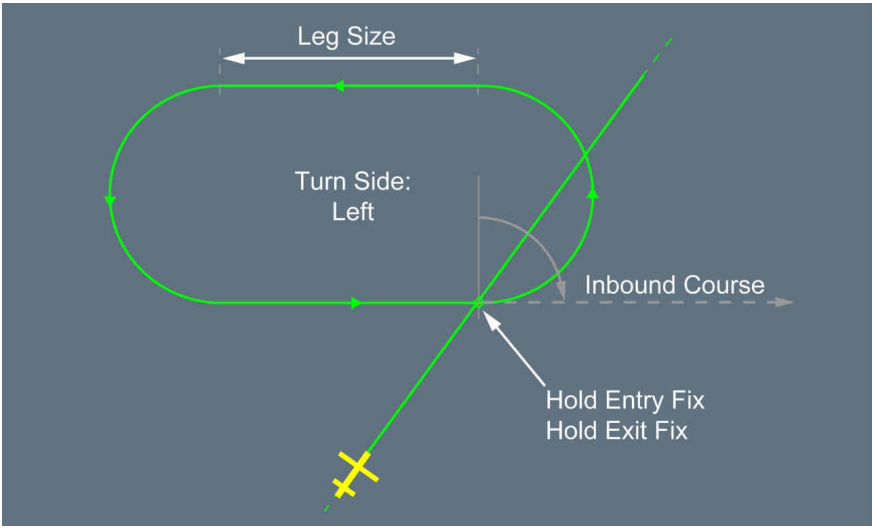
The aircraft flies the holding pattern until it reaches the specified altitude. Then, the aircraft exits the hold automatically at the hold fix.
The HA is part of a navigation database departure, or arrival procedure, and cannot be created by the flight crew.
The flight crew can remove the holding pattern from the flight plan, by deleting the hold fix.

HOLD WITH MANUAL TERMINATION (HM)

The aircraft flies the holding pattern until the flight crew decides to exit.
The flight crew may enter manually a HM at P.POS , or at any waypoint of the flight plan to comply with a defined procedure, a clearance limit, or an operational need, such as: Losing altitude, holding for weather improvement, or absorbing an ATC delay.
An HM may also be part of a navigation database arrival procedure.
The flight crew can always change an HM .

The HM is defined by:
- The hold fix
- The inbound course
- The turn side
- The leg size (in time, or distance).

Hold With Manual Termination



The flight crew inserts an HM into the flight plan, by performing a lateral revision on the flight plan waypoint, where the holding pattern should start. The revised waypoint becomes the hold fix.
To insert an HM at P.POS , the flight crew performs the lateral revision on the flight plan FROM waypoint.
The flight crew can insert three different types of HM :

DATABASE HOLD

The FMS navigation database, may have an HM , associated to the revised waypoint.
The inbound course, turn side, and leg size are taken from the navigation database.

COMPUTED HOLD

The FMS automatically creates a holding pattern, associated to the revised waypoint, and proposes it to the flight crew.

L2 This computed hold has the following parameters:
- Inbound course: Track of the flight plan leg preceding the holding fix, or the aircraft bearing if the holding fix is P.POS
- Turn side: RIGHT
- Leg size: 1 minute if the predicted aircraft altitude at the hold is below 14 000 ft , or 1.5 min if the altitude is above 14 000 ft .

L1 MODIFIED HOLD

The flight crew can always change one or more parameters of a database or computed hold. The HM is then called “modified hold”.

PREDICTIONS AND GUIDANCE FOR HF AND HA

The FMS considers a HF , or HA , as a normal flight plan leg.

The predicted speed on the hold leg is the lowest of:
- ICAO hold speed limit
- Maximum endurance speed
- Speed constraint or speed limit (if any)
- Navigation database hold speed.

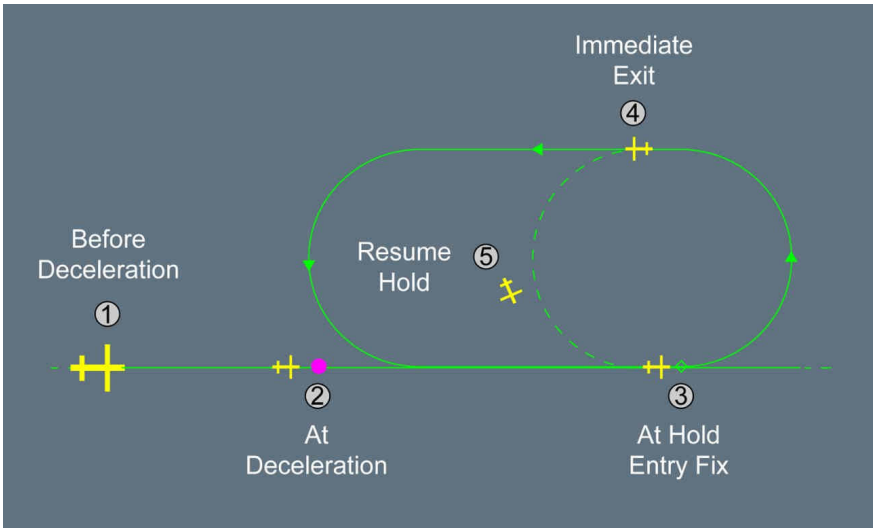
Note: The predicted speed is limited by the speed envelope.

L3 When there is a HF in the arrival procedure, that is on the runway axis, and the aircraft is on the runway axis, and has the right altitude, the flight crew may decide to engage the approach modes (LOC, G/S, F-LOC, F-G/S), without flying the holding pattern. In this case, the FMS still takes into account the holding pattern for the flight plan predictions. The result of this behavior is that the display on VD and PFD is not consistent.: The PFD displays the guidance raw data. The VD displays the data along the predicted flight plan. As the holding pattern is still part of the predicted flight plan, the VD distance between the aircraft's current position and the destination airport (and FLS beam, if any) is greater than the distance that the aircraft will really fly. In this particular case, the flight crew should monitor the PFD deviations and disregard the VD flight plan data.
When the aircraft sequences the hold entry/exit fix, the FMS updates the predictions: The holding pattern is no longer part of the predicted flight plan. PFD and VD are consistent.

L1 **PREDICTIONS AND GUIDANCE FOR HM**

The predictions and guidance for an HM depend on the position of the aircraft in the holding pattern, and on the following flight crew actions:

HM



Before deceleration

Although the hold is inserted into the flight plan, the FMS does not take it into account for predictions.
However, the FMS schedules a deceleration point and displays it on the ND and VD .
If the ND range is 80 nm or less, the ND displays the holding pattern and the entry trajectory, when the aircraft sequences the waypoint that precedes the holding fix, or passes the deceleration point.
When the holding leg parameter is a time (and not a distance), the FMS computes the holding pattern size based on the predicted hold speed.

The predicted hold speed is the lowest of:
- ICAO hold speed limit
- Maximum endurance speed
- Speed constraint or speed limit (if any)
- Navigation database hold speed.

Note: *The predicted speed is limited by the speed envelope.*

L2 When the selected speed mode is active, the FMS computes the holding pattern size based on the selected hold speed.

L1 The FMS also predicts the estimated time and amount of fuel remaining at which the aircraft must exit the holding pattern, so as to comply with the fuel policy. The HOLD page displays these time and fuel estimations.

Upon reaching the deceleration pseudo waypoint

The FMS assumes that the aircraft will fly one loop of the holding pattern, and revises the predictions accordingly.
The aircraft decelerates to the hold speed.
The hold speed is the speed target that is sent to the flight guidance (PRIM). This may be the predicted hold speed (limited by the speed envelope), or a different target speed associated with a flaps setting when the aircraft is in the approach phase.
When the holding leg parameter is a time (and not a distance), the FMS computes the holding pattern size based on the hold speed.

L2 When the selected speed mode is active, and the aircraft reaches the deceleration point, the MFD and PFD display the SET HOLD SPD message. (*Refer to Message*)
When the selected speed mode is active, the holding pattern size is based on the selected speed target.

L1 The flight crew can still decide not to fly the holding pattern, by using the IMMEDIATE EXIT button on the ACTIVE / F-PLN page.

After reaching the holding fix

The aircraft enters the hold.
When the holding leg parameter is a time (and not a distance), the FMS revises the size of the holding pattern, based on the speed target at the hold entry fix. The holding pattern size is frozen during one loop, and is updated again at the next overfly of the hold entry fix.

L2 When the selected speed mode is active, the holding pattern size revision is based on the selected speed target.

L1 Each time the aircraft flies over the hold fix, the FMS updates the predictions for one more holding loop.

Note: When the aircraft is flying a hold, the flight crew can make a revision of the hold. This revision will create a temporary flight plan. The flight crew can check the new holding pattern in the temporary flight plan (on MFD and ND). When the flight crew inserts the temporary flight plan however, the aircraft keeps on flying the old holding pattern. Only when the aircraft sequences the hold fix, the FMS takes into account and displays the updated holding pattern.

The flight crew decides to exit the hold immediately

The flight crew clicks on the IMMEDIATE EXIT button on the ACTIVE / F-PLN page.
The FMS assumes that the aircraft will return immediately to the hold exit fix, and revises the predictions accordingly. The aircraft keeps the hold speed until it reaches the hold exit fix.

When sequencing the hold fix, the aircraft exits the holding pattern, and resumes its navigation. The FMS sets the target speed to the applicable speed of the current flight phase.

The flight crew decides to resume the hold

The flight crew clicks on the RESUME HOLD button on the ACTIVE / F-PLN page.
The aircraft intercepts the holding pattern, following the holding pattern entries logic. (See Holding Pattern Entries)
Each time the aircraft flies over the hold fix, the FMS updates the predictions for one more holding loop.

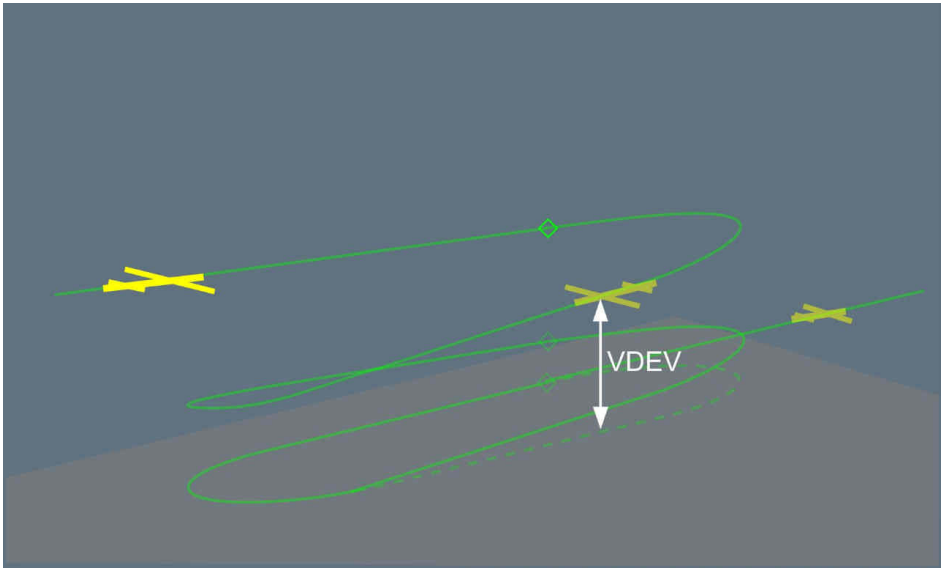
HM and Descent

The following applies for a holding pattern in descent, or approach:

- Before the deceleration pseudo waypoint, the FMS does not take into account the holding pattern for the descent path computation
- Upon reaching the deceleration pseudo waypoint, the FMS computes the theoretical descent path backwards from the destination airport up to the hold exit fix. The FMS does not compute a theoretical descent path inside the hold.

- During descent and approach, the PFD , the DES, and APPR panel of the PERF page display the vertical deviation (VDEV). In the deceleration leg, and in the hold, the vertical deviation is the difference between the aircraft's current altitude and the altitude at which it should be when it reaches the hold exit fix, in order to be properly positioned on the theoretical descent path.

VDEV and HOLD



- The vertical guidance in the HM , during the descent phase, targets a descent rate of 1 000 ft/min . However, the FMS takes into account altitude constraints that will take effect down path the flight plan, so that during the holding pattern, the aircraft will not descend lower than the next altitude constraint. If the aircraft reaches the constraint altitude, it will level off and the ALT CSTR mode will engage.
- The flight crew cannot enter speed constraints at the hold exit fix (This is only allowed at the hold entry fix)

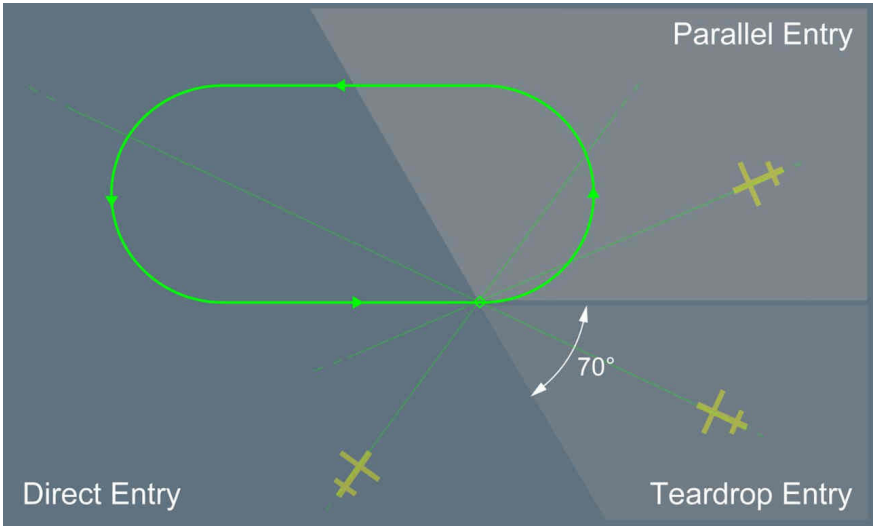
HOLDING PATTERN ENTRIES

The way of entering into a holding pattern depends on the difference of angle between the heading of the aircraft and the hold inbound course.

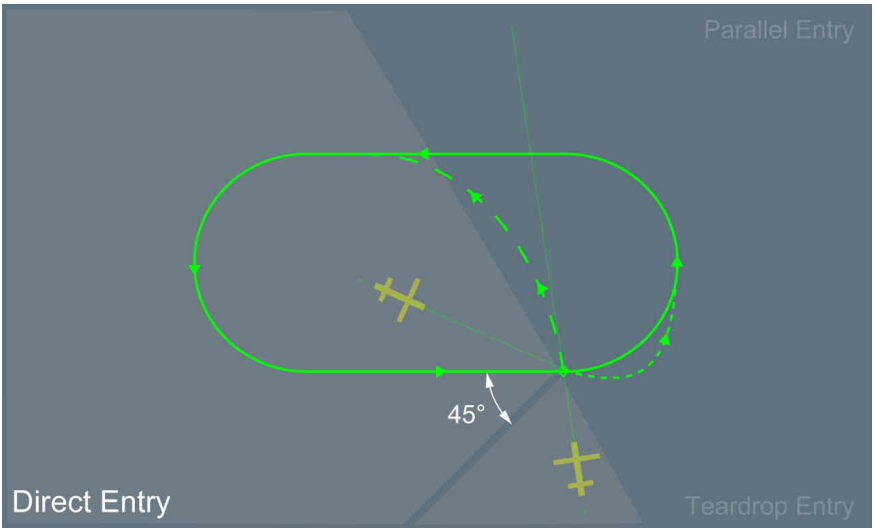
The FMS applies three holding entries:

- The direct entry
- The teardrop entry
- The parallel entry.

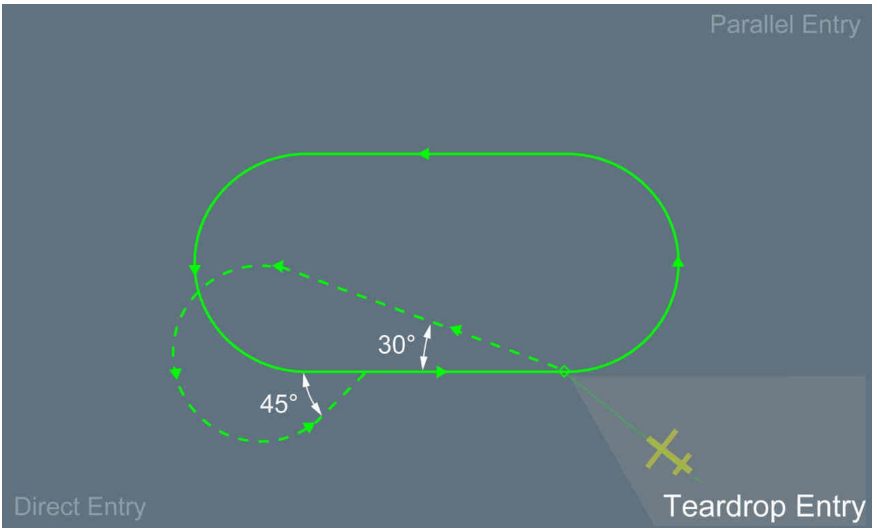
Holding Entries



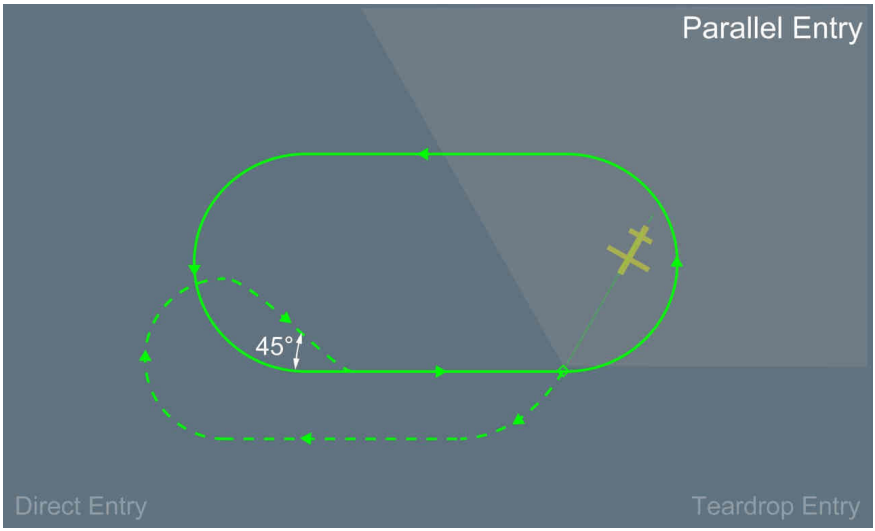
Direct Entry



Teardrop Entry



Parallel Entry



Note: *Border case: If the flight plan leg towards the hold entry fix has the opposite course of the hold inbound course, the aircraft will fly a parallel entry.*

L2 **HOLD REVISION AND SECONDARY FLIGHT PLAN**

The HOLD revision is available on the active (or temporary), and secondary flight plans.

HOLD REVISION AND TEMPORARY FLIGHT PLAN

The insertion of a holding pattern, or a change of an existing hold, creates a temporary flight plan.

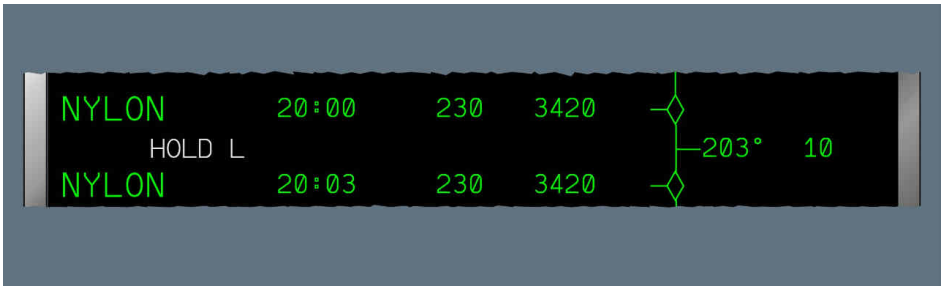
CONTROLS AND INDICATORS

ON THE MFD

On the F-PLN page, the different types of holding pattern are indicated as follows:

- HOLD TO FIX (HF)

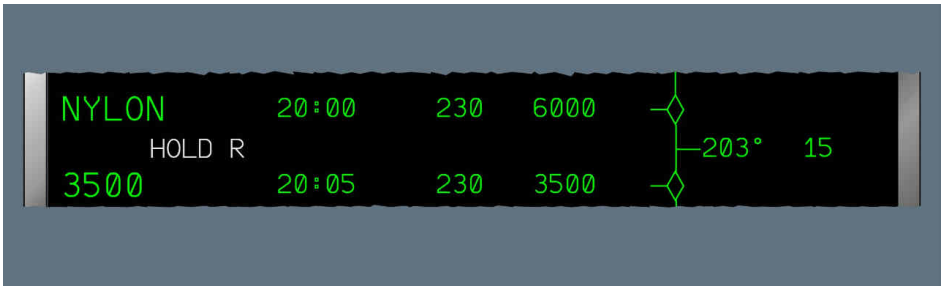
HF



The flight plan displays the entry and exit fix on two lines. The label HOLD L or HOLD R, between the fix waypoint lines, indicates the turning side.
The flight crew can remove the HF , by deleting the hold fix waypoint.

- HOLD TO ALTITUDE (HA)

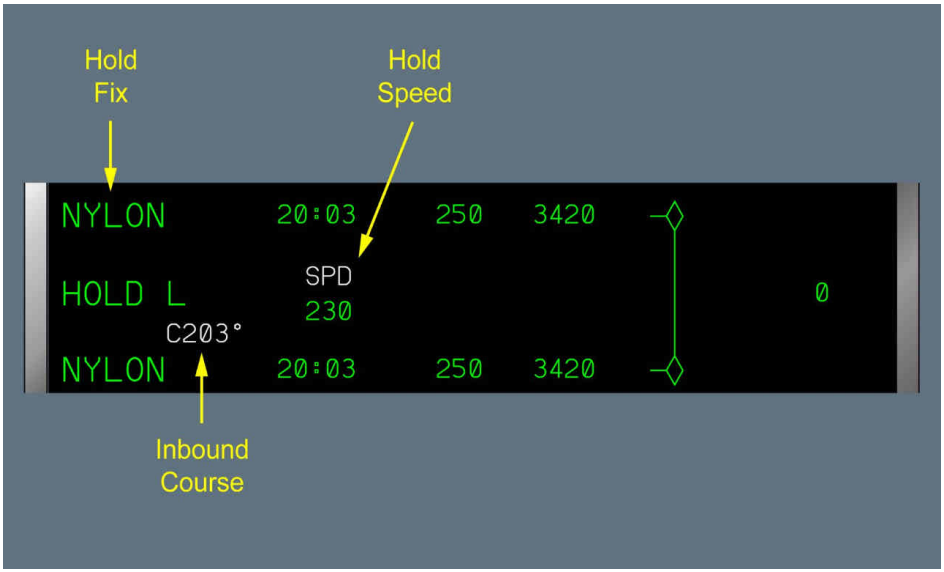
HA



The flight plan displays the entry fix on one line, and the exit altitude on another line. The label HOLD L or HOLD R, between the fix and altitude lines, indicates the turning side.
The flight crew can remove the HA , by deleting the hold fix waypoint.

- HOLD WITH MANUAL TERMINATION (HM)

HM



The flight plan displays the entry and exit fix on two lines. The label HOLD L or HOLD R (indicating the turning side), and the label SPD (indicating the hold managed or selected speed), are displayed on a line between the two fix waypoint lines. The inbound course is displayed between HOLD L(R) and the exit fix.
The flight crew can remove the HM , by deleting the hold fix waypoint.
After sequencing the hold deceleration point, the flight plan displays the IMMEDIATE EXIT button. The flight crew can use this button to delete the holding pattern, before sequencing the hold entry fix, or to immediately exit the holding pattern when flying it.

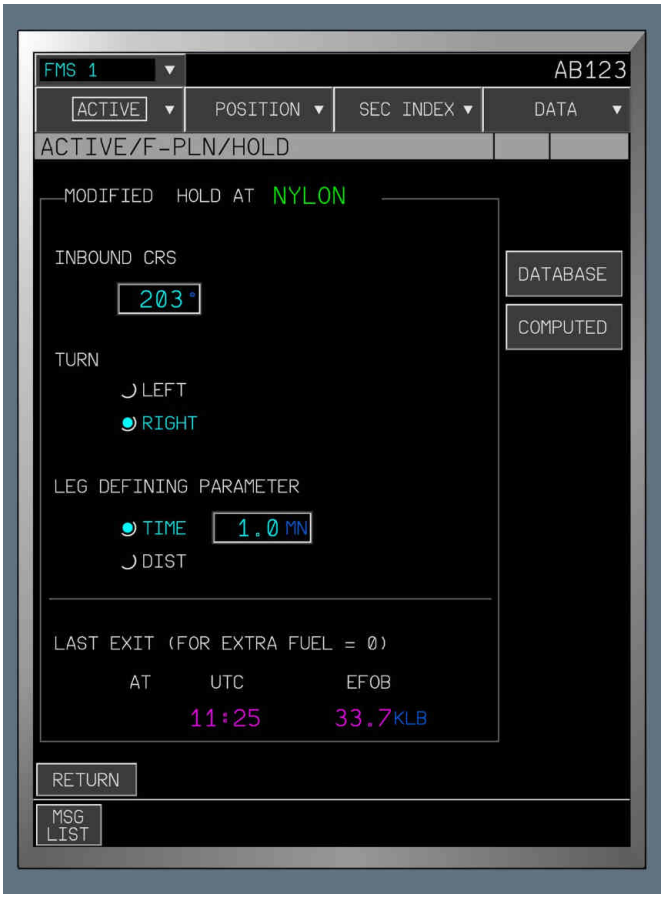
IMMEDIATE EXIT Button

The flight crew can resume the holding pattern, that was initially planned, using the RESUME HOLD button. The F-PLN page displays this button until the hold fix is sequenced.

RESUME HOLD Button

The flight crew can enter, or modify an HM on the ACTIVE (or SEC) / F-PLN / HOLD page.

HOLD Page



Refer to HOLD page

The flight crew can access the HOLD page via the F-PLN page, by selecting the HOLD revision in the waypoint revisions menu.

L2 When flying an HM , the PERF / DES page displays the vertical deviation (VDEV). It is the difference between the aircraft's current altitude and the altitude at which it should be when it reaches the hold exit fix. Also the PFD displays this parameter.

L1 **ON THE ND**

The ND displays the entire holding pattern and its entry trajectory, only when:
- The ND range is 80 nm or less, and
- The aircraft has sequenced the waypoint that precedes the hold entry fix or has passed the hold deceleration point.

In all other cases, the ND displays the holding pattern symbol.

L2 **ON THE PFD**

When flying an HM , the PFD displays the vertical deviation. It is the difference between the aircraft's current altitude and the altitude at which it should be when it reaches the holding exit fix. Also the DES panel of the PERF page displays this parameter.

ASSOCIATED MESSAGES

Refer to SET HOLD SPD
Refer to TIME TO EXIT

AIRWAYS

Applicable to: ALL

PURPOSE

The flight crew uses the AIRWAYS revision to insert airway segments in the flight plan.

Each airway segment is defined by:

- The start waypoint

L2 For the first segment, the start waypoint is the revised flight plan waypoint. For any other segment, the start waypoint is the end waypoint of the previous segment. .

L1 - The airway

L2 All airways are included in the navigation database. The flight crew can select the airway by entering the airway's ident.

L1 - The end waypoint.

The end waypoint can be defined either manually or automatically:

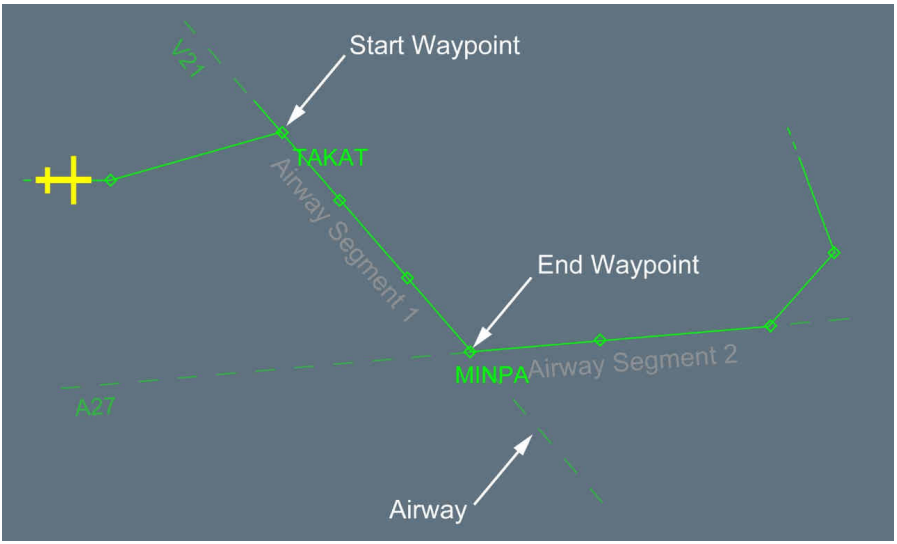
- Manually
  The flight crew can enter the ident of the end waypoint in the associated entry field.

  Note: The flight crew can enter any waypoint, if it belongs to the defined airway. If not, the "AIRWAY / WPT DISAGREE" message is displayed.

- Automatically
  The flight crew can enter two airways of two consecutive segments. The FMS then searches the common waypoint or computes the geographic intersection of both airways and defines it as the end waypoint of the first segment.

  Note: If the FMS does not find a common waypoint nor geographic intersection for the two defined airways, the "NO INTERSECTION FOUND" message is displayed.

Airway Segment



L2 The airway segments are inserted in the flight plan, starting with the revised waypoint, and ending with the end waypoint of the last segment. If the end waypoint is part of the original flight plan (= the flight plan before the revision), all waypoints and legs, of the original flight plan, that are up path the end waypoint are deleted.
If the end waypoint is not part of the original flight plan, a discontinuity will be inserted between the end waypoint and the first waypoint of the original flight plan, down path the revised waypoint.
When inserted in the flight plan, the airway segments are considered as normal flight plan legs and waypoints, with their associated flight plan revisions.

FIXED TURN RADIUS AIRWAYS

An airway can have a constant turn radius defined for one or more waypoints. The FMS uses this turn radius to compute the transition between the two legs at the specific waypoint.

L3 The turn radius is not taken into account, if:
- The waypoint is the start waypoint of the first airway segment, or the end waypoint of the last airway segment
- The flight crew inserts an overfly at the waypoint
- The flight crew performs an intercept direct to the waypoint
- The waypoint is part of an offset capture or return path.

L2 **AIRWAYS REVISION AND SECONDARY FLIGHT PLAN**

The AIRWAYS function is available on the active (or temporary), and secondary flight plans.

AIRWAYS REVISION AND TEMPORARY FLIGHT PLAN

Insertion, changing, or removing airways segments, creates a temporary flight plan. The entry of several airway segments is considered as a single flight plan revision.

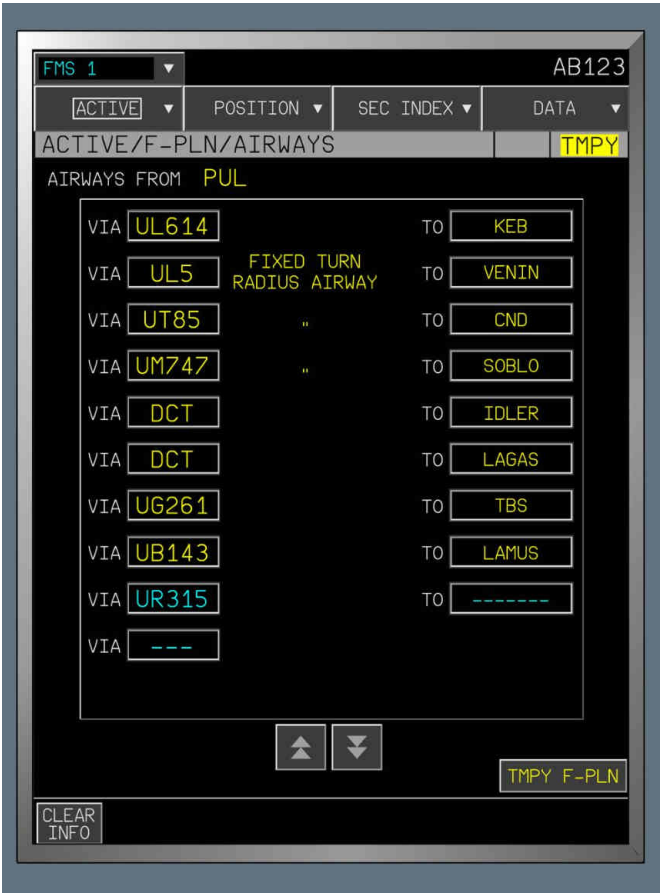
Note: If an airways entry is in progress, the flight crew cannot perform an other flight plan revision at the same time. The AIRWAYS INSERTION IN PROGRESS: F-PLN REVISION NOT ALLOWED message is displayed, when the flight crew tries to access a revision. (Refer to Message)

CONTROLS AND INDICATORS

ON THE MFD

The flight crew can enter airway segments on the ACTIVE (or SEC) / F-PLN / AIRWAYS page. On this page, the flight crew can also insert waypoints. An inserted waypoint is linked to an airway, or to another waypoint by a direct to.

AIRWAYS Page



Refer to AIRWAYS Page

The flight crew can access the AIRWAYS page via the F-PLN page, by selecting the AIRWAYS revision in the revisions option menu.

On the F-PLN page, the airway ident is indicated in the leg-label.

F-PLN Page

ON THE ND

The airway segments are considered as normal flight plan legs and waypoints. On the ND , no special symbology is used to indicate the airway segments.

ASSOCIATED MESSAGES

Refer to AIRWAY / WPT DISAGREE
Refer to NO INTERSECTION FOUND
Refer to AIRWAYS INSERTION IN PROGRESS: F-PLN REVISION NOT ALLOWED

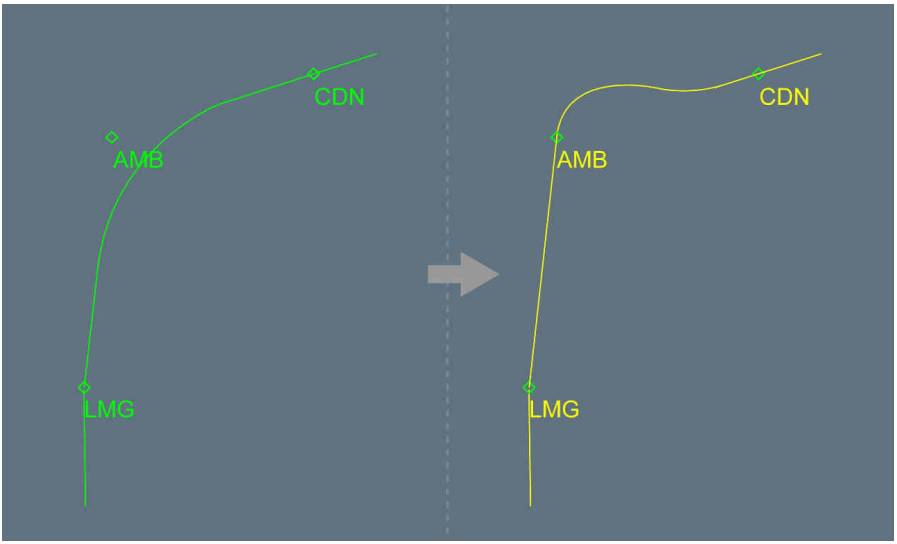
OVERFLY

Applicable to: ALL

PURPOSE

The flight crew uses the overfly revision (OVERFLY) to ensure that the aircraft overflies a specific flight plan waypoint.

Overfly



L2 The flight crew can define an overfly on any waypoint of the flight plan, except:
- On the origin and destination airport
- On the FROM waypoint
- On a holding fix
- On a manual leg.

L1 When an overfly is defined on a waypoint, the flight crew can remove it with the delete overfly revision (DELETE OVERFLY).

L2 **OVERFLY REVISION AND SECONDARY FLIGHT PLAN**

The overfly revision is available on the active (or temporary), and secondary flight plans.

OVERFLY REVISION AND TEMPORARY FLIGHT PLAN

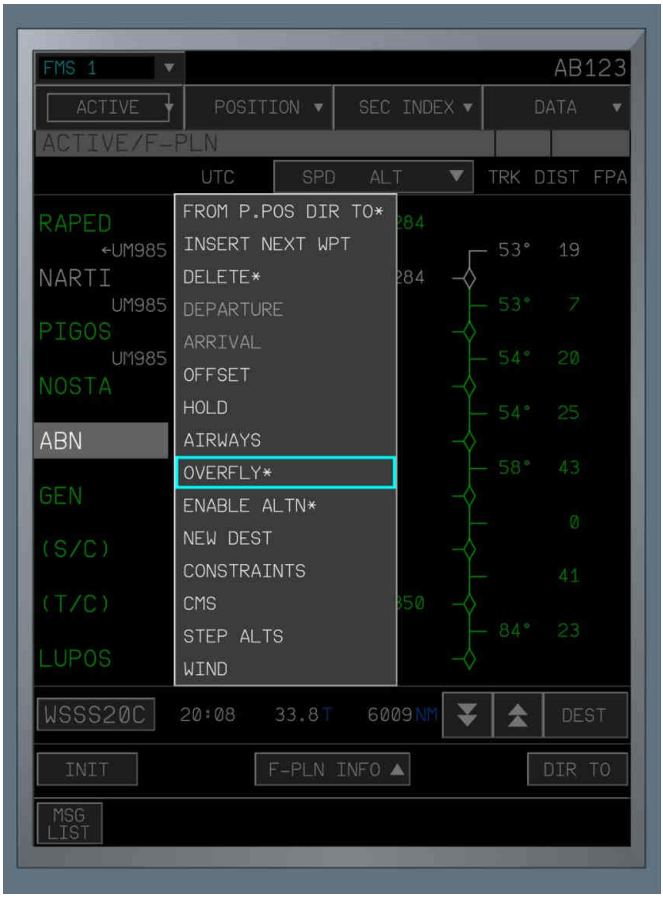
Creating, or deleting, an overfly, creates a temporary flight plan.

CONTROLS AND INDICATORS

ON THE MFD

The overfly revision is the eighth revision (OVERFLY) in the waypoint revisions menu on the ACTIVE (or SEC) / F-PLN page.

OVERFLY Revision



On the F-PLN page, a triangle next to the revised waypoint ident, indicates the overfly.

Overfly on F-PLN Page

The flight crew can remove an existing overfly, by selecting the DELETE OVERFLY in the waypoint revisions menu.

Note: *The eighth item in the revisions list is either DELETE OVERFLY or OVERFLY, depending on whether the revised waypoint has an overfly or not.*

Delete Overfly

ENABLE ALTERNATE (ENABLE ALTN)

Applicable to: ALL

PURPOSE

The flight crew uses the enable alternate revision (ENABLE ALTN) to initiate a diversion by enabling the alternate flight plan.

Enabling the alternate flight plan, deletes all waypoints of the primary flight plan beyond the revised waypoint (including the destination airport and the missed approach), and links the revised waypoint to the first waypoint of the alternate flight plan, with a discontinuity.

Enable Alternate Revision

L2 The flight crew can enable the alternate flight plan from a waypoint on the primary flight plan, including the flight plan discontinuities.

Note: *The flight crew cannot enable the alternate flight plan from a waypoint or airport of the alternate flight plan.*

L3 If the revised waypoint is the destination airport of the primary flight plan, the destination airport becomes a flight plan waypoint, and a discontinuity is inserted between the primary destination and the first waypoint of the alternate flight plan.

If the new primary destination (the former alternate destination) is the same as the previous primary destination, the following parameters remain unchanged:

- Go-around thrust reduction and acceleration altitudes
- Descent transition altitudes
- Descent speed limit
- Descent winds (not the alternate wind)
- Destination QNH, temperature, wind and landing configuration.

L2 **ENABLE ALTERNATE FUNCTION AND SECONDARY FLIGHT PLAN**

The enable alternate revision is available on the active (or temporary), and secondary flight plans.

ENABLE ALTERNATE FUNCTION AND TEMPORARY FLIGHT PLAN

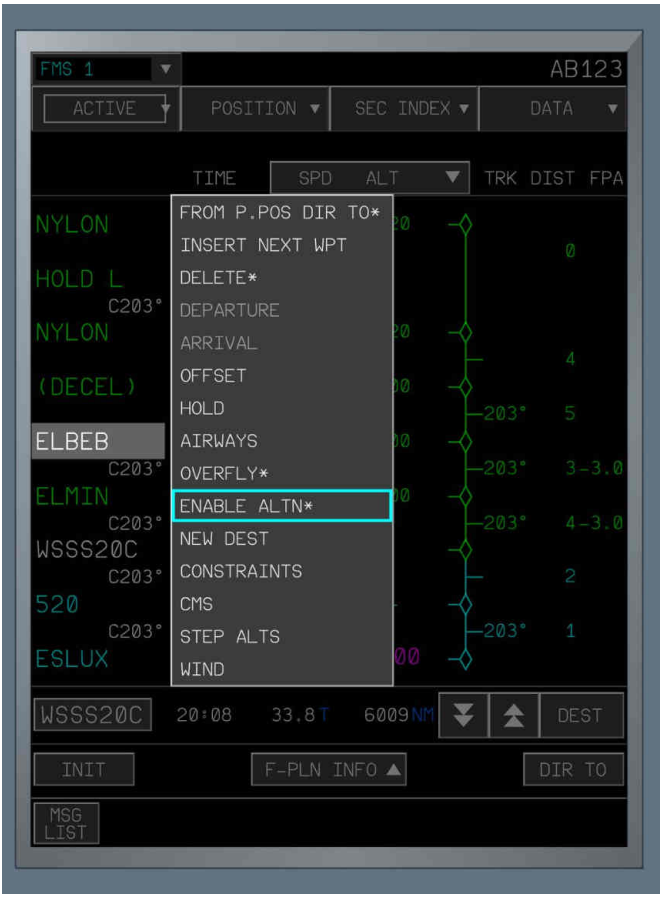
Enabling the alternate flight plan, creates a temporary flight plan.

CONTROLS AND INDICATORS

ON THE MFD

The enable alternate revision is the tenth revision (ENABLE ALTN) in the waypoint revisions menu on the ACTIVE (or SEC) / F-PLN page.

Enable Alternate Revision



NEW DESTINATION (NEW DEST)

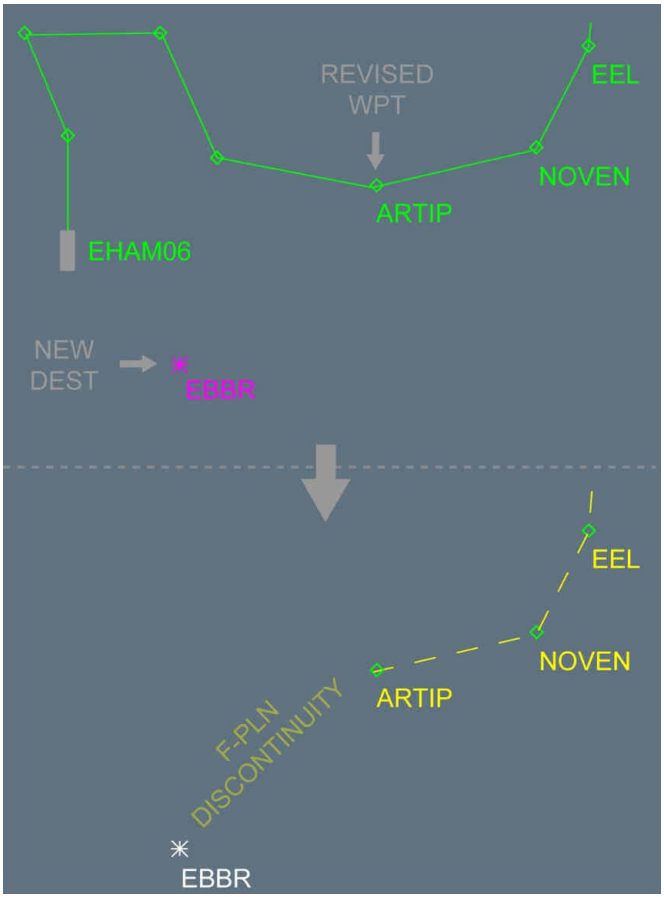
Applicable to: ALL

PURPOSE

The flight crew uses the new destination revision (NEW DEST) to define a new destination for the primary flight plan.

Insertion of a new destination, deletes all waypoints on the flight plan between the revised waypoint and the new destination, and inserts a flight plan discontinuity in their place.

New Destination Revision



L2 After a new destination entry, the alternate flight plan associated with the new destination replaces the old one if it is different.

The flight crew can create a new destination from any waypoint or discontinuity on the primary flight plan (including the origin and destination airports), except:

- From the FROM (or P.POS) waypoint in flight
- From a manual leg
- From a leg that does not end at a fixed waypoint.

L3 If the revised waypoint is the destination airport of the primary flight plan, the destination airport becomes a flight plan waypoint, and a discontinuity is inserted between the old and new destination.

L2 **NEW DESTINATION REVISION AND SECONDARY FLIGHT PLAN**

The new destination revision is available on the active (or temporary), and secondary flight plans.

NEW DESTINATION FUNCTION AND TEMPORARY FLIGHT PLAN

Insertion of a new destination, creates a temporary flight plan.

CONTROLS AND INDICATORS

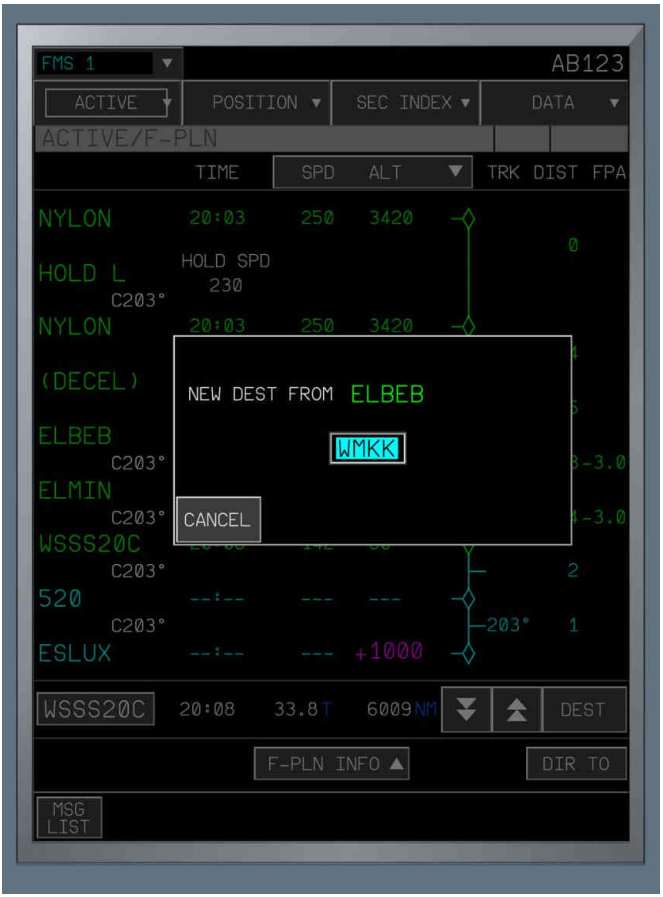
ON THE MFD

The new destination revision (NEW DEST) is the tenth revision in the waypoint revisions menu on the ACTIVE (or SEC) / F-PLN page.

New Destination Revision

Selecting the NEW DESTINATION revision displays the new destination window.

New Destination Window



Refer to New Destination Window

ALTERNATE

Applicable to: ALL

PURPOSE

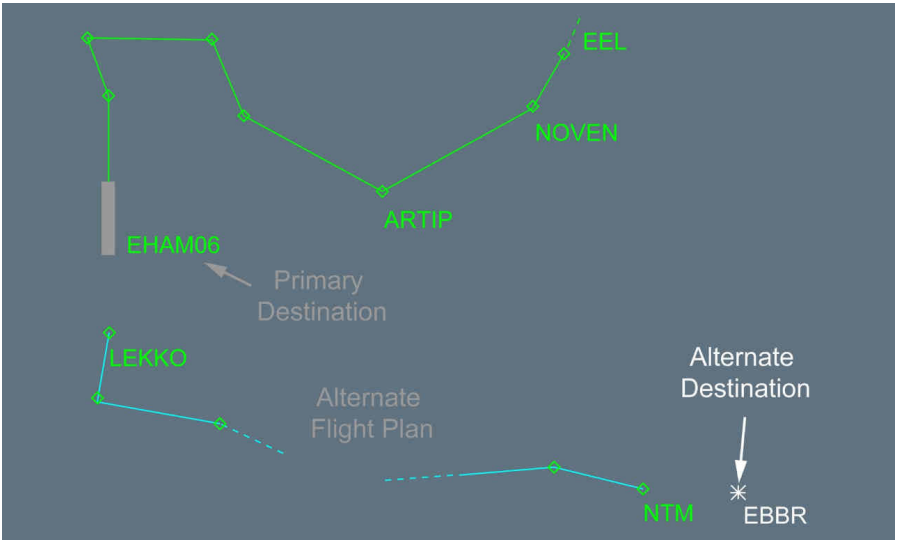
The flight crew uses the alternate revision (ALTERNATE) to insert, change or remove the alternate destination.

Associated to the destination airport, the navigation database may have a list of alternate airports (maximum 6) and related alternate company routes. One of the alternate airports is marked, by the airline, as the preferred one.

Note: *Some airports do not have associated alternate airports in the navigation database.*

When the flight crew enters a city pair (FROM/TO airports) or company route, the FMS completes the primary flight plan with the preferred alternate destination and alternate company route.
If the navigation database has no company route between the given primary and alternate airport, the alternate route will be a direct route (indicated by a flight plan discontinuity) between the primary and alternate destination.

Alternate Destination and Flight Plan



At any time, the flight crew can consult the list of alternate airports, that are associated with the current destination, and can designate any of the airports in the list as the alternate destination. The flight crew can also designate any other airport, that is not in the alternate list, as the alternate destination.

L2 ALTERNATE LIST INFORMATION AND PREDICTIONS

The FMS provides the following information, for each alternate airport in the navigation database alternate list:

- Alternate company route between the primary destination airport and the alternate airport, if there is one
- Distance between the primary destination airport and the alternate airport, along the company route, or the direct distance if there is no company route
- Great circle track between the primary destination airport and the alternate airport
- Estimated extra fuel at the alternate airport.

This information helps the flight crew to compare the alternate airports and to change the alternate destination, if necessary.

As soon as the alternate destination and the flight plan are inserted in the flight plan, the FMS computes the following supplementary predictions:

- Alternate trip time and trip fuel
- Estimated time and fuel on board at the alternate destination
- Estimated extra fuel at the alternate destination.

L3 The alternate predictions are based on the following assumptions:

- The alternate initial aircraft weight is equal to the estimated landing weight at the primary destination.
- The alternate flight plan represents a flight from takeoff at the primary destination to landing at alternate destination.
- The distance of the alternate flight plan is the distance along the alternate company route, or the distance along the alternate flight plan created by the flight crew, or the direct distance between primary and alternate destination when no waypoints have been created between them.
- If the alternate flight plan distance is less than 200 nm , the alternate cruise flight level is FL 220 . If the alternate flight plan distance is 200 nm or more, the alternate cruise flight level is FL 310 .
- The delta ISA is constant along the alternate flight plan, and is equal to the delta ISA at the primary destination.
- The alternate trip wind is a constant value, entered by the flight crew on the DESCENT WIND page.
- The cost index is equal to 0 (minimum fuel optimization).

L2 ALTERNATE REVISION AND SECONDARY FLIGHT PLAN

The alternate revision is available on the active (or temporary), and secondary flight plans.

ALTERNATE REVISION AND TEMPORARY FLIGHT PLAN

Insertion, changing, or removing the alternate destination, creates a temporary flight plan.

Note: Inserting, changing, or deleting the alternate destination (and alternate flight plan) on the ACTIVE / INIT page does not create a temporary flight plan.

L1 **ENABLE ALTERNATE**

The flight crew activates the alternate flight plan using the ENABLE ALTERNATE revision.
Refer to ENABLE ALTERNATE

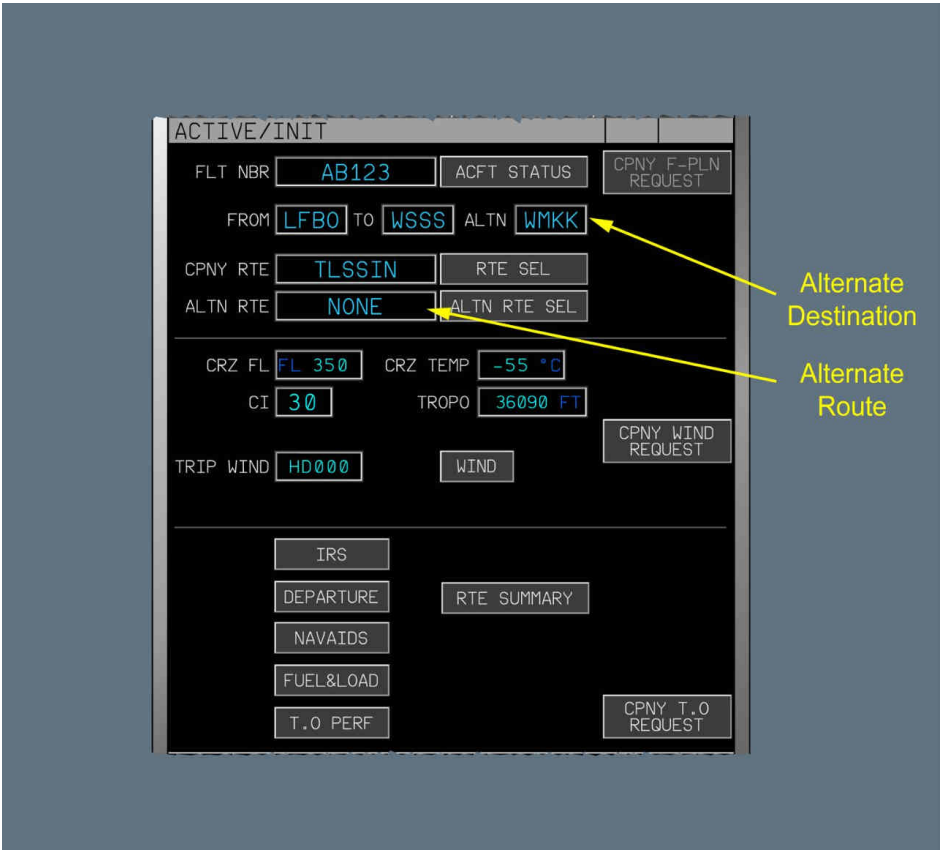
CONTROLS AND INDICATORS

ON THE MFD

During the flight plan initialization, the flight crew can check, enter, and change the alternate destination and alternate company route on the ACTIVE (or SEC)/INIT page.

Note: *Entering or changing the alternate destination and/or alternate company route via the INIT page does not create a temporary flight plan.*

Alternate on INIT Page



The flight crew can consult the list of possible alternate airports (and its associated predictions), and insert, delete or change the alternate destination, on the ACTIVE (or SEC)/F-PLN/ALTERNATE page.

ALTERNATE Page

Refer to ALTERNATE page

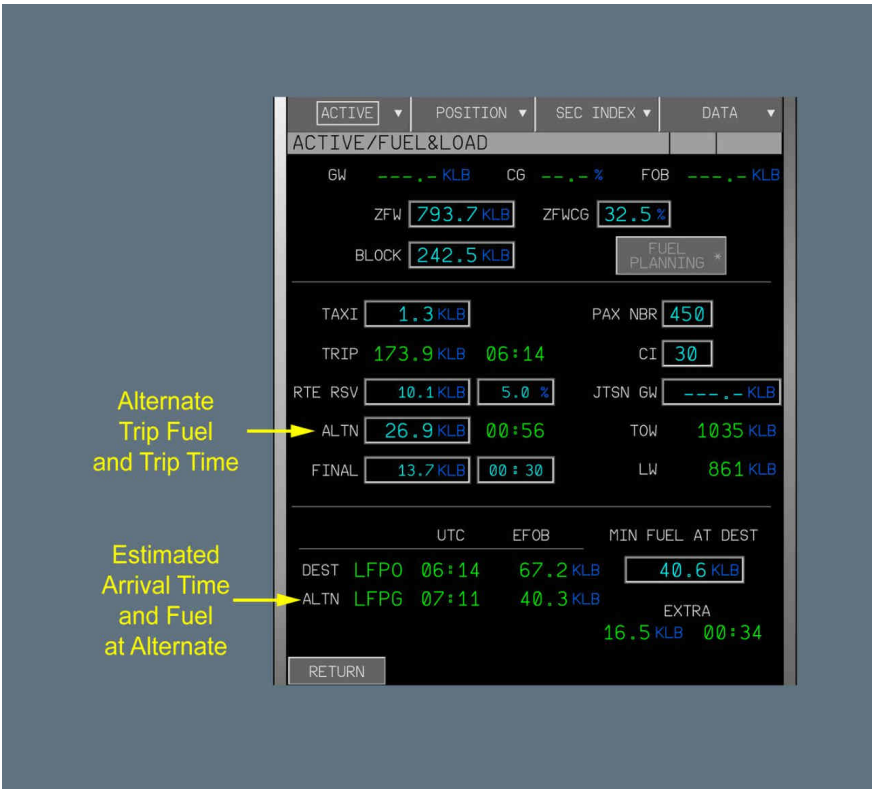
The flight crew can access the ALTERNATE page via the F-PLN page, by selecting ALTERNATE revision in the F-PLN INFO option menu.

The alternate flight plan is displayed in blue on the F-PLN page.

The ACTIVE (or SEC)/FUEL & LOAD page displays:

- The alternate trip fuel and time
- The time of arrival, at the alternate destination
- The estimated fuel on board, at the alternate destination

Alternate on FUEL&LOAD Page



FIX INFO

Applicable to: ALL

PURPOSE

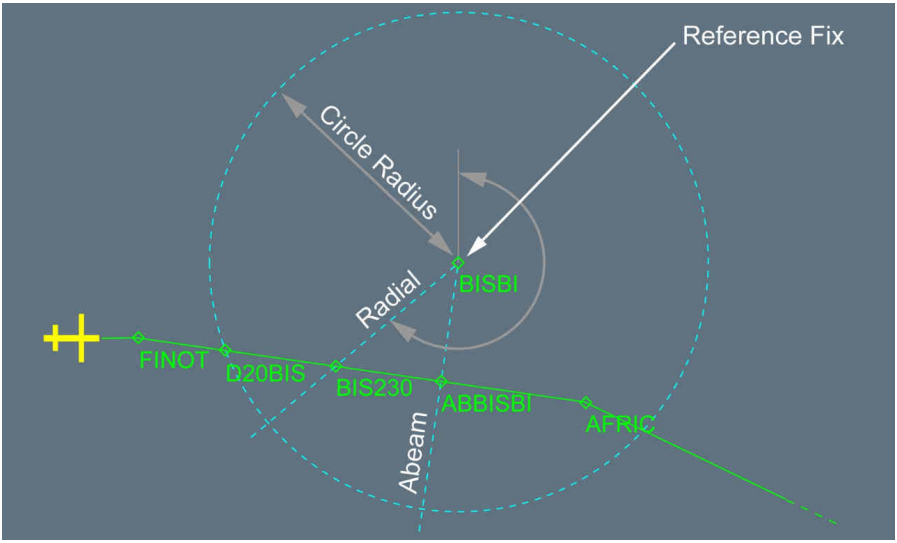
The flight crew uses the fix info revision (FIX INFO) to compute the intersection of the flight plan and:

- A radial from a specified reference point, and/or
- A circle with a specified reference point as center, and/or

Note: The FMS searches only for the first intersection down path the flight plan.

- The abeam line from a specified reference point.

Fix Info Revision



L2 The reference point, also called reference fix, can be a navigation database or pilot-stored waypoint, NAVAID, NDB, airport or runway.

L1 The FMS computes the following predictions for each intersection:

- Time of arrival
- Distance from P.POS
- Altitude.

INSERTION OF THE INTERSECTION IN THE FLIGHT PLAN

The flight crew can insert the computed intersections in the flight plan.

L2 The fix info waypoints are part of the flight plan, but are not stored in the pilot-stored elements database. This means that the fix info waypoints can be used for every flight plan revision (except AIRWAYS), until they are sequenced. As soon as they are sequenced, they are no longer memorized by the FMS.

Note: The fix info revision can also be used for display purposes only (without flight plan changes). The reference point, and selected radial, circle or abeam are highlighted on the lateral ND as soon as they are computed, whether an intersection with the flight plan is found or not.

FIX INFO FUNCTION AND SECONDARY FLIGHT PLAN

The fix info revision is only available on the active (or temporary) flight plan.
Intersections are only created on the primary active flight plan.

FIX INFO REVISION AND TEMPORARY FLIGHT PLAN

Insertion of a fix info intersection waypoint creates a temporary flight plan.

CONTROLS AND INDICATORS

ON THE MFD

The flight crew can consult, and insert, fix info waypoints on the ACTIVE / F-PLN / FIX INFO page.

FIX INFO Page

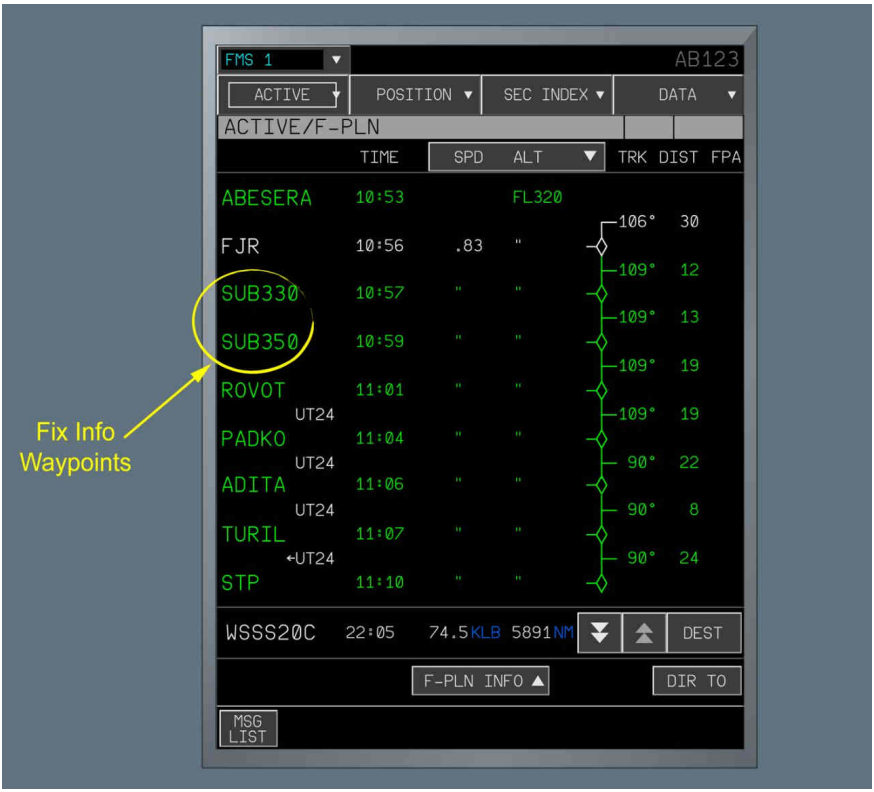
Refer to FIX INFO page

The flight crew can access the FIX INFO page via the F-PLN page, by selecting the FIX INFO revision in the F-PLN INFO option menu.

L3 The created intersections may be inserted in the flight plan. The fix info waypoints appear under the following ident:

- Intersection with radial: YYYNNN, where YYY are the first three characters of the reference fix, and NNN the radial (example: BIS230)
- Intersection with circle: DNNNYYY, where NNN is the radius of the circle (in nm), and YYY the first three characters of the reference fix (example: D70BIS)
- Abeam intersection: ABYYYYY, where YYYYY are the first five characters of the reference fix (example: ABBISBI).

F-PLN Page



L1 **ON THE ND**

The designated reference fix(es) is/are highlighted on the ND .

The selected radial(s) and circle(s) are also highlighted on the ND , whether an intersection with the flight plan is found or not.
The abeam radial is highlighted on the ND , only if an abeam point is found.
Radials, circles and abeam radials are no longer displayed on the ND , if their associated intersection is inserted in the flight plan, or if their entry field is cleared.

LAT/LONG CROSSING (LL CROSSING)

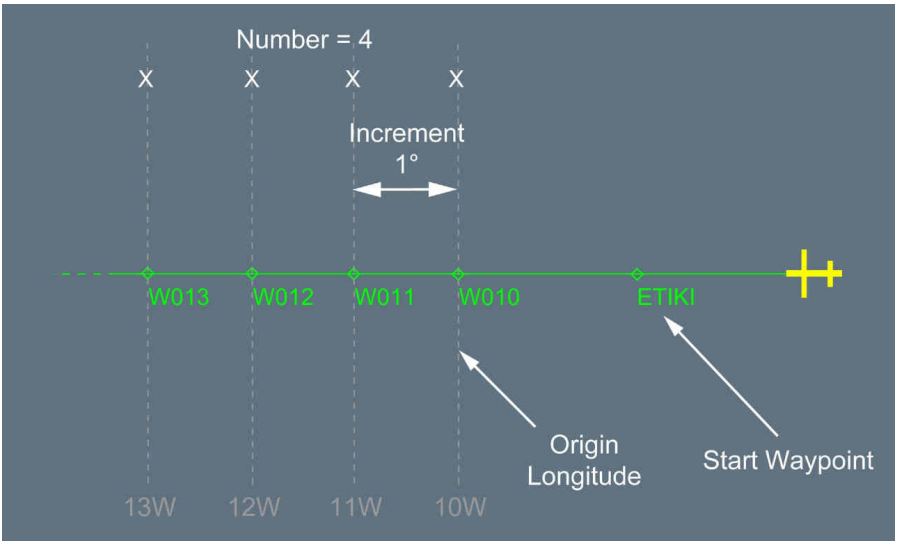
Applicable to: ALL

PURPOSE

The flight crew uses the latitude/longitude crossing revision (LL CROSSING) to insert a waypoint or a series of waypoints along the flight plan, defined by the intersection(s) of the flight plan with a series of latitudes or longitudes. The flight crew defines the series of waypoints, by entering:

- The start waypoint
- The origin latitude or longitude
- The latitude or longitude increment
- The maximum number of intersections.

Latitude/Longitude Crossing Revision



L2 No intersections are created beyond the last en—route waypoint.

L3 The latitude/longitude crossing waypoints are part of the flight plan, but are not stored in the pilot-stored elements database. This means that latitude/longitude crossing waypoints can be used for every flight plan revision (except AIRWAYS), until they are sequenced. As soon as they are sequenced, they are no longer memorized by the FMS.

L2 **LATITUDE/LONGITUDE CROSSING REVISION AND SECONDARY FLIGHT PLAN**

The latitude/longitude crossing revision is available on the active (or temporary), and secondary flight plans.

LATITUDE/LONGITUDE CROSSING REVISION AND TEMPORARY FLIGHT PLAN

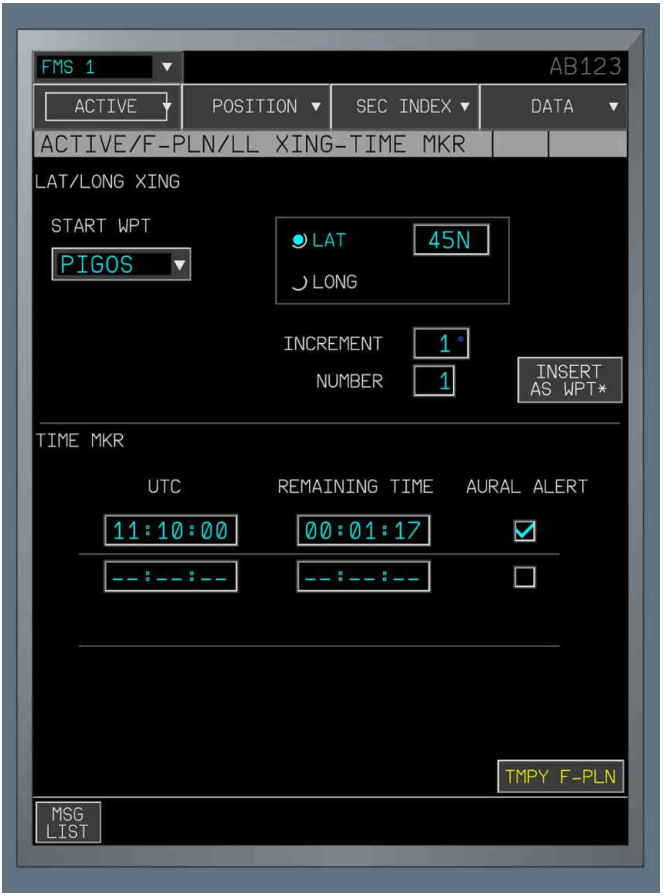
Insertion of a latitude/longitude crossing waypoint, or series of waypoints, creates a temporary flight plan.

CONTROLS AND INDICATORS

ON THE MFD

The flight crew can create, and insert, latitude/longitude crossing waypoints on the ACTIVE (or SEC) / F-PLN / LL XING - TIME MKR page.

LL XING - TIME MKR Page



Refer to LL XING — TIME MKR page
The flight crew can access the LL XING — TIME MKR page via the F-PLN page, by selecting the LL CROSSING revision in the F-PLN INFO option menu.

The created intersections are inserted in the flight plan, under the following IDENT :
- NXX or SXX for latitude crossings, example: N75
- EXXX or WXXX for longitude crossings, example: W125

ASSOCIATED MESSAGES

Refer to NO INTERSECTION FOUND

Vertical Flight Plan Revisions

VERTICAL REVISIONS - INTRODUCTION

Applicable to: ALL

A change to the vertical flight plan is called a vertical revision.
All vertical revisions can be accessed via the F-PLN page on the MFD .

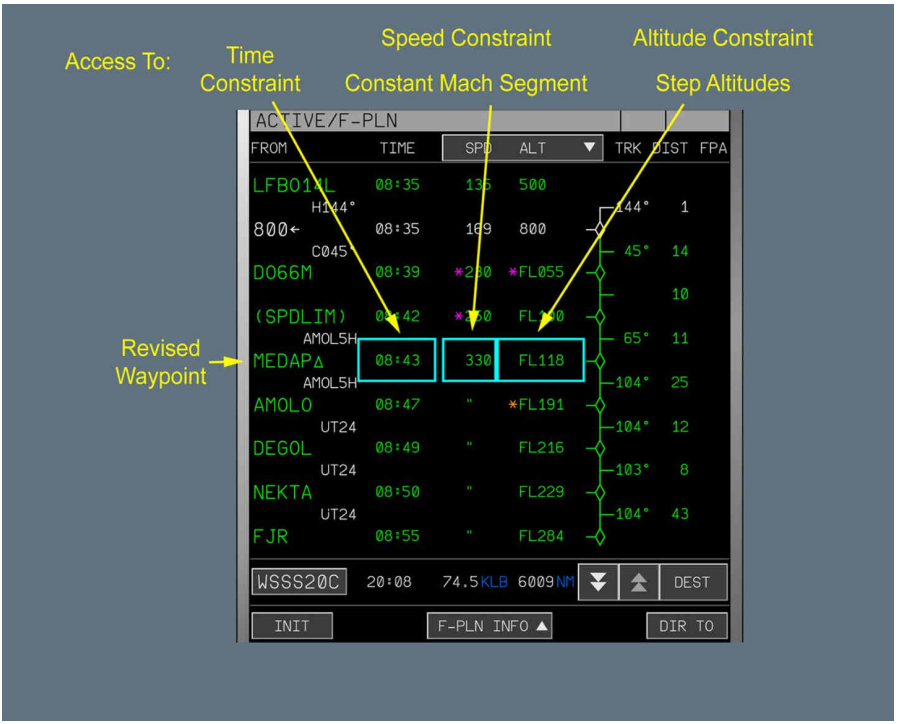
The starting point for all vertical revisions is a waypoint on the flight plan, called the revised waypoint.
The flight crew can access the vertical revision on the F-PLN page, by:
- Clicking on the time, speed, altitude, or wind prediction of the revised waypoint, or
- Via the waypoint revisions menu of the revised waypoint.

Note: The flight crew can also access the wind revision via the ACTIVE menu of the general menu bar.

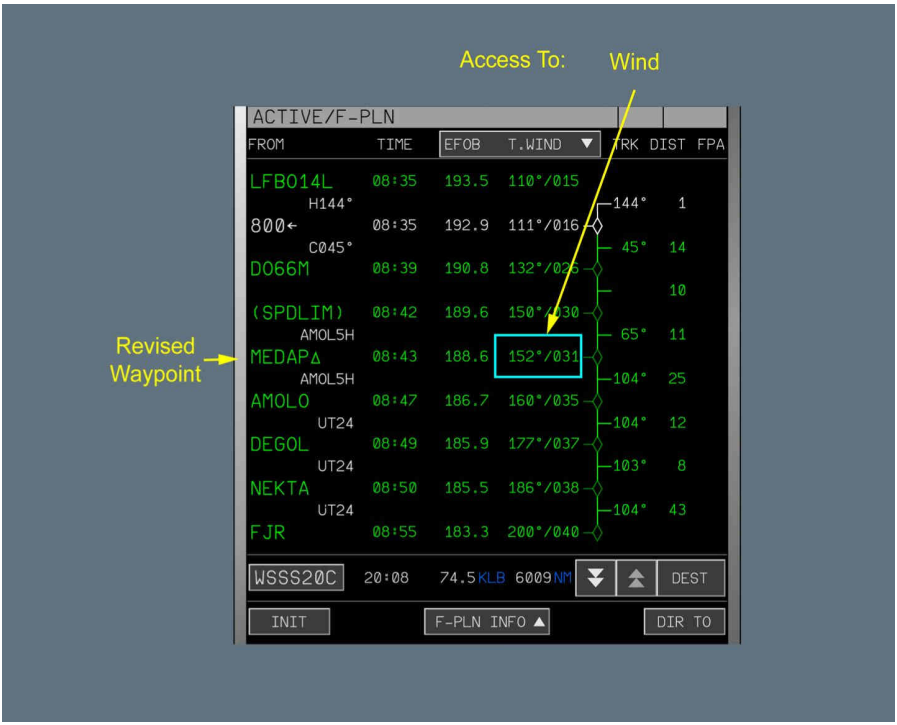
ACCESS VIA THE WAYPOINT PREDICTIONS

- The time prediction provides access to the time constraint revision
- The speed prediction provides access to the speed constraint, or to the Constant Mach Segment (CMS) revision, depending on the flight phase to which the revised waypoint belongs
- The altitude prediction provides access to the altitude constraint revision, or step altitudes revision, depending on the flight phase to which the revised waypoint belongs
- The wind prediction provides access to the wind revision.

Direct Access to Vertical Revisions



Direct Access to Vertical Revisions

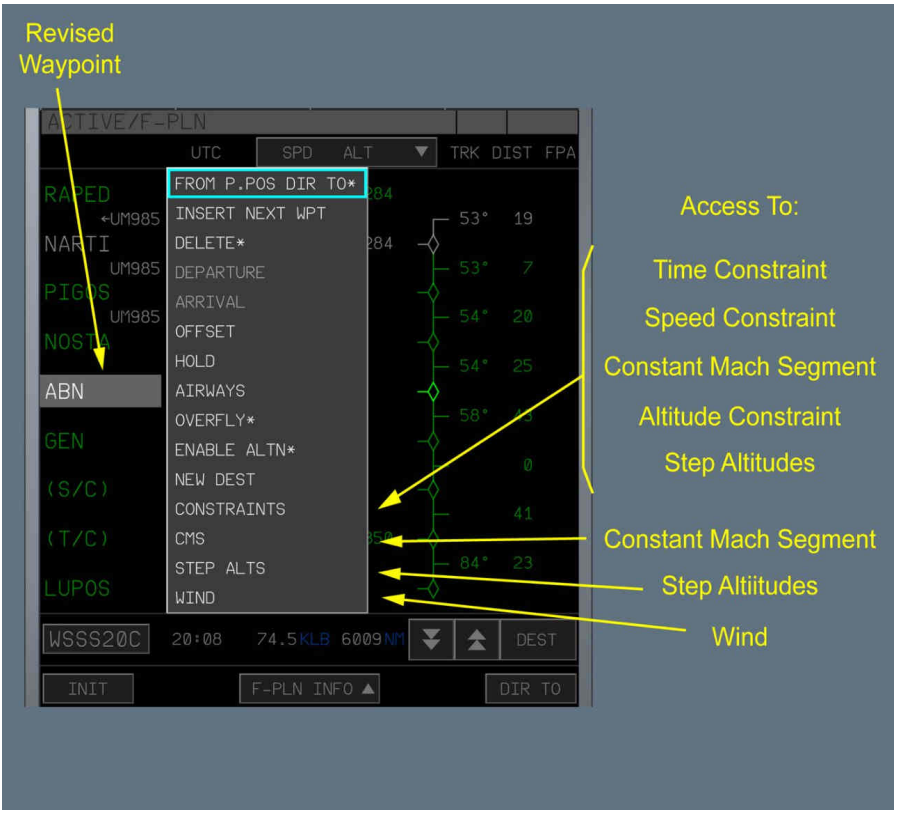


ACCESS VIA THE WAYPOINT REVISIONS MENU

The lower part of the waypoint revisions menu displays the following vertical revisions:

- CONSTRAINTS: Provides access to the VERT REV page, that collects all the vertical revisions, except the wind revision
- CMS : Provides access to the Constant Mach Segment (CMS) revision
- STEP ALTs: Provides access to the step altitudes revision
- WIND: Provides access to the wind revision.

Waypoint Revisions Menu



TIME CONSTRAINT (RTA)

Applicable to: ALL

PURPOSE

The flight crew uses the time constraint revision to:

- Enter, change, or delete a Required Time of Arrival (RTA) on a waypoint
- Enter or change the Estimated Takeoff Time (ETT).

REQUIRED TIME OF ARRIVAL (RTA)

The RTA is a time constraint that must be respected at the revised waypoint.

The constraint can be to reach the waypoint “AT”, “AT or BEFORE”, or “AT or AFTER” the entered RTA .

L2 The flight crew can define an RTA on all waypoints on the primary flight plan (including the destination airport), except on the origin airport, the FROM waypoint, and missed approach waypoints.
There can be only one RTA per flight plan. If there is already an RTA in the flight plan and the flight crew enters a new RTA on a different waypoint, the previous RTA is deleted, and the new one is taken into account.

L3 It is not possible to insert an RTA , or the existing RTA is not taken into account, if:
- The Engine Out (EO) mode is active
- The aircraft clock data is not valid
- The aircraft is in a hold with manual termination, or in the deceleration zone of this hold
- The flight phase is CRUISE and the aircraft is closer than 40 nm from the T/D
- The flight phase is DESCENT, APPROACH, or GO AROUND.

Automatic Deletion of the RTA

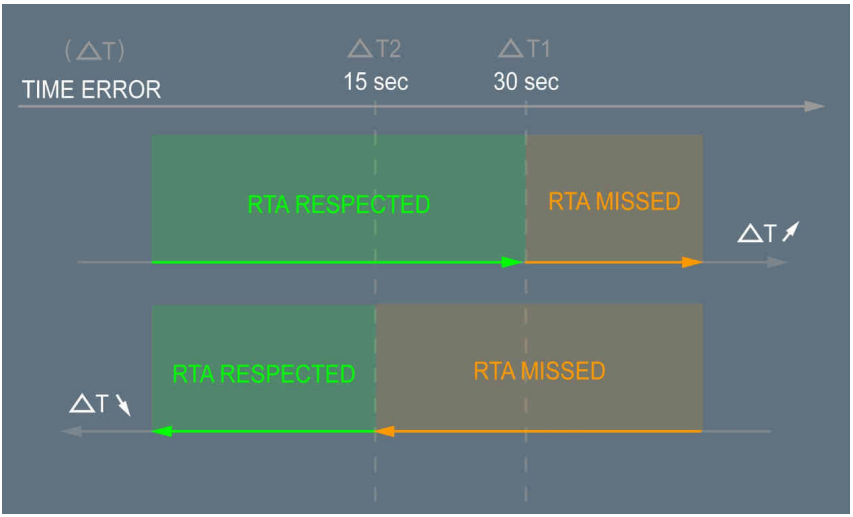
The existing RTA is automatically deleted, with the associated FMS message RTA DELETED (*Refer to Message*), if one of the following occurs:
- The Engine Out (EO) mode becomes active
- The aircraft clock data is no longer valid
- The aircraft enters a hold with manual termination, or the deceleration zone of this hold
- The flight phase transitions from DESCENT or APPROACH, to CLIMB or CRUISE
- The flight phase becomes GO AROUND.

The existing RTA is automatically deleted, with no associated FMS message, if one of the following occurs:
- A second RTA is entered in the flight plan
- The alternate flight plan is enabled
- The waypoint with the time constraint becomes an ABEAM waypoint, when a DIRECT TO with ABEAM is performed.

L1 Time Error

The FMS compares the RTA with the Estimated Time of Arrival (ETA) on the waypoint, and predicts whether the time constraint will be respected or missed. The difference between the RTA and the ETA is referred to as the time error.
The time constraint is predicted as missed, if the time error is more than 30 s . When missed, the time constraint remains missed as long as the time error is more than 15 s .

Time Error



L3 *Note:* *ΔT1 and ΔT2 are respectively 30 s and 15 s , if the distance between the aircraft and the waypoint with the time constraint is less than 2 000 nm .*
If the distance is more than 2 000 nm , ΔT1 and ΔT2 linearly increase at a rate of 60 s per 1 000 nm .

L1 When the time constraint is missed, the FMS displays the TIME ERROR AT XXXXXXX message on the MFD , with XXXXXXX the ident of the waypoint with the time constraint. (*Refer to Message*).

ESTIMATED TAKEOFF TIME (ETT)

The ETT is the time reference used for flight plan predictions in the PREFLIGHT flight phase. At transition to the TAKEOFF flight phase, the predictions are based on the current aircraft time.

The ETT may be (in the following order of priority):
- A flight crew entry
- An FMS computed value:
  The FMS computes an ETT , when there is an RTA in the flight plan. The default ETT is updated after each flight plan revision.

L2 *Note:* *There is an automatically computed ETT , when the necessary flight time from the origin airport to the constrained waypoint is less than the available time between the current aircraft time and the RTA .*

The flight crew can clear the manually entered ETT at any time. However, the automatically computed ETT can only be cleared by deleting the associated RTA .
When the flight crew changes the origin airport, the ETT is cleared automatically.

L1 If the aircraft clock time reaches the ETT , or at transition to the TAKEOFF flight phase, the ETT becomes the aircraft clock time.

L3 The ETT can only be defined, if:
- The flight phase is PREFLIGHT
- The aircraft clock data is valid.

L2 **TIME CONSTRAINT AND SECONDARY FLIGHT PLAN**

The RTA , and ETT revision is available on the active (or temporary), and secondary flight plans.

TIME CONSTRAINT AND TEMPORARY FLIGHT PLAN

Insertion, change, or deletion of an RTA , or ETT , creates a temporary flight plan.

CONTROLS AND INDICATORS

ON THE MFD

The flight crew can enter, change, or delete the RTA and ETT , on the RTA panel of the ACTIVE (or SEC) / F-PLN / VERT REV page.

RTA Panel on the VERT REV Page

Refer to RTA Panel

The flight crew can access the VERT REV page via the F-PLN page, by clicking on the time prediction associated with the revised waypoint, or by selecting the CONSTRAINTS revision in the waypoint revisions menu.

On the F-PLN page:
- The time constraint on a waypoint is indicated by a star to the left of the waypoint time prediction. The color of the star is magenta, if the time constraint will be respected, and amber, if the constraint will be missed.
- During the PREFLIGHT phase, the ETT is displayed in magenta in the time prediction column of the FROM waypoint.

Refer to F-PLN page

ON THE ND

On the lateral ND , the time constraint value is displayed under the waypoint ident, when the CONSTRAINTS option is selected on the EFIS CP . The color of the constraint is magenta, if the time constraint will be respected, and amber, if the time constraint will be missed.
The time constraint is not indicated on the vertical ND .

ASSOCIATED MESSAGES

Refer to RTA ALREADY EXISTING
Refer to RTA DELETED
Refer to RTA NOT CONSIDERED FOR FUEL PLANNING
Refer to TIME ERROR AT XXXXXXX
Refer to T.O TIME REACHED

SPEED CONSTRAINT (SPD CSTR)

Applicable to: ALL

PURPOSE

The flight crew uses the speed constraint revision to enter, change, or delete a speed constraint on a waypoint.

Speed constraints may exist for the CLIMB and the DESCENT phases:
- For a climb speed constraint, the aircraft has to fly at or below the specified speed, from the origin airport up to the speed constraint waypoint
- For a descent speed constraint, the aircraft has to fly at or below the specified speed, from the speed constraint down to the destination airport.

Speed Constraint

The speed constraint may be (in the following order of priority):

- A flight crew entry
- A database value (the speed constraints can be stored with the terminal area procedures in the navigation database).

L3 A holding pattern that is part of a procedure, may have a database speed constraint. In this case, however, the speed constraint will not apply at the hold entry fix, but at the hold exit fix. If the flight crew wants the speed constraint to apply on the hold entry fix, he should manually enter the speed constraint on the hold entry fix, or engage the selected speed control.

L2 The flight crew can define a speed constraint on the takeoff, climb, descent and approach waypoints of the primary flight plan. The flight crew cannot define a speed constraint on the origin and destination airports, the FROM waypoint, or any pseudo waypoint.

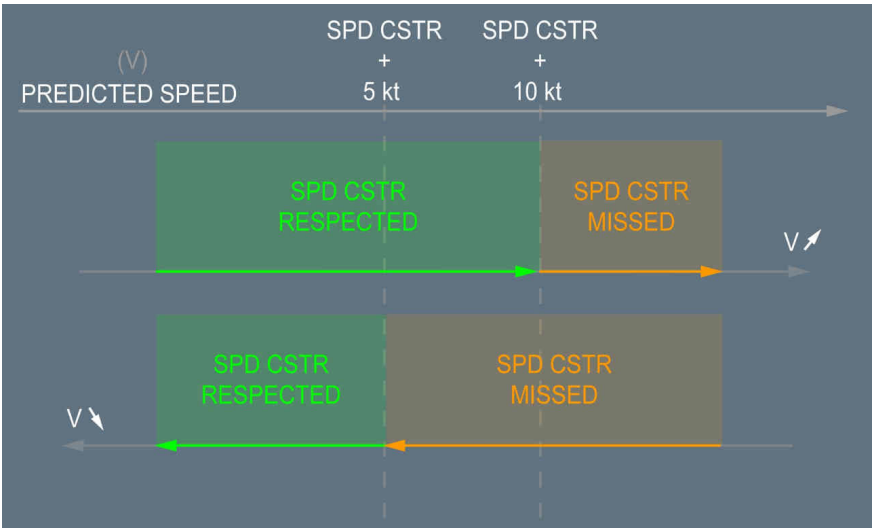
L3 AUTOMATIC DELETION OF THE SPEED CONSTRAINT(S)

- When the flight phase transitions from CRUISE, DESCENT, or APPROACH, to GO AROUND, all speed constraints between the aircraft and the primary destination are deleted.
  The CONSTRAINTS BEFORE XXXXXXX : DELETED message is displayed on the MFD , where XXXXXXX is the ident of the waypoint, following the last down path waypoint with a descent speed constraint. (*Refer to Message*).
- When the alternate flight plan is enabled, all speed constraints between the aircraft and the former primary destination, and all speed constraints on the alternate flight plan that are below the current aircraft altitude, are deleted.
  The CONSTRAINTS BEFORE XXXXXXX : DELETED message is displayed on the MFD , where XXXXXXX is the ident of the waypoint, following the last down path waypoint with a speed constraint below the current aircraft altitude. (*Refer to Message*).
- When the waypoint, with the speed constraint, becomes an ABEAM waypoint when a DIRECT TO with ABEAM is performed, the constraint is deleted.

L1 SPEED ERROR

The FMS compares the speed constraint value with the predicted speed on a waypoint, and predicts whether the speed constraint will be respected or missed.
The speed constraint is predicted as missed, when the predicted speed is more than 10 kt over the speed constraint value. When missed, the speed constraint remains missed as long as the predicted speed is more than 5 kt over the speed constraint value.

Speed Error



When the speed constraint is missed, the FMS displays the SPD ERROR AT XXXXXXX message on the MFD , with XXXXXXX the ident of the nearest waypoint (between P.POS and the revised waypoint in climb, or between P.POS and the destination in descent), where the speed constraint is missed. (*Refer to Message*)

L2 **SPEED CONSTRAINT AND SECONDARY FLIGHT PLAN**

The speed constraint revision is available on the active (or temporary), and secondary flight plans.

SPEED CONSTRAINT AND TEMPORARY FLIGHT PLAN

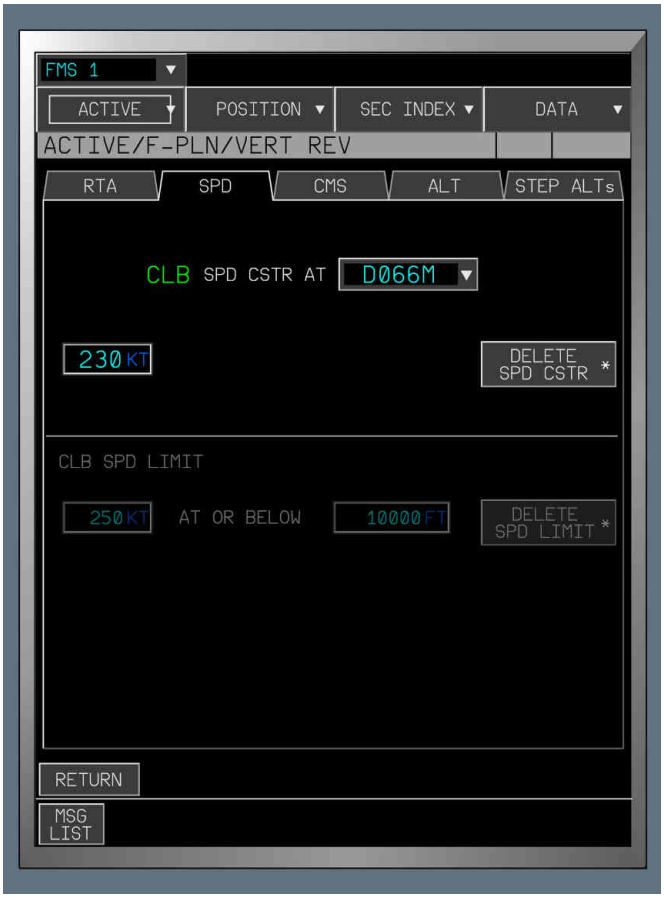
Insertion, change, or deletion of a speed constraint, creates a temporary flight plan.

CONTROLS AND INDICATORS

ON THE MFD

The flight crew can enter, change, or delete a speed constraint on the upper part of the SPD panel on the ACTIVE (or SEC) /F-PLN/ VERT REV page.

SPD Panel on the VERT REV Page



Refer to SPD Panel

The flight crew can access the VERT REV page via the F-PLN page, by clicking on the speed prediction associated with the revised waypoint, or by selecting the CONSTRAINTS revision in the waypoint revisions menu, then by selecting the SPD panel.

On the F-PLN page, the speed constraint on a waypoint is indicated with a star to the left of the speed prediction of the waypoint. The color of the star is magenta, if the constraint will be respected, and amber, if the constraint will be missed.

Refer to F-PLN Page

ON THE ND

On the ND , the speed constraint value is displayed under the waypoint ident, when the CONSTRAINTS option is selected on the EFIS CP . The color of the constraint is magenta, if the constraint will be respected, and amber, if the constraint will be missed.
The speed constraint is not indicated on the VD .

ASSOCIATED MESSAGES

Refer to DSC-22-FMS-20-110 CONSTRAINTS BEFORE XXXXXXX : DELETED CONSTRAINTS BEFORE XXXXXXX : DELETED
Refer to DSC-22-FMS-20-110 SPD ERROR AT XXXXXXX SPD ERROR AT XXXXXXX

SPEED LIMIT (SPD LIMIT)

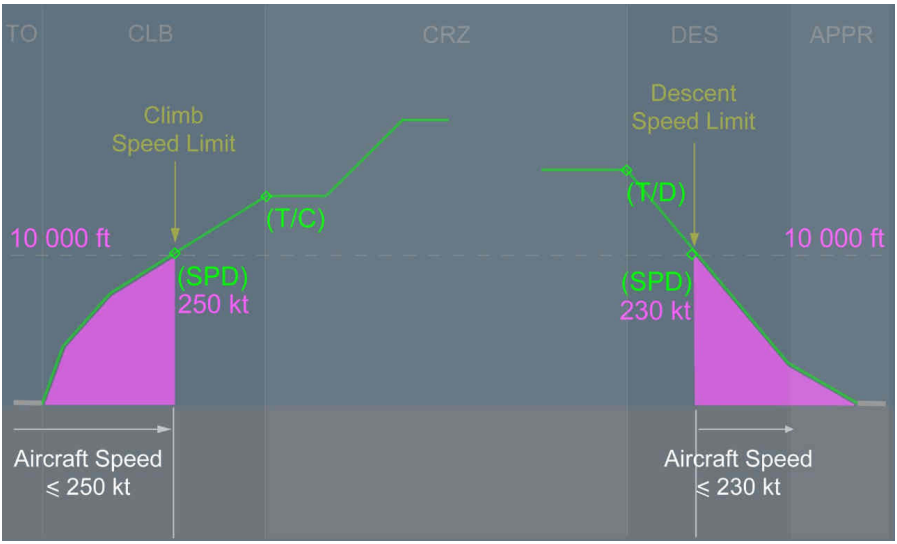
Applicable to: ALL

PURPOSE

The flight crew uses the speed limit revision to enter, change, or delete the climb or descent speed limit.
The speed limit is a speed constraint to be respected, at and below the specified altitude.
There is only one speed limit for the CLIMB phase (climb speed limit) and/or one for the DESCENT phase (descent speed limit).

Note: *The speed limit is not applied in the APPROACH phase.*

Speed Limit



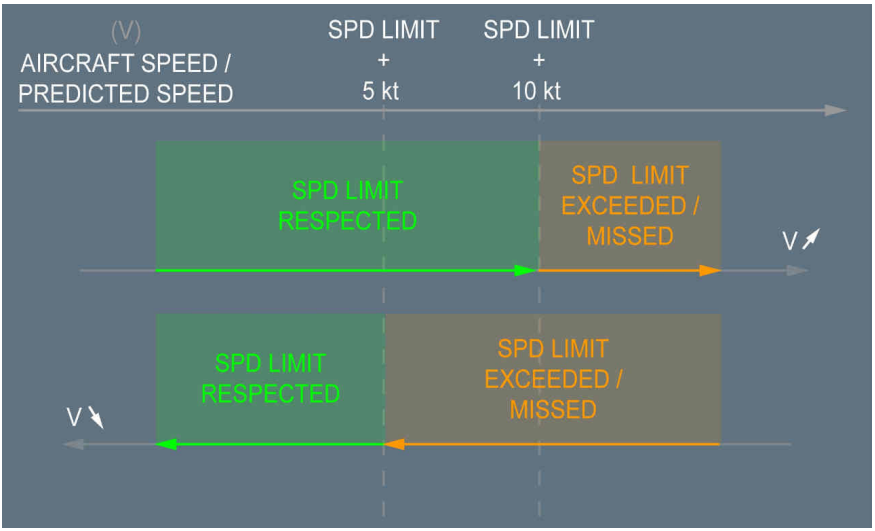
The speed limit may be (in the following order of priority):

- The flight crew entry
- The database value (the speed limits can be stored with the associated origin and destination airports in the navigation database)
- The FMS default value, that is 250 kt / 10 000 ft .

SPEED LIMIT EXCEEDED

The speed limit is exceeded when the aircraft's altitude is below the speed limit altitude, and the aircraft's speed is more than 10 kt over the speed limit. When exceeded, the speed limit remains exceeded, as long as the aircraft's speed is more than 5 kt over the speed limit.
When the speed limit is exceeded, the FMS displays the SPD LIMIT EXCEEDED message on the MFD . (*Refer to DSC-22-FMS-20-110 SPD LIMIT EXCEEDED* message)
The speed limit is predicted as missed when the predicted speed at the speed limit altitude is more than 10 kt over the speed limit. When missed, the speed limit remains missed, as long as the predicted speed is more than 5 kt over the speed limit.

Speed Limit Exceeded / Missed



L2 **SPEED LIMIT AND SECONDARY FLIGHT PLAN**

The speed limit revision is available on the active (or temporary), and secondary flight plans.

SPEED LIMIT AND TEMPORARY FLIGHT PLAN

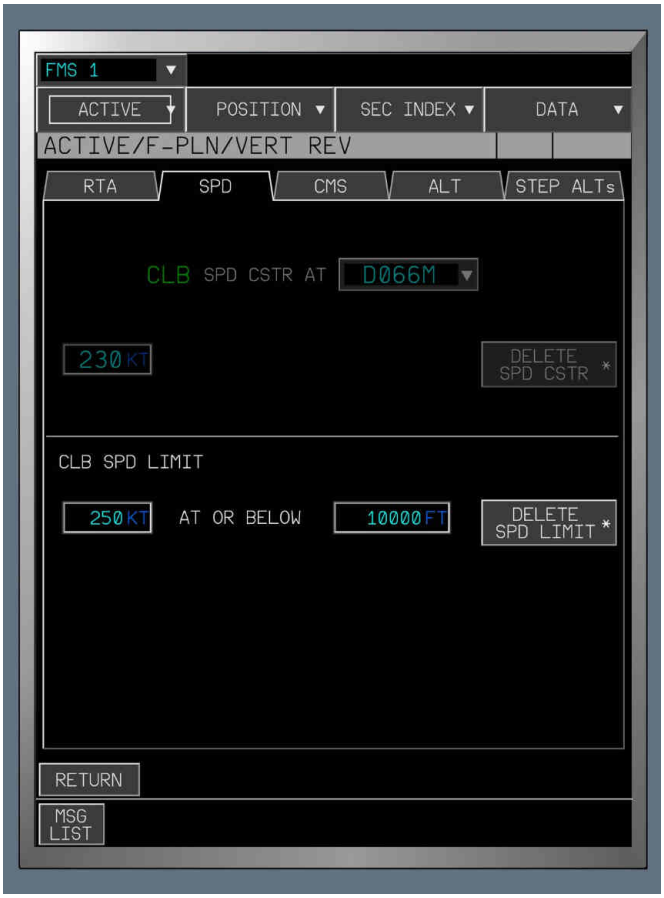
Insertion, change, or deletion of a speed limit, creates a temporary flight plan.

CONTROLS AND INDICATORS

ON THE MFD

The flight crew can enter, change, or delete a speed limit on the lower part of the SPD panel on the ACTIVE (or SEC) /F-PLN/ VERT REV page.

SPD Panel on the VERT REV Page



Refer to SPD Panel

The flight crew can access the VERT REV page via the F-PLN page, by clicking on the speed prediction associated with a waypoint of the CLIMB or DESCENT phase, or by selecting the CONSTRAINTS revision in the waypoint revisions menu, then by selecting the SPD panel.
On the F-PLN page, the speed limit is indicated by a pseudo-waypoint: (SPD). This pseudo-waypoint is inserted into the flight plan, where the aircraft will cross the speed limit altitude. A star to the left of the speed prediction of the pseudo-waypoint indicates whether the speed limit is predicted to be respected or missed. The color of the star is magenta, if the constraint is predicted to be respected, and amber, if the constraint is predicted to be missed.

Note: The flight crew can access the SPD panel of the VERT REV page via the speed limit pseudo-waypoint, by clicking on its associated speed prediction, or by selecting the CONSTRAINTS item in its revisions menu.

Refer to F-PLN Page

ON THE ND

On the ND, the speed limit pseudo-waypoint is indicated with a magenta dot, if the speed limit is respected. No dot is displayed, if the speed limit is missed.

ASSOCIATED MESSAGES

Refer to DSC-22-FMS-20-110 SPD LIMIT EXCEEDED SPD LIMIT EXCEEDED

CONSTANT MACH SEGMENT (CMS)

Applicable to: ALL

PURPOSE

The flight crew uses the Constant Mach Segment (CMS) revision to insert a constant Mach constraint on a cruise segment of the primary flight plan. The flight crew defines the CMS by entering:

- The start waypoint

L2 The start waypoint may be any cruise waypoint on the primary flight plan, if it is not part of the departure or arrival procedure.

L1 - The end waypoint

L2 The end waypoint may be any cruise waypoint on the primary flight plan, if it is not part of the departure or arrival procedure.

L1 - The Mach number

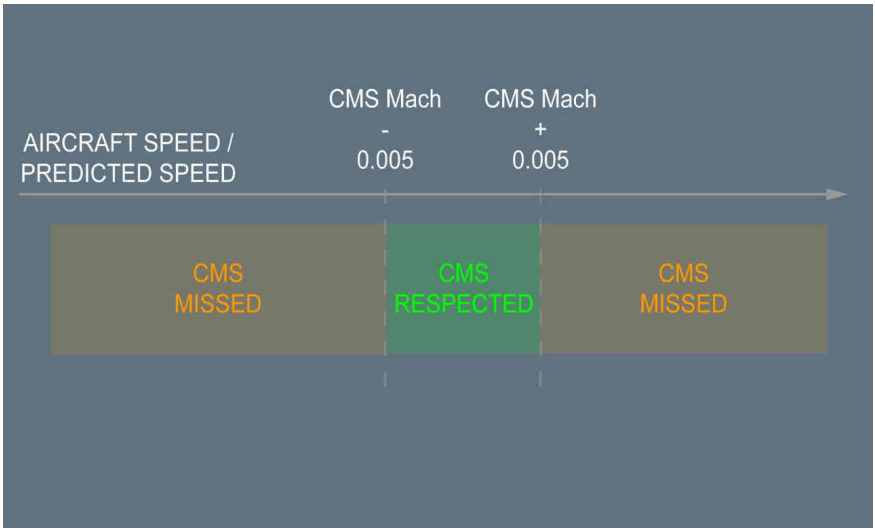
L2 The flight crew can create a CMS on all waypoints of the CRUISE phase of the primary flight plan.
The flight crew cannot create a CMS on the alternate flight plan.
The flight crew can create only one CMS in the flight plan.

L1 The flight crew can change or delete an existing CMS , even when the aircraft is already flying it.

CMS MISSED

The FMS compares the CMS Mach number with the aircraft speed, and the predicted speed on the CMS waypoints, and computes whether the CMS will be respected or missed.
The CMS is predicted as missed when the aircraft's speed, or predicted speed, is not within (CMS Mach — 0.005 , CMS Mach + 0.005).

CMS Missed



L3 AUTOMATIC DELETION OF THE CMS

The existing CMS is automatically deleted, if one of the following occurs:
- The alternate flight plan is enabled
- The Engine Out (EO) mode becomes active
- The flight phase transitions from CRUISE to another flight phase.

When the CMS is automatically deleted in the active flight plan, due to a flight phase transition from CRUISE to another flight phase, the MACH SEGMENT DELETED message is displayed on the MFD . (*Refer to DSC-22-FMS-20-110 MACH SEGMENT DELETED* message)

L2 CONSTANT MACH SEGMENT AND SECONDARY FLIGHT PLAN

The constant Mach segment revision is available on the active (or temporary), and secondary flight plans.

CONSTANT MACH SEGMENT AND TEMPORARY FLIGHT PLAN

Insertion, change or deletion of a constant Mach segment creates a temporary flight plan.

CONTROLS AND INDICATORS

ON THE MFD

The flight crew can enter, change, or delete the CMS on the CMS panel of the ACTIVE (or SEC) /F-PLN/ VERT REV page.

CMS Panel on the VERT REV Page

Refer to CMS Panel

The flight crew can access the VERT REV page via the F-PLN page, by clicking on the speed prediction, associated with the revised waypoint, or by selecting the CMS revision in the waypoint revisions menu.
On the F-PLN page, the CMS is indicated by a star to the left of the speed prediction of all the waypoints (except the start waypoint) of the segment. The color of the star is magenta, if the constraint will be respected, and amber, if the constraint will be missed.
Refer to F-PLN Page

ON THE ND

On the ND , the CMS Mach number is displayed under the waypoint ident of all waypoints of the segment (except the start waypoint), when the CONSTRAINTS option is selected on the EFIS CP . The color of the constraint is magenta, if the constraint will be respected, and amber, if the constraint will be missed.
The ND also displays the speed change indicator, where the aircraft will accelerate or decelerate to reach the required Mach of the CMS.
The CMS is not indicated on the VD .

ASSOCIATED MESSAGES

Refer to DSC-22-FMS-20-110 MACH SEGMENT DELETED MACH SEGMENT DELETED

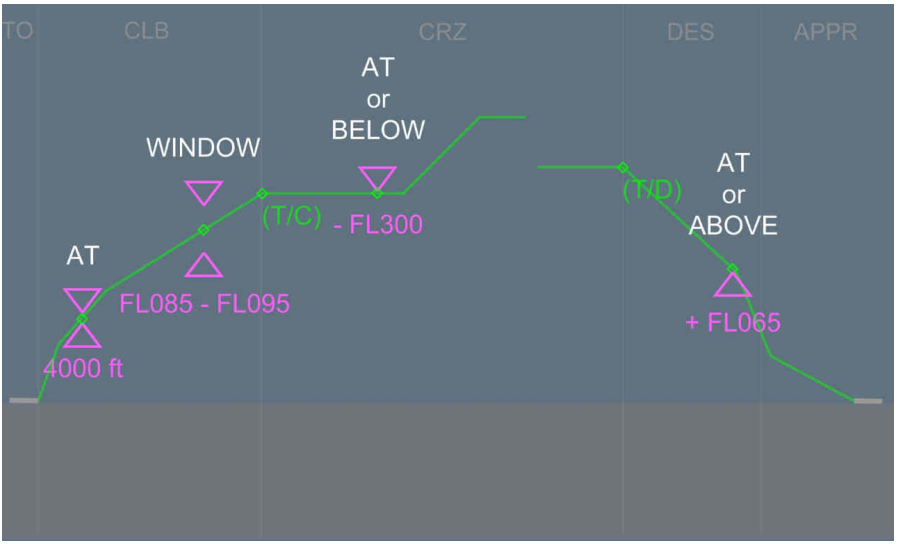
ALTITUDE CONSTRAINT (ALT CSTR)

Applicable to: ALL

PURPOSE

The flight crew uses the altitude constraint revision to enter, change, or delete an altitude constraint on a waypoint.
The altitude constraint can be to reach the waypoint AT, AT or BELOW, AT or ABOVE the specified altitude, or between two specified altitudes (ALTITUDE WINDOW).

Altitude Constraint



The altitude constraint may be (in the following order of priority):
- The flight crew entry
- The database value (the altitude constraints can be stored with the terminal area procedures in the navigation database).

Note: *The ALTITUDE WINDOW constraint can only be a value from the navigation database. The flight crew cannot manually enter or change this constraint.*

L2 The flight crew can define an altitude constraint on the TAKEOFF, CLIMB, DESCENT, and APPROACH waypoints on the primary flight plan. The flight crew cannot define an altitude constraint on the origin and destination airports, the FROM waypoint, or any pseudo waypoint.

L3 **AUTOMATIC DELETION OF THE ALTITUDE CONSTRAINT(S)**

- When the flight phase transitions from CRUISE, DESCENT, or APPROACH, to GO AROUND, all altitude constraints between the aircraft and the primary destination are deleted.
  The CONSTRAINTS BEFORE XXXXXXX : DELETED message is displayed on the MFD .
  XXXXXXX is the ident of the waypoint, following the last down path waypoint with a descent altitude constraint. (*Refer to Message*)
- When the alternate flight plan is enabled, the following altitude constraints are deleted: All altitude constraints between the aircraft and the former primary destination, and all altitude constraints on the alternate flight plan, that are below the current aircraft altitude.
  The CONSTRAINTS BEFORE XXXXXXX : DELETED message is displayed on the MFD .
  XXXXXXX is the ident of the waypoint, following the last down path waypoint with an altitude constraint, below the current aircraft altitude. (*Refer to Message*)
- When the CRZ FL or step altitudes are changed, the following constraints are deleted:
  The climb and descent constraints, that are at or above the new CRZ FL , and the descent constraints, that are at or above any inserted step altitude.
  The CONSTRAINTS ABOVE CRZ FL: DELETED message is displayed on the MFD . (*Refer to Message*)
- When the waypoint, with the constraint, becomes an ABEAM waypoint when a DIRECT TO with ABEAM is performed, the constraint is deleted.

L2 **ALTITUDE CONSTRAINT UNIT REFERENCE**

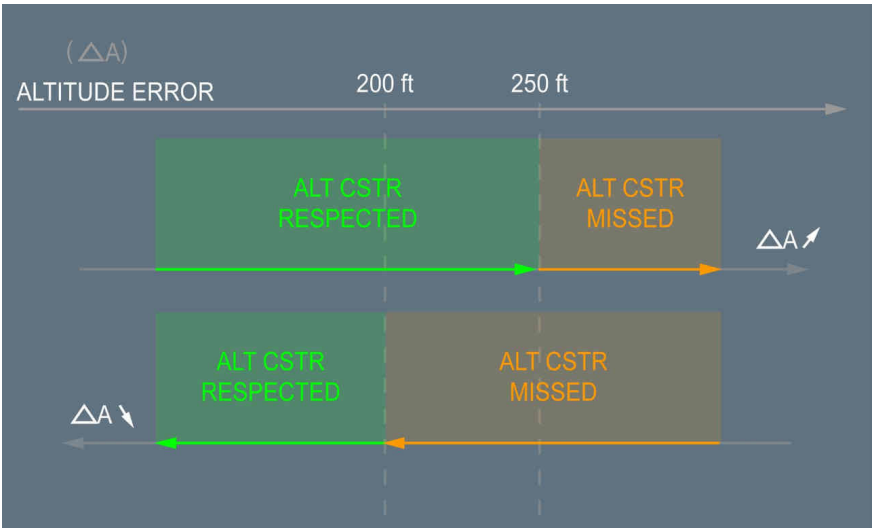
The altitude constraint is in feet, if its value is less than the transition altitude.
The altitude constraint is in FL , if its value is above the transition altitude.
If there is a transition altitude change, the altitude constraints change accordingly.

Note: *The altitude constraint unit of measure does not change if the flight crew changes the baro setting.*
For example, if the baro setting is changed from QNH to STD , a down path altitude constraint that was defined in feet, remains defined in feet.

L1 **ALTITUDE ERROR**

The FMS compares the altitude constraint value with the predicted altitude value on the waypoint, and predicts whether the altitude constraint will be respected or missed. The difference between the two values is referred to as the altitude error.
The altitude constraint is predicted as missed, if the altitude error becomes more than 250 ft .
When missed, the altitude constraint remains missed as long as the altitude error is more than 200 ft .

Altitude Error



L2 **ALTITUDE CONSTRAINT AND SECONDARY FLIGHT PLAN**

The altitude constraint revision is available on the active (or temporary), and secondary flight plans.

ALTITUDE CONSTRAINT AND TEMPORARY FLIGHT PLAN

Insertion, change, or deletion of an altitude constraint creates a temporary flight plan.

CONTROLS AND INDICATORS

ON THE MFD

The flight crew can enter, change, or delete the altitude constraint on the ALT panel of the ACTIVE (or SEC) /F-PLN/ VERT REV page.

ALT Panel on the VERT REV Page

Refer to ALT Panel

The flight crew can access the ALT tab panel of the VERT REV page via the F-PLN page, by clicking on the altitude prediction, associated with the revised waypoint, or by selecting the CONSTRAINTS revision in the waypoint revisions menu, followed by selecting the ALT panel.
On the F-PLN page, the altitude constraint on a waypoint is indicated with a star to the left of the altitude prediction of the waypoint. The color of the star is magenta, if the constraint is predicted to be respected, and amber, if the constraint is predicted to be missed.

Refer to F-PLN Page

ON THE ND

On the ND , the altitude constraint is indicated with a circle around the waypoint symbol. The constraint value under the waypoint ident is displayed when the CONSTRAINTS option is selected on the EFIS CP . The color of the constraint and the circle is magenta, if the constraint is predicted to be respected, and amber, if the constraint is predicted to be missed.

On the VD , the altitude constraint is indicated with:
- An upside-down triangle, for the AT OR BELOW altitude constraint
- A triangle, for the AT OR ABOVE altitude constraint
- Two triangles (hourglass shape, with touching tips), for the AT altitude constraint
- Two triangles (hourglass shape, with tips that do not touch), for the WINDOW altitude constraint.

ASSOCIATED MESSAGES

Refer to DSC-22-FMS-20-110 CONSTRAINTS ABOVE CRZ FL: DELETED CONSTRAINTS ABOVE CRZ FL : DELETED

STEP ALTITUDES (STEP ALTS)

Applicable to: ALL

PURPOSE

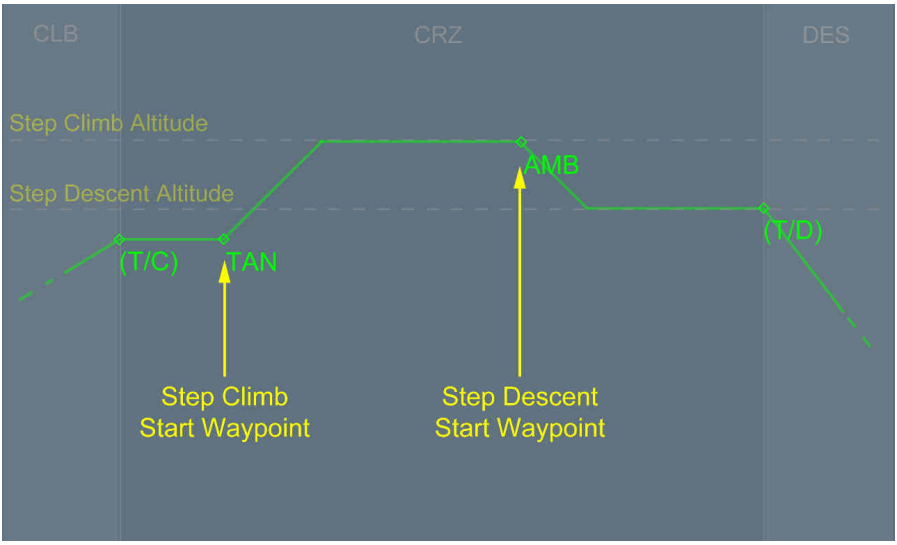
The flight crew uses the step altitudes revision to insert or modify a step climb, or step descent. A step climb or step descent is a change to a higher or lower cruise altitude, respectively.
The flight crew inserts step altitudes to create a vertical flight plan, with associated predictions, that correspond as much as possible to the Operator's computerized flight plan.
The flight crew can define up to 10 steps.

The flight crew defines the step, by entering:
- The step altitude
- The step start waypoint
  The step start waypoint is the waypoint on the flight plan where the aircraft should leave the current cruise altitude to join the step altitude.

  Note: An automatic vertical maneuver will not occur, when reaching the step point. The flight crew has to manually initiate the step climb or step descent by changing the target FCU altitude. The flight crew can do this at any time before reaching the step point.

L2 The flight crew can insert up to 10 step altitudes on the CRUISE waypoints of the primary flight plan.

Step Altitudes



L1 **OPTIMUM STEP POINT**

If the flight crew has entered one (or more) altitude steps, the FMS computes an optimum step start point for the next down path step, if it is a step climb. The FMS also computes the fuel and time savings that would be made, if the step climb was initiated at the optimum step, instead of at the start waypoint entered by the flight crew.

If there is no step in the flight plan, the FMS computes an optimum step start point, after entry of the step altitude. In this case, the fuel and time savings are computed between a flight plan with, and a flight plan without, the step climb.

L2 The optimum step point function is not available for the secondary flight plans.

Note: *When the active flight plan has an optimum step point, and the flight crew imports the active flight plan into a secondary flight plan, the optimum step point will not be copied into the secondary flight plan.*

IGNORED STEP

A step is IGNORED when:
- The step end waypoint (the point of reaching the step altitude), is nearer than 50 nm to the T/D , or
- The step start point, or the step end waypoint, are located before the T/C or after the T/D .

Ignored steps are not deleted, but are ignored for the computation of predictions. An ignored step is not indicated in the flight plan on the MFD or the ND , but remains displayed on the STEP ALTS panel on the VERT REV page.
An ignored step may become a predicted step again, after a flight plan change.

L3 **AUTOMATIC STEP DELETION**

A step climb or step descent is automatically deleted when:
- The step start waypoint is deleted, or sequenced
- The Engine Out (EO) mode becomes active
- In PREFLIGHT, TAKEOFF, or CLIMB, the flight crew changes the cruise flight level, and a step climb becomes a step descent, or vice versa
- In CRUISE, the flight crew sets the FCU altitude above the aircraft altitude. In this case, all step descents, and all step climbs with a step altitude less than the new FCU altitude, are deleted.
- In CRUISE, the flight crew sets the FCU altitude below the aircraft altitude. In this case, all step climbs, and all step descents with a step altitude greater than the new FCU altitude, are deleted.

When the step altitude is automatically deleted, the STEP DELETED message is displayed on the MFD (*Refer to Message).*

L2 **STEP ALTITUDES AND SECONDARY FLIGHT PLAN**

The step altitudes revision is available on the active (or temporary), and secondary flight plans.

STEP ALTITUDES AND TEMPORARY FLIGHT PLAN

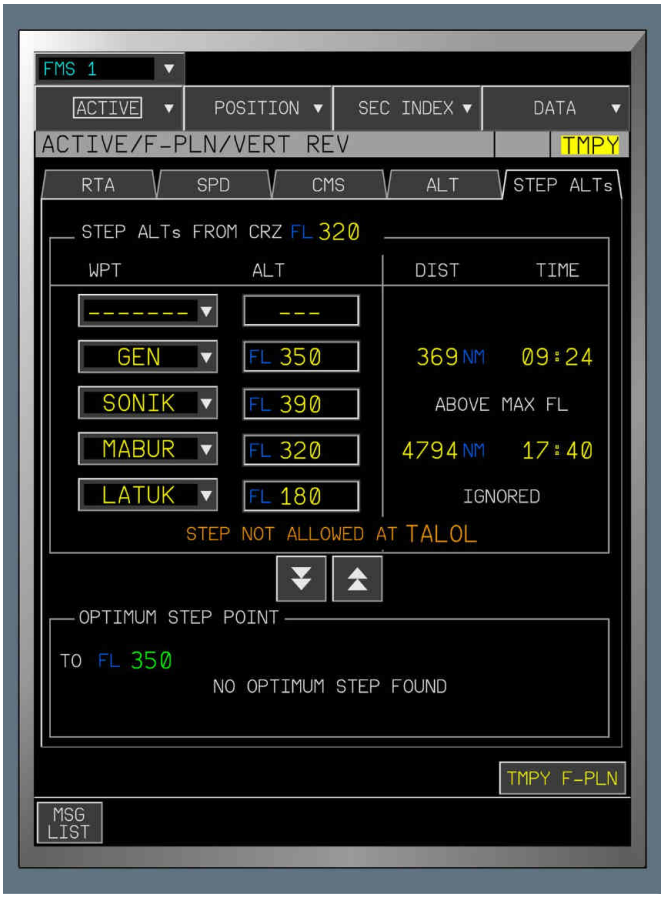
Insertion, change, or deletion of a step climb, or step descent creates a temporary flight plan.

CONTROLS AND INDICATORS

ON THE MFD

The flight crew can enter, change, or delete step altitudes on the STEP ALT panel of the ACTIVE (or SEC) /F-PLN/ VERT REV page.
The flight crew consults, enters, and updates the optimum step point in the OPTIMUM STEP area at the bottom of the page.

STEP ALT Panel on the VERT REV Page



Refer to STEP ALTs Panel

The flight crew can access the STEP ALT panel of the VERT REV page via the F-PLN page, by clicking on the altitude prediction, associated with the revised waypoint, or by selecting the STEP ALT revision in the waypoint revisions menu.

On the F-PLN page, the step point is indicated with the Step Climb (S/C), or Step Descent (S/D) pseudo-waypoint.

ON THE ND

On the ND , the step start waypoint is indicated with the step climb, or step descent symbol.

ASSOCIATED MESSAGES

Refer to STEP ABOVE MAX FL
Refer to STEP DELETED
Refer to STEP AHEAD

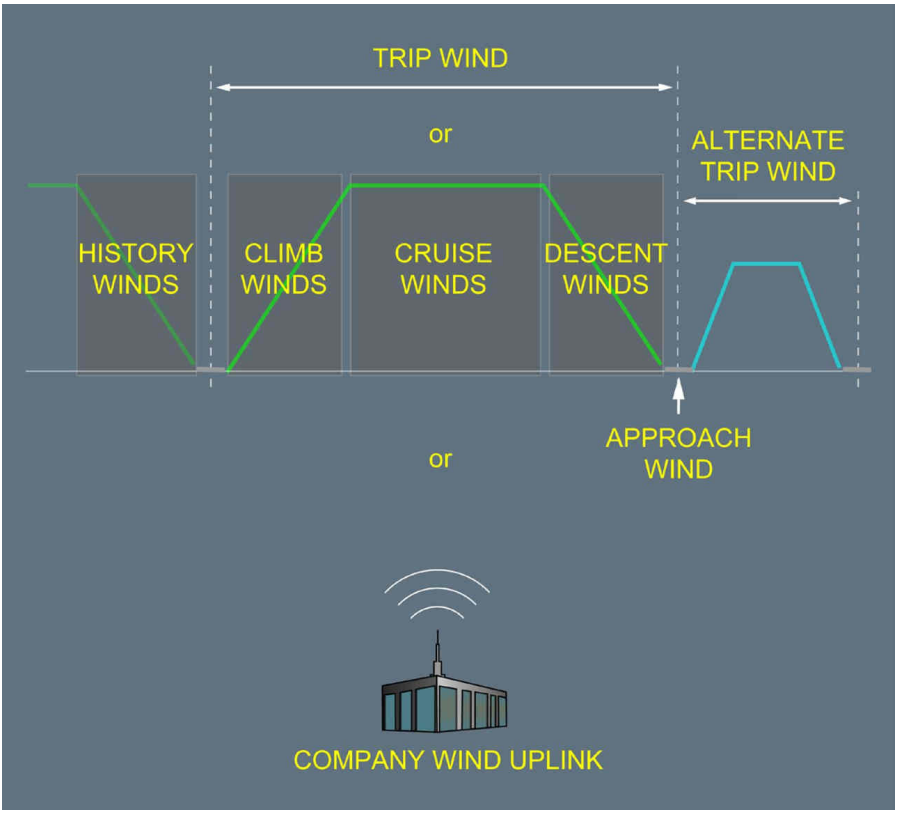
WIND

Applicable to: ALL

PURPOSE

The flight crew uses the WIND revision to check, insert, and modify flight plan winds.
Wind data has to be entered to obtain realistic flight plan predictions. The flight crew can enter an average trip wind for the entire flight, or can enter more precise wind data for the different flight phases, and different flight plan cruise waypoints.
The FMS uses the inserted winds to compute the flight plan wind predictions. The wind predictions are on their turn used to compute the other flight plan and performance predictions. (*Refer to More Information on the Wind Predictions*)

Wind Revision



TRIP WIND

The trip wind is an average wind for the entire flight from the origin airport to the primary destination.

Note: *The predictions for the alternate flight plan do not consider this trip wind. The trip wind for the alternate flight plan has to be entered separately. (See Alternate Trip Wind)*

The trip wind is defined as a headwind or tailwind component.
The FMS uses the trip wind for predictions computation as long as no climb, cruise, descent, or approach winds are entered.

HISTORY WINDS

The history winds are the stored descent winds of the previous flight.
After the T/D of the previous flight, the FMS measures and stores the winds at CRZ FL, FL 250 , FL 150 , and FL 050 .
In preflight, the flight crew can insert the history winds of the previous flight as the climb winds for the next flight.

CLIMB WINDS

The flight crew can insert climb winds on 5 different levels. The wind at ground level (GND) can be entered as one of these levels. An altitude entry below 400 ft is considered as a ground level.
The flight crew can also insert the history winds as the climb winds. The inserted history winds can always be changed by the flight crew afterwards.

L2 The climb winds can only be inserted, or changed before the CLB phase.

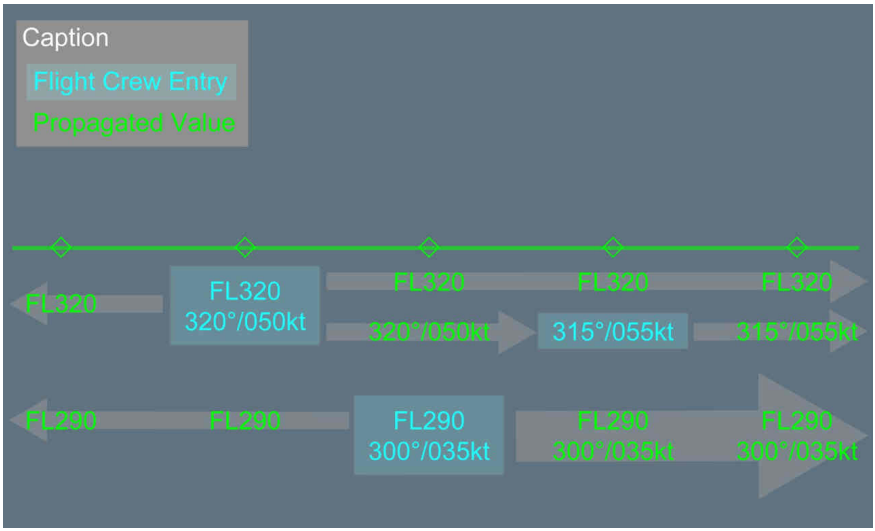
L1 CRUISE WINDS AND TEMPERATURES

The flight crew can insert different cruise wind data for all cruise waypoints, and this for 4 different flight levels.

When the flight crew enters wind data on a waypoint:
- The associated flight level is propagated to all (up path and down path) cruise waypoints
- The wind direction and velocity are propagated to the down path cruise waypoints until the waypoint for which the flight crew has entered wind data for the same flight level.

The flight crew can always change (but not clear) propagated wind data.

Wind Propagation



For each cruise waypoint, the flight crew can insert a temperature for a specific flight level. The FMS uses the temperature data to define a temperature profile, that is used for predictions computation. The temperature is propagated to the down path cruise waypoints in the same manner as the wind data.

L2 The FMS defines an estimated temperature profile based on the difference between a reference temperature profile, and a measured or entered Static Air Temperature (SAT) at different altitudes.
The reference temperature profile is defined by the tropopause altitude that is entered on the INIT page. The default tropopause altitude is the ISA tropopause.
The flight crew defines the deviation from the reference temperature profile, for the cruise waypoints, by entering the SAT associated to an altitude.

L1 **DESCENT WINDS**

The flight crew can insert descent winds on 5 different levels. The wind at ground level (GND) at the primary destination can be entered as one of these levels. An altitude entry below 400 ft is considered as a ground level.

Note: *The wind at ground level is also considered as the approach wind.*

L2 The descent winds can only be inserted, or changed before the DES phase.

L1 **APPROACH WIND**

The flight crew can enter the approach wind at the primary destination. The approach wind is used for the approach speed computation.

Note: *The approach wind is also considered as the wind at ground level for the descent wind profile computation.*

ALTERNATE TRIP WIND

The alternate trip wind is an average cruise wind for the alternate flight plan (from the primary destination to the alternate destination).
If the alternate flight plan distance is less than 200 nm , the alternate cruise flight level is defaulted to FL 220 . If the alternate flight plan distance is 200 nm or more, the alternate cruise flight level is FL 310 .
The alternate trip wind is defined by a wind direction and wind velocity.
The flight crew can always change the alternate flight level and associated trip wind.

COMPANY WIND UPLINK

The flight crew can request company wind and temperature data for the active, and the three secondary flight plans. The received wind and temperature data will be associated with the flight plan from which the request was sent.
The company can also uplink wind and temperature data without any request from the flight crew. These wind data will be associated with the active flight plan.

L2 **WIND REVISION AND SECONDARY FLIGHT PLAN**

The WIND revision is available on the active, and secondary flight plans.

WIND REVISION AND TEMPORARY FLIGHT PLAN

Insertion, change, or deletion of any wind data does not create a temporary flight plan. However, insertion, change, or deletion of wind data, creates a set of draft winds. The draft winds are not considered for predictions computation before they are inserted.

Note: *Insertion of history winds does not create draft winds, the history winds are directly inserted as the climb winds of the active flight plan.*

Insertion, change, or deletion of any wind data is not possible if a temporary flight plan is pending.
When draft winds are pending, and the flight crew creates a temporary flight plan, the draft winds are automatically inserted in the active (and temporary) flight plan. The FMS displays the DRAFT WIND INSERTED message. (*Refer to Message*)

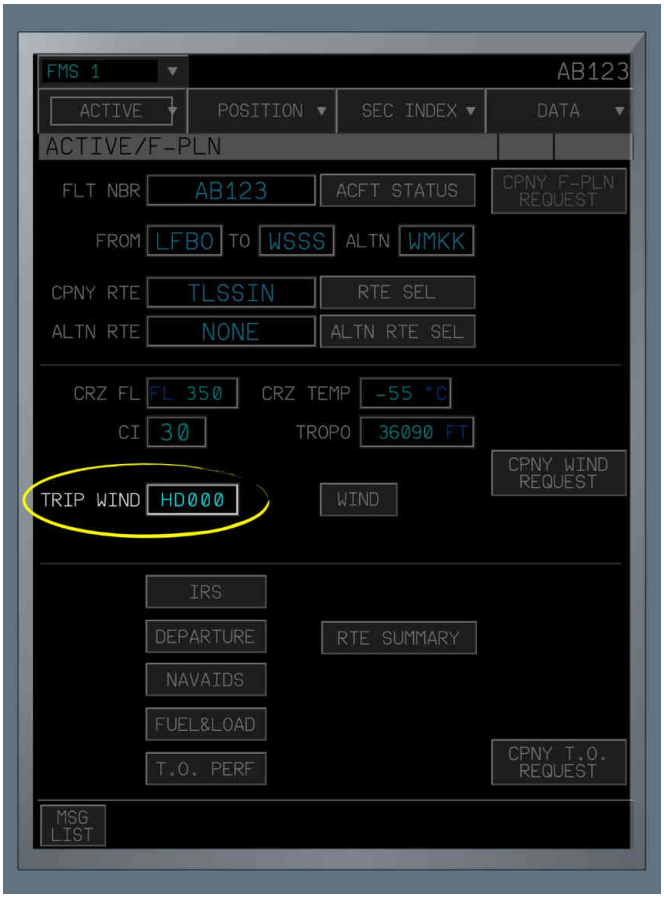
CONTROLS AND INDICATORS

ON THE MFD

The flight crew can:

- Enter the trip wind on the INIT page

INIT Page

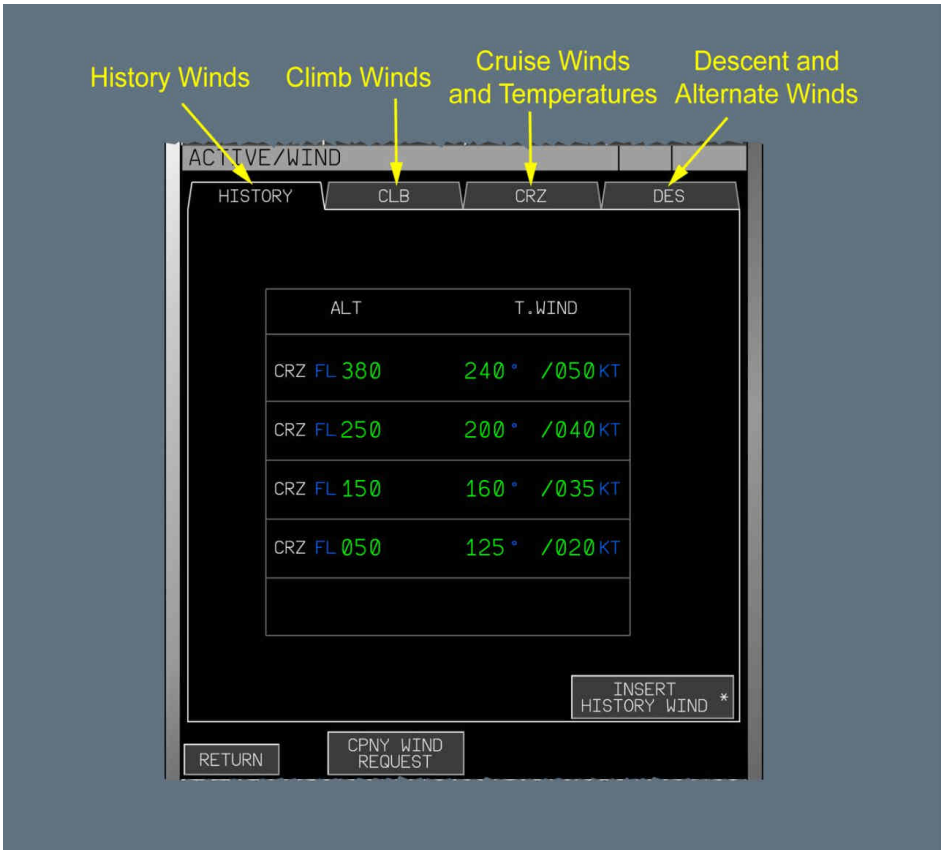


Refer to Page

- Insert the history, climb, cruise, descent, and alternate winds on the WIND page

L2 Note: *The descent wind at ground level is automatically copied on the APPR panel of the PERF page.*

WIND Page



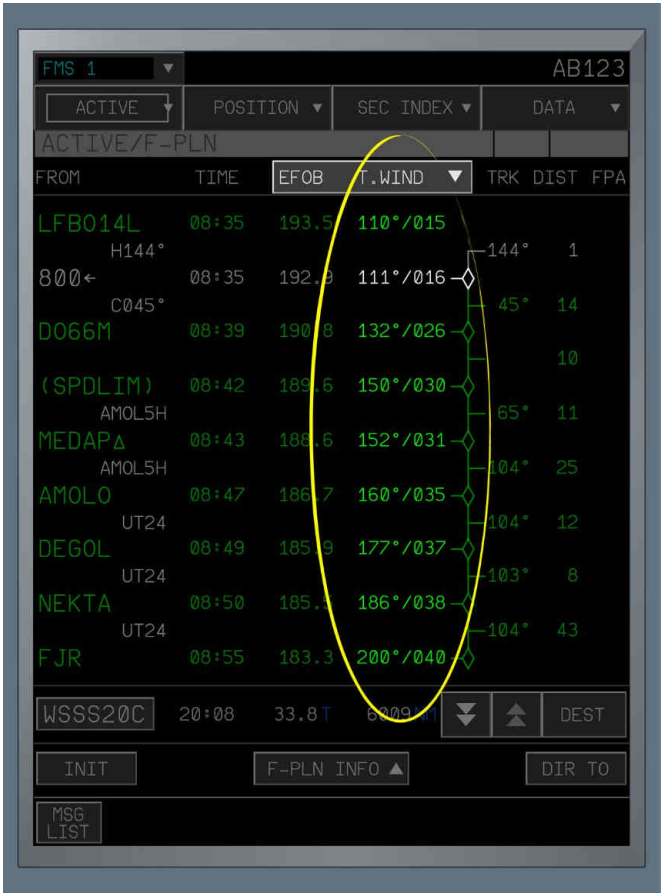
L1 *Refer to Page*

- Enter the approach wind on the APPR panel of the PERF page

L2 Note: *The approach wind is automatically copied on the DES panel of the WIND page as the wind at ground level (GND).*

L1 - Check the flight plan wind profile on the F-PLN page

F-PLN Page



Refer to Page

- Make a wind request on the INIT, or WIND page

Diversion

INTRODUCTION

Applicable to: ALL

To prepare an en route diversion over oceanic and deserted areas, the flight crew uses the Equi-Time Point (ETP) function to determine the diversion point(s) between two diversion airports, *Refer to The Equi-Time Point (ETP) Function* . The flight crew defines the diversion airports prior to departure, or in flight, using the closest airports data, *Refer to The Closest Airports Function* .
When the flight crew defines the most suitable diversion point and diversion airport, they then prepare the diversion on the secondary flight plan, *Refer to The Secondary Flight Plan* .
The flight crew performs a diversion by activating the secondary flight plan, *Refer to Performing a Diversion* .
If the flight crew decides to divert at the end of the cruise, beyond the last ETP , or in the DES or GA phase, they will most probably divert to the alternate airport using the ALTERNATE and ENABLE ALTERNATE revisions, *Refer to Diversion to the Alternate Airport* .

EQUI-TIME POINT

Applicable to: ALL

The flight crew uses the Equi-Time Point (ETP) function to compute the point along the lateral flight plan where the time to reach two designated reference airports(waypoints) is the same.
The default reference airports are the origin and destination airports. The flight crew may overwrite these default airports, and insert the local wind values at the applicable cruise flight level.

The FMS computes and updates regularly the ETP , using:
- The current aircraft speed: managed or selected speed
- The flight plan winds, combined with the winds at the reference airports.

The FMS defines the ETP as a place/distance waypoint associated with the subsequent waypoint, (e.g. RANAH/-40.5NM).
L2 The ETP can only be located on a cruise flight plan leg, and cannot be located in a holding pattern or procedure turn.

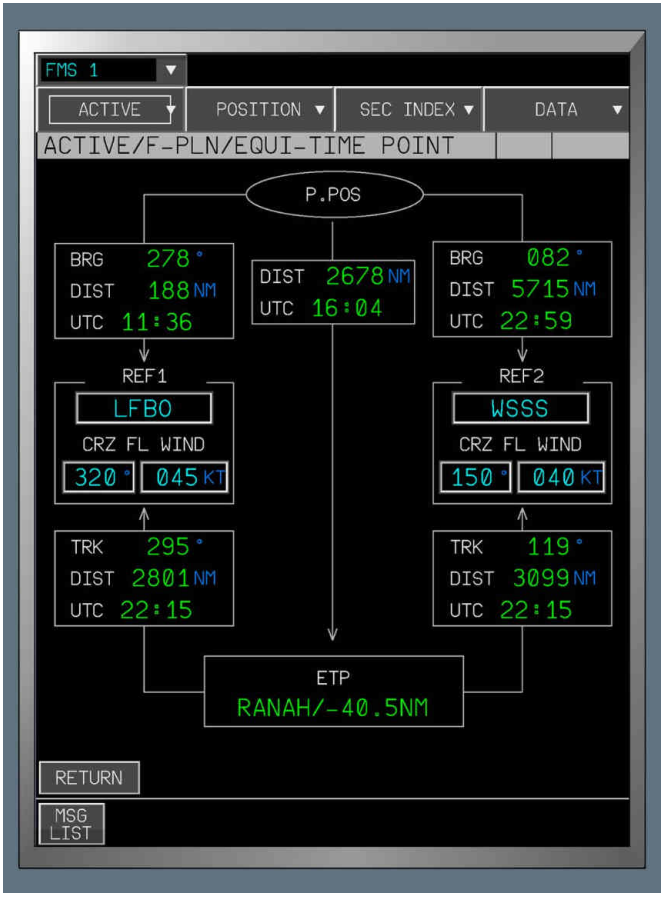
L1 The FMS also provides the following data:

- From the current position of the aircraft to the ETP :
  - Distance along the flight plan
  - Estimated time of arrival (UTC) at the ETP , based on a trajectory along the flight plan.
- From the current position of the aircraft to the reference airports:
  - Bearing (BRG)
  - Direct distance (DIST)
  - Estimated time of arrival (UTC) at the reference airport, based on a direct trajectory.
- From the ETP to the reference airports:
  - Track (TRK)
  - Direct distance (DIST)
  - Estimated time of arrival (UTC) at the reference airport, based on an overfly of the ETP and a direct trajectory between the ETP and the reference airport.

CONTROLS AND INDICATORS

ON THE MFD

The flight crew can compute the ETP on the ACTIVE/F-PLN/EQUI-TIME POINT page.



Refer to EQUI-TIME POINT page
No associated pseudo waypoint exists on the F-PLN page.

Note: *In order to indicate the ETP on the F-PLN page, and/or to prepare the next applicable ETP on the EQUI-TIME POINT page, the flight crew may define a TIME MARKER at the estimated time of arrival at the ETP , Refer to LL XING-TIME MKR page .*

ON THE ND

The ND displays the ETP pseudo waypoint.

CLOSEST AIRPORTS

Applicable to: ALL

The closest airports function computes the four database airports, that are closest to the current position of the aircraft.

For each airport, the FMS computes:
- The direct distance (DIST) between the current position of the aircraft, and the airport
- The bearing (BRG) to the airport
- The estimated time of arrival (UTC) at the airport, based on a direct trajectory
- The Estimated Fuel On Board (EFOB) at the airport
- An effective wind (EFF WIND) default value, based on the flight plan winds.
  The flight crew may overwrite this default value.

The fuel and time predictions are based on:
- The great circle distance and bearing to the airport
- The effective winds (default values, or values entered by the flight crew)
- The current delta ISA
- A flight from the current position to the ground, based on:
  - A computed cruise distance, flown at an optimum cruise Mach (based on the current CRZ FL , GW , and CI) in managed speed control, or at the selected Mach in selected speed control.
L2 In the case of an engine out, the EO LRC Mach, and the EO MAX FL (or the CRZ FL , if it is lower than the EO MAX FL) are considered.
L1 - A continuous descent from the CRZ FL to the airport elevation.

The flight crew can also enter up to three other airports, for which they want to compute the associated predictions.

CONTROLS AND INDICATORS

The CLOSEST AIRPORTS page displays the closest airports and their associated data.

CLOSEST AIRPORTS Page

Refer to CLOSEST AIRPORTS page

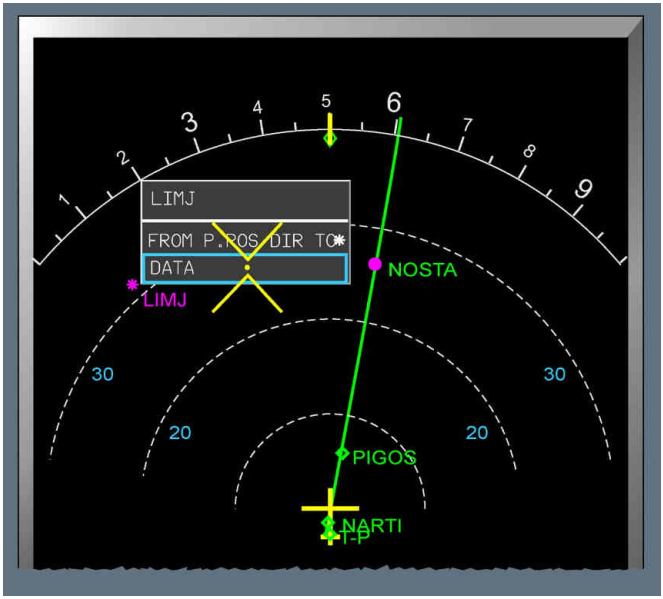
AIRPORTS ON THE ND

Applicable to: ALL

In certain cases, the flight crew may choose the diversion airport on the ND :

- Display all database airports on the ND by selecting the ARPT option on the EFIS CP

- If required, obtain additional information on the database airport(s) by selecting DATA in the airport list. This displays the DATA/AIRPORT page on the MFD, *Refer to Page* .



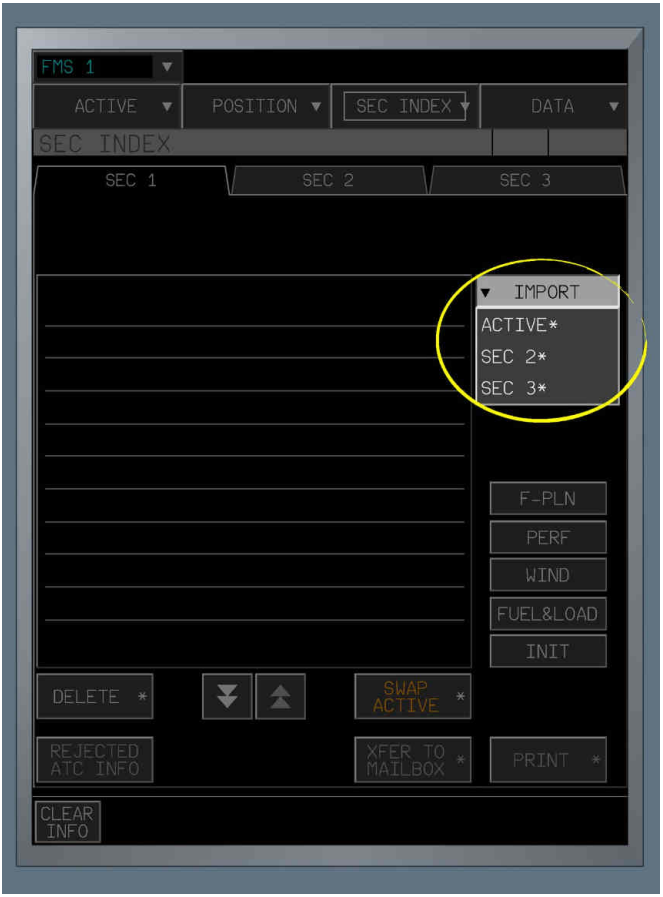
In addition, during oceanic or deserted area flights, the flight crew may use the BRG/DIST function on the POSITION/MONITOR page to continuously monitor the direct distance and bearing to the selected diversion airport(s), *Refer to Page* .

SECONDARY FLIGHT PLAN

Applicable to: ALL

The flight crew prepares the diversion on the secondary flight plan:

- Import the active flight plan into SEC 1(2)(3)



Note: *The flight crew should not use SEC 3 for diversion purposes if they plan to load an ATC flight plan from the ATC mailbox into the FMS. This is because if there is a flight plan in SEC 3, this flight plan will be deleted when the ATC flight plan is loaded.*

- Select the NEW DEST revision on the diversion waypoint, *Refer to Revision*

- Enter the ident of the diversion airport in the NEW DEST entry field

- Complete the flight plan between the diversion waypoint and the diversion airport

When the diversion airport is no longer applicable, or the ETP is sequenced, repeat the same procedure for the next diversion airport.

PERFORMING A DIVERSION

Applicable to: ALL

When the flight crew decides to divert:

- Display the secondary flight plan panel on which the diversion is prepared
- Click on the SWAP ACTIVE button to activate the secondary flight plan, *Refer to Swap Function*

- Perform a DIRECT TO, if required.

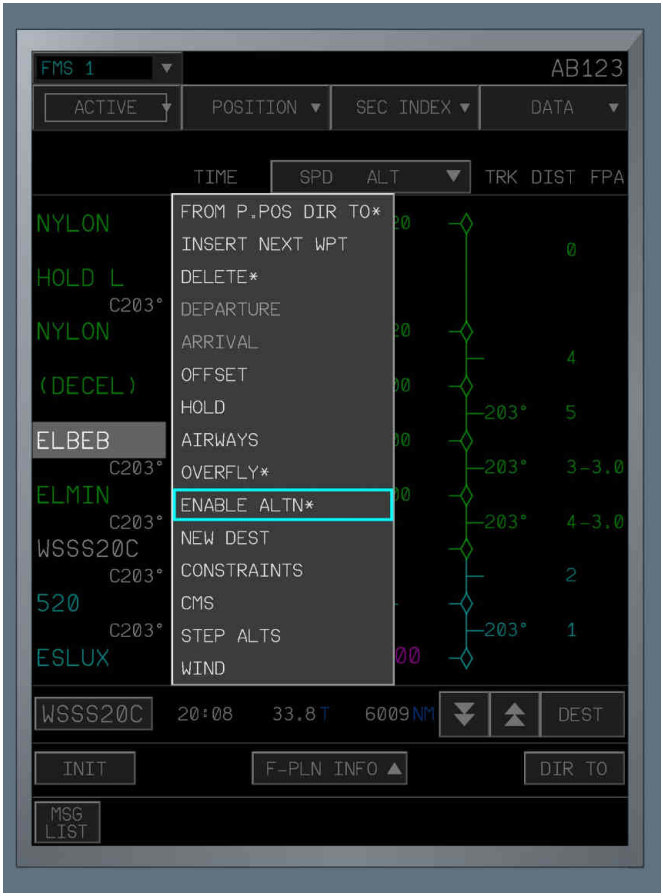
DIVERSION TO AN ALTERNATE AIRPORT

Applicable to: ALL

The flight plan includes an alternate flight plan. The alternate flight plan is the diversion flight plan from the primary destination airport to the alternate destination airport.
The flight crew selects an alternate airport with the ALTERNATE revision, *Refer to Revision* .
After the alternate airport selection, the flight crew completes the alternate flight plan, if required.

When the flight crew decides to divert:

- Select the ENABLE ALTN revision on the TO waypoint (or another flight plan waypoint, if appropriate), *Refer to Revision*



- Check the temporary flight plan, and insert the temporary flight plan when it is validated
- Perform a DIRECT TO, if required.

Intentionally left blank

Temporary Flight Plan

TEMPORARY FLIGHT PLAN

Applicable to: ALL

GENERAL

When the flight crew makes a flight plan revision, the FMS creates a temporary flight plan.
The temporary flight plan is a copy of the active flight plan, with the flight plan revision integrated.
This flight plan draft replaces temporarily the active flight plan, and allows the flight crew to check the impact of the revision on the flight plan before insertion.
While the temporary flight plan exists, the FMS still uses the original active flight plan for guidance and radio tuning.

The temporary flight plan exists until it is inserted, or erased:
- When the flight crew inserts the temporary flight plan, it replaces the active flight plan.
- When the flight crew erases the temporary flight plan, the revisions are not taken into account. The active flight plan remains unchanged.

L2 When both FMS are in DUAL mode, only one temporary flight plan can exist at a time.

L1 CREATION OF A TEMPORARY FLIGHT PLAN

The FMS creates (or updates) a temporary flight plan upon a lateral, or vertical flight plan revision (except the WIND revision) of the active flight plan. A revision of a secondary flight plans does not create a temporary flight plan.
Refer to Lateral Revisions
Refer to Vertical Revisions

L3 The FMS creates automatically a temporary flight plan when it detects an engine out at takeoff, before the EOSID diversion point. (*Refer to EOSID*)

L2 The FMS does not create a temporary flight plan when the flight crew:
- Changes the cruise flight level
- Changes the cost index, ZFW , ZFWCG , fuel data, perf, or idle factor
- Changes any wind, or temperature
- Inserts a time marker
- Exits, or resumes a holding pattern (*Refer to HOLD revision).*

L1 MULTI-REVISION

The flight crew can make multiple lateral, and vertical flight plan revisions in the same temporary flight plan.

Note: This is not valid for the DIRECT TO revision:
- *When the flight has created a temporary flight plan via the direct to revision, no other flight plan revisions can be made in this temporary flight plan. The flight crew has to insert (or erase) the temporary flight plan first*
- *When the flight has created a temporary flight plan via a revision, other than the direct to revision, the flight crew can not insert a direct to in this temporary flight plan. The flight crew has to insert (or erase) the temporary flight plan first.*

When a temporary flight plan with multiple revisions exists, the flight crew can UNDO the last revision. This removes the last revision from the temporary flight plan.

Note: The flight crew can only UNDO the "last" revision of the temporary flight plan. When he has done that, he only can insert or erase the temporary flight plan.

L2 **TEMPORARY FLIGHT PLAN SEQUENCING**

The temporary flight plan is sequenced with the active flight plan, if the first leg of the temporary flight plan is identical to the first leg of the active flight plan.

Note: When the NAV mode is engaged, and the flight crew tries to insert a temporary flight plan with a first leg different from the active leg, the SELECT HDG OR TRK FIRST message is displayed. (Refer to Message)

CONTROLS AND INDICATORS

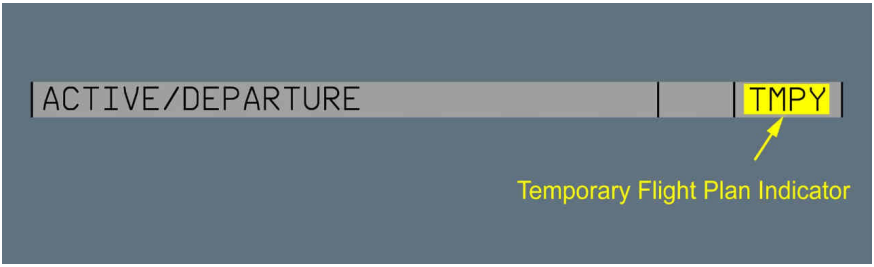
Applicable to: ALL

CONTROLS AND INDICATORS

When both FMS are in DUAL mode, the temporary flight plan data is displayed on the Captain's and First Officer's MFD and ND .

ON THE MFD

When a temporary flight plan exists, the page header displays TMPY for all pages that are related to the active or secondary flight plan: F-PLN page, flight plan revisions pages, INIT, FUEL&LOAD, PERF, WIND, and SEC INDEX page.



The temporary flight plan is displayed in yellow on the ACTIVE/F-PLN page. The active flight plan that is used for guidance and NAVAIDS tuning cannot be displayed on the MFD when a temporary flight plan exists. The flight crew uses the temporary flight plan page as the ACTIVE/F-PLN page (*Refer to Page*).

The revision data on a flight plan revision page are displayed in yellow, if the revision has created or updated the temporary flight plan.
Example: If the flight crew creates a temporary flight plan by inserting a time constraint, the data on the RTA panel of the VERT REV page are displayed in yellow. However, the data on the other panels of the VERT REV page (ALT, SPD, CMS, STEP ALTS) are not displayed in yellow, because the revisions of these panels are not included in the temporary flight plan.

INSERT/ERASE/UNDO

The flight crew can insert, or erase, the temporary flight plan on the ACTIVE/F-PLN page. The INSERT, and ERASE (UNDO) buttons are displayed in the bottom right, and left corner of the ACTIVE/F-PLN page.

The flight crew can also directly insert a temporary flight plan that was created by a DIRECT TO revision via the DIRECT TO page.

ON THE ND

The ND displays the temporary flight plan as a yellow dashed line.
The active flight plan remains on the ND in green, when a temporary flight plan exists. It is used for guidance, and NAVAIDS tuning. However, the waypoints of the active flight plan that are not part of the temporary flight plan, are no longer interactive.
The revision data on the ND DIRECT TO, and INSERT NEXT WPT revision windows are displayed in yellow.

INSERT/ERASE/UNDO

The flight crew can insert, or erase the temporary flight plan on the ND . The INSERT, and ERASE (UNDO) buttons are displayed in the bottom right, and left corner of the ND .

Note: The INSERT, and ERASE (UNDO) buttons are only displayed when the cursor is on the ND.

ASSOCIATED MESSAGES

Applicable to: ALL

ASSOCIATED MESSAGES

Refer to INSERT OR ERASE TMPY F-PLN FIRST
Refer to SELECT HDG OR TRK FIRST

Secondary Flight Plans

ACTIVE AND SECONDARY FLIGHT PLANS

Applicable to: ALL

The FMS can simultaneously memorize four flight plans: one active and three secondary flight plans. The FMS uses the active flight plan for lateral and vertical long-term guidance, and for radio navigation auto-tuning.

The flight crew uses the three secondary flight plans to:
- Prepare a second takeoff runway and/or departure procedure, in preflight
- Prepare a second landing runway and/or approach procedure
- Plan a diversion
- Prepare a down path flight plan part or a complete flight plan
- Compare predictions of possible flight plans
- Store a company, or ATC flight plan before activation.

SECONDARY FLIGHT PLAN INITIALIZATION

Applicable to: ALL

SECONDARY FLIGHT PLAN INITIALIZATION

The flight crew can initialize a secondary flight plan by:
- Making a copy from the active, or one of the secondary flight plans
- Up linking a company flight plan from the company ground station (if the option is embedded)
- Entering the flight plan initialization data on the SEC 1(2)(3) / INIT and SEC 1(2)(3) / F-PLN pages.
- Up loading an ATC flight plan from the ATC mailbox.

COPY FROM ACTIVE (OR SECONDARY) FLIGHT PLAN

A copy from the active (or secondary) flight plan includes:
- Flight plan data (company route, cruise flight level, cost index, wind, speed constraints, etc ...)
- Fuel and load data (ZFWCG, ZFW, BLOCK, etc ...)
- Performance data (V1, VR, V2, flaps setting, etc ...)

L2 A **copy from the active flight plan** is still linked with the active flight plan through the following parameters:
- Flight number
- Cruise flight level and temperature
- Tropopause altitude
- Cost index
- Before engine start: ZFW, ZFWCG, Minimum fuel at destination, and BLOCK fuel

- Route reserve and final fuel (or time) data
- Passenger number

This means that when the flight crew changes one of these parameters in the active flight plan, the same parameter will be updated automatically in the secondary flight plan.
However, if the flight crew changes one of these parameters in the secondary flight plan, the link is broken, and the active and secondary flight plans become independent.

Note: The link does not exist for a copy from a secondary flight plan. A copy from a secondary flight plan is independent from its original secondary flight plan.

L1 **ATC FLIGHT PLAN UPLOAD**

The flight crew can load an ATC flight plan into the FMS via the LOAD function on the ATC mailbox.
By clicking on the LOAD to SEC 3 button on the ATC mailbox, the received ATC flight plan is inserted in the third secondary flight plan (SEC 3).

CAUTION	If there is a flight plan in SEC 3, this flight plan will be deleted when the ATC flight plan is up loaded. To avoid an involuntary loss of a flight plan, the flight crew has to copy the SEC 3 flight plan in SEC 1, or SEC 2 before up loading the ATC flight plan.

SECONDARY FLIGHT PLAN SEQUENCING

Applicable to: ALL

SECONDARY FLIGHT PLAN SEQUENCING

A secondary flight plan is sequenced with the active flight plan, if:
- The secondary flight plan is a copy from the active flight plan (or a copy from a secondary flight plan that was created with a copy from the active flight plan), and
- The first leg of the secondary flight plan is identical to the active leg of the active flight plan.

Note: The active leg is the leg that is actually flown (between the aircraft present position and the TO waypoint).

SECONDARY FLIGHT PLAN PREDICTIONS

Applicable to: ALL

SECONDARY FLIGHT PLAN PREDICTIONS

The FMS computes the same flight plan predictions for the three secondary flight plans as for the active flight plan, and uses the same rules and assumptions as for the active flight plan predictions computation.

Refer to Flight Plan Predictions

The predictions of a secondary flight plan, that was created by a copy of the active flight plan, are based on the following parameters, reflecting the aircraft current situation and environment:

- GW , FOB , CG
- Aircraft clock time
- Aircraft position
- Perf and idle factors
- Lateral, and vertical guidance modes
- AFS CP altitude target
- Wind and temperature
- ...

However, a secondary flight plan, that was created via the SEC 1(2)(3) / INIT page, considers the aircraft on ground, before engine start. In this case, the predictions are not based on the current aircraft and environment parameters. The secondary flight plan is completely independent from the active flight plan.

SECONDARY FLIGHT PLAN REVISIONS

Applicable to: ALL

SECONDARY FLIGHT PLAN REVISIONS

The flight crew can make all lateral (except direct to, and fix info) and vertical flight plan revisions on the three secondary flight plans.

Refer to Lateral Revisions

Refer to Vertical Revisions

A flight plan revision on a secondary flight plan does not create a temporary flight plan.

SWAP SECONDARY WITH ACTIVE FLIGHT PLAN

Applicable to: ALL

SWAP SECONDARY AND ACTIVE FLIGHT PLAN

The flight crew can activate a secondary flight plan by using the swap function.

The swap function exchanges the entire active and selected secondary flight plan.

L3 If for the secondary flight plan, the flight number, cost index, ZFW, ZFWCG, BLOCK, or TAXI fuel are not defined, the FMS will keep the active flight plan value for the specific parameter, when the swap action is performed.

L1 The swap function is always available on ground.

In flight, the swap function is available:
- When the NAV mode is engaged, and the first leg of the selected secondary flight plan is identical to the active leg, or
- When the HDG/TRACK mode is engaged.

When the NAV mode is engaged, and the first leg from the secondary flight plan is different from the active leg, the flight crew cannot swap the active and secondary flight plan: the SWAP button on the SEC INDEX page cannot be selected. In this case, the flight crew needs to engage the HDG/TRACK mode first, before he can swap the flight plans.

Note: The swap function is not available when a temporary flight plan is pending, or when the secondary flight plan is empty.

PILOTS INTERFACE

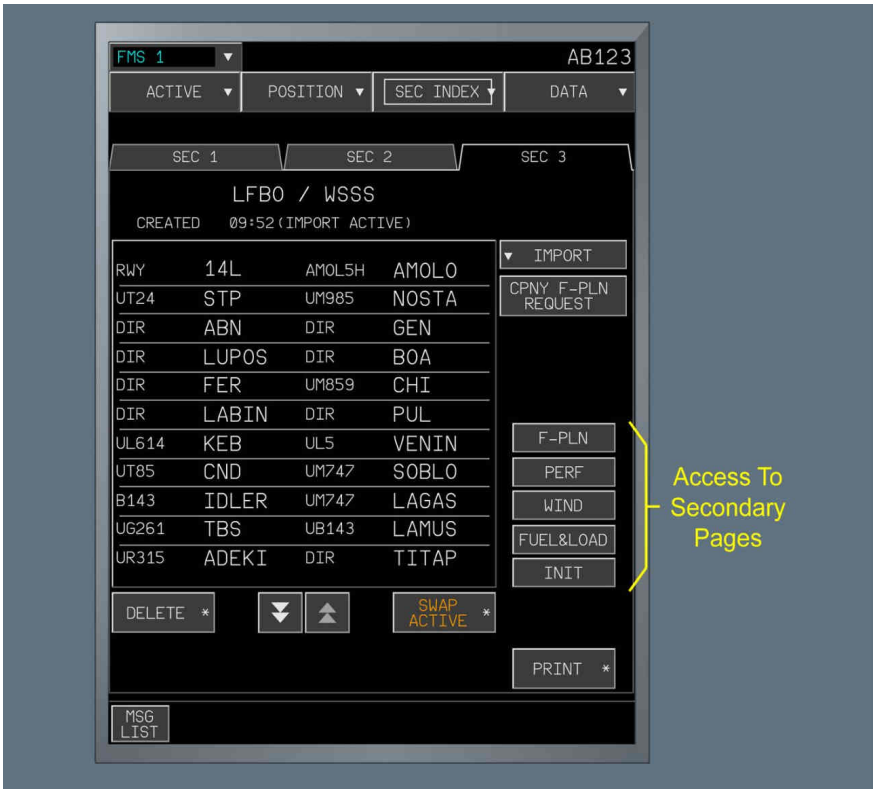
Applicable to: ALL

CONTROLS AND INDICATORS

ON THE MFD

The flight crew manages the three secondary flight plans on the SEC INDEX page.
This page gives a route summary, and gives access to the main secondary pages, related to each secondary flight plan.

SEC INDEX Page



Refer to Page

L2 The secondary pages have globally the same content as the active pages. There are however a few differences:

- The system computed values are white (they are green for the active flight plan)
- There are no amber boxes (there are no mandatory parameters)
- SEC / INIT page:
  - No access to the POSITION / IRS, DEPARTURE, ROUTE SUMMARY, POSITION / NAVAIDS, FUEL&LOAD, and PERF pages.
  - Display of the latitude and longitude of the origin airport reference point.

- SEC / PERF page:
  - No display of the optimum nor recommended maximum flight level
  - No access to the POSITION / MONITOR page
  - No engine out mode
  - No activate approach button
  - CLB, CRZ, and DES panel: No time and distance predictions for the different speed profiles
  - TO panel: No company takeoff data request
  - DES panel: No descent cabin rate entry field, and no display of the vertical deviation
  - APPR panel: No display of the VREF .
- SEC / WIND page: No history winds are available.

L1 **ON THE ND**

When a secondary page is displayed, the related secondary flight plan is displayed in white on the ND.

Note: The flight crew cannot make revisions on the secondary flight plan via the interactive ND.

Flight Plan Predictions

FLIGHT PLAN PREDICTIONS

Applicable to: ALL

The FMS computes flight plan predictions for the active, the temporary, and the three secondary flight plans.
The predictions are based on the flight plan, the current state of the aircraft (position, GW , CG , etc ...), and its environment (wind, temperature, etc ...).

The flight plan predictions include:
- Time of arrival, speed, altitude, estimated fuel on board (EFOB), and wind at each waypoint
- Pseudo-waypoints
  (*Refer to Pseudo-waypoints*)
- Equi-time-point.

Note: The equi-time-point is not computed for the secondary flight plans.

START AND UPDATE OF PREDICTIONS

Applicable to: ALL
Impacted by TDU: 00016865 Start and Update of Predictions

In preflight, the FMS starts computing the flight plan predictions when the following data is available:
- The lateral flight plan
- The cruise flight level (CRZ FL)
- The cost index (CI)

L2 *Note: If the flight crew does not enter a cost index, the FMS uses the cost index of the previous flight, stored in the DONE phase. When there is no stored cost index, the FMS uses a cost index equal to 0.*

L1 - The aircraft gross weight (GW)
L2 Before engine start, the FMS computes the GW from the flight crew entered ZFW, and BLOCK fuel.
After engine start, the FMS uses the GW, computed by the FQMS

L1 The FMS updates the predictions at regular intervals, and when one of the following events occur:
- Change of the lateral, or vertical flight plan (e.g. insertion of a waypoint, a time constraint, constant mach segment, etc...),
- Change of the cost index,
- Change of the cruise temperature, SAT, or tropopause altitude,
- Change of any load data (e.g. ZFW)

- Switching from managed to selected control, or vice versa,
- Change of the selected target,
- Sequencing a (pseudo-) waypoint,
- L2 Change of the maximum cabin rate,
- Change of the performance factor,
- Engine out.

START AND UPDATE OF PREDICTIONS

Applicable to: ALL
Impacted DU: 00007400 Start and Update of Predictions

In preflight, the FMS starts computing the flight plan predictions when the following data is available:
- The lateral flight plan
- The cruise flight level (CRZ FL)
- The cost index (CI)

Note: If the flight crew did not enter a cost index, the default value is the cost index of the previous flight, stored in the DONE phase (or 0 if there is no stored cost index).

- The aircraft gross weight (GW)

L2 Before engine start, the FMS computes the GW from the flight crew entered ZFW, and BLOCK fuel.
After engine start, the FMS uses the GW, computed by the FQMS

L1 The FMS updates the predictions at regular intervals, and when:
- The lateral, or vertical flight plan is changed
- The cost index is changed
- The cruise temperature, SAT, or tropopause altitude are changed
- The load data is changed
- The flight crew switches from managed to selected control, or vice versa
- A (pseudo-) waypoint is sequenced
- L2 The maximum cabin rate is changed
- The performance factor is changed
- An engine out occurs.

L1 *Note: After an FMS reset, the predictions may be lost. Entering again the cost index (even when the Cost Index entry field is not empty) brings the predictions back.*

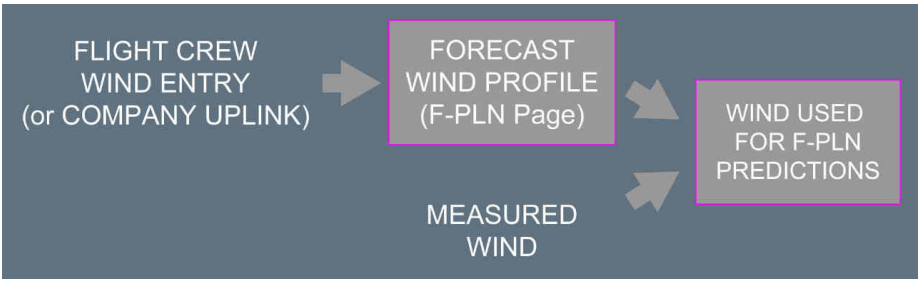
WIND PREDICTIONS

Applicable to: ALL

The computation of the wind predictions considers:
- The wind data entered by the flight crew (or uplinked by the operator), and
- The measured wind

The FMS computes a forecast wind profile, based on the entered wind. The forecast wind is displayed on the F-PLN page.
Once in flight, the FMS takes into account the measured wind to compute a corrected wind profile that is used for the flight plan predictions (time, EFOB, etc...). This corrected wind profile is never displayed on the F-PLN page.

Wind Predictions



The wind predictions computation is different for the climb, cruise, or descent waypoints:

WIND PREDICTIONS AND TRIP WIND

TRIP WIND ENTRY

In preflight, the flight crew can enter a trip wind, in order to have flight plan predictions before entering more precise wind data afterwards.
The flight crew enters the trip wind on the INIT page. (*Refer to Page*)
When the flight crew enters any climb, cruise, or descent data, the trip wind is ignored for the predictions computation.

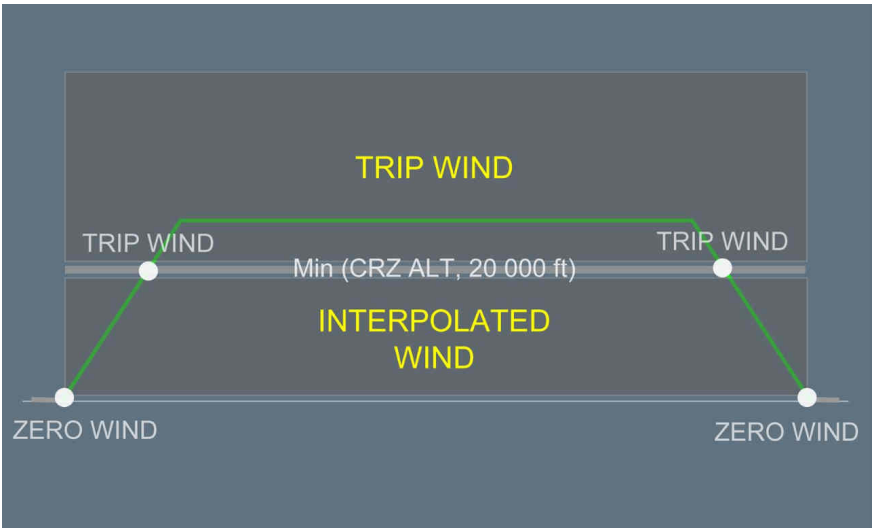
FORECAST WIND PROFILE

The FMS creates the following forecast wind profile when only the trip wind is entered:

- In cruise: The trip wind applies for all altitudes
- In climb, and descent:
  - Below 20 000 ft (or below the cruise flight level, if it is below 20 000 ft): The wind is interpolated between zero wind at ground level (origin or destination elevation) and the trip wind at 20 000 ft .
  - Above 20 000 ft (or above the cruise flight level, if it is below 20 000 ft): The trip wind applies for all altitudes.

Note: *On the F-PLN page, the trip wind value is displayed for all climb, cruise, and descent waypoints. The interpolated wind profile below 20 000 ft is used for predictions computation, but is not displayed on the F-PLN page.*

Trip Wind



CORRECTED WIND PROFILE

Once in flight, the FMS takes into account the measured wind. This wind correction depends on the flight phase, and is explained in the following chapters.

WIND PREDICTIONS FOR CLIMB WAYPOINTS

WIND ENTRY

The flight crew can insert climb winds for 5 different flight levels. The wind at ground level (GND) can be entered as one of these levels.
The flight crew enters the climb winds on the CLB panel of the WIND page. (*Refer to Page*)

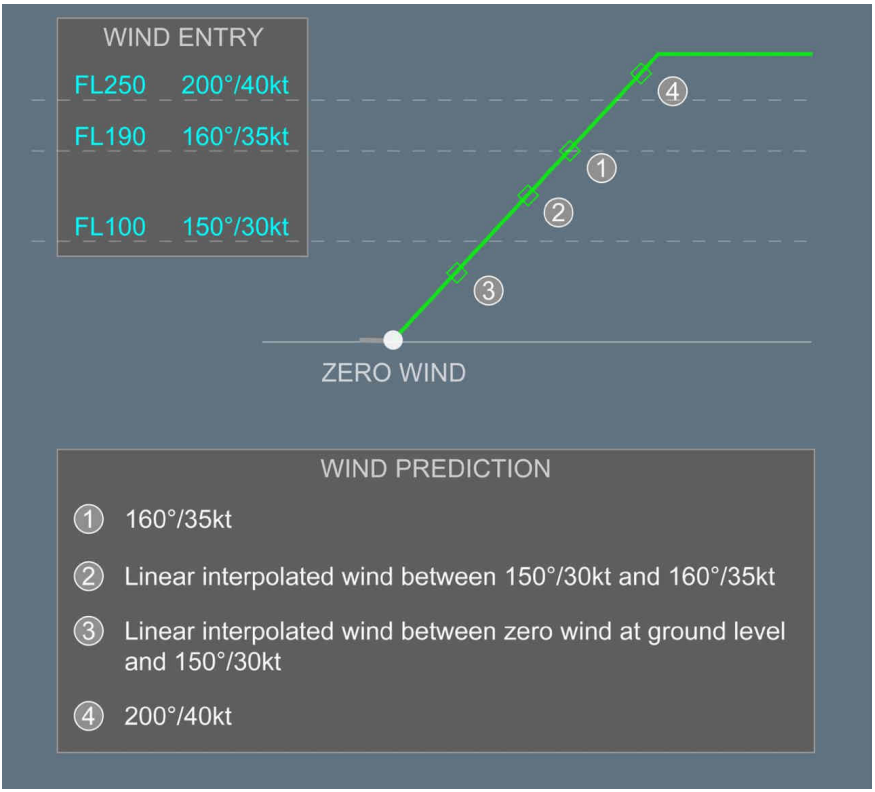
FORECAST WIND PROFILE

The FMS creates the wind profile for the climb waypoints, as follows:

- If the predicted altitude at a waypoint matches one of the entered climb wind altitudes, the predicted wind at the waypoint is the associated climb wind
- If the predicted altitude at a waypoint is between two entered climb wind altitudes, the predicted wind at the waypoint is linearly interpolated between the two associated climb winds
- If the predicted altitude at a waypoint is below the lowest entered climb wind altitude (no ground wind is entered), the predicted wind at the waypoint is linearly interpolated between zero wind at ground level, and the lowest entered climb wind
- If the predicted altitude at a waypoint is above the highest entered climb wind altitude, the predicted wind at the waypoint is the extrapolated highest entered climb wind.

Note: If no climb winds (nor trip wind) are entered, a default wind of 0 °C / 0 kt is used.

Climb Waypoints Predictions



CORRECTED WIND PROFILE

In climb, the FMS takes into account the measured wind, as follows:

- At the aircraft's current altitude, the corrected wind is equal to the measured wind,
- Higher than 10 000 ft above the aircraft's current altitude, the wind is no longer corrected with the measured wind: the wind prediction is equal to the forecast wind,
- Between the aircraft's current altitude and 10 000 ft above the current altitude, the corrected wind is a linear interpolation between the measured wind and the forecast wind.

WIND PREDICTIONS FOR CRUISE WAYPOINTS

WIND ENTRY

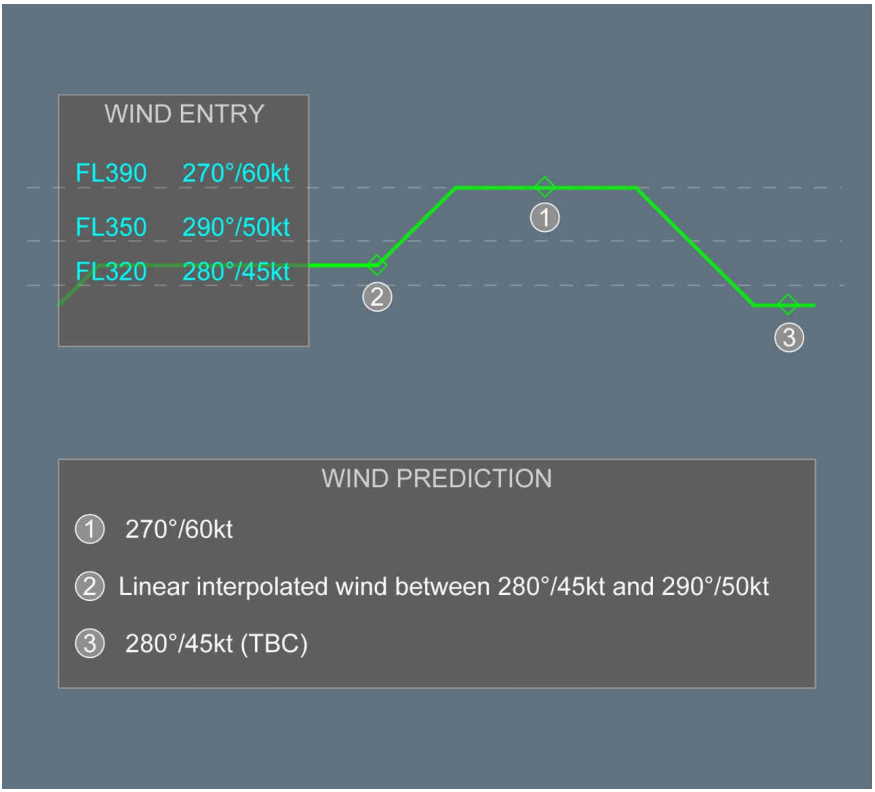
The flight crew can insert different cruise wind data for all cruise waypoints, and this for 4 different flight levels.
When the flight crew enters wind data on a waypoint, the wind direction and velocity is propagated on the down path cruise waypoints until the waypoint for which the flight crew has entered other wind data for the same flight level.
The flight crew enters the cruise winds on the CRZ panel of the WIND page. (*Refer to Page*)

FORECAST WIND PROFILE

The FMS creates the wind profile for the cruise waypoints, as follows:

- If the predicted altitude at a waypoint matches one of the entered or propagated cruise wind altitudes, the predicted wind at the waypoint is the associated descent wind
- If the predicted altitude at a waypoint is between two entered or propagated cruise wind altitudes, the predicted wind at the waypoint is linearly interpolated between the two associated descent winds
- If the predicted altitude at a waypoint is above (or below) the highest (or lowest) entered or propagated cruise wind altitude, the predicted wind at the waypoint is the extrapolated highest (or lowest) entered or propagated cruise wind.

Cruise Waypoints Predictions



Once in flight, the predicted wind profile is corrected with the measured wind. The measured wind is propagated laterally to200 nm ahead of the aircraft, and to10000 ft above and below the aircraft. The influence of the measured wind decreases with the distance (or altitude) from the aircraft.
The F-PLN page displays the wind predictions without the measured wind correction.

CORRECTED WIND PROFILE

In cruise, the FMS takes into account the measured wind, as follows:

- At the aircraft's current position and current altitude, the corrected wind is equal to the measured wind,
- Further than 200 nm ahead the aircraft, or higher than 10 000 ft above the aircraft's current altitude, the wind is no longer corrected with the measured wind: the wind prediction is equal to the forecast wind,
- Between the aircraft's current altitude and 10 000 ft above the current altitude, the corrected wind is a linear interpolation between the measured wind and the forecast wind,
- Between the aircraft's current position and 200 nm ahead the aircraft, the corrected wind is a linear interpolation between the measured wind and the forecast wind.

WIND PREDICTIONS FOR DESCENT WAYPOINTS

WIND ENTRY

The flight crew can insert descent winds for 5 different levels. The wind at ground level (GND) can be entered as one of these levels.

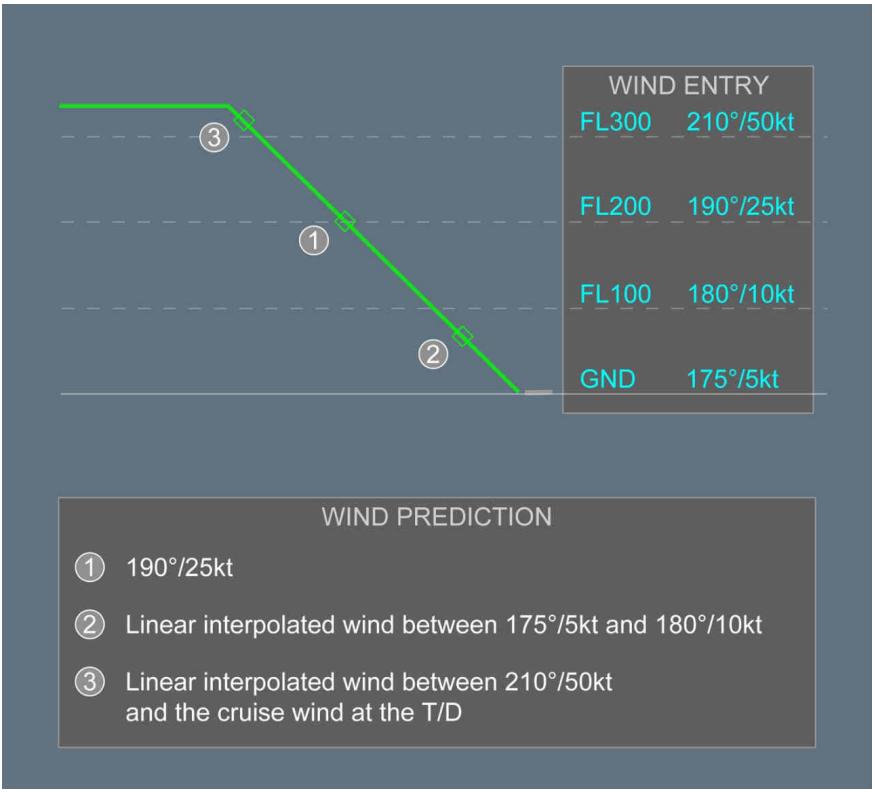
FORECAST WIND PROFILE

The FMS creates the wind profile for the descent waypoints, as follows:

- If the predicted altitude at a waypoint matches one of the entered descent wind altitudes, the predicted wind at the waypoint is the associated descent wind
- If the predicted altitude at a waypoint is between two entered descent wind altitudes, the predicted wind at the waypoint is linearly interpolated between the two associated descent winds
- If the predicted altitude at a waypoint is below the lowest entered descent wind altitude (no ground wind is entered), the predicted wind at the waypoint is linearly interpolated between zero wind at ground level, and the lowest entered descent wind
- If the predicted altitude at a waypoint is above the highest entered descent wind altitude, the predicted wind at the waypoint is linearly interpolated between the cruise wind at the T/D and the highest entered descent wind.

Note: If no descent winds (nor trip wind) are entered, the predicted descent winds are linearly interpolated between the cruise wind at T/D and zero wind at ground level.

Descent Waypoints Predictions



CORRECTED WIND PROFILE

In descent, the FMS takes into account the measured wind, as follows:

- At the aircraft's current altitude, the corrected wind is equal to the measured wind,
- Lower than 10 000 ftbelow the aircraft's current altitude, the wind is no longer corrected with the measured wind: the wind prediction is equal to the forecast wind,
- Between the aircraft's current altitude and 10 000 ftbelow the current altitude, the corrected wind is a linear interpolation between the measured wind and the forecast wind.

WIND PREDICTIONS FOR ALTERNATE FLIGHT PLAN

The flight crew can enter an alternate cruise wind.

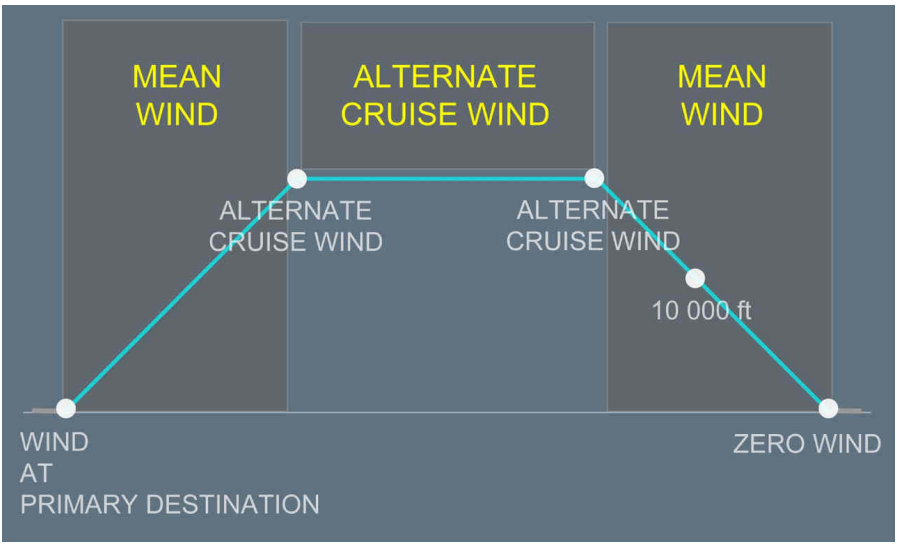
If the alternate flight plan distance is less than 200 nm, the alternate cruise flight level is defaulted to FL 220. If the alternate flight plan distance is 200 nm or more, the alternate cruise flight level is FL 310.

The FMS creates the following forecast wind profile for the alternate flight plan:

- For the alternate climb applies a mean climb wind between the wind at the primary destination and the entered alternate cruise wind
- For the alternate cruise applies the entered alternate cruise wind
- For the alternate descent applies a mean descent wind between the entered alternate cruise wind and the interpolated wind at 10 000 ft. The wind at 10 000 ft is interpolated between the entered alternate cruise wind and zero wind at ground level.

Note: *The alternate wind profile is used for predictions computation, but is not displayed on the F-PLN page.*
Once the alternate flight plan enabled (it becomes part of the active flight plan), the wind profile is computed as for the active flight plan.

Alternate Flight Plan Predictions



PREDICTIONS AND SELECTED MODES

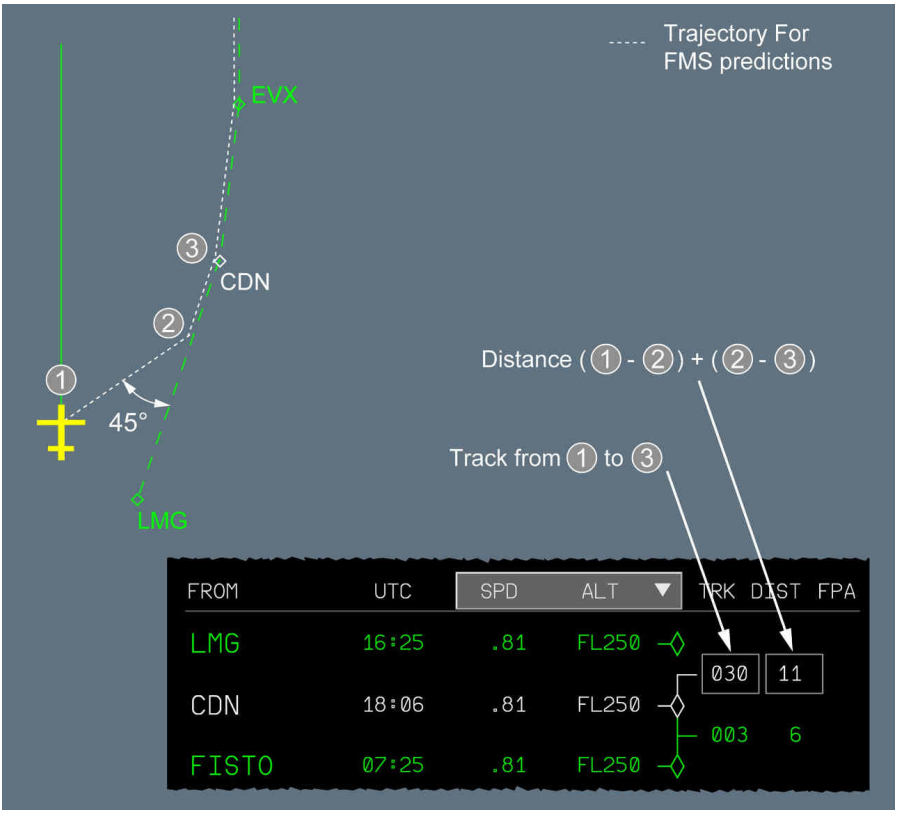
Applicable to: ALL

The FMS builds up a lateral and vertical flight plan that will be flown when the lateral and vertical managed modes are engaged.
When one or more selected modes are engaged, the predictions are updated to reflect the new situation of the aircraft.
The update of the predictions follows the general philosophy: the selected modes are short-term modes and are engaged temporarily. The FMS assumes that the flight crew returns quickly to the managed modes. The exact moment of return to the managed flight plan predictions depends on the selected mode, and the flight phase:

HDG/TRACK MODE

When the flight crew selects the HDG/TRACK mode, the FMS assumes an immediate return to the lateral flight plan. This rule is valid for all flight phases.
The return path is the direct leg from the aircraft present position to the TO waypoint. This direct leg (with its distance and track) is displayed as the first leg of the flight plan on the F-PLN page.

Example: Immediate Return to Lateral Flight Plan

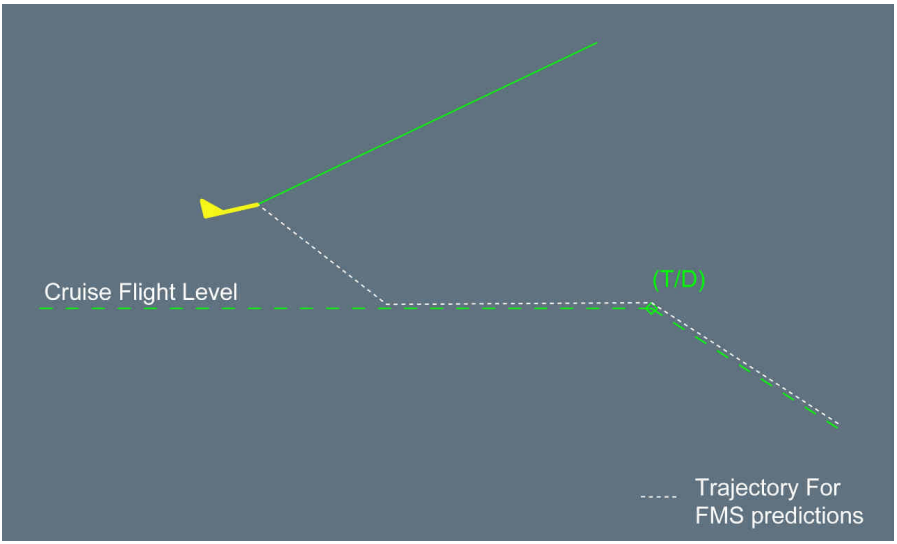


OP CLB, OP DES, OR V/S / FPA MODE

When the flight crew selects the OP CLB, OP DES, or V/S / FPA mode, the FMS assumes an immediate de-selection of the selected mode, and:

- In the climb phase: An immediate return to the CLB mode
- In the cruise phase: An immediate return to the cruise flight level (in CLB, or DES mode if necessary)
- In the descent phase: An immediate return to the theoretical descent profile in the DES mode.

Example: Immediate Return To Cruise Altitude



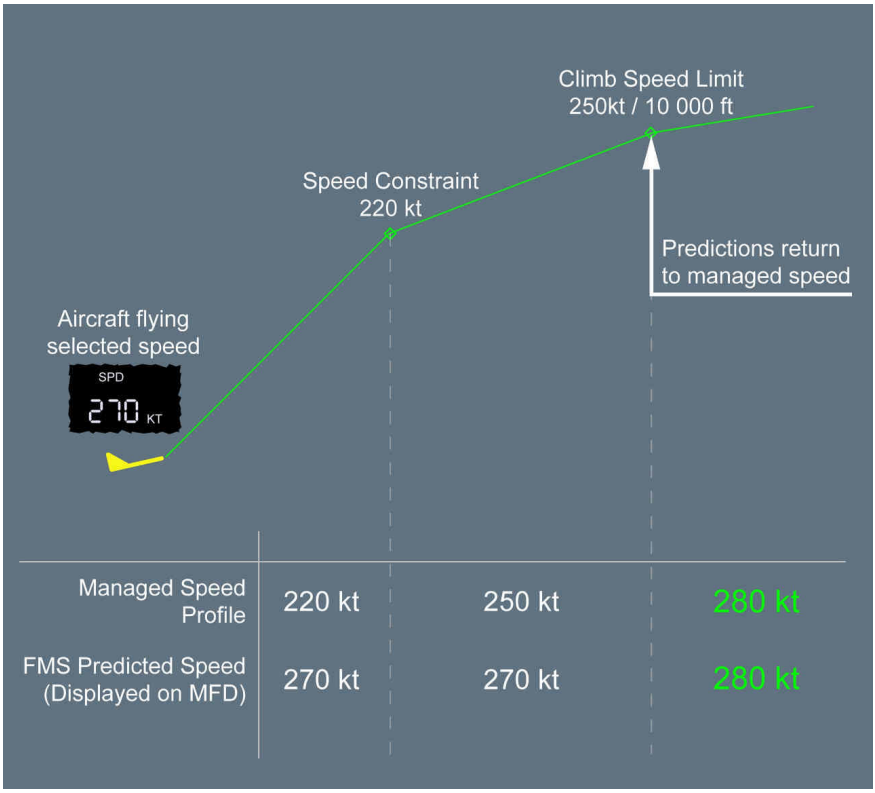
SELECTED SPEED/MACH

The FMS assumptions depend on the flight phase:

IN TAKEOFF AND CLIMB

When the flight crew engages the selected speed/MACH control, the FMS assumes a return to the managed speed at the next climb speed limit or speed constraint where the managed speed becomes greater than the selected speed.
If the managed speed does not become greater than the selected speed at the speed limit and constraints, or there are no speed limits nor speed constraints, the FMS assumes a return to the managed speed at the top of climb (T/C).

Example: Selected Speed in Climb



IN CRUISE

When the flight crew engages the selected speed/MACH control, the FMS assumes a return to the managed speed at the top of descent (T/D).

L3 When the flight crew selects a CAS (or Mach) and there is a step altitude in the flight plan, that crosses the CAS/Mach cross over altitude, the FMS uses the complementary Mach (or CAS) of the selected CAS (or Mach) for the predictions beyond the cross over altitude.

L1 ### IN DESCENT

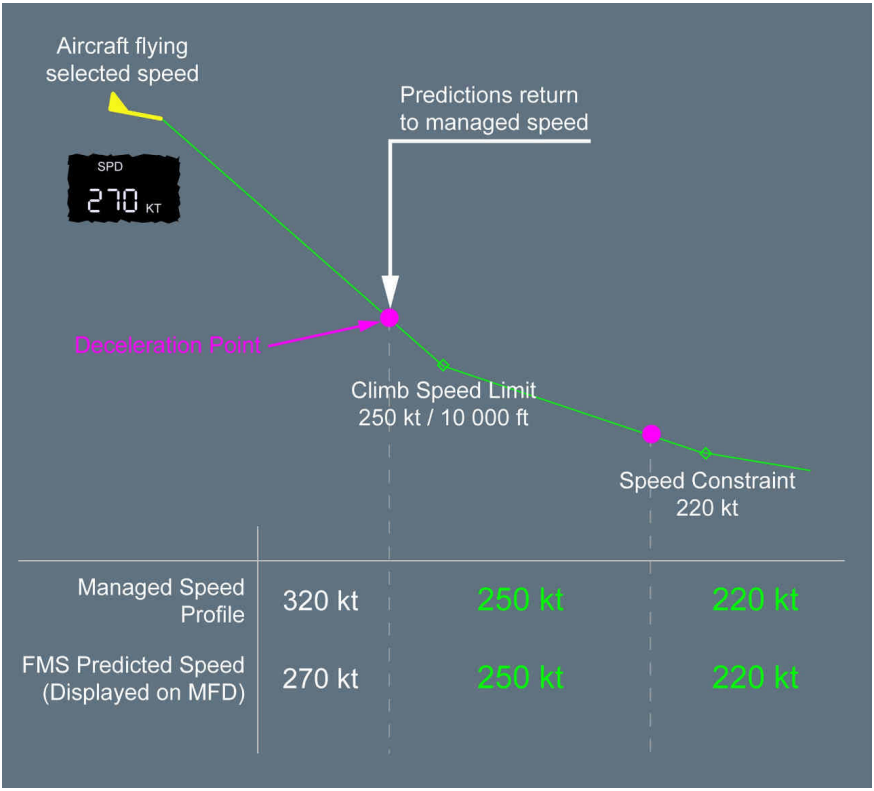
When the flight crew engages the selected speed/MACH control, the FMS assumes a return to the managed speed at the start of the deceleration to the next speed constraint or descent speed limit where the managed speed becomes less than the selected speed.

If the managed speed does not become less than the selected speed at the speed limit and constraints, or there are no speed limits nor speed constraints, the FMS assumes a return to the managed speed:

- At the deceleration point (start of the approach segment), if the managed speed after deceleration is less than the selected speed, or
- Beyond the deceleration point, where the managed speed becomes less than the selected speed.

L3 When the flight crew selects a Mach, the FMS uses the complementary CAS of the selected Mach, for the predictions beyond the cross over altitude.

Example: Selected Speed in Descent



L1 **IN APPROACH**

When the flight crew engages the selected speed/MACH control, the FMS assumes an immediate return to the managed speed.

PREDICTIONS IN GO AROUND

Applicable to: ALL

The FMS does not compute the waypoint vertical predictions for the missed approach segment. The F-PLN page only displays the distance, and track of the missed approach legs. The time, speed, altitude, EFOB, and wind predictions display dashes. If there is an altitude or speed constraint on a missed approach waypoint, the constraint value is displayed in magenta on the F-PLN page.

During the go around phase, the FMS provides only the following data for the primary and alternate destination:
- Distance
- EFOB
- Estimated Time of Arrival
- Route Reserve, Final, and Extra Fuel

For these predictions, the FMS does not consider any speed or altitude constraints, nor wind.

L2 *Note: The FMS does not compute the vertical predictions during the GA_{phase}. The FMS cannot manage a vertical flight plan when the vertical predictions are not available. At the GA ACCEL ALT, the CLB_{phase} becomes active and the FMS computes again the vertical predictions, taking into account the flight plan constraints.*
When the flight crew sets an AT, or AT or BELOW constraint, that has a constraint value that is equal to the GA ACCEL ALT, the FMS will not take into account this constraint, because of the fact that the FMS will start the predictions computation when the constraint altitude is already sequenced.

PREDICTIONS FOR THE ALTERNATE FLIGHT PLAN

Applicable to: ALL

As soon as the alternate destination and the flight plan are inserted in the flight plan, the FMS computes the following predictions:
- Alternate trip time and trip fuel,
- Estimated time and fuel on board at the alternate destination,
- Estimated extra fuel at the alternate destination.

The alternate predictions are based on the following assumptions:

- The alternate initial aircraft weight is equal to the estimated landing weight at the primary destination,
- The alternate flight plan represents a flight from takeoff at the primary destination to landing at alternate destination,
- The distance of the alternate flight plan is the distance along the alternate company route, or the distance along the alternate flight plan created by the flight crew, or the direct distance between primary and alternate destination when no waypoints have been created between them,
- If the alternate flight plan distance is less than 200 nm , the alternate cruise flight level is FL 220 . If the alternate flight plan distance is 200 nm or more, the alternate cruise flight level is FL 310 ,
- The delta ISA is constant along the alternate flight plan, and is equal to the delta ISA at the primary destination,
- The alternate trip wind is a constant value, entered by the flight crew on the DES panel of the WIND page,
  Refer to WIND page
  Refer to Wind Predictions for the Alternate Flight Plan
- The cost index is equal to 0 (minimum fuel optimization).

Datalink with Company Ground Station

INTRODUCTION

Applicable to: ALL

With the Airline Operational Control (AOC) function, it is possible to transfer data:
- From the FMS to the company ground station, i.e data requests and reports
- From the company ground station to the FMS , i.e. data messages.

The AOC function enables the transfer of the following:
- *Refer to F-PLN initialization data*
- *Refer to Wind data*
- *Refer to Takeoff data*
- *Refer to Flight reports*
- *Refer to Broadcast data.*

For more information on the AOC , *Refer to AOC function.*

L2 The FMS sends the requests and reports to the ground station via the Avionics Communication Router (ACR).
The ACR receives the data from the company ground station, and sends it to the FMS .
If a communication failure occurs between the FMS and the ACR , the FMS message area displays NOT TRANSMITTED TO ACR .

L3 For more information on the ACR , *Refer to Communication System Architecture.*

F-PLN INITIALIZATION DATA

Applicable to: ALL

The flight crew can request and receive the following flight plan initialization data from the company ground station:

- Flight number
- Lateral and vertical F-PLN data:
  - FROM, TO, ALTN airports
  - Waypoints, airways, speed/altitude constraints, step, hold procedures.
- Associated performance and load data:
  - Cruise flight level
  - Tropopause Altitude
  - Cruise Temperature
  - Perf Factor
  - Cost Index
  - Climb transition altitude
  - ZFW, ZFWCG
  - Block fuel
  - Taxi fuel
  - Route reserve.

COMPANY F-PLN REQUEST

The flight crew can send a F-PLN request:

- Before engine start: for the active and secondary flight plan

L2 *Note: For active F-PLN , a request is only possible when active F-PLN is empty*

L1 - After engine start: for the secondary flight plan only.

Only one request is possible at a time, for active or secondary flight plan.
The flight crew can initiate a company F-PLN request using the CPNY F-PLN REQUEST button on the ACTIVE or SEC1(2)(3) / INIT page, or on the SEC / INDEX page.
Refer to INIT page
Refer to SEC INDEX page

CPNY F-PLN REQUEST Button

When clicked, displays the COMPANY F-PLN REQUEST page, where the flight crew can add the flight Number, the company route and any free text before sending the request, *Refer to COMPANY F-PLN REQUEST page* .
Once the flight crew has sent the request, the button label changes to REQUEST PENDING... , till the flight plan data is received.

REQUEST PENDING ...

L2 If the FMS does not receive a response from the company ground station, within 4 min after the request:
- The FMS message area displays: NO COMPANY REPLY
- The associated buttons on the INIT, SEC INDEX, and COMPANY F-PLN REQUEST page allow a new flight plan request.

RECEIVED COMPANY F-PLN

The FMS receives flight plan initialization data:
- In response to the flight crew request, or
- Directly without previous request from the flight crew.

The FMS may receive:
- Flight plan data only
- Flight plan data with associated performance and load data
- Performance and load data only.

When the FMS receives the uplink, it displays one of the following messages in the FMS message area:
- COMPANY F-PLN RECEIVED WAITING FOR INSERTION: The uplink has only flight plan data
- COMPANY F-PLN & LOAD RECEIVED WAITING FOR INSERTION: The uplink has flight plan and performance and load data
- COMPANY LOAD DATA RECEIVED WAITING FOR INSERTION: The uplink has only performance and load data
- RECEIVED COMPANY F-PLN NOT VALID: The flight plan, up linked from the company ground station, is not valid
- RECEIVED FLT NUMBER NOT VALID: The received flight number, that is part of the up linked flight plan data, is not valid.

L3 After insertion, the FMS message area may display one of the following messages:
- CHECK CPNY RTE: The company route ident of the up linked flight plan differs from the company route ident of the flight plan request
- FLT NUMBER RECEIVED: The FMS has received the flight number, as part of the up linked flight plan data, without previous request from the flight crew
- CHECK FLT NUMBER: The company up linked flight number differs from the flight number of the flight plan request

L1 The flight crew can insert the uplink via the RECEIVED CPNY F-PLN button (or the RECEIVED CPNY LOAD button, if the uplink has only performance and load data) on the ACTIVE (or SEC) / INIT page, or on the SEC / INDEX page.

RECEIVED CPNY F-PLN

When clicked, opens a menu:
- INSERT: Inserts the uplink
- CLEAR: Clears the uplink

Note: The flight crew cannot preview the received data, prior to insertion.

The following table gives the rules of insertion for the active and secondary flight plans:

	Active flight plan empty			Active flight plan exists	
	Uplink received without request	Request from active	Request from secondary	Uplink received without request	Request from secondary
Before Engine Start	Insertion in active or secondary		Insertion in secondary only		
After Engine Start	Insertion in secondary only				

Note: The flight crew can only insert performance and load data before engine start.

WIND DATA

Applicable to: ALL

The flight crew can request and receive the following wind data from the company ground station:
- Climb winds
- Cruise winds
- Descent winds
- Alternate winds.

The flight crew can request and receive the wind data for active or secondary flight plans.

COMPANY WIND REQUEST

The flight crew can send a wind request in all flight phases, except in DES, APPR, and GA.
Before sending a request to the ground, the flight crew may define a minimum of flight plan information, depending on the forecasted wind data they need (e.g. cruise flight level, waypoints, top of climb, step climb etc.). The FMS will send this information with the request .
Only one request is possible at a time, for active or secondary flight plan.
The flight crew can initiate a wind request using the CPNY WIND REQUEST button on the INIT, or WIND page.
Refer to INIT page
Refer to WIND page

CPNY WIND REQUEST Button

When clicked, displays the COMPANY WIND DATA REQUEST page, where the flight crew can add any free text before sending the request. The request refers to the F-PLN from where it is sent.

Refer to COMPANY WIND DATA REQUEST page

Once the flight crew has sent the request, the button label changes to REQUEST PENDING... , till the wind data is received.

REQUEST PENDING ...

L2 If the FMS does not receive a response from the company ground station, within 4 min after the request:

- The FMS message area displays: NO COMPANY REPLY
- The associated buttons on the INIT, or WIND page allow a new wind request.

RECEIVED COMPANY WIND:

The FMS receives the wind data:
- In response to the flight crew request: The received wind data is linked with the flight plan from which the request was sent.
- Directly without previous request from the flight crew: The received wind data is linked to the active flight plan only.

Note: *If the active flight plan is empty, the received data are buffered till the active flight plan is filled.*

To ensure its compatibility with the active, or secondary flight plans, the received wind message has wind data for different waypoints on different altitudes or flight levels. The wind data that is not compatible with the flight plan is deleted automatically.

The FMS may receive:
- Climb wind data: Wind direction and wind velocity for up to 5 altitudes and/or flight levels
- Cruise wind data: Wind direction and wind velocity for up to 4 flight levels, for a list of cruise waypoints
- Descent wind data:
  - Wind direction and wind velocity for up to 5 altitudes and/or flight levels
  - The destination delta ISA, QNH and the transition flight level.
- Alternate wind data: Wind direction and wind velocity for the alternate cruise flight level

Note: *If the flight crew inserts wind data, with destination QNH, and/or destination ground wind, and/or destination OAT, the three values are updated on the APPR panel of the PERF page.*
In this case, when the aircraft is less than 180 nmfrom destination, the FMS displays the CHECK DES DATA message to notify the flight crew that the QNH, and/or ground wind, and/or OAT, have been completed by a company wind uplink.

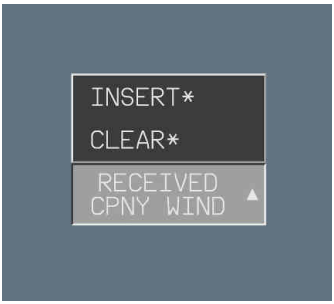
When the FMS receives the uplink, it displays one of the following messages in the FMS message area:
- COMPANY WIND DATA RECEIVED WAITING FOR INSERTION IN ACTIVE: The uplink has wind data compatible with the active flight plan
- COMPANY WIND DATA RECEIVED WAITING FOR INSERTION IN SEC1(2)(3): The uplink has wind data compatible with the secondary 1(2)(3) flight plan

- COMPANY WIND UPLINK PENDING: The FMS receives company wind data, while a temporary flight plan exists, or the DIRECT TO page is displayed. The flight crew needs to insert, or clear the temporary flight plan, or needs to finalize the DIRECT TO revision, before he can insert the received wind data.

L3 - RECEIVED COMPANY WIND DATA NOT VALID: The wind data, up linked from the company ground station, is not valid.

L1 The flight crew can insert the uplink via the RECEIVED CPNY WIND button on the ACTIVE (or SEC) / WIND page.

RECEIVED CPNY WIND Menu



When clicked, opens a menu:
- INSERT: Inserts the uplink
- CLEAR: Clears the uplink

TAKEOFF DATA

Applicable to: ALL

The flight crew can request and receive the following takeoff data from the company ground station:
- Takeoff speeds: V1, VR, V2
- Thrust rating: TOGA, Flex, Derated
- Flaps setting
- Thrust reduction and acceleration altitudes
- Noise procedure parameters.

The flight crew can request and receive takeoff data for the active flight plan only.

COMPANY TAKEOFF DATA REQUEST:

The flight crew can send a takeoff data request before engine start, for the active flight plan only.

The flight crew can initiate a takeoff data request for 2 runways using the CPNY T.O REQUEST button on the ACTIVE / INIT, or ACTIVE / PERF page.
Refer to INIT page
Refer to PERF page

COMPANY T.O. REQUEST button

When clicked, displays the COMPANY T.O DATA REQUEST page, *Refer to COMPANY T.O DATA REQUEST page* .

This page displays the data, that are sent in the request message. The FMS completes automatically the data, based on the available flight plan and load data. The flight crew may always complete or change the takeoff request data.

- The departure airport
- The runway ident
- The takeoff weight
- The takeoff CG
- The environmental conditions:
  - Baro setting
  - Wind
  - Runway condition
  - Temperature
- The takeoff thrust rating
- The FLAPS setting
- The takeoff shift
- The takeoff limit
- Any free text

The flight crew clicks on the SEND T.O REQUEST button to send the request.
Once the flight crew has sent the request, the button label changes to REQUEST PENDING... , till the flight plan data is received.

REQUEST PENDING ...

L2 If the FMS does not receive a response from the company ground station, within 4 min after the request:
- The FMS message area displays: NO COMPANY REPLY
- The associated buttons on the INIT, PERF, and COMPANY T.O DATA REQUEST page allow a new flight plan request.

RECEIVED COMPANY TAKEOFF DATA:

The FMS receives the takeoff data:
- In response to the flight crew request
- Directly, without previous request from the flight crew.

When the FMS receives the uplink, it displays one of the following messages in the FMS message area:
- COMPANY T.O DATA RECEIVED WAITING FOR INSERTION

L3 - RECEIVED COMPANY T.O DATA NOT VALID: The takeoff data, up linked from the company ground station, is not valid.

L1 The flight crew displays the received takeoff data using the RECEIVED CPNY T.O button on ACTIVE / INIT page or ACTIVE / PERF page.

RECEIVED CPNY T.O.

When clicked, displays the RECEIVED COMPANY T.O DATA page, *Refer to RECEIVED COMPANY T.O DATA page* .

The received takeoff data (for up to 4 different takeoff runways and for up to 2 engine thrust ratings per runway) are:

- The takeoff runway
- The takeoff weight
- The takeoff CG
- The environmental conditions:
  - Baro setting
  - Wind
  - Runway condition
  - Temperature
- The takeoff speeds: V1, VR, V2
- The takeoff thrust rating
- The flaps setting
- The takeoff shift
- The takeoff limit
- The thrust reduction and acceleration altitudes
- The noise procedure parameters.

The flight crew can insert (or clear) this data using the INSERT (or CLEAR) button. When inserted, the T.O panel of the PERF page is updated.

L2 The flight crew can insert the received takeoff data only if the following conditions are fulfilled:
- The departure airport and runway match the departure airport and runway of the active flight plan
- The takeoff weight is not more than 4 400 lb below or 15 500 lb above the takeoff weight on the FUEL&LOAD page
- The following data are part of the received data: The takeoff speeds (V1, VR, V2), wind, runway condition, baro setting and temperature.

Note:
- *If one of these conditions is not met, the flight crew cannot insert the uplinked data.*
- *If the condition on the takeoff weight is not met and the received runway matches the active runway, the TOW value appears in amber on the RECEIVED COMPANY T.O DATA page, associated with the UPLINK/ACTIVE TOW DISAGREE message.*

FLIGHT REPORTS

Applicable to: ALL

The FMS sends real time flight reports to provide information on the aircraft's current position and situation to the company ground station. There are 4 types of reports:
- Position report: Current aircraft position
- Progress report: Destination data
- F-PLN report: Active flight plan data
- Performance data report: Active performance data.

The flight crew can manually send the position and F-PLN reports.
The FMS can automatically send the position, progress, F-PLN and performance data reports after specific events or in response to a ground request.

POSITION REPORT

The position report has the following information:
- Last sequenced waypoint with its related SAT , wind and FOB
- TO waypoint
- NEXT waypoint
- Next cruise vertical profile change
- Destination with its related ETA , distance and EFOB

The flight crew can display and send the position report on the POSITION / REPORT page, *Refer to Page* .

PROGRESS REPORT

The progress report has the ETA and EFOB at destination.

The FMS automatically sends a position report upon a ground request, or if one of the following occurs:

- A change of the destination airport in flight
- A change of the destination runway in flight
- A specific event (optional):
  - X minutes to T/D
  - X minutes to destination
  - The ETA differs from the initial ETA by more than X minutes.

  The airline defines X.

F-PLN REPORT

The F-PLN report has the following information:

- Company route
- Flight number
- Departure airport
- Takeoff runway
- Departure procedure
- En route segment
- Destination airport
- Arrival procedure
- Approach procedure
- Destination runway
- Step

The flight crew can send a F-PLN report by selecting CPNY F-PLN REPORT in the F-PLN INFO menu of the ACTIVE / F-PLN page, *Refer to Page* .

PERFORMANCE DATA REPORT

The performance report has the following information:

- Current GW
- Cruise flight level
- Current CG
- FOB
- Block fuel
- Route reserve
- CI
- T/C temperature
- Climb transition altitude
- Performance factor

- Tropopause altitude
- Taxi fuel
- ZFW
- ZFWCG

The FMS automatically sends a performance report upon a ground request.

BROADCAST DATA

Applicable to: ALL

The FMS automatically sends data to the ACR. The FMS acts as an information provider without any flight crew action.

L2 The data sent to the ACR is:

- MS identifier word (System Address Label)
- Flight number
- Active database
- Company route
- TO waypoint
- Wind direction and velocity
- ZFW
- Block fuel
- FOB
- GW
- Destination runway
- Alternate destination
- ETA
- Discrete AP modes
- Discrete flight phase
- Aircraft altitude, latitude/longitude
- Roll angle
- City pair.

Datalink with ATC Center

INTRODUCTION

Applicable to: ALL

The ATC function of the FMS enables the flight crew to:

- Prepare and send flight plan clearances requests to an ATC center, *Refer to ATC F-PLN Clearance Request* .
- Receive ATC flight plan clearances from an ATC center, *Refer to Received ATC F-PLN Clearance* .

To request or receive flight plan clearances, the ATC Datalink system must be connected and notified to an ATC center, for more information *Refer to ATC Datalink System.*

The ATC flight plan clearances, requested or received, may have the following information:

- Departure:
  - Airport
  - Runway
  - Procedure (SID)
  - TRANS
- Enroute segment:
  - Waypoints
  - Holding patterns
  - Speed and/or altitude constraints
  - Time constraints
  - Airways
- Arrival:
  - TRANS
  - Procedure (STAR)
  - Approach transition (APPR VIA)
  - Approach procedure (APPR)
  - Airport
  - Runway

L2 In addition, the FMS automatically sends data (position, altitude, speed...) to the ATC Datalink System. This data is used for:

- The ATC reports:
  - *Refer to Position Reports*
  - *Refer to Modify Reports*
  - *Refer to Other Reports* .
- The ATC confirm messages
- The ATC deferred clearances: *Refer to How to Manage a Deferred Clearance Message*
- The ADS function: *Refer to ADS* .

Note: For all ATC reports, the FMS acts as an information provider without any flight crew action.

ATC F-PLN CLEARANCE REQUEST

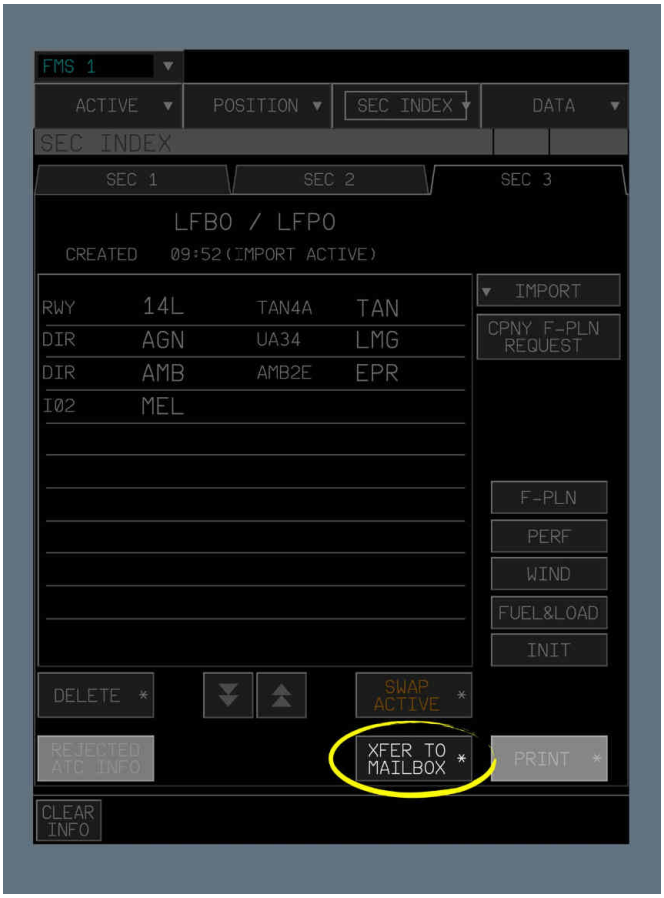
Applicable to: ALL

The flight crew can, during all the phases of flight, request an ATC F-PLN clearance:

- To initialize the flight plan
- To modify the flight plan.

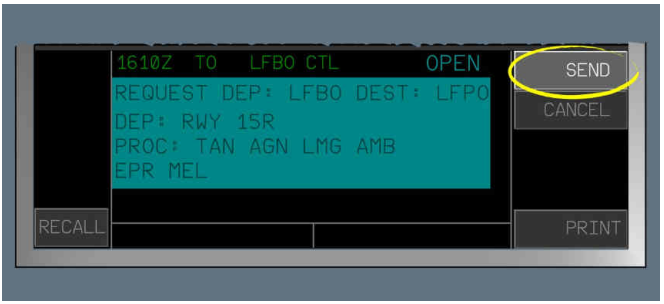
To initiate an ATC F-PLN Request, the flight crew will prepare the desired flight plan in the secondary flight plan SEC 1(2)(3) and, then transfer it in the mailbox.
For more information, *Refer to Secondary Flight Plans* .
The flight crew sends the desired flight plan to the mailbox by clicking on the XFER TO MAILBOX button on the SEC INDEX page.

TRANSFER TO MAILBOX



The flight crew then sends the ATC flight plan request to the ATC center by clicking on the SEND button on the mailbox.

SEND button on the mailbox



Only one F-PLN clearance request can be loaded in the mailbox at a time.

L2 Furthermore, as soon as the request is transferred in the mailbox, the flight crew has 2 min to send the clearance request to the ATC center, otherwise the mailbox displays the message CLOSE RTE REQUEST FIRST.

RECEIVED ATC F-PLN CLEARANCE

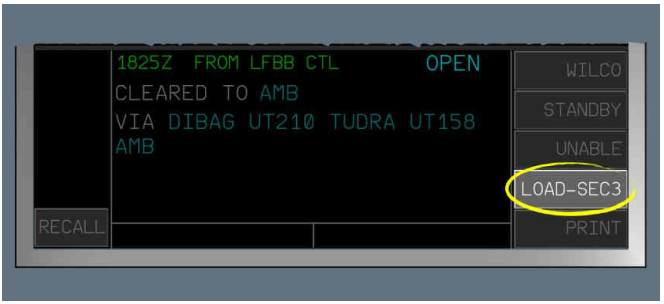
Applicable to: ALL

The ATC center may clear the flight crew to fly a route by sending a loadable flight plan clearance:

- To initialize the flight plan
- To modify the flight plan.

The flight crew first receives the flight plan clearance in the mailbox.
When received, the flight crew can load the flight plan clearance to the third secondary flight plan (SEC 3) by clicking on the mailbox LOAD-SEC 3 button.

LOAD-SEC3 button on Mailbox

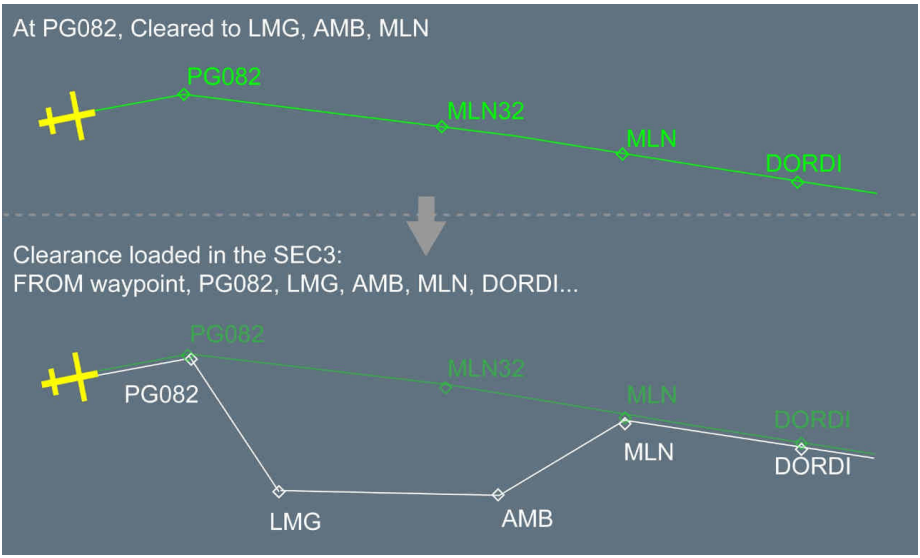


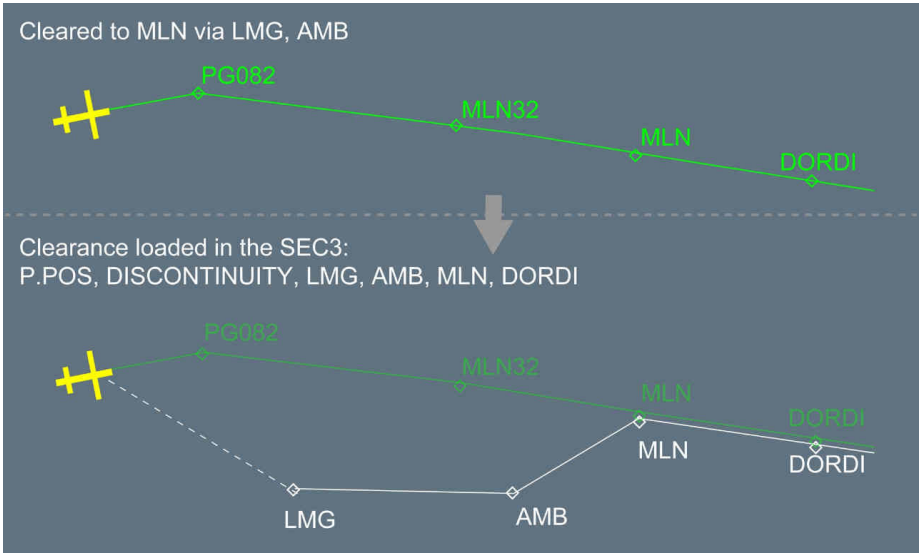
For more information, *Refer to How to manage a received ATC F-PLN clearance*

To load the ATC clearance, the FMS automatically creates a third secondary flight plan as a copy from the active flight plan and inserts the ATC clearance. When the clearance is a flight plan initialization, the FMS also copies all data from the ACTIVE/INIT and ACTIVE/FUEL&LOAD pages into the third secondary flight plan (SEC 3).

Note: *If there is a flight plan in SEC 3, this flight plan will be deleted when the ATC flight plan is up loaded.*
To avoid an involuntary loss of a flight plan, the flight crew has to copy the SEC 3 flight plan in SEC 1, or SEC 2 before up loading the ATC flight plan.

L2 Examples:





L1 When the received ATC F-PLN clearance is loaded in the FMS , one of the following message appears in the FMS messages area:

- ATC F-PLN INSERTED IN SEC3: The received ATC F-PLN is loaded in the secondary flight plan SEC3

L2 The mailbox displays LOAD OK. *Refer to ATC mailbox messages.*

L1 - ATC F-PLN INSERTED IN SEC 3 REJECTED INFO SEE SEC / INDEX: The received ATC F-PLN is partially loaded in the secondary flight plan SEC 3 due to not valid data sent by the ATC center.
The flight crew can review the rejected data from the REJECTED ATC INFO page, *Refer to REJECTED ATC INFO page.*

L2 The mailbox displays PARTIAL LOAD. *Refer to ATC mailbox messages.*

L1 - RECEIVED ATC MSG NOT VALID: The received ATC F-PLN is totally rejected by the FMS due to not valid data sent by the ATC center.
The flight crew can review the rejected data from the REJECTED ATC INFO page, *Refer to REJECTED ATC INFO page.*

L2 The mailbox displays LOAD FAILED. *Refer to ATC mailbox messages.* Any data previously entered in the SEC3 is deleted.

Introduction

INTRODUCTION

Applicable to: ALL

The performance function of the FMS:

- Provides the operating speeds for takeoff, approach, and go-around,
- Computes an optimum, and recommended maximum flight level,
- Computes a speed/Mach profile for the CLIMB, CRUISE, and DESCENT phase, that is based on the cost index,
- Computes a descent path from the cruise flight level to the destination airport,
- Allows the flight crew to fly a Noise Abatement Departure Procedure (NADP) in managed speed mode.

Intentionally left blank

Cost Index

COST INDEX

Applicable to: ALL

The operator uses the cost index to achieve minimum trip cost by means of a trade-off between operating costs per hour (time costs) and fuel consumption per hour (fuel costs).

Cost Index (CI) = $\frac{TimeCosts}{FuelCosts}$

The range of the cost index is between 0 and 999:
CI = 0, means optimized fuel cost (maximum range),
CI = 999, means optimized time cost (minimum time).

The FMS uses the cost index to compute the ECON speed/Mach, that define the managed speed profile. (*Refer to Managed Speed Profile*)
The FMS also uses the cost index to compute the optimum flight level. (*Refer to Optimum Flight Level*)
The cost index is often associated to a company route.
The flight crew can also enter (or change) the cost index manually. The cost index can no longer be changed when the DES $_{phase}$ becomes active.
L2 When the flight crew has not entered a cost index before entering the ZFW (on the FUEL&LOAD page), the FMS sets a default value. The default value is the last cost index of the previous flight, stored in the DONE $_{phase}$ (or 0, if there is no stored cost index, after a power up for example).

CONTROLS AND INDICATORS

The flight crew can enter (or change) the cost index on the INIT, FUEL&LOAD, or on the CLB, CRZ, and DES panel of the PERF page.
Refer to INIT Page
Refer to FUEL&LOAD Page
Refer to PERF Page
L2 When the flight crew has not entered a cost index before entering the ZFW (on the FUEL&LOAD page), the FMS sets a default value. The default value is the last cost index of the previous flight, stored in the DONE phase (or 0, if there is no cost index, after a power up for example).

ASSOCIATED MESSAGES

Intentionally left blank

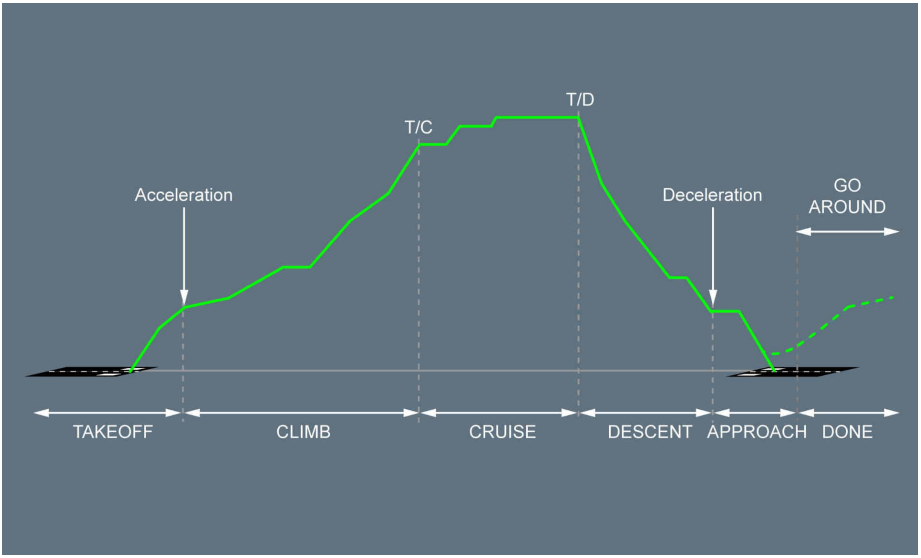
FMS Flight Phases and Speed Profile

FLIGHT PHASES - OVERVIEW

Applicable to: ALL

The vertical flight plan is divided into eight flight phases: PREFLIGHT, Takeoff (T.O), Climb (CLB), Cruise (CRZ), Descent (DES), Approach (APPR), Go-Around (GA), and DONE.

FMS Flight Phases



For each flight phase, the FMS computes the optimum speed/Mach profile. The aircraft will fly this speed profile when the managed speed control is active.

L123

Flight Phase	Speed Profile	Switching Conditions
PREFLIGHT *(1)*	-	See PREFLIGHT → T.O
T.O	*Refer to T.O Speed Profile*	See T.O → CLB
CLB	*Refer to CLB Speed Profile*	See CLB → CRZ See CLB → APPR See CLB → DES See CLB → GA

Continued on the following page

Continued from the previous page

Flight Phase	Speed Profile	Switching Conditions
CRZ	*Refer to CRZ Speed Profile*	See CRZ → DES See CRZ → APPR See CRZ → GA
DES	*Refer to DES Speed Profile*	See DES → APPR See DES → CRZ See DES → GA See DES → CLB
APPR	*Refer to APPR Speed Profile*	See APPR → DONE See APPR → GA See APPR → CLB See APPR → CRZ
GA	*Refer to GA Speed Profile*	See GA → CLB See GA → APPR
DONE *(2)*	-	See Any flight phase → DONE See DONE → PREFLIGHT See DONE → T.O

(1) In the PREFLIGHT phase, the flight crew inserts the flight plan, and all other data that are needed for the flight.

(2) In the DONE phase, the FMS erases the data that was entered for the flight.

PREFLIGHT → T.O

- The SRS TO mode is engaged (*Refer to SRS TO Mode*),
  and
- The current engine thrust is sufficient (two inner engines N1 ≥ 85 %), **or**
  The ground speed > 90 kt .

T.O → CLB

At the acceleration altitude, **or**
The flight crew engages one of the following vertical modes: V/S , FPA , ALT* , ALT , ALT CST* , ALT CST , CLB , OP CLB , DES or OP DES . (*Refer to AF/FD Modes*)

CLB → CRZ

The aircraft reaches the cruise flight level (The ALT CRZ* , or ALT CRZ mode is engaged).

CLB → APPR

The flight crew activates the approach phase via the ACTIVATE APPR button on the PERF page. (*Refer to Page*)

L3 **CLB → DES**

- The distance to destination (along the flight plan) ≤ 200 nm , **or**
  The selected altitude target ≤ Max (FL 200 , highest descent altitude constraint), **or**
  There is no destination,
  and
- The selected altitude target ≤ cruise flight level,
  and
- DES or OP DES is engaged, **or**
  V/S or FPA is engaged, and the selected altitude target ≤ aircraft current altitude.

CLB → GA

The flight crew engages the go-around modes. (*Refer to Go-Around Modes*)

L1 **CRZ → DES**

- No planned step descent ahead the aircraft,
  and
- The distance to destination (along the flight plan) ≤ 200 nm , **or**
  The selected altitude target ≤ Max (FL 200 , highest descent altitude constraint),
  and
- The selected altitude target ≤ cruise flight level,
  and
- DES or OP DES is engaged, **or**
  V/S or FPA is engaged, and the selected altitude target ≤ aircraft current altitude.

CRZ → APPR

The flight crew activates the approach phase via the ACTIVATE APPR button on the PERF page. (*Refer to Page*)

L3 **CRZ → GA**

The flight crew engages the go-around modes. (*Refer to Go-Around Modes*)

L1 **DES → APPR**

The aircraft overflies the DECEL pseudo-waypoint, with NAV mode engaged and at an altitude < 7 200 ft AGL , **or**
The flight crew activates the approach phase via the ACTIVATE APPR button on the PERF page. (*Refer to Page*)

L2 **DES → CRZ**

The flight crew defines a new cruise flight level (on the PERF page, *Refer to Page*), **and** the aircraft altitude ≥ cruise flight level.

L3 **DES → GA**

The flight crew engages the go-around modes. (*Refer to Go-Around Modes*)

DES → CLB

The flight crew defines a new cruise flight level (on the PERF page, *Refer to Page*), **and** the aircraft altitude < cruise flight level.

L1 **APPR → DONE**

30 s after landing.

APPR → GA

The flight crew engages the go-around modes. (*Refer to Go-Around Modes*)

L3 **APPR → CLB**

The flight crew defines a new cruise flight level (on the PERF page, *Refer to Page*), **and** the aircraft altitude < cruise flight level.

APPR → CRZ

The flight crew defines a new cruise flight level (on the PERF page, *Refer to Page*), **and** the aircraft altitude ≥ cruise flight level.

L1 **GA → CLB**

At the go-around acceleration altitude, **or**
The flight crew engages one of the following vertical modes: V/S , FPA , ALT* , ALT , ALT CST* , ALT CST , CLB , OP CLB , DES or OP DES . (*Refer to AF/FD Modes*)

GA→ APPR

The flight crew activates the approach phase via the ACTIVATE APPR button on the PERF page. (*Refer to Page*)

ANY FLIGHT PHASE → DONE

Not airborne for 30 s , **and** all engines are off.

DONE → PREFLIGHT

The flight crew displays the ACTIVE / INIT, ACTIVE / FUEL&LOAD, or ACTIVE PERF page, **or**
The flight crew initializes the flight plan by swapping a secondary flight plan, or by inserting a company flight plan uplink.

L3 **DONE → T.O**

- The SRS TO mode is engaged (*Refer to SRS TO Mode*),
  and
- The current engine thrust is sufficient (two inner engines N1 ≥ 85 %), **or**
  The ground speed > 90 kt .

FLIGHT PHASES - SPEED PROFILE

Applicable to: ALL

For each flight phase, the FMS computes the optimum speed/Mach profile. The aircraft will fly this speed profile when the managed speed control is active.

TAKEOFF

OPERATING SPEEDS

The performance function computes the operating speeds for takeoff, and displays these speeds on the T.O panel of the PERF page (*Refer to PERF page*):

- The Flaps retraction speed F: The minimum recommended speed at which the flaps may be retracted from CONF 2 or 3 to CONF 1+F after takeoff,
- The Slats retraction speed S: The minimum recommended speed at which the slats may be retracted,
- The Green Dot speed O : The recommended speed with the best climb performance, and the minimum fuel consumption.

L2 In PREFLIGHT, the FMS uses the estimated weight, CG to compute the operating speeds. During the T.O $_{phase}$, the FMS uses the current weight and CG .

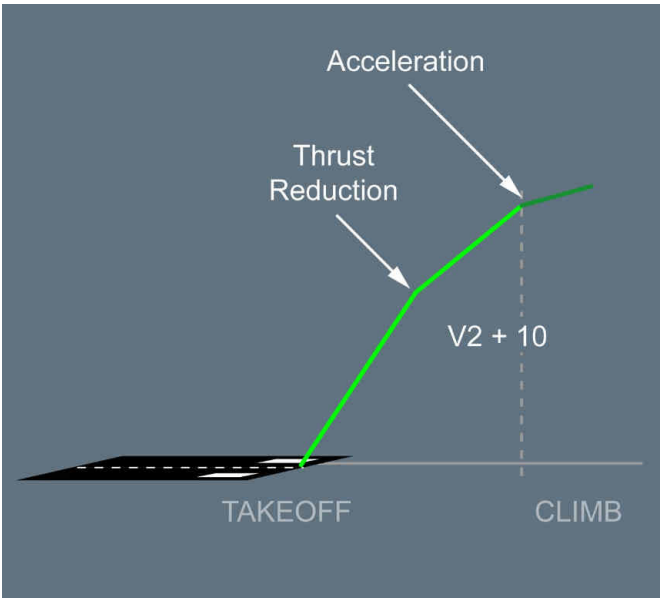
Note: The operating speeds that are displayed on the PFD , are computed by the PRIM s, always based on the current weight, CG . Therefore, in PREFLIGHT, the operating speeds displayed on the PFD may be slightly different from the speeds displayed on the T.O panel of the PERF page.

L1 **MANAGED SPEED PROFILE**

From liftoff to the acceleration altitude, the managed speed target is V2 + 10 kt .

Note: The magenta triangle on the PFD airspeed scale indicates V2. However, the managed speed target is V2 + 10 kt .

T.O Speed Profile



CLIMB

The FMS computes an optimized speed/Mach couple (ECON speed/Mach), that is based on:
- The cost index
- The aircraft gross weight
- The cruise flight level
- The wind and temperature data
- A time constraint, if any (*Refer to Time Constraint*).

When a time constraint exists, the optimized speed is called RTA.

L3 The ECON speed/Mach are limited by the following operational speed envelope:
- Minimum Speed = MAX (VLS , green dot)
- Maximum Speed = MIN (MMO -Δ MMO , VMO -Δ VMO , Mach(0.3G buffet margin)).

L1 The CLB panel of the PERF page displays the ECON speed/Mach couple for the CLB $_{phase}$. (*Refer to PERF page*)

MANAGED SPEED PROFILE

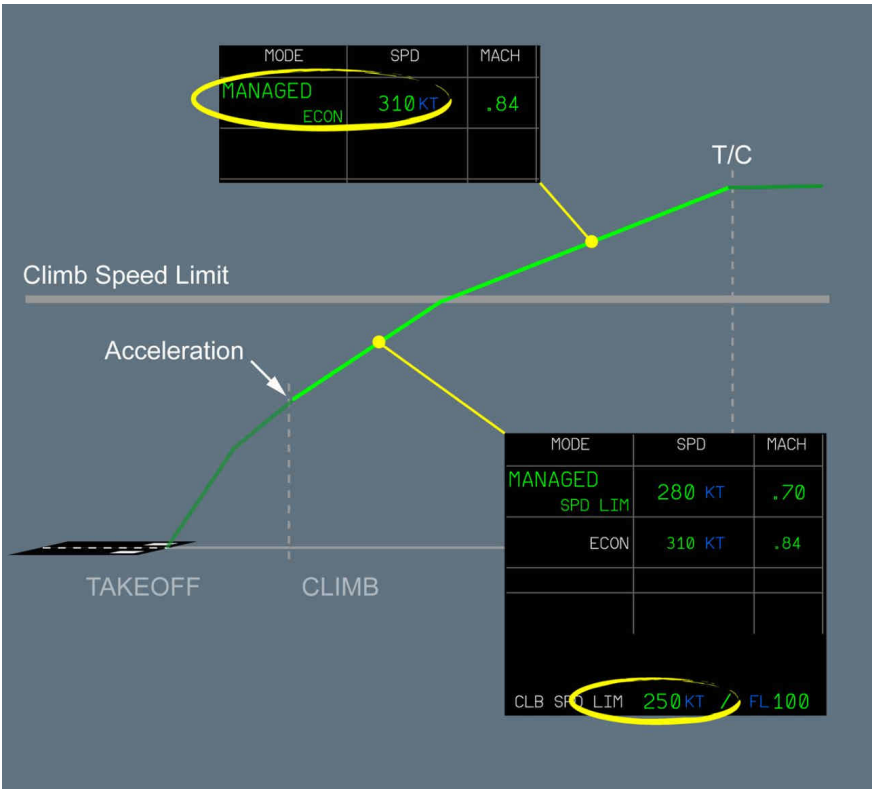
When a climb speed limit (or climb speed constraint) is defined in the flight plan, the managed speed target is:

- The speed limit (or speed constraint) between the acceleration altitude and the speed limit altitude (or speed constraint waypoint)
- The ECON speed/Mach between the speed limit altitude (or speed constraint waypoint) and the T/C.

L3 The aircraft flies at the ECON speed until the cross-over altitude. Between the cross-over altitude and the T/C, the aircraft flies at the ECON Mach. The cross-over altitude is the altitude where the ECON speed and the ECON Mach have the same TAS.

L1 The CLB panel of the PERF page also displays the climb speed limit (or climb speed constraint), if any.
Refer to Speed Limit
Refer to Speed Constraint
If no climb speed limit (nor climb speed constraint) is defined in the flight plan, the managed speed target, between the acceleration altitude and the T/C, is the ECON speed/Mach.

CLB Speed Profile



CRUISE

ECON

The FMS computes an optimized Mach/speed (ECON speed/Mach) , that is based on:

- The cost index
- The aircraft gross weight
- The cruise flight level
- The wind and temperature data
- A time constraint, if any (*Refer to Time Constraint*).

L2 The FMS computes a cruise Mach when the cruise flight level is above FL 200 , and a cruise speed when the cruise flight level is below FL 200 .

L1 When a time constraint exists, the optimized speed is called RTA.

L3 The ECON speed/Mach are limited by the following operational speed envelope:
- Minimum Speed = MAX (VLS , green dot)
- Maximum Speed = MIN (MMO -Δ MMO , VMO -Δ VMO , Mach(0.3G buffet margin), Mach(Thrust Limitation)).

L1 The CRZ panel of the PERF page displays the ECON Mach/speed for the CRZ_{phase} . (*Refer to PERF page*)

LONG RANGE CRUISE MACH (LRC)

For the CRZ_{phase} , the FMS also computes the speed to fly a long range (minimum fuel consumption).

The LRC Mach depends on:
- The current gross weight
- The wind and temperature conditions.

The CRZ panel of the PERF page displays the LRC Mach.
To fly this speed, the flight crew selects the LRC Mach on the AFS CP, and engages the manual speed control.

MAXIMUM TURBULENCE MACH (MAX TURB)

For the CRZ_{phase} , the FMS also computes the recommended speed in turbulent atmospheric conditions.
The turbulence speed is a protection against inadvertent stall, and maintains structural margins.

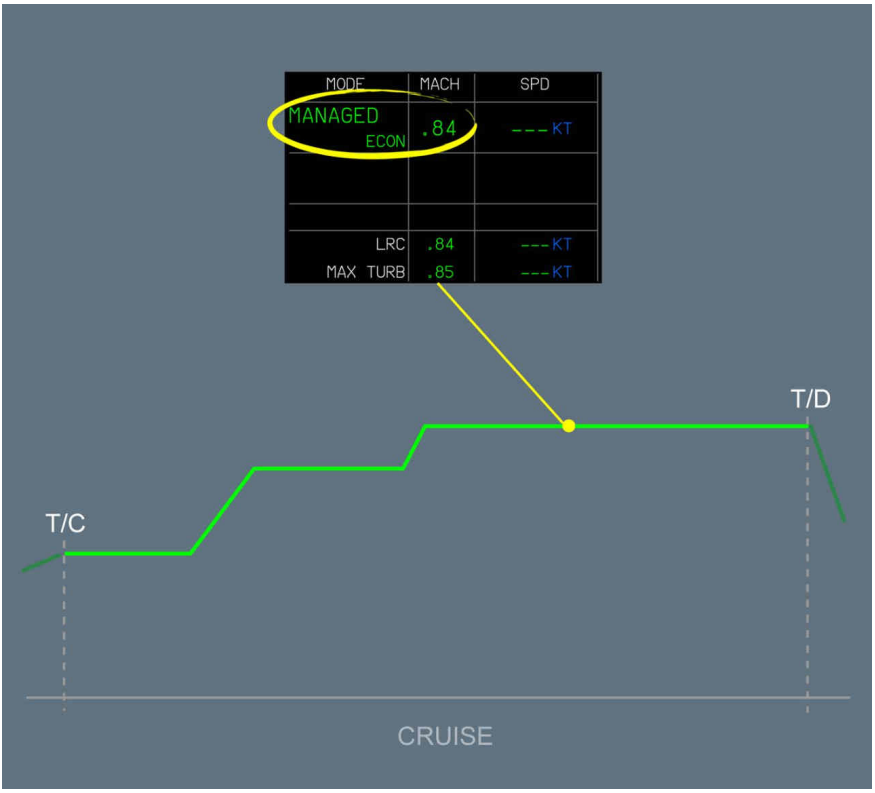
The MAX TURB Mach depends on:
- The current gross weight
- The current altitude.

The CRZ panel of the PERF page displays the MAX TURB Mach.
To fly this speed, the flight crew selects the MAX TURB Mach on the AFS CP, and engages the manual speed control.

MANAGED SPEED PROFILE

When no Constant Mach Segment (CMS) is defined in the flight plan, the managed speed target, between the acceleration altitude and the T/C, is the ECON Mach/speed.

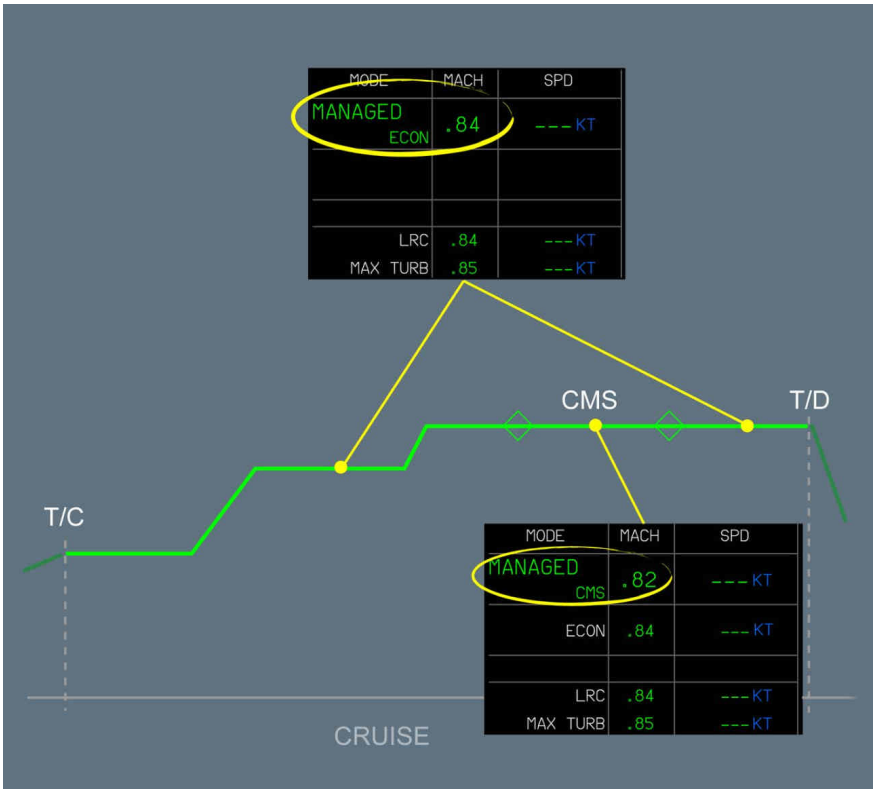
CRZ Speed Profile



When a CMS is defined in the flight plan, the managed speed target is:

- The Mach defined by the flight crew, during the CMS (*Refer to Constant Mach Segment*) When the aircraft is flying a CMS , the optimized speed is called CMS. A CMS has priority over a time constraint.
- The ECON Mach/speed otherwise.

CRZ Speed Profile - with CMS



DESCENT

The FMS computes an optimized Mach/speed (ECON Mach/speed) , that is based on:

- The cost index
- The aircraft gross weight at the T/D
- The cruise flight level
- The wind and temperature data
- A time constraint, if any (*Refer to Time Constraint*).

When a time constraint exists, the optimized speed is called RTA.

L3 The ECON speed/Mach are limited by the following operational speed envelope:
- Minimum Speed = MAX (VLS , green dot),
- Maximum Speed = MIN (MMO -Δ MMO , VMO -Δ VMO , Mach(0.3G buffet margin)).

L1 Before the DES $_{phase}$, the flight crew can change the ECON speed. If he does so, the speed will not be updated during the DES $_{phase}$ when the flight conditions change.
The DES panel of the PERF page displays the ECON Mach/speed couple for the DES $_{phase}$. (*Refer to PERF page*)

L2 **OPTIMIZED DESCENT PATH**

The descent path is computed to minimize the fuel consumption, while respecting the various altitude constraints and the descent speed profile, in order to reach VAPP at 1 000 ft .

The descent path computation is also based on:
- The lateral and vertical flight plan data,
- The descent and approach winds, and the maximum cabin descent rate.

During the DES $_{phase}$, the descent path is updated when the flight crew changes the flight plan, or any approach data (approach wind, VAPP , or landing configuration).

Note: *The descent path computation does not take into account the position of the speed brakes.*

L1 **MANAGED SPEED PROFILE**

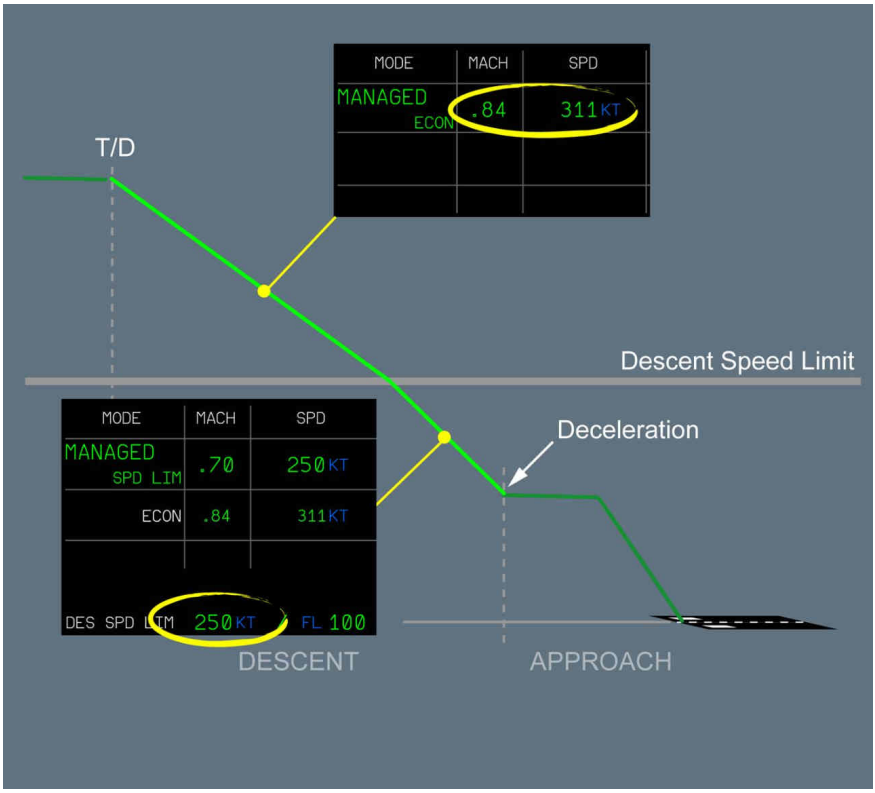
When a descent speed limit (or descent speed constraint) is defined in the flight plan, the managed speed target is:
- The ECON Mach/speed between the T/D and the speed limit altitude (or speed constraint waypoint),

L3 The aircraft flies at the ECON Mach until the cross-over altitude. Between the cross-over altitude and the DECEL point, the aircraft flies at the ECON speed. The cross-over altitude is the altitude where the ECON speed and the ECON Mach have the same TAS.

L1 - The speed limit (or speed constraint) between the speed limit altitude (or speed constraint waypoint) and the DECEL point.

The DES panel of the PERF page also displays the descent speed limit (or descent speed constraint), if any.
Refer to Speed Limit
Refer to Speed Constraint
If no descent speed limit (nor descent speed constraint) is defined in the flight plan, the managed speed target, between the T/D and the DECEL point, is the ECON speed/Mach.

DES Speed Profile



APPROACH

The performance function computes the following speeds for the APPR $_{phase}$:

- The operating speeds (green dot, S, and F),
- VREF ,
- VLS of the selected landing configuration,
- VAPP .

Before the APPR $_{phase}$, the FMS uses the predicted landing weight and CG to compute the speeds.
When the APPR $_{phase}$ is active, the FMS uses the current GW and CG .
The APPR panel of the PERF page displays these speeds. (*Refer to PERF page*)

OPERATING SPEEDS

The performance function computes the operating speeds (green dot, S, and F):

- The green dot speed O : The managed speed target, when in CONF 0,
- The Slats extension speed S: The managed speed target, when in CONF 1 or CONF 1+F,
- The Flaps extension speed F: The managed speed target, when in CONF 2 or CONF 3.

VLS

VLS is the lowest selectable speed for the selected landing configuration.

The VLS depends on:
- The selected landing configuration (The FMS computes the VLS for CONF 3 or CONF FULL),
- The estimated landing weight and CG ,
- The destination airport elevation.

L3 When the APPR $_{phase}$ is active, the FMS uses the current weight and CG , received from the FQMS .

Note: The VLS , that is displayed on the PFD , is computed by the PRIM s, and is based on the current weight, CG , flaps configuration, and altitude. (Refer to VLS from PRIM s) Therefore, the VLS displayed on the PFD may be different from the VLS , displayed on the APPR panel of the PERF page.

L1 ### VAPP

VAPP is the final approach speed. It is the managed speed target when in the approach configuration (CONF 3 or CONF FULL).

To compute a default VAPP , the FMS takes into account:
- VLS , that depends on the selected landing configuration,
- The wind at the destination airport,
L3 - Constants, defined in different tables, that are selected by OPC option.

L1 The flight crew can always overwrite the default value.

VREF

VREF is the reference speed for approach and landing. This speed is used to compute the regulatory landing performance of the aircraft.
The flight crew also uses this speed to compute landing performance with failures.

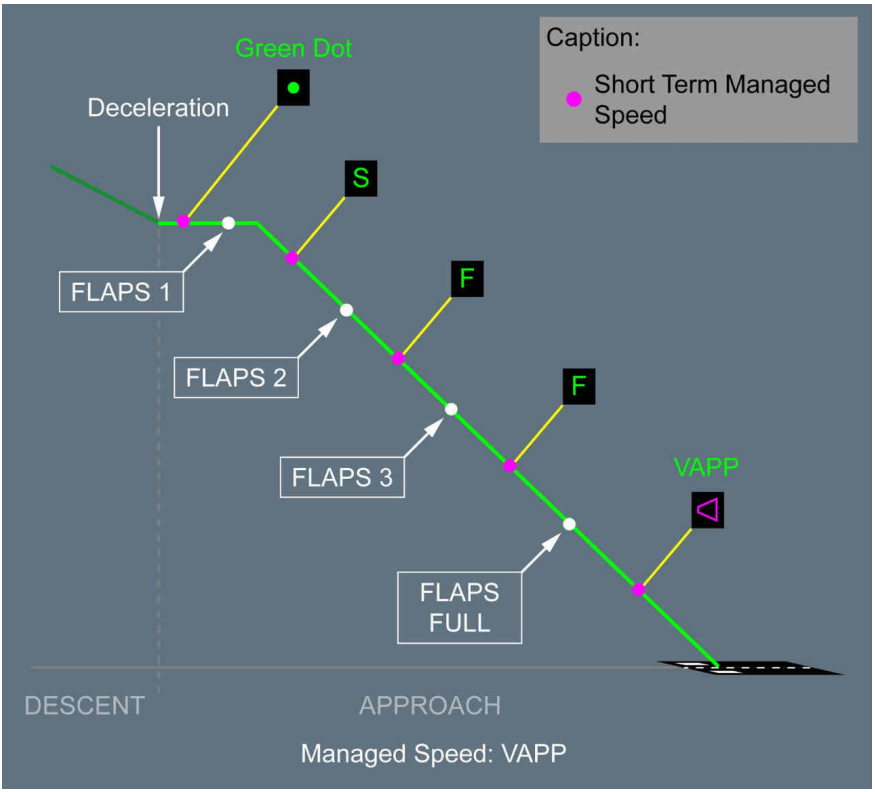
MANAGED SPEED PROFILE

During the APPR $_{phase}$, the managed speed target is VAPP .

However, the flight guidance uses the short-term managed speed as the current speed target:

- When sequencing the DECEL point, the short-term managed speed is green dot: the aircraft decelerates from the descent speed to green dot,
- When the flight crew sets PLAPS 1, the short-term managed speed becomes the S speed, the aircraft decelerates from green dot to S,
- When the flight crew sets FLAPS 2, the short-term managed speed becomes the F speed, the aircraft decelerates from S to F,
- When the flight crew sets FLAPS 3:
  - And the landing FLAPS setting is CONF FULL: the short-term managed speed becomes the F speed for CONF 3, the aircraft decelerates from F (CONF 2) to F (CONF 3),
  - And the landing FLAPS setting is CONF 3: the aircraft decelerates from F to VAPP.
- When the flight crew sets FLAPS FULL: the aircraft decelerates from F to VAPP.

APPR Speed Profile



GO-AROUND

OPERATING SPEEDS

The performance function computes the operating speeds (F, S, and green dot), and displays these speeds on the GA panel of the PERF page (*Refer to PERF page*):

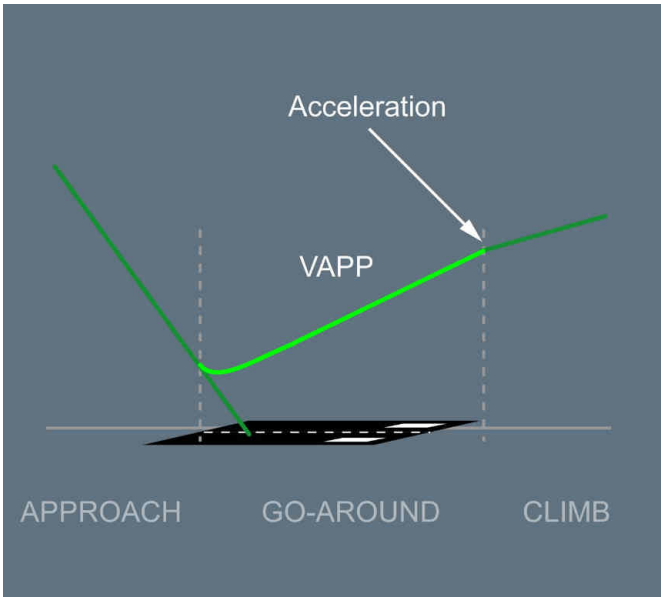
- The Flaps retraction speed F: The minimum recommended speed at which the flaps may be retracted from CONF 2 or 3 to CONF 1+F after takeoff,
- The Slats retraction speed S: The minimum recommended speed at which the slats may be retracted,
- The Green Dot speed O : The recommended speed with the best climb performance, and the minimum fuel consumption.

The FMS uses the estimated weight, CG , and altitude to compute the operating speeds.

MANAGED SPEED PROFILE

During the GA $_{phase}$, the managed target speed is the speed that the aircraft was flying when the GA $_{phase}$ became active.
In normal operation, this speed will be VAPP .

GA Speed Profile



Intentionally left blank

Optimum and Maximum Flight Level

OPTIMUM FLIGHT LEVEL

Applicable to: ALL

The performance function of the FMS computes the optimum flight level. The optimum flight level is the flight level with the lowest fuel consumption.

The optimum flight level computation takes into account:
- The aircraft gross weight
- The cost index
- The temperature and winds
- A minimum cruising time of 15 min at that altitude.

The computation does not take into account any Constant Mach Segment (CMS).
The FMS computes the optimum flight level until 15 nm from the T/D.
The PERF page displays the optimum flight level.
Refer to Page

RECOMMENDED MAXIMUM FLIGHT LEVEL

Applicable to: ALL

The performance function of the FMS computes the recommended maximum flight level, based on the delta ISA and the current aircraft gross weight.

L3 The delta ISA vertical profile, that is used for the computation of the recommended maximum flight level, is defined by the CRZ FL , CRZ TEMP , and TROPO entries on the INIT page. In cruise, the delta ISA vertical profile is corrected by the measured temperature.

L1 The aircraft can reach the recommended maximum flight level with a minimum vertical speed of 300 ft/min at MAX CLB thrust. At the recommended maximum flight level, the aircraft:
- Can fly a speed between green dot and VMO / MMO
- Can keep a thrust rating, without acceleration, less than MAX CRUISE
- Has a buffeting margin of 0.3 G.

In engine-out, the FMS computes the engine-out maximum flight level, *Refer to Engine-Out Maximum Flight level* .
The PERF page displays the recommended maximum flight level (or EO maximum flight level) in the upper right corner, *Refer to Page* .

L2 The FMS message area displays the CRZ FL ABOVE MAX FL, or STEP ABOVE MAX FL message if the flight crew enters a cruise flight level or step altitude that is higher than the recommended maximum flight level.

Intentionally left blank

NADP

INTRODUCTION

Applicable to: ALL

The NOISE function of the FMS allows the flight crew to fly an optimized Noise Abatement Departure Procedure (NADP) in managed mode.

There are two types of NADP:

- An NADP of type I is a departure procedure that intends to reduce noise levels close to the airport. This procedure involves a thrust cutback at or above a prescribed minimum altitude and delaying the flaps/slats retraction (not later than the prescribed maximum altitude).
  This procedure is also called a **close-in** noise abatement procedure.
- An NADP procedure of type II aims at reducing noise levels further away from the airport. This is a departure procedure where the initiation of the flaps/slats retraction occurs before reducing the thrust (the thrust reduction altitude is higher than the acceleration altitude).
  This procedure is also called a **distant** noise abatement procedure.

The NOISE function of the FMS covers both NADP types.

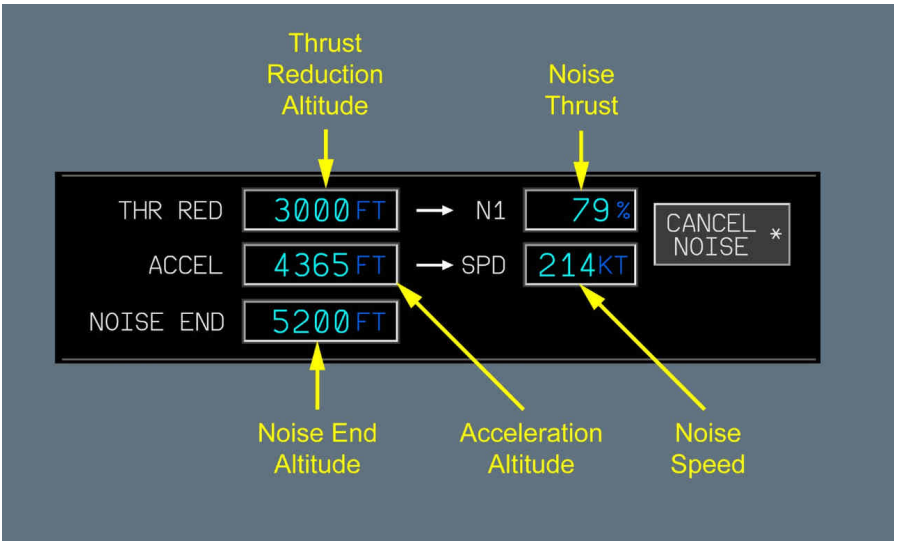
NADP DESCRIPTION

Applicable to: ALL

NOISE PARAMETERS

The FMS computes a vertical noise profile, based on the following 5 parameters. The flight crew enters these parameters on the T.O panel of the PERF page.

NOISE Parameters



THRUST REDUCTION ALTITUDE

The thrust reduction altitude is the altitude where the flight crew reduces the thrust from TOGA (or FLX) to CLB.
In case of an NADP, at the thrust reduction altitude the thrust target changes from TOGA (or flex, or derated) thrust to noise thrust.
The default value is 1 500 ftabove the origin airport elevation.

ACCELERATION ALTITUDE

The acceleration altitude is the altitude where the aircraft accelerates towards the noise speed.
The default value is 1 500 ftabove the origin airport elevation.

NOISE END ALTITUDE

The noise end altitude is the altitude where the noise restrictions end. Below this altitude, a speed and noise restriction may apply.
At the noise end altitude, the thrust target changes from noise thrust to climb (or derated climb) thrust.
The transition from noise thrust to climb thrust is a smooth transition with a thrust gradient of 0.2 %N1 per second. During the thrust ramp, the aircraft still flies at the noise speed.
If no end altitude is entered, no noise profile is computed.

NOISE THRUST

The noise thrust is the thrust target (in percentage of N1) between the thrust reduction altitude and the noise end altitude.
The lowest accepted noise thrust is 40 %N1.
At the noise end altitude, the thrust target changes from noise thrust to climb (or derated climb) thrust.
The transition from noise thrust to climb thrust is a smooth transition with a thrust gradient of 0.2 %N1 per second. During the thrust ramp, the aircraft still flies at the noise speed.
When no noise end altitude exists, no noise thrust can be entered.

NOISE SPEED

The noise speed is the managed speed between the acceleration altitude and the end of the noise thrust ramp.
When the flight crew has entered a noise end altitude, the FMS computes a default noise speed that is the maximum of (S + 15 kt, VLS + 10 kt), where S is the slats retraction speed, and VLS is the lowest selectable speed in clean configuration at the noise end altitude.

Note: The default noise speed may be less than the green dot speed.

The flight crew can always overwrite the default value.
When no noise end altitude exists, no default noise speed is computed, and no noise speed can be entered.

NOISE PROFILE

The FMS computes a noise profile as soon as the flight crew has entered a noise end altitude and a noise speed, or noise thrust.

L2 If no noise end altitude exists, no noise profile is computed.
If a noise end altitude and noise speed exist, but no noise thrust is defined, the FMS computes a noise profile based on the MAX CLB thrust.
If a noise end altitude and noise thrust exist, but no noise speed is defined, the FMS computes a noise profile based on the ECON CLB speed.
In what follows, all noise parameters are entered.

L1 The flight can change the noise parameters until the aircraft reaches the noise end altitude.

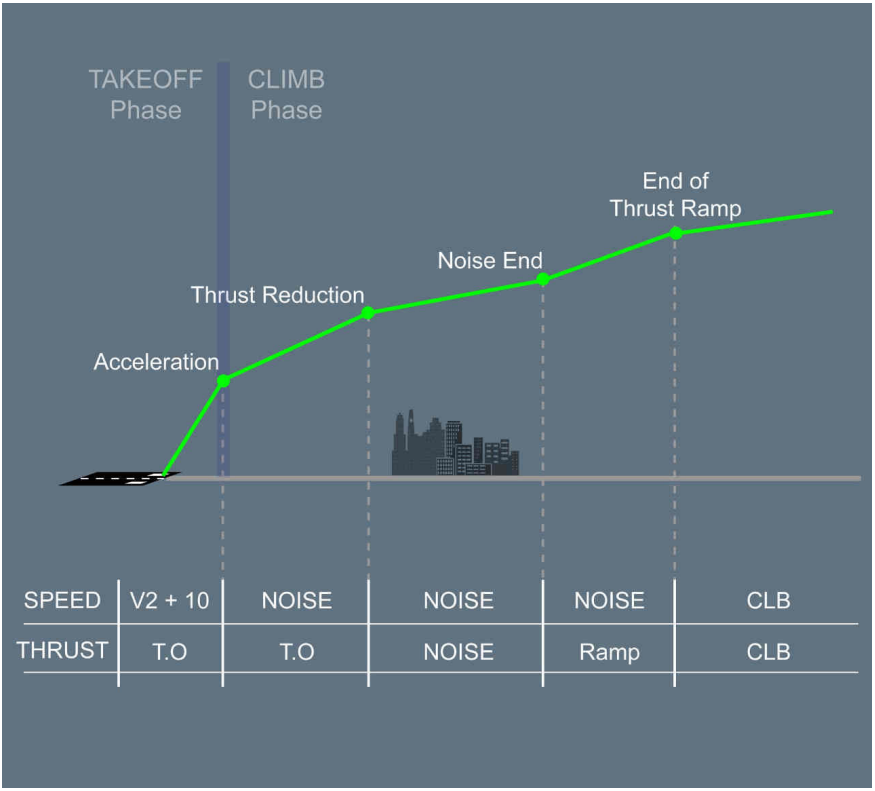
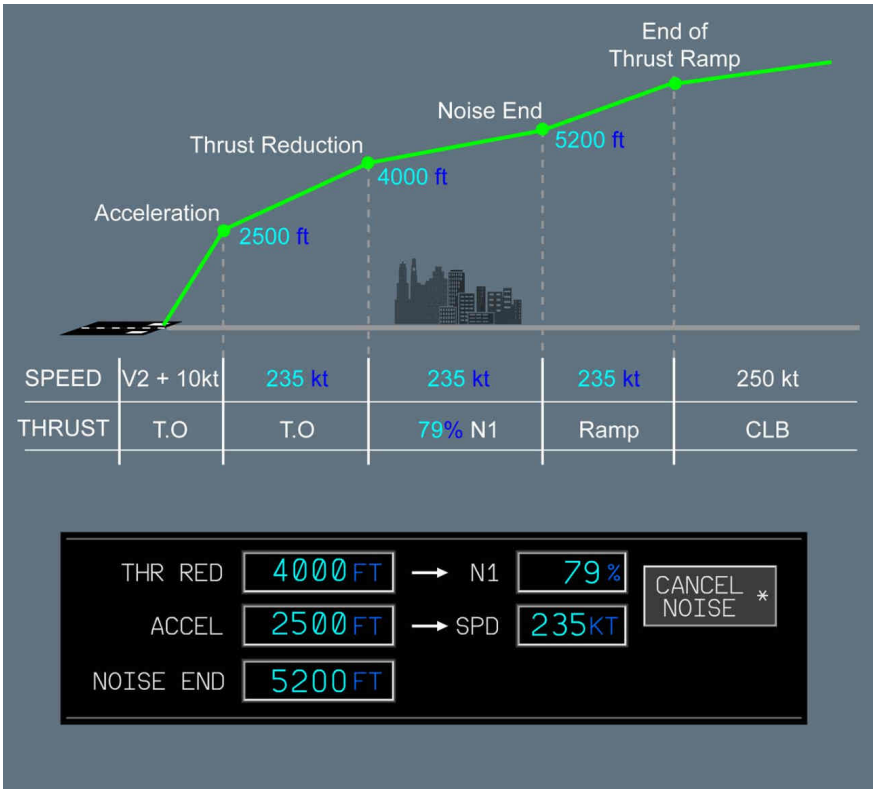
DISTANT NADP

Distant NADP



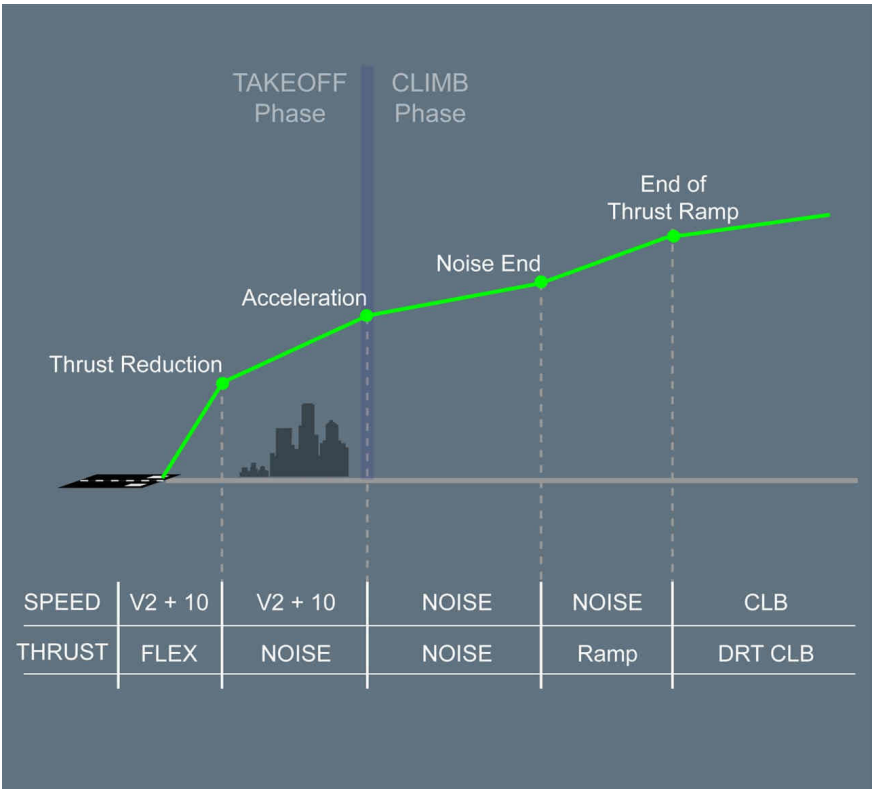
Example



L2 **NADP WITH FLEX(OR DRT) T.O AND DRT CLIMB**

An FMS noise procedure may be combined with a flex or derated takeoff and/or a derated climb.

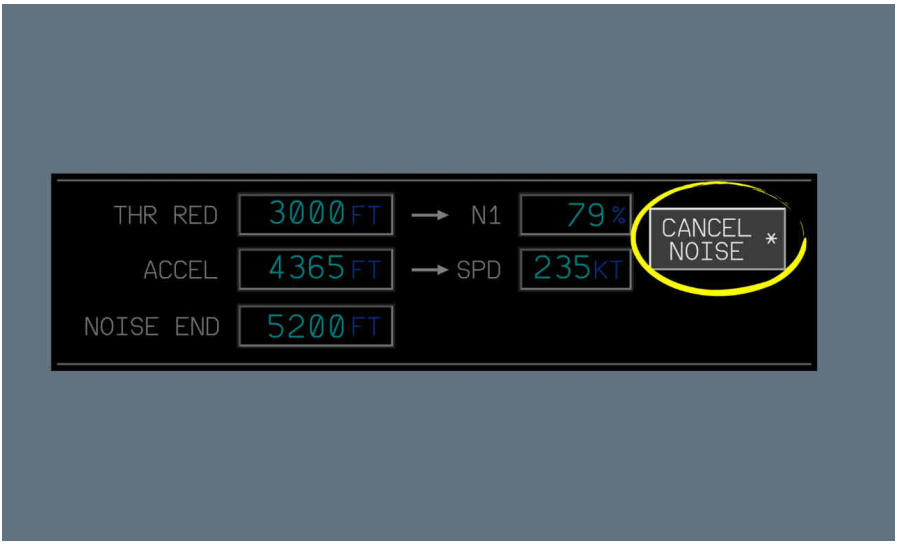
FLEX + Derated



END OF NADP

The FMS noise procedure ends at the end of the thrust ramp.
The flight crew can always cancel and exit the noise procedure by clicking on the CANCEL NOISE button on the T.O or CLB panel of the PERF page.

CANCEL NOISE Button



When the noise procedure is exited, then:

- The thrust target reverts to CLB thrust if the aircraft is above the thrust reduction altitude, or to T.O thrust if the aircraft is below the thrust reduction altitude
- The managed target speed reverts to the ECON climb speed if the aircraft is above the acceleration altitude, or to V2 + 10 ktif the aircraft is below the acceleration altitude.

Note: *In flight, once exited, the noise procedure cannot be activated again.*

NADP AND ENGINE-OUT

When an engine-out is detected, the noise procedure is exited automatically.

L2 **NADP AND FLIGHT GUIDANCE MODES**

The noise procedure is part of the FMS climb profile. As a consequence, when the flight crew engages a selected guidance mode, the guidance rules, as described in the Flight Guidance chapter, are respected.

A few examples:

- When the flight crew disconnects the A/THR while flying the noise procedure, the noise thrust is disregarded. However, the managed speed target is still the noise speed. When the flight crew activates the A/THR again, the thrust target becomes the noise thrust.
- When the flight crew engages the HDG/TRACK mode, the vertical mode reverts to selected guidance (OP CLB, V/S / FPA). In this case, the noise thrust is disregarded: the thrust mode switches to SPEED mode in order to target the managed speed, that is still the noise speed.
- When the flight crew activates the selected speed control, the managed noise speed is disregarded. However, the thrust target is still the noise thrust. When the flight activates the managed speed control again, the managed speed target becomes the noise speed.

Note: *When the flight crew has preset a selected speed on the CLB panel of the PERF page, the selected speed control is activated automatically at the acceleration altitude. In this case, the aircraft will fly the selected speed, between the acceleration altitude and the noise end altitude. The thrust target is still the noise thrust.*

When the OP CLB, V/S, or ALT mode is engaged while the aircraft is flying the thrust ramp, the noise procedure is exited definitively.

CONTROLS AND INDICATORS

Applicable to: ALL

CONTROLS AND INDICATORS

ON THE MFD

The flight crew enters the noise parameters on the T.O or CLB panel of the PERF page. (*Refer to PERF page*)

PERF page

ON THE FMA (PFD)

Noise Thrust

While flying a noise abatement departure procedure, and the noise thrust is applied, the Flight Mode Annunciator (FMA) displays the percentage of N1.

Perf and Idle Factor

PERF AND IDLE FACTOR

Applicable to: ALL

The performance factor is a correction factor for the fuel flow, due to aerodynamics or engine deterioration. The perf factor is taken into account in the computation of the managed speed profile, and the optimum altitude.

The idle factor is a correction factor for the engine idle rating. The idle factor is taken into account in the construction of the descent and approach path and predictions.

Perf and idle factors can be up linked via ACARS, or entered manually on the STATUS page. (*Refer to Page*)

Intentionally left blank

GENERAL

Applicable to: ALL

The FMS takes into account a single and double engine failure for performance, predictions, and long-term guidance targets computation.

When an engine failure occurs, the FMS :
- Changes the managed speed target, upon the active flight phase
- Computes the engine-out maximum flight levels (LRC and green dot maximum flight levels)
- Updates the flight plan predictions, based on the new managed speed targets, and engine-out maximum altitudes

  Note: - *In case of a single engine failure, the FMS considers the outer engine as failed*
  - *In case of a double engine failure, the FMS considers the two failed engines on the same wing*

- Deletes all the pre-selected speeds
  The flight crew can enter new pre-selected speeds, if required.
- Creates a temporary flight plan with the engine-out SID, if applicable
- Deletes all the planned altitude steps (climb or descent), if any
- Deletes the time constraint, if any
- Displays the PERF page.

When the engine out is recovered, the FMS returns automatically to its normal performance and predictions computation.
At all times, the flight crew can clear the engine-out state manually via the CLEAR EO button on the PERF page. (*Refer to Page*)

ENGINE-OUT SID

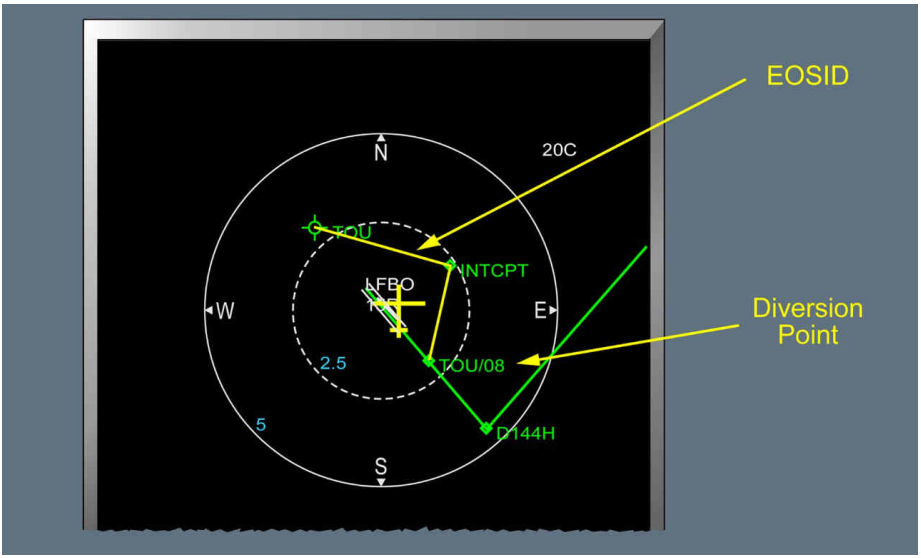
Applicable to: ALL

The Engine-Out Standard Instrument Departure (EOSID) is a standard procedure to fly when an engine fails just after takeoff.
L2 The operator can define an EOSID for a specific runway in the navigation database.
L1 The DEPARTURE page displays the ident of the EOSID, if any.

DEPARTURE Page

The flight crew can review the EOSID on the PLAN mode of the ND. The EOSID is indicated by a yellow line.
The last point that is common between the SID and EOSID is called the diversion point.

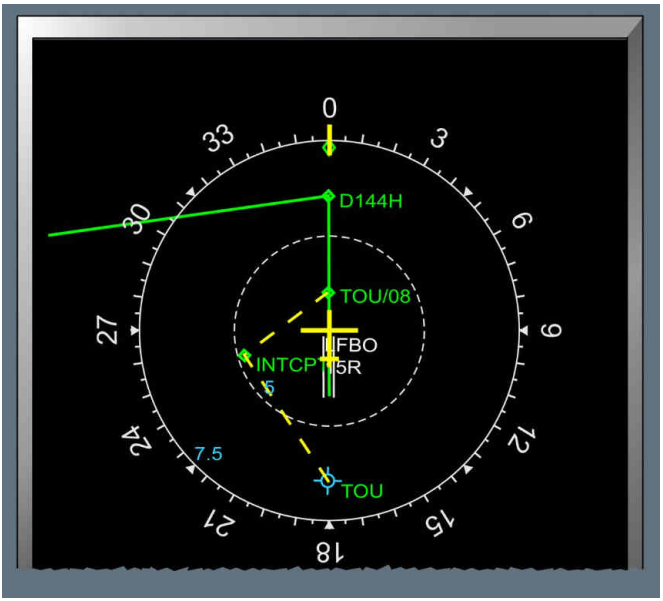
EOSID in ND PLAN mode



ENGINE-OUT BEFORE THE DIVERSION POINT

When an engine-out occurs before the diversion point, the FMS creates a temporary flight plan with the EOSID strung after the diversion point. The EOSID is followed by a discontinuity.
The flight crew can insert or erase the temporary flight plan, whether he wants to fly the EOSID or not.

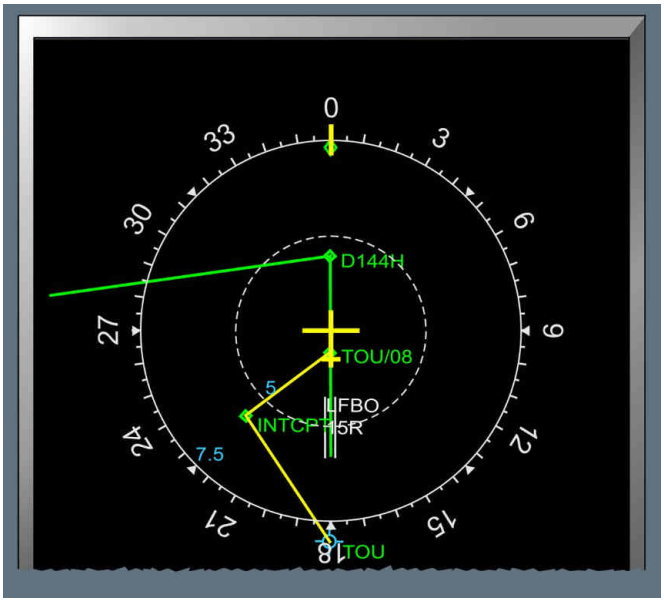
EO Before Diversion Point



ENGINE-OUT AFTER THE DIVERSION POINT

When an engine-out occurs after the diversion point, the FMS does not create a temporary flight plan. The EOSID is indicated by a yellow line on the ND, for information only.
If required, the flight crew can perform a direct to a waypoint of the EOSID, and adjusts the resulting flight plan afterwards.

EO After Diversion Point



ENGINE-OUT MAXIMUM FLIGHT LEVEL

Applicable to: ALL

In engine-out, the FMS computes the long range cruise maximum flight level, based on the current aircraft gross weight and temperature.

At this flight level, the aircraft:

- Can fly in level flight at the long range cruise (LRC) speed, with the operating engines in MCT, anti-ice OFF, and the failed engine(s) in wind milling
- Has a buffeting margin of 0.3 G.

The PERF page displays the EO maximum flight level in the upper right corner. (*Refer to Page*)

EO MAX

GREEN DOT DRIFT DOWN FLIGHT LEVEL

Applicable to: ALL

In engine-out, during the CRUISE $_{phase}$, the FMS computes the green dot drift down altitude.

The green dot drift down altitude is the maximum flight level where the aircraft can fly in level flight, at the green dot speed, with the operating engines in MCT.

L2 The FMS computes this flight level as follows: When the aircraft descents at the green dot speed, the drift down altitude is the altitude where the aircraft would reach the level-off.

L1 The CRZ panel of the PERF page displays the green dot drift down altitude. (*Refer to Page*)

ENGINE-OUT IN TAKEOFF PHASE

Applicable to: ALL

BELOW THE THRUST REDUCTION ALTITUDE

When an engine failure occurs below the thrust reduction altitude:
- The speed target is the current aircraft speed, limited between V2 and V2+ 15 kt
- The FMS creates a temporary flight plan with the EOSID if the aircraft is before the EOSID diversion point, or displays the EOSID on the ND, for information only, if the aircraft is after the diversion point(*Refer to Engine-out SID*)
- The FMS displays the PERF page, with the EO maximum altitude in the upper right corner, and the CLR EO button on the bottom of the page (*Refer to PERF page*)

FLIGHT PLAN PREDICTIONS

The FMS does not compute the flight plan predictions until the aircraft reaches the acceleration altitude.

ABOVE THE THRUST REDUCTION ALTITUDE

When an engine failure occurs above the thrust reduction altitude:
- The speed target is the current aircraft speed, limited between V2 and V2+ 15 kt
- LVR MCT flashes on the FMA
- The ND displays the EOSID , for information only (*Refer to Engine-out SID*)
- The FMS displays the PERF page, with the EO maximum altitude in the upper right corner, and the CLR EO button on the bottom of the page. (*Refer to PERF page*)

FLIGHT PLAN PREDICTIONS

The FMS does not compute the flight plan predictions until the aircraft reaches the acceleration altitude.

ENGINE-OUT IN CLIMB PHASE

Applicable to: ALL

BELOW THE EO MAXIMUM FLIGHT LEVEL

When an engine failure occurs below the EO maximum flight level:

- And the aircraft is climbing (CLB , or OP CLB mode), the managed target speed is green dot (EO-GDOT)
  When the aircraft is in level flight (ALT , ALT* , ALT CST , or ALT CST* mode), the managed target speed is the engine-out long range cruise speed (EO-LRC), limited by the speed limit or speed constraint, if any.

  Note: *To avoid heavy thrust reduction, the target speed ramps down from the current speed to EO-GDOT (or EO-LRC) with 1 kt per second.*

- LVR MCT flashes on the FMA
- The FMS displays the PERF page, with the EO maximum flight level in the upper right corner, and the CLR EO button on the bottom of the page. (*Refer to PERF page*)
  The CLB panel of the PERF page displays the managed target speed (EO-GDOT, or EO-LRC).

FLIGHT PLAN PREDICTIONS

The FMS computes the flight plan predictions based on the EO-GDOT , or EO-LRC speed, and a cruising at Minimum(Cruise Flight Level, EO Maximum Flight Level).

ABOVE THE EO MAXIMUM FLIGHT LEVEL

When an engine failure occurs above the EO maximum flight level:

- The CLB mode, if engaged, reverts to OP CLB . (or V/S , with current vertical speed)

  Note: *The flight crew cannot arm nor engage the CLB mode above the EO maximum flight level.*

- When the aircraft is climbing (CLB , or OP CLB mode), the managed target speed is green dot (EO-GDOT),
  When the aircraft is in level flight (ALT , ALT* , ALT CST , or ALT CST* mode), the managed target speed does not change (However, the aircraft will decelerate due to engine performance).

  Note: *To avoid heavy thrust reduction, the target speed ramps down from the current speed to EO-GDOT with 1 kt per second.*

- LVR MCT flashes on the FMA,
- The FMS displays the PERF page, with the EO maximum flight level in the upper right corner, and the CLR EO button on the bottom of the page. (*Refer to PERF page*)
  The CLB panel of the PERF page displays the managed target speed (EO-GDOT).

FLIGHT PLAN PREDICTIONS

The FMS computes the flight plan predictions assuming an immediate level-off and deceleration to green dot, followed by a descent (at green dot speed and a minimum vertical speed of - 100 ft/min) to the EO maximum flight level, and a cruising at this flight level at the EO LRC speed.

ENGINE-OUT IN CRUISE PHASE

Applicable to: ALL

ENGINE-OUT IN CRUISE PHASE

When an engine failure occurs during the CRZ $_{phase}$ (and above the EO maximum flight level):

- The managed target speed does not change (However, the aircraft will decelerate due to engine performance),
  When the flight crew engages the OP DES mode, the managed speed target becomes EO-GDOT

  At or below the EO maximum flight level, the flight crew can choose between two target speeds representing two engine-out strategies:
  - EO-ECON: The managed target speed is based on the current cost index
  - EO-LRC: The managed target speed is based on an optimized cost index to ensure a minimum fuel consumption (long range).

  When the flight crew initiates a climb (and the aircraft is below the drift down flight level), the managed target speed is EO-GDOT.
- LVR MCT flashes on the FMA
- The FMS displays the PERF page, with the EO maximum flight level in the upper right corner, and the CLR EO button on the bottom of the page, *Refer to PERF page* .

  The CRZ panel of the PERF page displays:
  - The green dot drift down flight level
  - The managed target speed: EO-GDOT, EO-ECON, or EO-LRC.

FLIGHT PLAN PREDICTIONS

The FMS computes the flight plan predictions assuming a deceleration to green dot, followed by a descent (at green dot speed and a minimum vertical speed of - 100 ft/min) to the EO maximum flight level, and a cruising at this flight level at the EO-LRC speed.

ENGINE-OUT IN DESCENT PHASE

Applicable to: ALL

ENGINE-OUT IN DESCENT PHASE

When an engine failure occurs during the DES $_{phase}$:

- The managed speed target speed does not change
- The DES mode, if engaged, reverts to V/S (with the current vertical speed)

Note: The flight crew can keep the V/S mode, or can engage OP DES , as appropriate. Below the EO LRC maximum flight level, the flight crew can engage the DES mode again.

- LVR MCT flashes on the FMA
- The FMS displays the PERF page, with the EO maximum flight level in the upper right corner, and the CLR EO button on the bottom of the page, *Refer to PERF page* .

FLIGHT PLAN PREDICTIONS

The FMS computes the theoretical descent (and approach) path, based on a 3 (or 2) operative engines model.
If the engine failure occurs above the EO LRC maximum flight level, the FMS assumes that the OP DES mode is used until the EO LRC maximum flight level, and the DES mode below this altitude.

ENGINE-OUT IN GO-AROUND PHASE

Applicable to: ALL

ENGINE-OUT IN GO-AROUND PHASE

For an engine-out during the go-around phase, the computations and procedures of the TAKEOFF phase apply.
However, the ND does not display the EOSID.

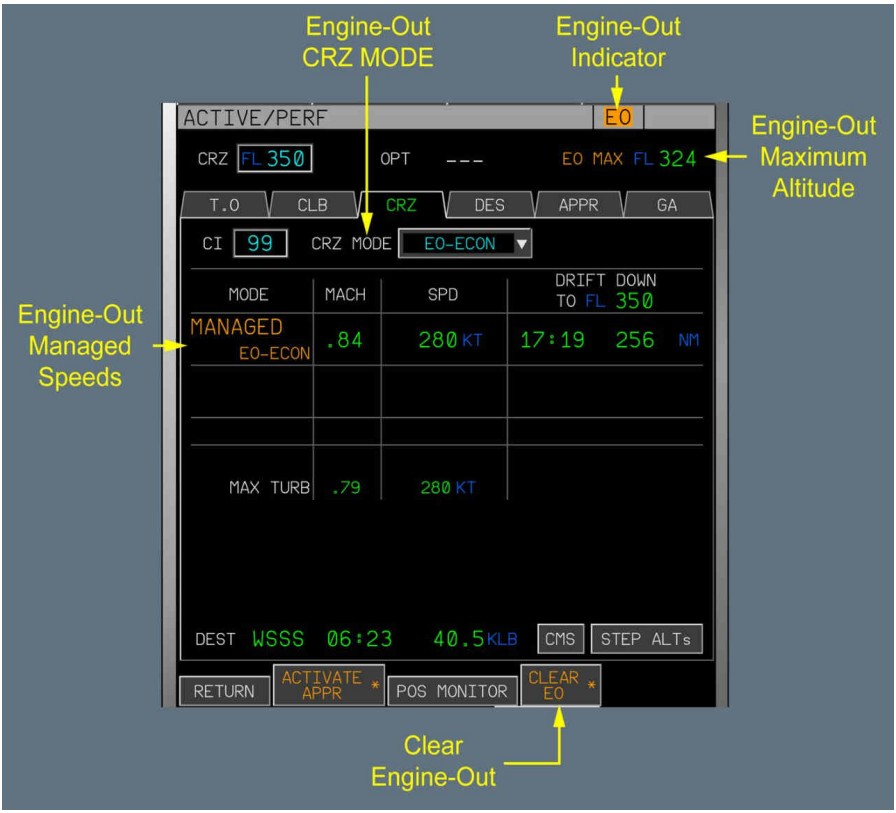
CONTROLS AND INDICATORS

Applicable to: ALL

ON THE MFD

In engine-out, the MFD page header displays EO in the upper right corner.
The PERF page displays the engine-out maximum altitude in the upper right corner, and the CLEAR EO button on the bottom of the page.
The CLB, and CRZ panel display the engine-out managed speeds (EO-GDOT , and EO-LRC), if applicable.

Engine-Out on MFD



ON THE ND

The ND displays the EOSID , as a part of the temporary flight plan if the engine-out occurs before the diversion point, or for information only (yellow line) if the engine-out occurs after the diversion point.

Refer to EOSID

ASSOCIATED MESSAGES

- From the ATC center: Flight plan initialization data.

The received data are automatically printed at reception.

CONTROLS AND INDICATORS

On the DATA/PRINTER page, the flight crew can:
- Start the manual printing of active flight plan data and secondary flight plan reports
- Configure the automatic printing of company data and active flight plan reports.

For more information, *Refer to DATA/PRINTER page.*
On the SEC INDEX page, the flight crew can manually print the secondary flight plan data for SEC1(2)(3).

For more information, *Refer to SEC INDEX page.*

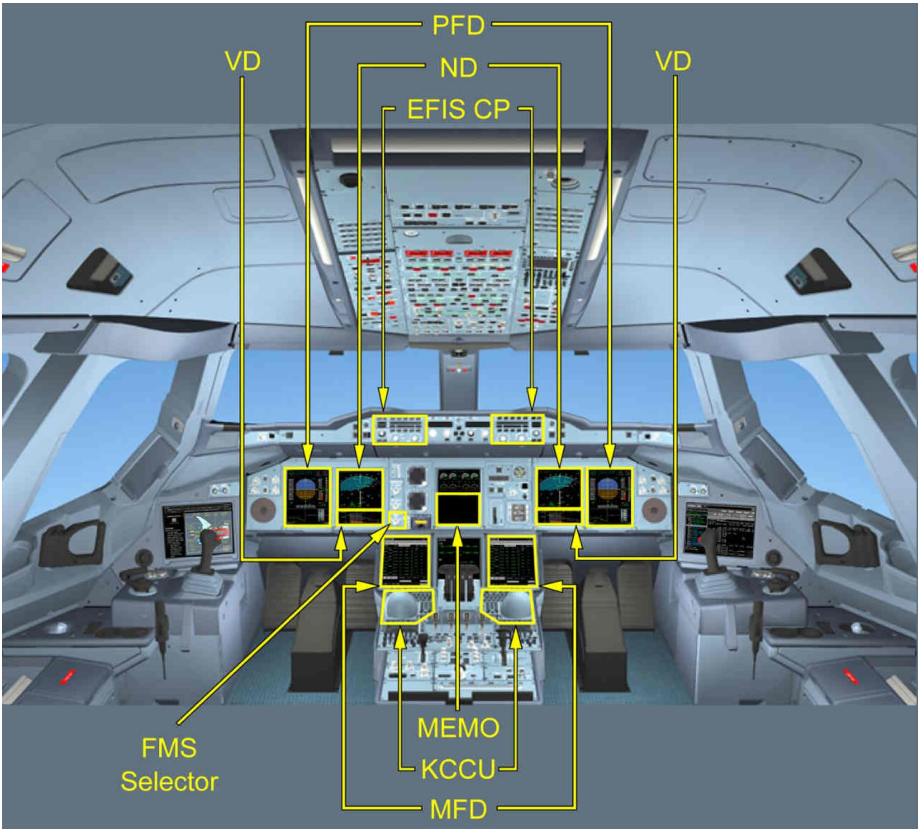
FMS Controls and Indicators

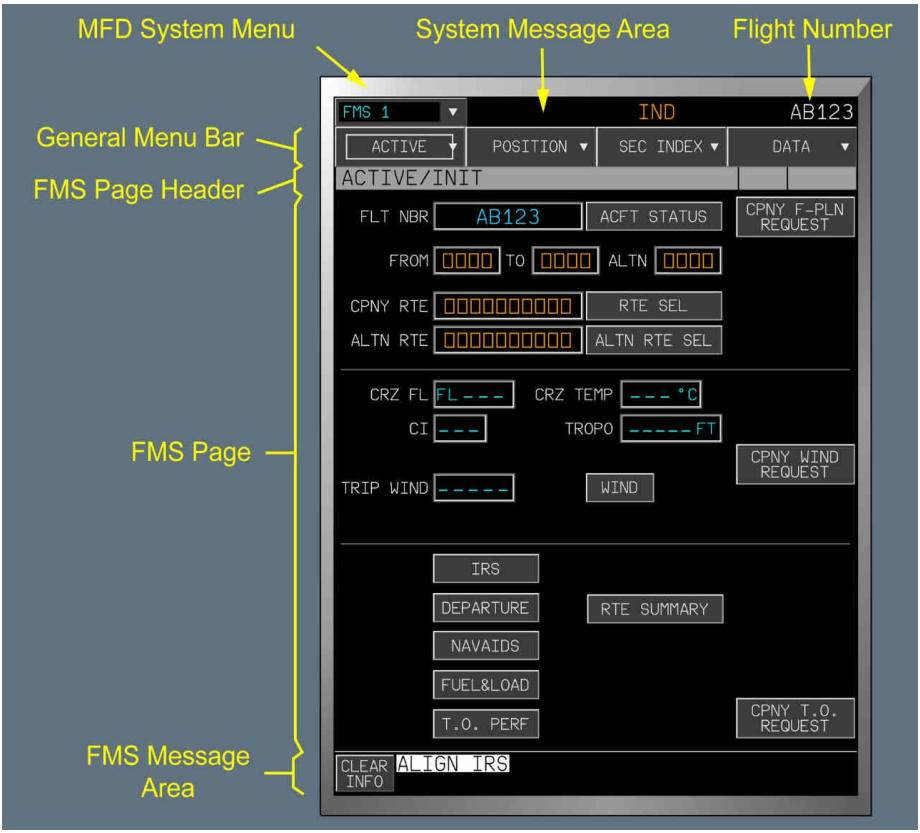


Intentionally left blank

MFD - OVERVIEW

Applicable to: ALL

Multi Function Display (MFD)



Refer to Cockpit View

There are two Multi Function Displays (MFD s): One for the Captain (CAPT) and one for the First Officer (F/O).

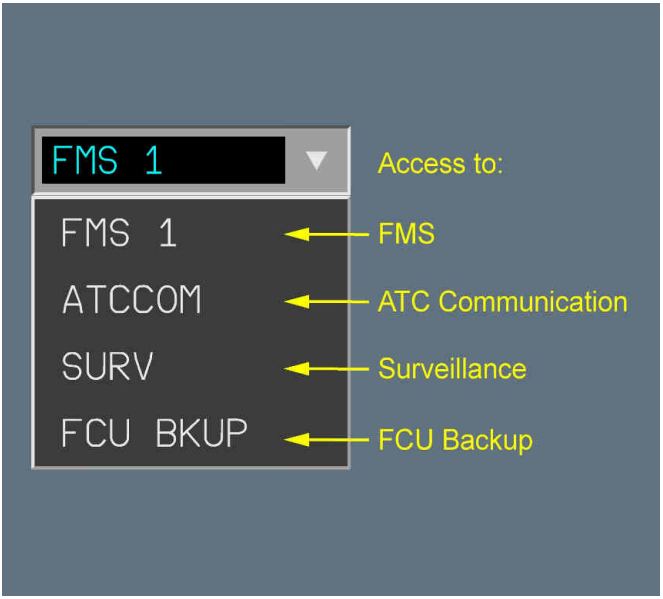
The Multi Function Display (MFD) displays the FMS textual data, on 50 FMS pages.

The MFD is interactive: The flight crew can navigate through the FMS pages, and can consult, enter or modify the data via the KCCU . (*Refer to KCCU*)

L2 In addition to the FMS data, the MFD also displays:
- The ATC Communication pages (ATC COM)
- The surveillance pages (SURV)
- The FCU backup pages (FCU BKUP).

MFD SYSTEM MENU

MFD System Menu



Indicates the system identifier that is actually displaying data on the MFD .
The menu list displays all systems that can display data on the MFD :

FMS

Gives access to the FMS pages.
The identifier is different on the captain's side and first officers's side, and depends on which FMC is providing data for display on the MFD .
Refer to Abnormal Operations
Refer to FMS Selector
On the captain's side:

FMS 1	Normal configuration: FMC -A provides data for FMS 1.
FMS 1-C	Abnormal configuration: FMC -C provides data for FMS 1.
FMS 2	Abnormal Configuration: The flight crew has selected BOTH ON 2 on the FMS Source Select Switch. FMC -B provides data for FMS 2, and the data from side 2 is displayed on side 1.
FMS 2-C	Abnormal Configuration: The flight crew has selected BOTH ON 2 on the FMS Source Select Switch. FMC -C provides data for FMS 2, and the data from side 2 is displayed on side 1.

On the first officer's side:

FMS 2	Normal configuration: FMC -B provides data for FMS 1.
FMS 2-C	Abnormal configuration: FMC -C provides data for FMS 2.
FMS 1	Abnormal Configuration: The flight crew has selected BOTH ON 1 on the FMS Source Select Switch. FMC -A provides data for FMS 1, and the data from side 1 is displayed on side 2.
FMS 1-C	Abnormal Configuration: The flight crew has selected BOTH ON 1 on the FMS Source Select Switch. FMC -C provides data for FMS 1, and the data from side 1 is displayed on side 2.

ATC COM

Gives access to the ATC communication pages.
Refer to ATCCOM Pages Overview

SURV

Gives access to the surveillance pages.
Refer to SURV Pages Overview

FCU BKUP

Gives access to the FCU backup pages.
Refer to FCU Backup Pages Overview

SYSTEM MESSAGE AREA

The System Message Area displays three different messages to get the attention of the flight crew on an FMS or ATCCOM event, when the MFD actually not displays the FMS, or ATCCOM pages:

- NEW ATIS RECEIVED:
  Indicates that a new ATIS report is received, and the MFD displays an application other than ATCCOM. This message is removed when the flight crew accesses an ATCCOM page.
- ATIS SYS MSG:
  Indicates that a ATIS FSM message is received, and the MFD displays an application other than ATC COM. This message is removed when the flight crew accesses an ATC COM page.
- CHECK FMS MESSAGE:
  Indicates that an amber FMS message is pending, and the MFD displays an application other than FMS. This message is removed when the flight crew accesses an FMS page.

FLIGHT NUMBER

Indicates the flight number that the flight crew has entered on the ACTIVE / INIT page. (*Refer to Page*)

L2 The Control and Display System (CDS) manages the display of the flight number.

GENERAL MENU BAR

General Menu Bar

The general menu bar gives the flight crew access to the main FMS pages.
The main FMS pages are divided into 4 groups, represented by the 4 menus of the general menu bar: ACTIVE, POSITION, SEC , and DATA.

Note: - *The pages that are not in one of the menus of the general menu bar, are pages of a second level in the page hierarchy. They are accessed via the main pages. (example: the F-PLN page is a main FMS page, the OFFSET page is not a main FMS page and is accessed via the F-PLN page).*
- *A rectangle around the menu name indicates that the displayed page belongs to this menu.*

ACTIVE MENU

Active Menu

The ACTIVE menu groups the active flight plan pages:
- ACTIVE / F-PLN (*Refer to Page*)
- ACTIVE / PERF (*Refer to Page*)
- ACTIVE / FUEL&LOAD (*Refer to Page*)
- ACTIVE / WIND (*Refer to Page*)
- ACTIVE / INIT (*Refer to Page*)

POSITION MENU

Position Menu

The POSITION menu groups the pages related to the FMS aircraft position:

- POSITION / MONITOR (*Refer to Page*)
- POSITION / REPORT (*Refer to Page*)
- POSITION / NAVAIDS (*Refer to Page*)
- POSITION / IRS (*Refer to Page*)
- POSITION / GPS (*Refer to Page*)

SEC INDEX MENU

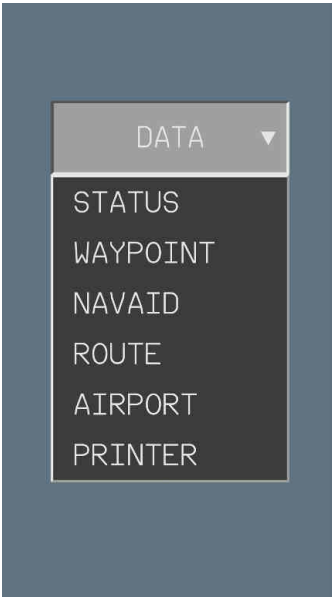
SEC Menu

The SEC INDEX menu groups the three secondary flight plans:
- SEC 1
- SEC 2
- SEC 3

Selecting SEC 1(2)(3) displays the SEC INDEX page with the SEC 1(2)(3) panel opened. (*Refer to SEC INDEX page*)

DATA MENU

DATA Menu

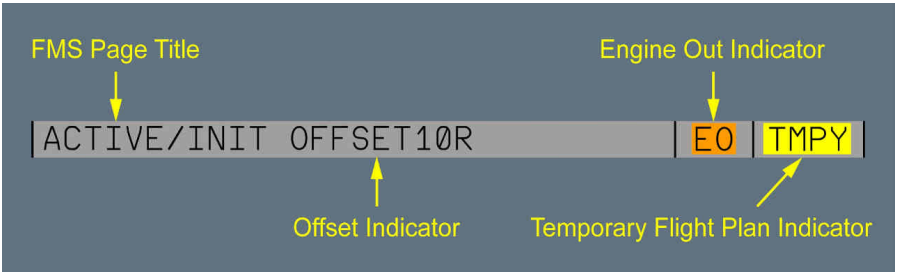


The DATA menu groups the pages related to the database, the aircraft status, and printer configuration.

- STATUS (*Refer to Page*)
- DATA / WAYPOINT (*Refer to Page*)
- DATA / NAVAID (*Refer to Page*)
- DATA / ROUTE (*Refer to Page*)
- DATA / AIRPORT (*Refer to Page*)
- PRINTER (*Refer to Page*)

FMS PAGE HEADER

FMS Page Header



FMS PAGE TITLE

Indicates the title of the FMS page.
The page title contains the different levels of the page hierarchy, separated with a slash.

OFFSET INDICATOR

When the aircraft is currently flying an offset, the header displays OFFSET NNX, where NN is the lateral offset distance, and X is the offset side (example: OFFSET 10R).

ENGINE OUT INDICATOR

When the FMS engine out mode is currently active, the header displays EO .
Refer to Engine-Out

TEMPORARY FLIGHT PLAN INDICATOR

When the FMS displays a page that is related to the active or secondary flight plan (F-PLN + revisions pages, INIT, FUEL&LOAD, PERF, WIND, and SEC INDEX), the header displays TMPY when a temporary flight plan is pending.
Refer to Temporary Flight Plan

Intentionally left blank

FMS PAGES - INDEX

Applicable to: ALL

The FMS pages are sorted in alphabetical order:

Refer to AIRWAYS page
Refer to ALTERNATE page

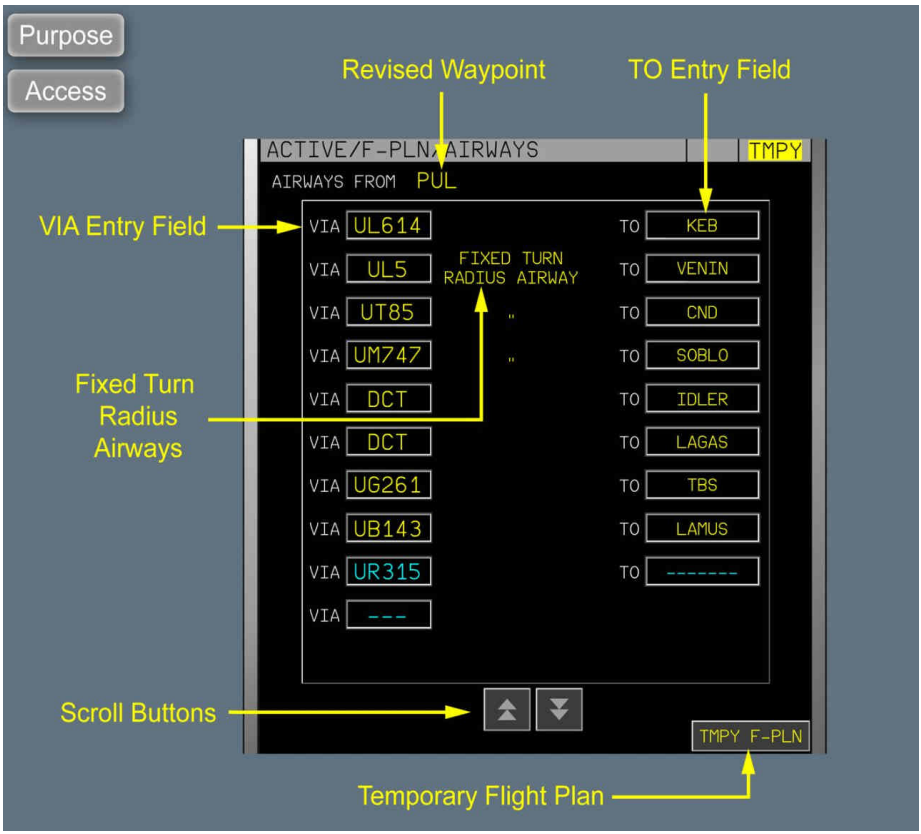
AIRWAYS PAGE

Applicable to: ALL

AIRWAYS Page



PURPOSE

The AIRWAYS page enables the flight crew to insert up to 31 airway segments, or waypoints in the flight plan, starting from the revised waypoint.
The AIRWAYS page is available for the active and secondary flight plans.

LINKS

LINKS *Refer to AIRWAYS Revision*

ACCESS

The flight crew can access the AIRWAYS page via the F-PLN page, by selecting the AIRWAYS revision in the waypoint revisions menu.

F-PLN Page

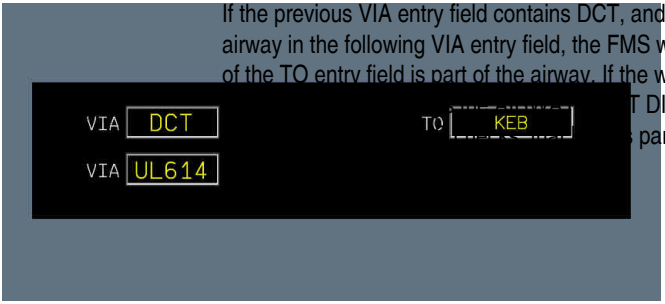
REVISED WAYPOINT

The revised waypoint is the waypoint from which the flight crew has selected the AIRWAYS revision.

VIA ENTRY FIELD

Indicates the ident of the airway, or DCT .
The flight crew can enter an airway, or DCT in the VIA entry field.

DCT creates a Direct To between the previous waypoint, and the following waypoint.



If the previous VIA entry field contains DCT, and the flight crew enters an airway in the following VIA entry field, the FMS will check that the waypoint of the TO entry field is part of the airway. If the waypoint is not part of the T DISAGREE message.
part of the UL616 airways.

ENTRY FORMAT

Refer to AIRWAY (VIA) Entry Format

TO ENTRY FIELD

Indicates the end waypoint of the airway segment, or a waypoint.

WHEN THERE ARE TWO CONSECUTIVE AIRWAYS BETWEEN THE TO ENTRY FIELDS

When the flight crew enters the ident of two airways in two consecutive VIA entry fields, the TO entry field displays the common waypoint of both airways.

L2 If the two entered airways do not have a common waypoint in the navigation database, the FMS creates a latitude/longitude waypoint at the geographic intersection of the airways. The ident of this waypoint starts with an “X” and is followed by the ident of the second airway (e.g. XUB4).

L1 The flight crew can also manually enter or change the end waypoint.

WHEN THERE IS NO AIRWAY BEFORE THE TO ENTRY FIELD

In this case, the VIA entry field, that is before the TO entry field, is empty, or has DCT.
The flight crew can enter a waypoint in the TO entry field. In this case, if the VIA entry field, that is before the TO waypoint is empty, this VIA entry field automatically displays DCT.

ENTRY FORMAT

Refer to WAYPOINT Entry Format

SCROLL BUTTONS

The flight crew uses the Scroll down (up) button to move, page by page, downwards (upwards) through the airway segments list.

FIXED TURN RADIUS AIRWAY

Indicates that the flight crew has inserted a fixed turn radius airway.

L2 A fixed turn radius airway has a constant turn radius defined for one or more waypoints.

TEMPORARY FLIGHT PLAN BUTTON

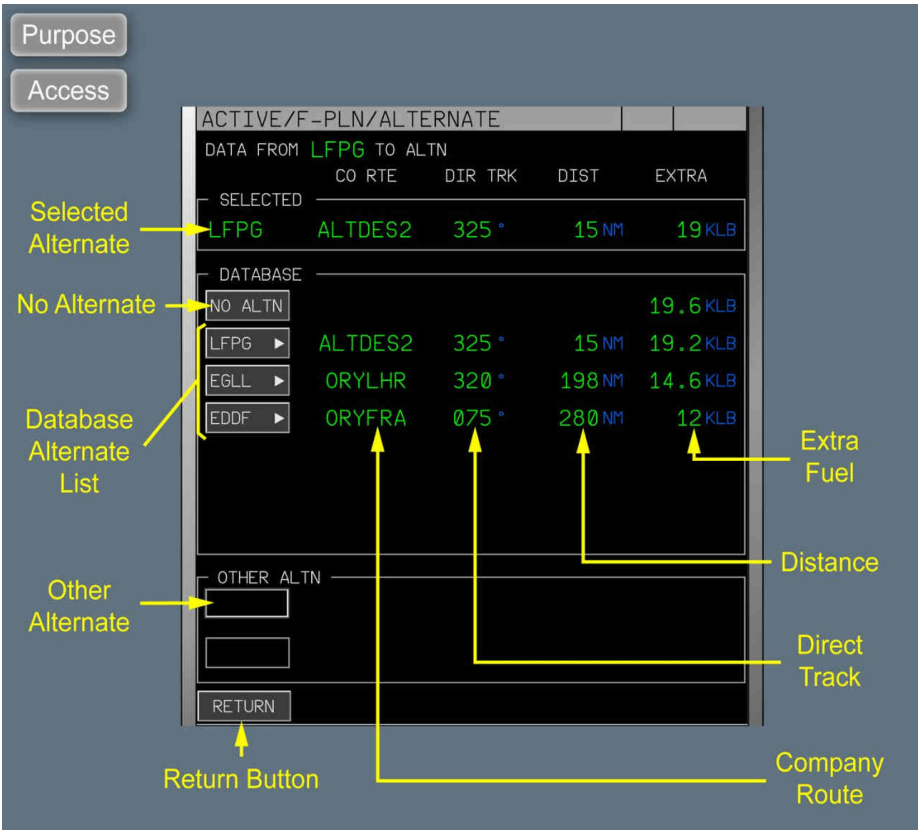
When clicked, displays the ACTIVE / F-PLN page. (*Refer to Page*)

L2 The Temporary Flight Plan button is only displayed if a temporary flight plan exists. If no temporary flight plan exists, the Return button is displayed: Clicking on the Return button, displays the F-PLN page.

ALTERNATE PAGE

Applicable to: ALL

ALTERNATE Page



PURPOSE

On the ALTERNATE page, the flight crew can:

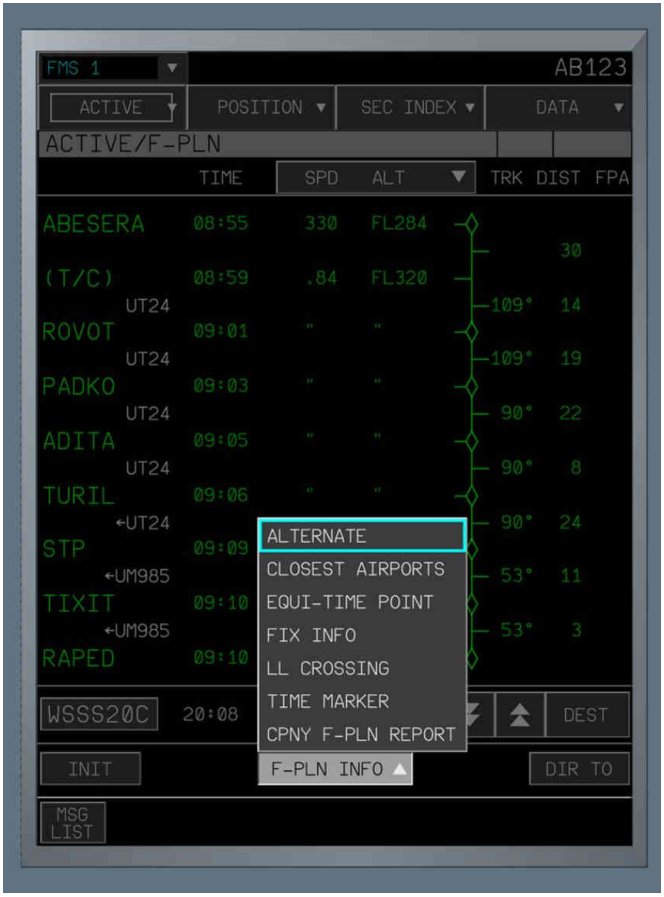
- Access and compare the different alternate airports and their associated predictions (i.e. company route, direct track, distance, extra fuel)
- Enter any other airport (different from the navigation database alternate airports), and access and compare their associated predictions
- Select any airport displayed on this page as the alternate destination.

LINKS

Refer to ALTERNATE Revision

ACCESS

The flight crew can access the ALTERNATE page via the F-PLN page by selecting ALTERNATE in the F-PLN INFO menu.



SELECTED ALTERNATE

Indicates the selected alternate airport and the associated information (i.e. alternate company route, direct track and distance from the primary to the alternate destination, and the extra fuel at the alternate destination).

Note: *The distance from the primary to the alternate destination is the distance along the alternate company route, or the direct distance if there is no alternate company route.*

NO ALTN BUTTON

When clicked, the FMS creates a temporary flight plan without an alternate destination.
For this option, the FMS computes and displays the extra fuel at the primary destination.

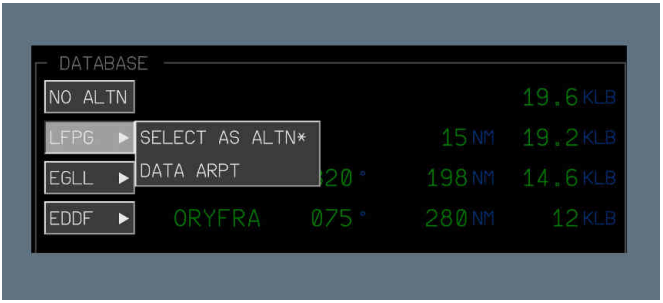
DATABASE ALTERNATE LIST

Indicates all the alternate airports that are stored in the navigation database (a maximum of 6). Also indicates for each alternate airport the alternate company route (if there is one), the direct track and distance from the primary to alternate destination, and the extra fuel at the alternate destination.

Note: *The distance from the primary to the alternate destination is the distance along the alternate company route, or the direct distance, if there is no alternate company route.*

When the airport ident is clicked, the airport ident menu displays the following options:

Airport Ident Menu



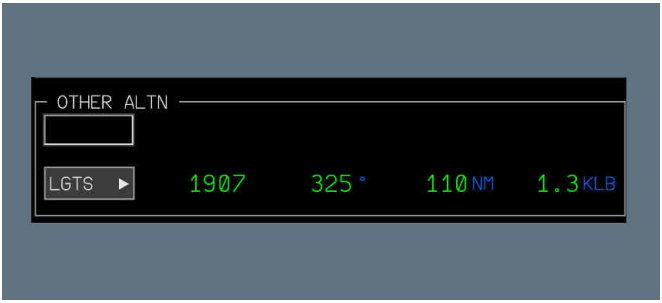
- SELECT AS ALTN: Selects the associated airport as the new alternate destination and creates a temporary flight plan
- DATA AIRPORT: Displays the DATA/AIRPORT page with additional information on the alternate airport, *Refer to Page* .

OTHER ALTN ENTRY FIELD

The flight crew may enter any airport in the entry field.
The FMS computes and displays the following for the entered airport: The alternate company route (if there is one), the direct track and distance from primary to alternate destination, and the extra fuel at the alternate destination.

Note: *The distance from the primary to the alternate destination is the distance along the alternate company route, or the direct distance, if there is no alternate company route.*

OTHER ALTN Entry Field



When the airport ident is clicked, a menu displays the following options:

OTHER ALTN Menu

- SELECT AS ALTN: Selects the associated airport as the new alternate destination and creates a temporary flight plan
- DATA AIRPORT: Displays the DATA/AIRPORT page with additional information on the airport, *Refer to Page*
- RTE SELECTION: Displays the ROUTE SELECTION page which enables the flight crew to select a company route, if there is one, *Refer to Page* .

CO RTE

Indicates the alternate company route.

DIR TRK

Indicates the direct track from the destination airport to the alternate airport.

DIST

Indicates the distance between the primary airport and the alternate destination, along the alternate company route, if there is one, or the direct distance, if there is no alternate company route.

EXTRA

Indicates the extra fuel at the alternate airport.

Note: - *The extra fuel for the NO ALTN option is the extra fuel at the primary destination.*
- *The extra fuel for all the alternate airports is dashed if the flight crew enters a MIN FUEL AT DEST on the FUEL&LOAD page.*

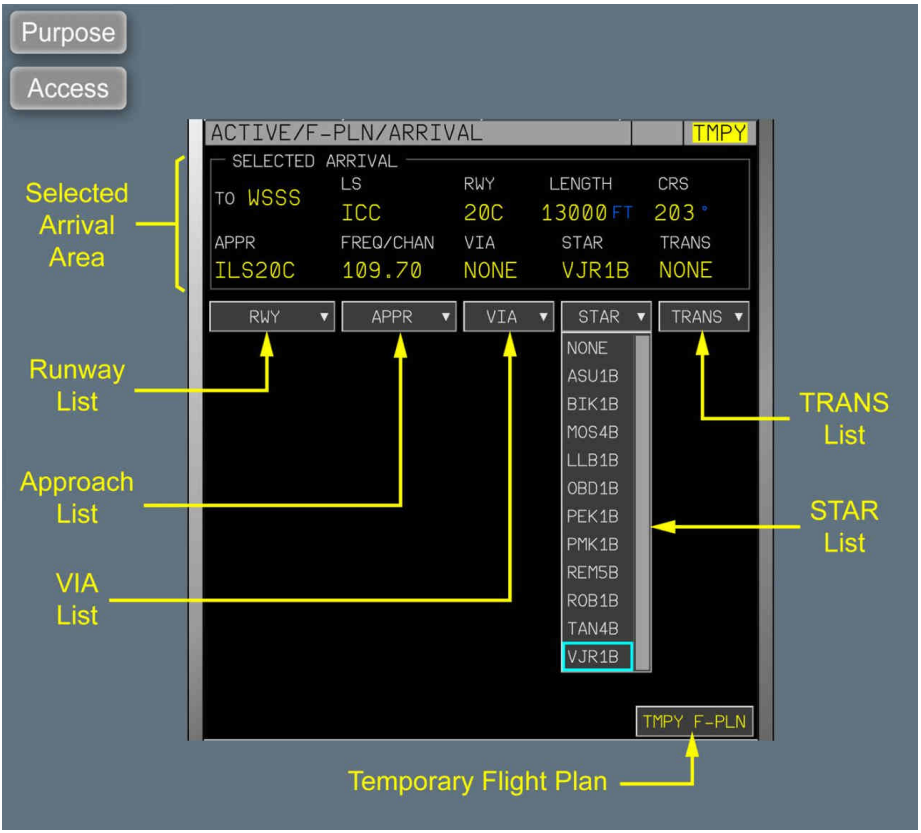
RETURN BUTTON

When clicked, displays the F-PLN page, *Refer to Page* .

ARRIVAL PAGE

Applicable to: ALL

ARRIVAL Page



PURPOSE

The ARRIVAL page enables the flight crew to insert or change the arrival procedure.
The ARRIVAL page is available for the active and secondary flight plans.

LINKS

Refer to ARRIVAL Revision

ACCESS

The flight crew can access the ARRIVAL page via the F-PLN page, by:

- Clicking directly on the destination airport

- Selecting the ARRIVAL revision in the waypoint revisions menu of the primary(alternate) destination.

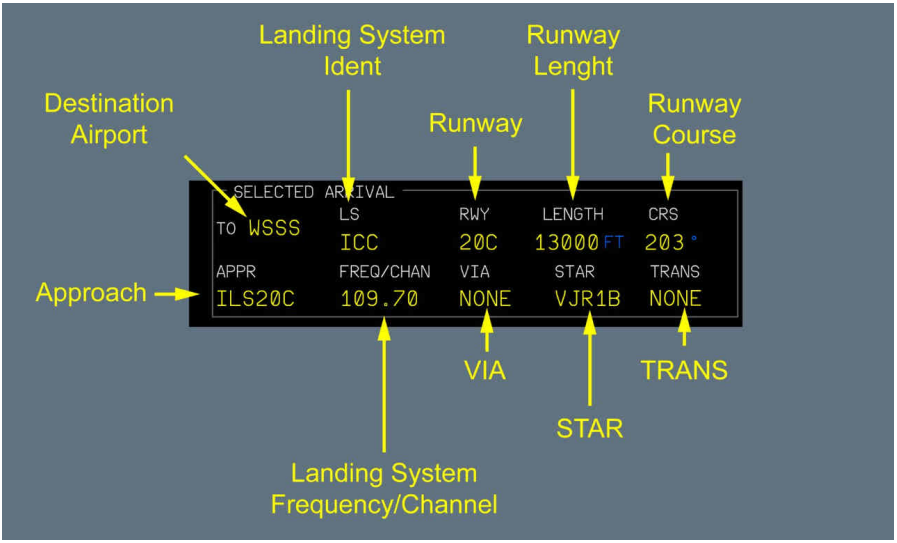
SELECTED ARRIVAL AREA

Selected Arrival Area



This area displays the selected arrival procedure parameters.

L2 The information appears in green, if it is part of the active flight plan. It appears in yellow, if the flight crew created a temporary flight plan, by selecting or changing the arrival procedure.

Note: If a temporary flight plan exists, and was created by a revision other than the arrival procedure revision, the information is displayed in green.

The arrival information is displayed in white for the secondary flight plans.

L1 All fields, except the destination airport, display dashes if the flight crew did not make any selection.

TO

Indicates the current destination airport of the primary, or alternate, flight plan.

RWY

Indicates the runway of the selected approach.

LENGTH

Indicates the navigation database runway length (in meters or feet) of the selected arrival runway.

CRS

Indicates the navigation database runway course (in degrees °) of the selected arrival runway.

APPR

Indicates the approach selected by the flight crew in the APPROACH list.

LS

Indicates the ident of the landing system of the selected approach.

LANDING SYSTEM FREQUENCY(CHANNEL)

Indicates the frequency(channel) of the landing system of the selected approach.

VIA

Indicates the VIA, selected by the flight crew from the VIA list.

STAR

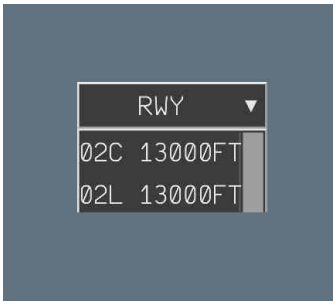
Indicates the STAR, selected by the flight crew from the STAR list.

TRANS

Indicates the TRANS, selected by the flight crew from the TRANS list.

RWY LIST

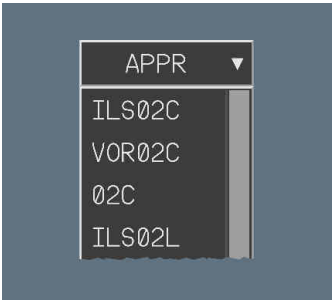
Runway List



Displays all runways that are compatible with the current destination airport, and their associated length.
When the flight crew selects a runway, the FMS creates or updates a temporary flight plan with a default leg of 5 nm on the axis of the selected runway, and completes the runway, runway length and runway course fields in the selected arrival area.

APPR LIST

Approach List



Displays all the approaches that are compatible with the current destination airport. The approaches are sorted by runway. The last option of each group of approaches, associated to one runway, is the runway itself (e.g. 02C).

L3 If the aircraft does not have an ADF receiver, the NDB approaches are not part of the list.

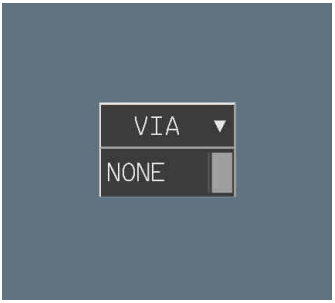
L2 *Note: When the flight crew selects the runway (e.g. 02C), a default leg of 5 nm in the runway axis is created.*

L1 When the flight crew selects an approach, the FMS creates(updates) a temporary flight plan, and completes(updates) the following fields in the selected arrival area:

- The approach
- The landing system
- The landing system frequency/channel
- The runway
- The runway length
- The runway course.

VIA LIST

VIA List



Displays all VIAs that are compatible with the selected approach and STAR. If no STAR is selected, the list displays all VIA that are compatible with the selected approach.

L2 *Note: The flight crew can only open the VIA list if an approach is selected.*

L1 The first option in the VIA list is NONE.

L2 *Note: The NONE option is selected automatically when the flight crew selects an approach and STAR, and there is no compatible VIA.*

L1 When the flight crew selects a VIA, or the NONE option, the FMS creates(updates) a temporary flight plan and completes(updates) the VIA field in the selected arrival area.

STAR LIST

STAR List

Displays all STARs that are compatible with the selected approach.

L2 Note: *The flight crew can only open the STAR list if an approach is selected.*

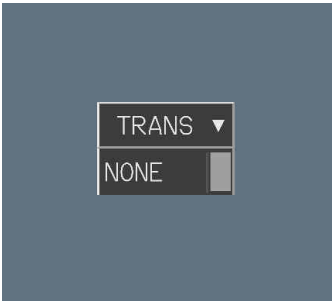
L1 The first option in the STAR list is NONE.

L2 Note: *The NONE option is selected automatically, when the flight crew selects an approach, and no STAR is available.*

L1 When the flight crew selects a STAR, or the NONE option, the FMS creates(updates) a temporary flight plan, and completes(updates) the STAR field in the selected arrival area.

TRANS LIST

TRANS List



Displays all TRANS that are compatible with the selected STAR.

L2 Note: *The flight crew can only open the TRANS list if a STAR is selected.*

L1 The first option in the TRANS list is NONE.

L2 Note: *The NONE option is selected automatically, when the flight crew selects a STAR, and no TRANS is available.*

L1 When the flight crew selects a TRANS, or the NONE option, the FMS creates(updates) a temporary flight plan, and completes(updates) the TRANS field in the selected arrival area.

TMPY F-PLN BUTTON

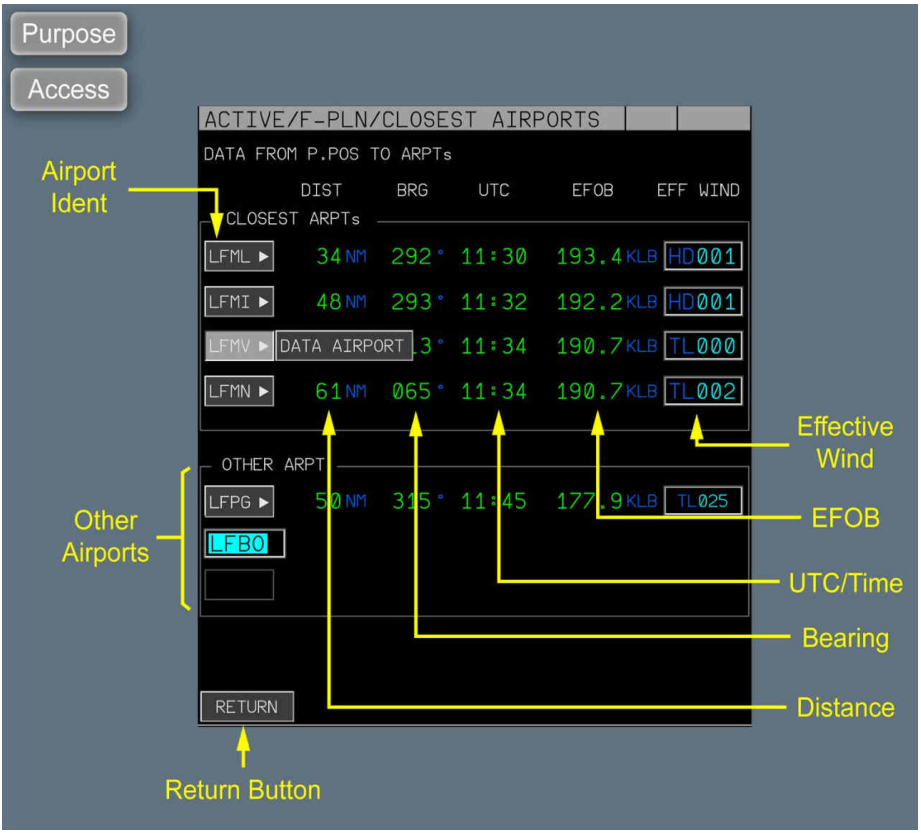
When clicked, displays the ACTIVE/F-PLN page, *Refer to Page* .

L2 The TMPY F-PLN button is only displayed if a temporary flight plan exists. If no temporary flight plan exists, the RETURN button is displayed in the bottom left corner of the page. When the flight crew clicks on the RETURN button, the F-PLN page appears.

CLOSEST AIRPORTS PAGE

Applicable to: ALL

CLOSEST AIRPORTS Page



PURPOSE

On the CLOSEST AIRPORTS page, the flight crew can:

- Access the four closest airports and their associated data (i.e. distance, bearing, UTC and EFOB).

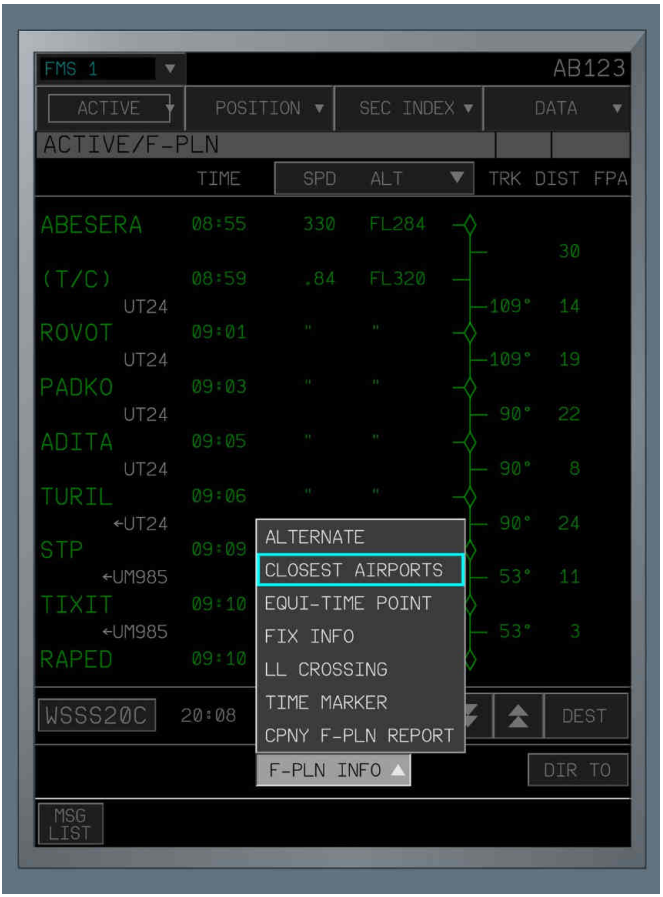
L2 The airports are ranked in increasing order of distance from the current aircraft position.

L1 - Compute the same data for the three other desired airports.

ACCESS

The flight crew can access the CLOSEST AIRPORT page via the ACTIVE/F-PLN page by selecting CLOSEST AIRPORTS in the F-PLN INFO menu.

ACTIVE/F-PLN Page

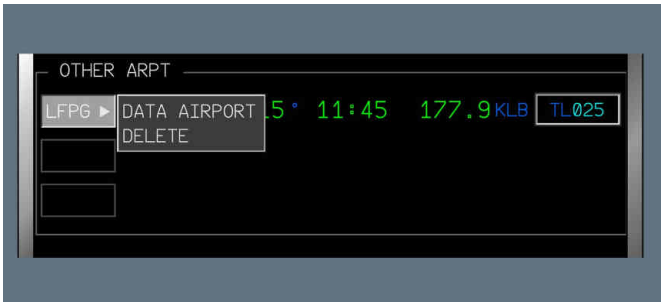


OTHER ARPT

The flight crew can manually enter up to three airport idents in order to compute the associated distance, bearing, UTC and EFOB predictions.

The flight crew can then compare these data with the closest airports computed by the FMS.
When the flight crew clicks on the airport ident button, a list opens and enables the flight crew to access airport data or to delete the manually entered airport.

Other Airports



AIRPORT IDENT

Indicates the airport ident.
When clicked, opens a menu. Selecting DATA AIRPORT displays the DATA/AIRPORT page that contains additional data about the selected airport, *Refer to Page* .

DIST

Indicates the direct distance between the current aircraft position and the airport.

BRG

Indicates the bearing from the current aircraft position to the airport.

Note: *The bearing displayed reflects the MAG/TRUE flight crew selection.*

UTC/TIME

Indicates the estimated time of arrival (in UTC time, or flight time) at the airport.
The UTC/TIME is computed in cruise flight phase only.

L2 *Note:* *The UTC/TIME displayed on the page is based on:*
- *Current aircraft gross weight*
- *Flight from current aircraft position to ground*
- *Great-circle distance and bearing to the airport*
- *Current CRZ FL*
- *Constant ISA DEV equal to current aircraft ISA DEV*
- *Entered or computed EFF WIND along the bearing*
- *Current Cost Index (CI).*

EFOB

Indicates the Estimated Fuel On Board (EFOB) at the airport.
The EFOB is computed in cruise flight phase only.

L2 *Note:* *The UTC/TIME displayed on the page is based on:*
- *Current aircraft gross weight*
- *Flight from current aircraft position to ground*
- *Great-circle distance and bearing to the airport*
- *Current CRZ FL*
- *Constant ISA DEV equal to current aircraft ISA DEV*
- *Entered or computed EFF WIND along the bearing*
- *Current Cost Index (CI).*

EFF WIND ENTRY FIELD

Indicates a head or tail wind for the associated airport route.
The FMS computes and displays a default wind that is based on the wind data entered by the flight crew.
The flight crew can overwrite the default value at any time.
The FMS uses the effective wind to compute the time and EFOB prediction for the airports.

ENTRY FORMAT

Refer to EFF WIND Entry Format

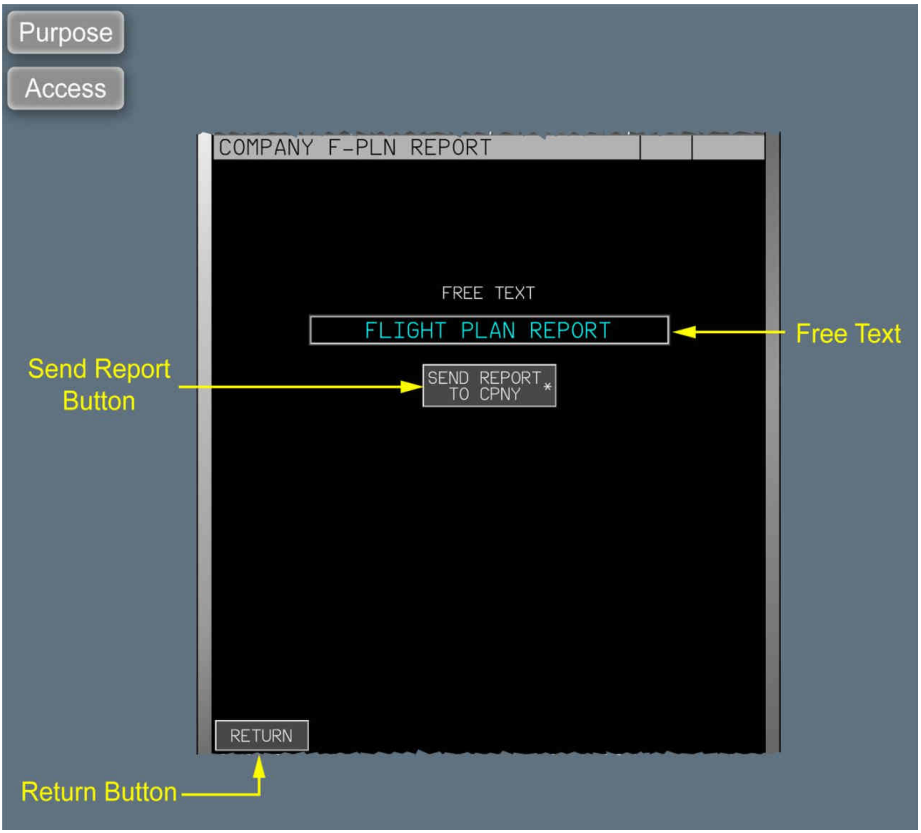
RETURN BUTTON

When clicked, displays the ACTIVE/F-PLN page, *Refer to Page* .

COMPANY F-PLN REPORT PAGE

Applicable to: ALL

COMPANY F-PLN REPORT page



PURPOSE

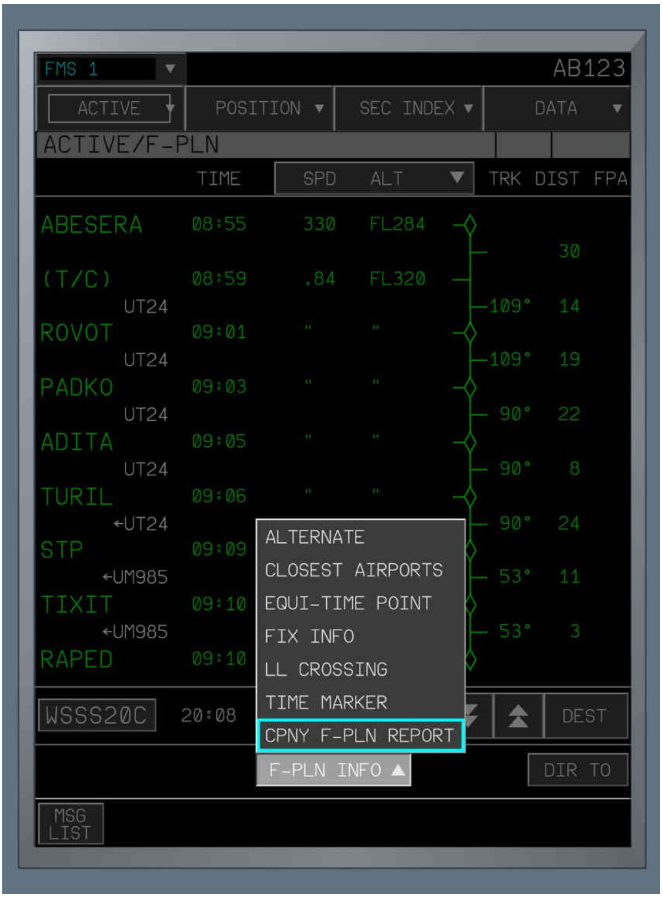
On the COMPANY F-PLN REPORT page, the flight crew can send (via ACARS) an active flight plan report to the company ground station.
If the Free Text AMI option is not activated, the COMPANY F-PLN REPORT page is not available. In this case, the flight crew sends the flight plan report by selecting CPNY F-FPLN REPORT in the F-PLN INFO menu.

The COMPANY F-PLN REPORT page is only available for the active flight plan.

ACCESS

The flight crew can access the COMPANY F-PLN REPORT page via the ACTIVE / F-PLN page by selecting CPNY F-PLN REPORT in the F-PLN INFO menu.

ACTIVE / F-PLN page



FREE TEXT

The flight crew can enter a free text, of maximum 24 characters, in the entry field. The free text is sent with the flight plan report to the company ground station.

ENTRY FORMAT

Refer to FREE TEXT Entry Format .

SEND REPORT BUTTON

When clicked, sends the flight plan report to the company ground station (via ACARS).

L2 During the report transmission to the Avionics Communication Router (ACR), the button displays SENDING ... .

SENDING ...

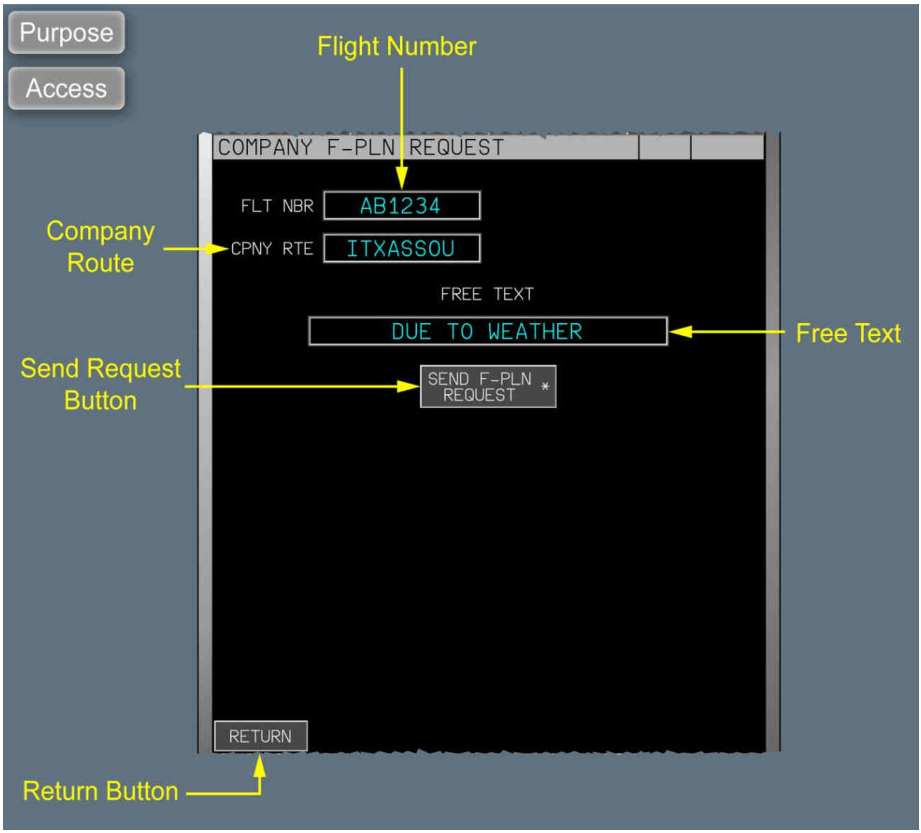
RETURN BUTTON

When clicked, displays the ACTIVE / F-PLN page.

COMPANY F-PLN REQUEST PAGE

Applicable to: ALL

COMPANY F-PLN REQUEST Page



PURPOSE

On the COMPANY F-PLN REQUEST page, the flight crew can send a flight plan request to the company ground station.

Before engine start, a performance data request is associated with the flight plan request.

L2 The request is always associated with the flight plan (active or any secondary) from where the request was sent.

After engine start, the flight crew can only send a flight plan request from one of the secondary flight plans.

L1 The COMPANY F-PLN REQUEST page is available for the active and secondary flight plans.

ACCESS

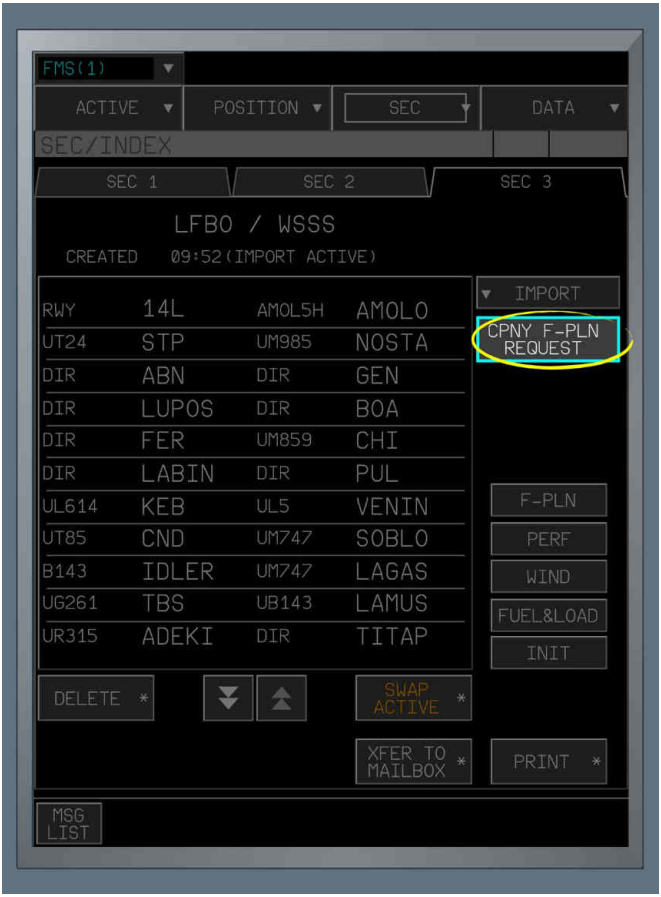
The flight crew can access the COMPANY F-PLN REQUEST page, via:

- The INIT page, by clicking on the CPNY F-PLN REQUEST button.

INIT page

Note: For the secondary flight plans, the flight crew can access the COMPANY F-PLN REQUEST page via the SEC / INIT or the SEC INDEX page.

SEC INDEX page



FLIGHT NUMBER

Indicates the flight number of the requested flight plan.
The default value is the flight number of the active (or secondary) flight plan, if any. The flight crew can always overwrite the default value.

ENTRY FORMAT

Refer to FLT NBR Entry Format .

COMPANY ROUTE

Indicates the company route of the requested flight plan.
If the F-PLN request is accessed from one of the SEC pages, the default value is the company route of the secondary flight plan, if any. The flight crew can always overwrite the default value.

ENTRY FORMAT

Refer to CO RTE Entry Format .

FREE TEXT

The flight crew can enter a free text, of maximum 24 characters, in the entry field. The free text is sent with the flight plan request to the company ground station.
If the Free Text AMI option is not activated, the free text entry field is not available.

ENTRY FORMAT

Refer to FREE TEXT Entry Format .

SEND REQUEST BUTTON

When clicked, sends the F-PLN and performance data request to the company ground station (via ACARS).

L2 During the request transmission to the Avionics Communication Router (ACR), the button displays REQUEST PENDING ... .

Request Pending

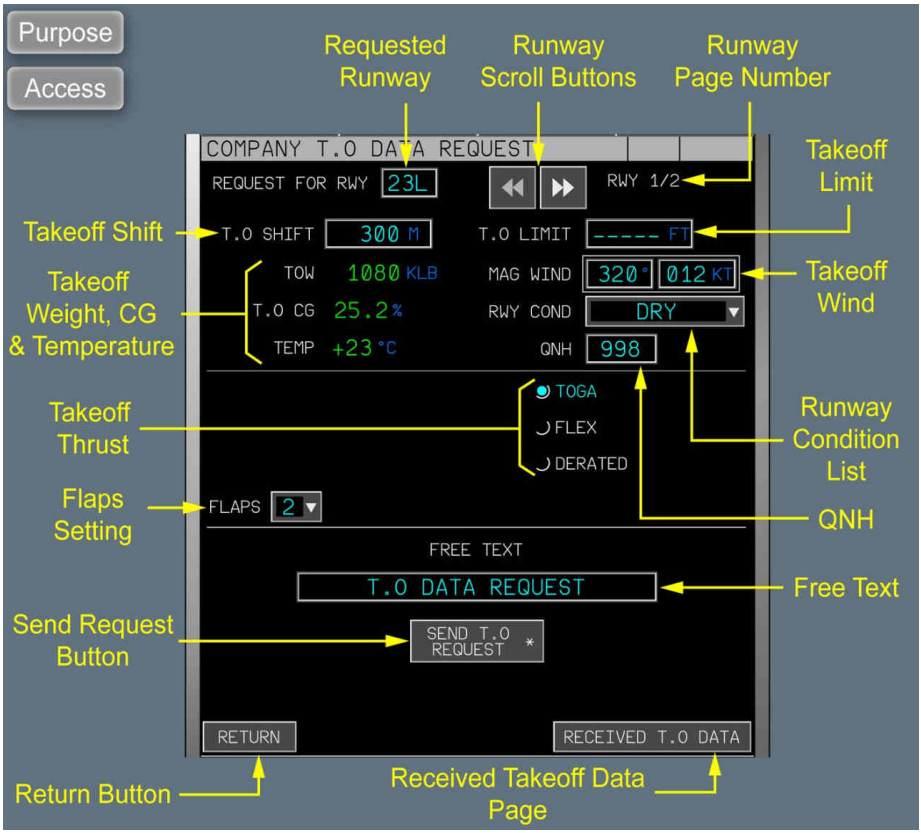
RETURN BUTTON

When clicked, displays the page that was displayed before the COMPANY F-PLN REQUEST page.

COMPANY T.O DATA REQUEST PAGE

Applicable to: ALL

COMPANY T.O DATA REQUEST page



PURPOSE

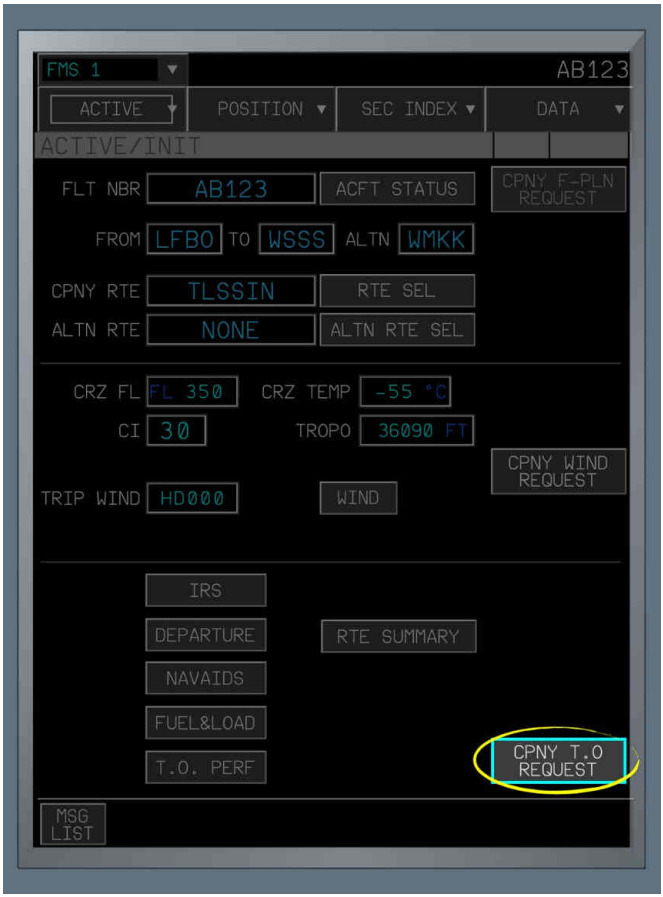
On the COMPANY T.O DATA REQUEST page, the flight crew can request takeoff data (for two different runways) to the company ground station.
The flight crew may also enter additional takeoff parameters that will be sent with the request, and used for the takeoff data computation on ground.
The COMPANY T.O DATA REQUEST page is only available for the active flight plan.

ACCESS

The flight crew can access the COMPANY T.O DATA REQUEST page, via:

- The INIT page, by clicking on the CPNY T.O REQUEST button

INIT Page



- The T.O panel of the ACTIVE / PERF page, by clicking on the CPNY T.O REQUEST button

ACTIVE / PERF / T.O Page

- The RECEIVED COMPANY T.O DATA page, by clicking on the CPNY T.O REQUEST button.

RECEIVED COMPANY T.O DATA Page

REQUESTED RUNWAY

Indicates the runway for which the takeoff data is requested.
If a departure runway is defined in the active flight plan, its ident is automatically entered in the entry field. The flight crew can always overwrite the automatically-selected ident.

ENTRY FORMAT

Refer to RWY IDENT Entry Format .

RUNWAY SCROLL BUTTONS

The flight crew uses the scroll buttons to scroll through the two requested runway pages.

RUNWAY PAGE NUMBER

Indicates the ranking of the requested runway page.

TAKEOFF WEIGHT, CG & TEMPERATURE

Indicate the aircraft weight, CG and the outside temperature at takeoff.
The takeoff weight is the FMS value that is displayed on the ACTIVE / FUEL & LOAD page (TOW). *Refer to page* .
The FQMS provides the takeoff CG.
The takeoff temperature is the current static temperature value, provided by the ADIRS .

TAKEOFF WIND ENTRY FIELDS

Indicate the wind direction and velocity.
The takeoff wind direction and velocity are those defined at the origin airport, on the CLB panel of the WIND page. The flight crew can always overwrite the default values.

L2 If the airport reference is the true north, the wind is the true wind. The label displays TRUE WIND.

L1 **ENTRY FORMAT**

Refer to WIND DIRECTION Entry Format .
Refer to WIND VELOCITY Entry Format .

RUNWAY CONDITION LIST

Indicates the runway condition at takeoff.
The flight crew selects the runway condition in the list.

Runway Condition List

QNH ENTRY FIELD

Indicates the selected QNH at takeoff.
The QNH selected on the EFIS CP is displayed by default. The flight crew can overwrite the default values at any time.

ENTRY FORMAT

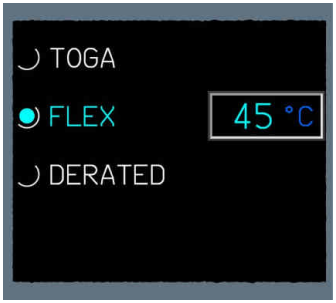
Refer to QNH Entry Format .

TAKEOFF THRUST OPTION

The flight crew selects the desired takeoff thrust:

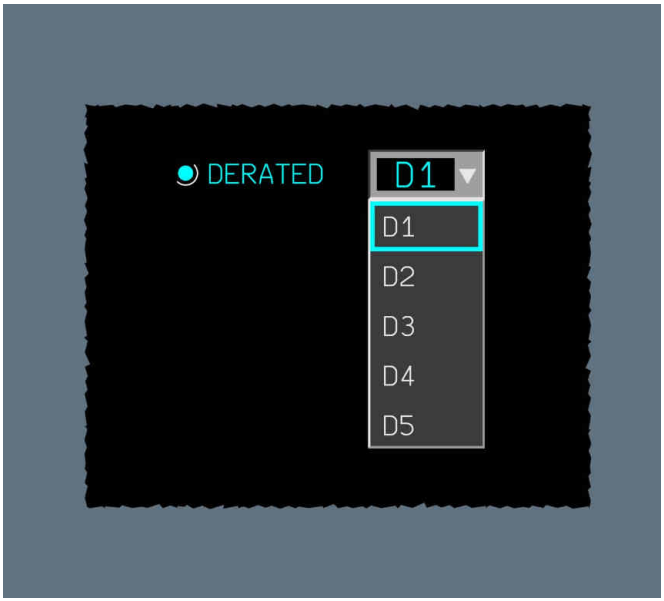
- TOGA, default setting
- FLEX
  The flight crew enters the flex value in the entry field.

FLEX Entry Field



- DERATED.
  The flight crew enters the derated level via the keyboard, or by selecting it in the list.

Derated List



ENTRY FORMAT

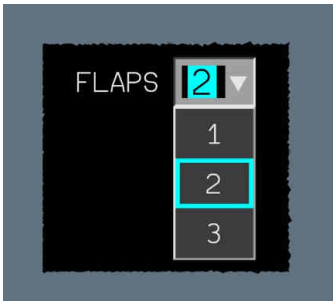
Refer to FLEX Entry Format .
Refer to DERATED Entry Format .

FLAPS SETTING LIST

Indicates the flaps setting for takeoff.
The default setting is the flaps setting of the T.O panel on the PERF page.

The flight crew can always overwrite default value by:
- Selecting in the list
- Entering via the keyboard.

Flaps Setting List



ENTRY FORMAT

Refer to FLAPS Entry Format .

TAKEOFF SHIFT ENTRY FIELD

Indicates the runway shift for takeoff.
The takeoff shift is the distance in meters (or feet) between the runway threshold and the aircraft's takeoff position.
The default value is the takeoff shift of the T.O panel on the PERF page. The flight crew can always overwrite an automatically-selected takeoff shift.

ENTRY FORMAT

Refer to TAKEOFF SHIFT Entry Format .

TAKEOFF LIMIT ENTRY FIELD

Indicates the limited runway length considering obstacles.

ENTRY FORMAT

Refer to TAKEOFF LIMIT Entry Format .

FREE TEXT ENTRY FIELD

The flight crew can enter a free text, of maximum 24 characters, in the entry field. The free text is sent with the T.O data request to the company ground station.
If the Free Text AMI option is not activated, the free text entry field is not available.

ENTRY FORMAT

Refer to FREE TEXT Entry Format .

SEND REQUEST BUTTON

When clicked, sends the T.O data request to the company ground station (via ACARS).

L2 During the request transmission to the Avionics Communication Router (ACR), the button displays REQUEST PENDING ... .

REQUEST PENDING ...

RECEIVED TAKEOFF DATA PAGE

When clicked, displays the RECEIVED CPNY T.O DATA page.
Refer to Page .

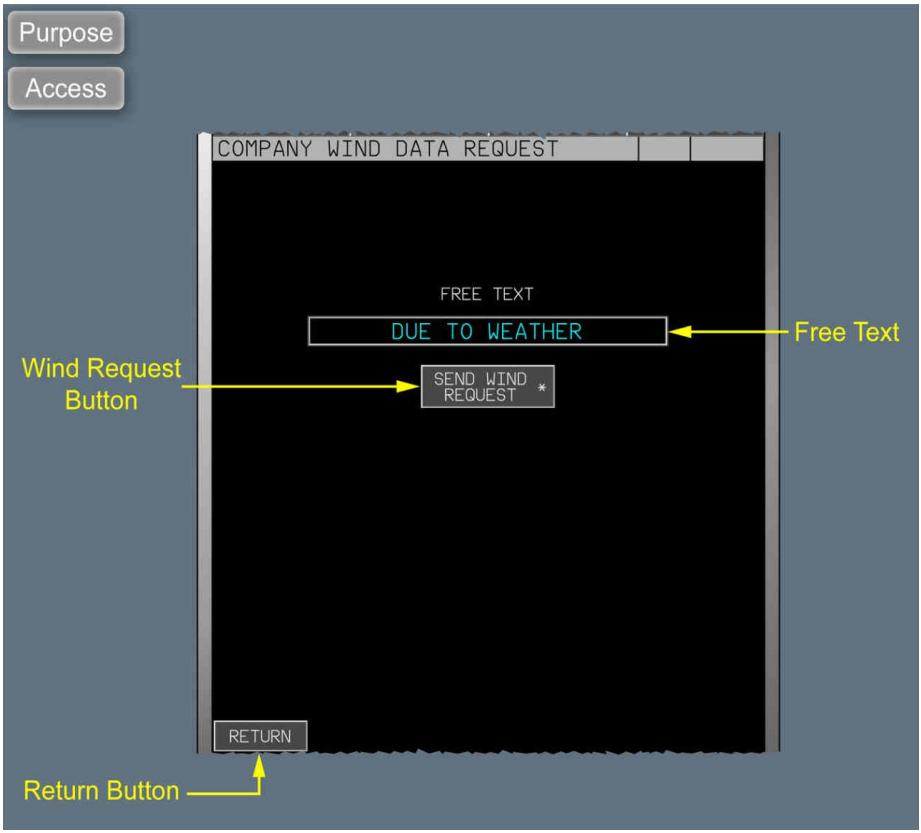
RETURN BUTTON

When clicked, displays the page that was displayed before the COMPANY T.O DATA REQUEST page.

COMPANY WIND DATA REQUEST PAGE

Applicable to: ALL

COMPANY WIND DATA REQUEST page



PURPOSE

On the COMPANY WIND DATA REQUEST page, the flight crew can send a wind request to the company ground station.

L2 The content of the wind request message depends on the flight phase currently flown by the aircraft:
- In $PREFLIGHT_{phase}$ or $T.O_{phase}$: Climb, cruise, descent and alternate wind data
- In CLB_{phase} or CRZ_{phase}: Cruise, descent and alternate wind data.

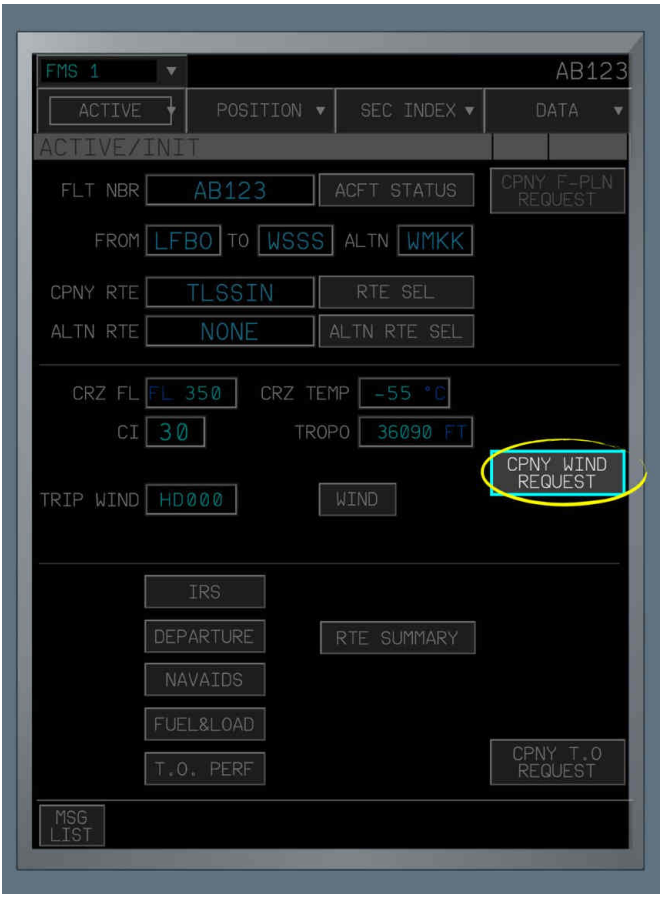
L1 When the aircraft is in DES_{phase}, $APPR_{phase}$, or GA_{phase}, no wind request is possible.
If the Free Text AMI option is not activated, the COMPANY WIND DATA REQUEST page is not available. In this case, the flight crew sends the wind request by clicking on the CPNY WIND REQUEST button on the INIT or WIND page.
The COMPANY WIND DATA REQUEST page is available for the active and secondary flight plans.

ACCESS

The flight crew can access the COMPANY WIND DATA REQUEST page, via:

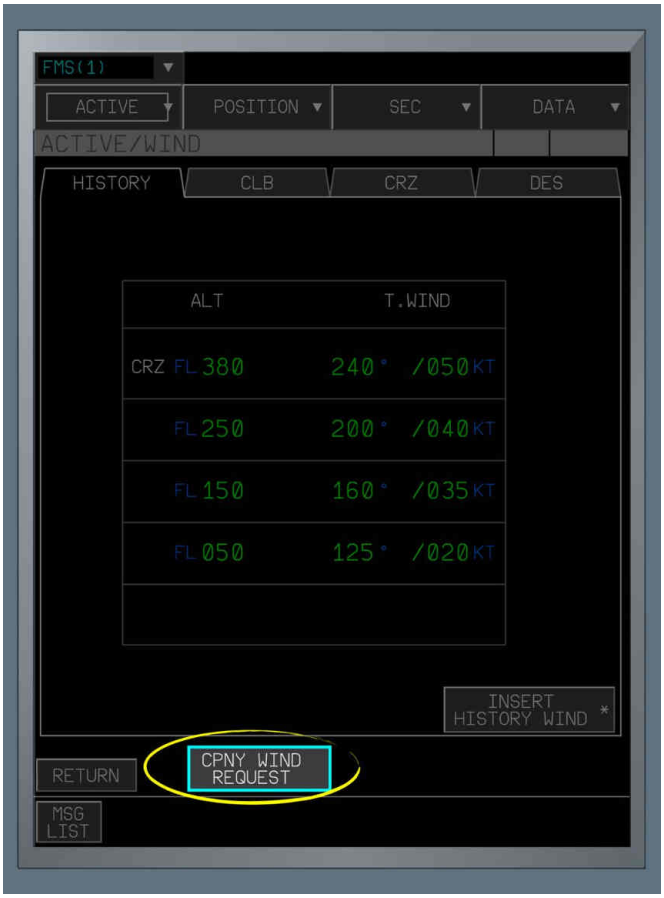
- The INIT page, by clicking on the CPNY WIND REQUEST button,

INIT Page



- The WIND page, by clicking on the CPNY WIND REQUEST button.

WIND Page



Note: *For the secondary flight plans, the flight crew can access the COMPANY WIND DATA REQUEST page via the SEC / INIT or SEC / WIND pages.*

FREE TEXT ENTRY FIELD

The flight crew can enter a free text, of maximum 24 characters, in the entry field. The free text is sent with the wind data request to the company ground station.

ENTRY FORMAT

Refer to FREE TEXT Entry Format .

WIND REQUEST BUTTON

When clicked, sends the wind request to the company ground station (via ACARS).

L2 During the request transmission to the Avionics Communication Router (ACR), the button displays REQUEST PENDING ... .

Request Pending

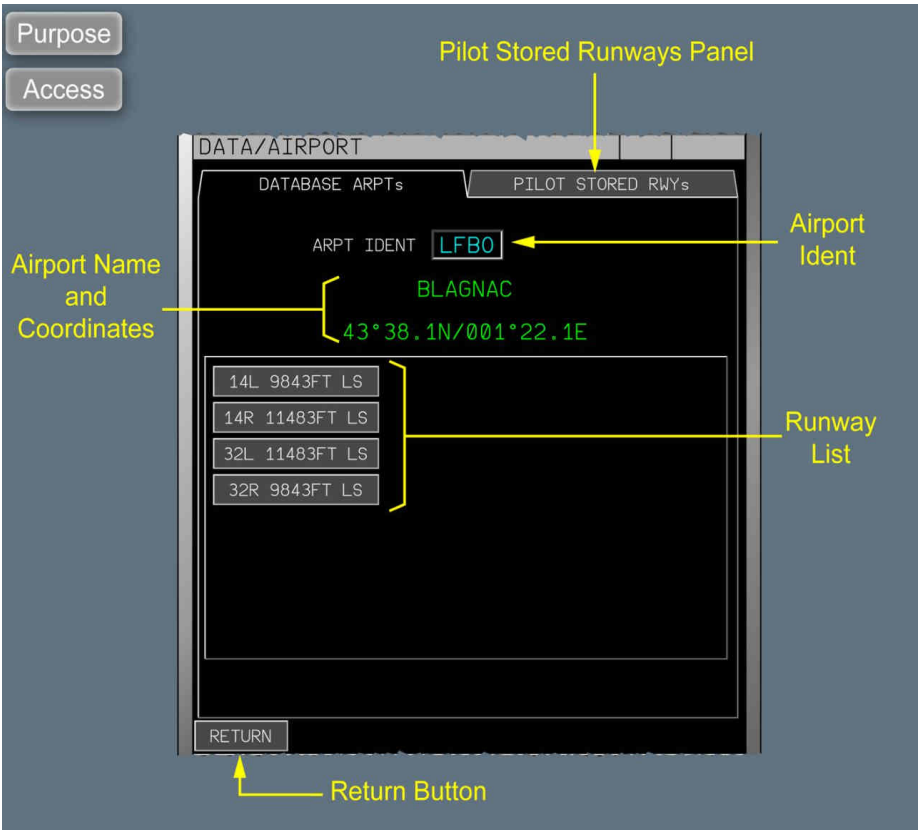
RETURN BUTTON

When clicked, displays the page that was displayed before the COMPANY WIND DATA REQUEST page.

DATA / AIRPORT PAGE

Applicable to: ALL

Overview



PURPOSE

On the DATA / AIRPORT page, the flight crew can:

- Call up the data for a runway or an airport, that is stored in the navigation database, or in the pilot stored elements database
- Create or delete runways in the pilot stored elements database.

LINKS

Refer to Navigation Database .
Refer to Pilot Stored Elements Database .

ACCESS

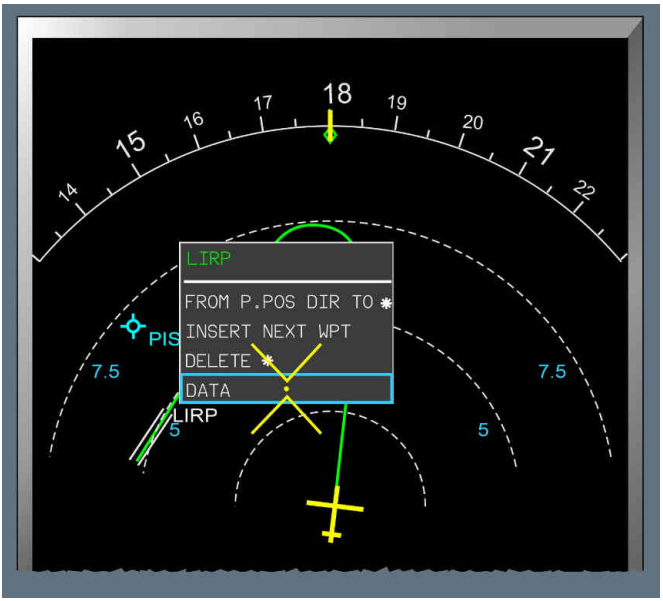
The flight crew can access the DATA / AIRPORT page:

- Via the General Menu Bar, by selecting AIRPORT in the DATA menu
  The DATABASE ARPTs panel is opened by default.

General Menu

- Via the Interactive ND, by selecting DATA in the menu of any airport

Flight Plan Airport



The DATABASE ARPTs panel is opened by default if the airport is part of the navigation database. The PILOT STORED RWYs panel is opened by default in all other cases.

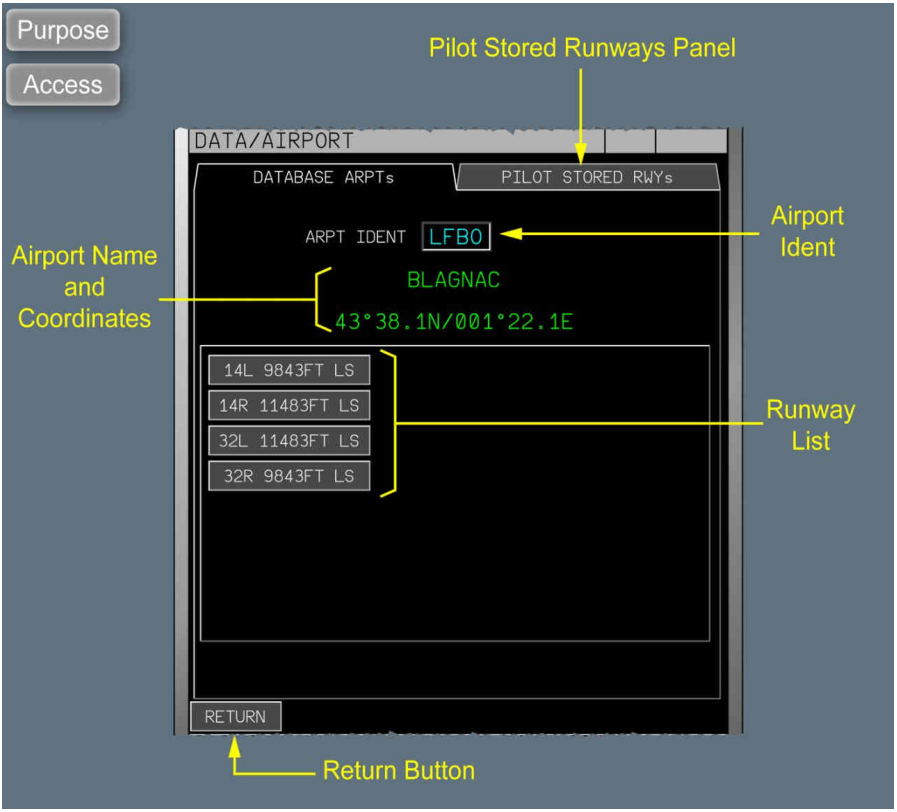
- By selecting DATA AIRPORT in the ARPT menu of:
  - The ALTERNATE page, or
  - The CLOSEST AIRPORTS page.

  The DATABASE ARPTs panel is opened by default if the airport is part of the navigation database. The PILOT STORED RWYs panel is opened by default in all other cases.

ALTERNATE Page

DATABASE ARPTS PANEL

DATABASE ARPTs Panel



AIRPORT IDENT ENTRY FIELD

The flight crew enters the ident of an airport in the entry field.

L2 If the entered airport is an airport created by the flight crew, the PILOT STORED RWYS panel is opened, and displays the associated position data.

If the entered airport is not a navigation database, nor a pilot created airport, the PILOT STORED RWYS panel is opened, and displays the new runway function, *Refer to New Runway Function* .

L1 **ENTRY FORMAT**

Refer to AIRPORT Entry Format .

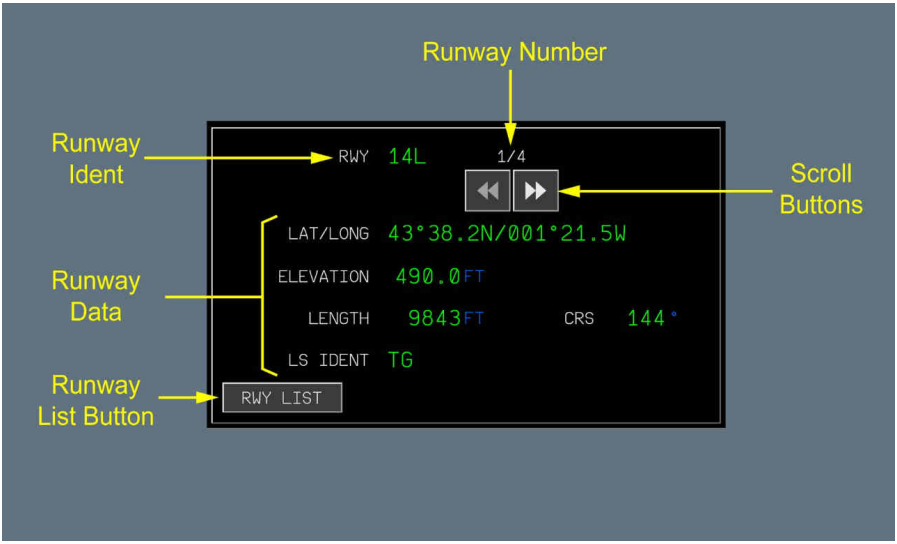
AIRPORT NAME AND COORDINATES

Indicates the name and the latitude/longitude coordinates of the navigation database airport.

RUNWAY LIST

Indicates all the runways that are associated with the navigation database airport.
The flight crew clicks on the runway button to display additional data about the associated runway.

Runway Data Panel



RWY

Indicates the ident of the runway.

RUNWAY NUMBER

Indicates the ranking of the displayed runway, and the total number of runways that are associated with the selected airport.

SCROLL BUTTONS

The flight crew uses the scroll buttons to scroll, one by one, through the runways of the selected airport.

RUNWAY DATA

Indicates:

- The latitude and longitude of the runway threshold
- The runway elevation
- The runway length
- The runway course

L2 The letter T indicates that the course is defined in the TRUE north reference.

L1 - The landing system NAVAID that is associated with the runway, if there is one.

RUNWAY LIST BUTTON

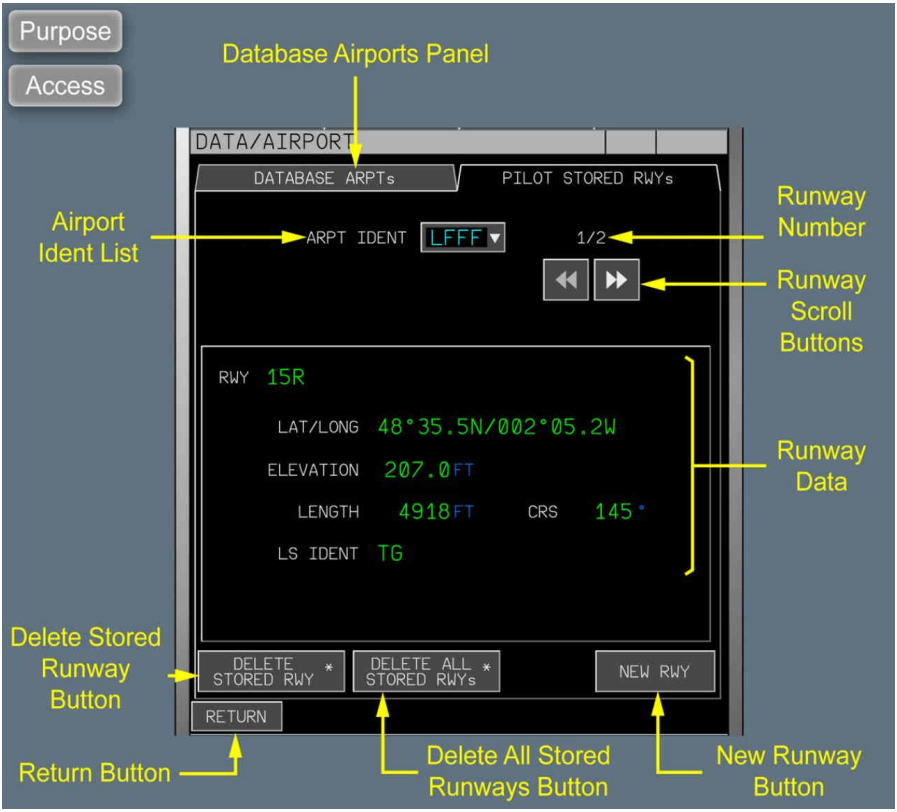
When clicked, displays the runway list.

RETURN BUTTON

When clicked, displays the page that was displayed before the DATA / AIRPORT page.

PILOT-STORED RWYS PANEL

PILOT-STORED RWYs Panel



AIRPORT IDENT LIST

Indicates the ident of the consulted pilot stored airport.
The list displays all airports that are associated with the pilot stored runways.
If the pilot stored runways database is empty, the panel displays " NO PILOT STORED RWY ".

NO PILOT STORED RWY

ENTRY FORMAT

Refer to AIRPORT Entry Format .

RUNWAY NUMBER

Indicates the ranking of the displayed pilot stored runway, and the total number of pilot stored runways.
The pilot stored runways database has a maximum of 10 runways.

RUNWAY SCROLL BUTTONS

The flight crew uses the scroll buttons to scroll, one by one, through the pilot stored runways.

RUNWAY DATA

Indicates:

- The latitude and longitude of the runway threshold
- The runway elevation
- The runway length
- The runway course

L2 The T letter indicates that the course is defined in the TRUE north reference.

L1 - The landing system NAVAID that is associated with the runway, if any.

DELETE ALL STORED RUNWAYS BUTTON

When clicked, deletes all pilot stored runways.
A confirmation action is required.

CONFIRM/CANCEL Window

If there are pilot stored runways that are still used by the FMS , they are not deleted. The FMS displays the message F-PLN ELEMENT RETAINED (*Refer to Message*).

L2 The operator can choose (via the AMI file) to have all pilot stored elements automatically deleted at transition to the DONE flight phase.

DELETE STORED RUNWAY BUTTON

When clicked, deletes the pilot stored runway that is currently displayed.
A confirmation action is required.

CONFIRM/CANCEL

If the pilot stored runway is still used by the FMS , it is not deleted. The FMS displays the message F-PLN ELEMENT RETAINED (*Refer to Message)* .

RETURN BUTTON

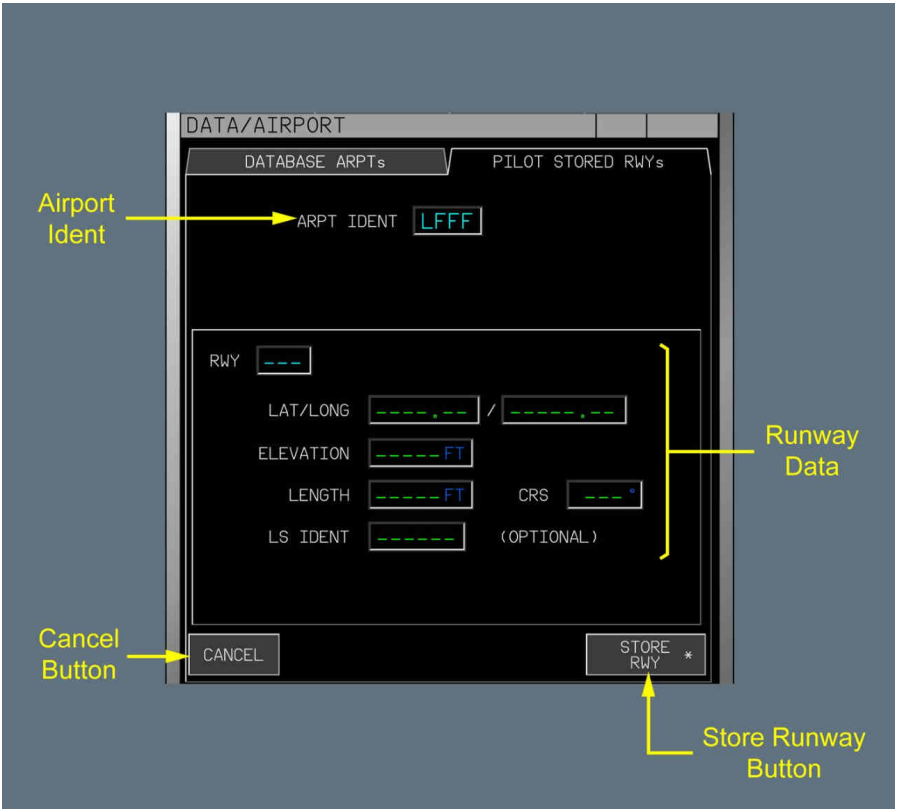
When clicked, displays the page that was displayed before the DATA / AIRPORT page.

NEW RUNWAY BUTTON

When clicked, displays the new runway function on the PILOT STORED RWYS panel, *Refer to New Runway Function* .

NEW RUNWAY FUNCTION

New Runway Function



AIRPORT IDENT ENTRY FIELD

Indicates the airport ident of the new runway.

ENTRY FORMAT

Refer to AIRPORT Entry Format .

RUNWAY DATA ENTRY FIELDS

The flight crew enters:
- The ident of the new runway,
- The latitude and longitude of the runway threshold,
- The runway elevation,
- The runway length,
- The runway course, if both latitude and longitude are defined,
- The landing system NAVAID that is associated with the runway, if any.

The flight crew needs to enter all data (except the landing system) to define a new runway.

ENTRY FORMAT

The formats for the runway data entries are:
- *Refer to RWY Entry Format*
- *Refer to LAT Entry Format*
- *Refer to LONG Entry Format*
- *Refer to RWY ELEVATION Entry Format*
- *Refer to RWY LENGTH Entry Format*
- *Refer to CRS Entry Format*
- *Refer to LS IDENT Entry Format* .

STORE RUNWAY BUTTON

When clicked, stores the new runway in the pilot stored runways database.
The pilot stored runways database has a maximum of 10 runways.

L2 If the pilot stored runways database is full, the first created runway (that is not part of the flight plan) is deleted. If all of the 10 runways are used by the FMS , the runway creation is rejected, and the 10 RWYS MAX: ALL IN USE message is displayed. *Refer to 10 RWYS MAX: ALL IN USE message* .

L3 If the PILOT STORED RWYS panel is accessed from the PILOTS STORED NAVAID panel of the DATA / NAVAID page, the STORE RWY button is replaced by the STORE RWY + NAVAID button.

STORE RWY + NAVAID Button

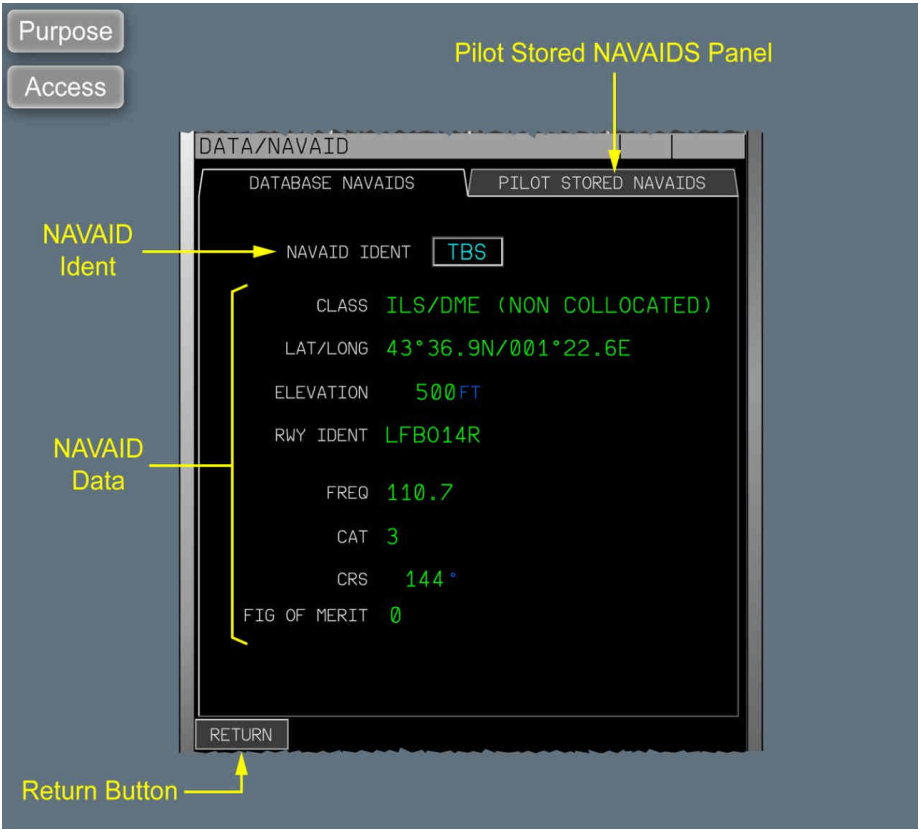
CANCEL BUTTON

When clicked, cancels the new runway function.

DATA / NAVAID PAGE

Applicable to: ALL

Overview



PURPOSE

On the DATA / NAVAID page, the flight crew can:

- Call up the data for a NAVAID, that is stored in the navigation database, or in the pilot stored elements database
- Create or delete NAVAIDS in the pilot stored elements database.

LINKS

Refer to Navigation Database .
Refer to Pilot Stored Elements Database .

ACCESS

The flight crew can access the DATA / NAVAID page:

- Via the General Menu Bar, by selecting NAVAID in the DATA menu
  The DATABASE NAVAIDS panel is opened by default.

General Menu

- By selecting DATA NAVAID in the NAVAID menu of the TUNED FOR FMS NAV panel of the POSITION / NAVAID page
  The DATABASE NAVAIDS panel is opened by default if the NAVAID is in the navigation database. The PILOT STORED NAVAIDS panel is opened by default, in all other cases.

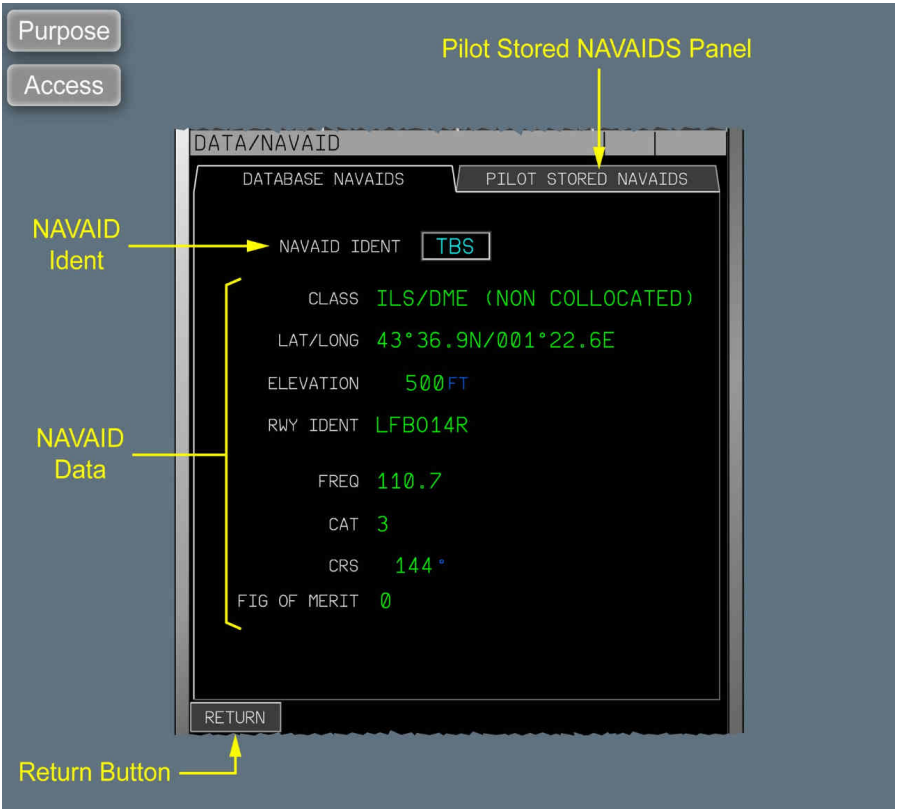
DATABASE NAVAIDS Panel



NAVAID IDENT ENTRY FIELD

The flight crew enters the ident of a NAVAID in the entry field.

L2 If the entered NAVAID is a NAVAID created by the flight crew, the PILOT STORED NAVAIDS panel is opened, and displays the associated data.

If the entered NAVAID is not a navigation database, nor a pilot created NAVAID, the PILOT STORED NAVAIDS panel is opened, and displays the new NAVAID function, *Refer to New NAVAID Function* .

L1 **ENTRY FIELD**

Refer to NAVAID Entry Format .

NAVAID DATA

Indicates:

- The class

L2
- VOR
- DME
- LOC
- ILS
- GLS
- NDB
- ILS/DME
- VOR/DME.

L1 - The latitude/longitude coordinates (LAT/LONG)
- The elevation (ELEVATION)

L2 This label is not displayed for VOR and NDB.

L1 - The ident of the runway that is associated with the NAVAID (RWY IDENT)

L2 This label is only displayed for landing system NAVAIDS.

L1 - The magnetic declination (STATION DEC)

L2 This label is only displayed for VOR and VOR/DME.

L1 - The frequency (FREQ),
or channel (CHANNEL) for GLS
- The approach category (CAT)

L2 The category may be 1, 2 or 3.

L1 - The figure of merit, (FIG OF MERIT), that indicates the maximum tuning distance of the NAVAID

L2 The FIG OF MERIT may be one of the following:
- 0 (40NM)
- 1 (70NM)
- 2 (130NM)
- 3 (250NM).

L1 - The course (CRS)

L2 This label is only displayed for landing system NAVAIDS.
The T letter indicates that the course is defined in TRUE north reference.

L1 - The slope (SLOPE).

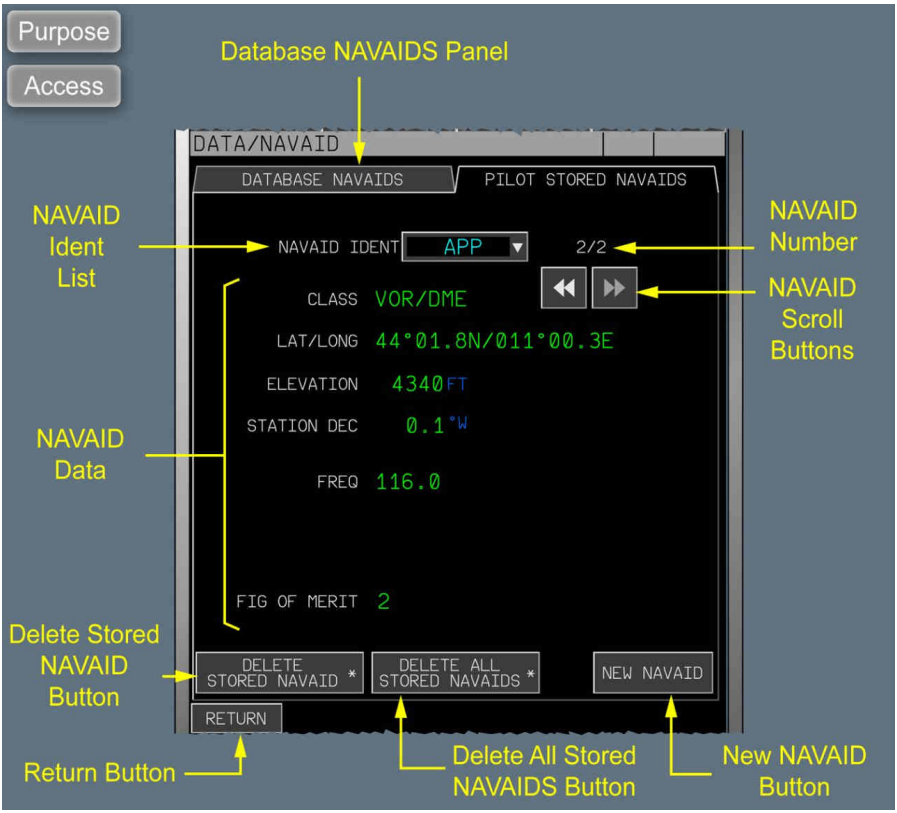
L2 This label is only displayed for GLS.

RETURN BUTTON

When clicked, displays the page that was displayed before the DATA / NAVAID page.

PILOT STORED NAVAIDS PANEL

PILOT STORED NAVAIDS Panel



NAVAID IDENT LIST

Indicates the ident of the consulted pilot stored NAVAID.
The list displays all the pilot stored NAVAIDs.

L2 If the entered NAVAID is not a navigation database, nor a pilot created NAVAID, the New NAVAID Function is displayed, *Refer to New NAVAID Function* .

L1 If the pilot stored NAVAIDs database is empty, the panel displays " NO PILOT STORED NAVAID ".

NO PILOT STORED NAVAID

ENTRY FORMAT

Refer to NAVAID Entry Format .

NAVAID NUMBER

Indicates the ranking of the displayed pilot stored NAVAID, and the total number of pilot stored NAVAIDS.

The pilot stored NAVAIDS database has a maximum of 20 NAVAIDS.

NAVAID SCROLL BUTTONS

The flight crew uses the scroll buttons to scroll, one by one, through the pilot stored NAVAIDS.

NAVAID DATA

Indicates:

- The class

L2
- VOR
- DME
- LOC
- ILS
- GLS
- NDB
- VOR/DME.

L1 - The latitude/longitude coordinates (LAT / LONG)

- The elevation (ELEVATION)

L2 This label is not displayed for VOR and NDB.

L1 - The ident of the runway that is associated with the NAVAID (RWY IDENT)

L2 This label is only displayed for landing system NAVAIDS.

L1 - The magnetic declination (STATION DEC)

L2 This label is only displayed for VOR and VOR/DME.

L1 - The frequency (FREQ),
or channel (CHANNEL) for GLS

- The approach category (CAT)

L2 The category may be 1, 2 or 3.

L1 - The figure of merit, (FIG OF MERIT), that indicates the maximum tuning distance of the NAVAID

L2 The FIG OF MERIT may be one of the following:
- 0 (40NM)
- 1 (70NM)
- 2 (130NM)
- 3 (250NM).

L1 - The course (CRS)

L2 This label is only displayed for landing system NAVAIDS.
The T letter indicates that the course is defined in TRUE north reference.

L1 - The slope (SLOPE).

L2 This label is only displayed for GLS.

DELETE ALL STORED NAVAIDS BUTTON

When clicked, deletes all pilot stored NAVAIDs.
A confirmation action is required.

CONFIRM/CANCEL

If there are pilot stored NAVAIDs that are still used by the FMS , they are not deleted. The FMS displays the message F-PLN ELEMENT RETAINED (*Refer to Message).*

L2 The operator can choose (via the AMI file) to have all pilot stored elements automatically deleted at transition to the DONE flight phase.

DELETE STORED NAVAID BUTTON

When clicked, deletes the pilot stored NAVAID that is currently displayed.
A confirmation action is required.

CONFIRM/CANCEL

If the pilot stored NAVAID is still used by the FMS , it is not deleted. The FMS displays the message F-PLN ELEMENT RETAINED (*Refer to Message)* .

RETURN BUTTON

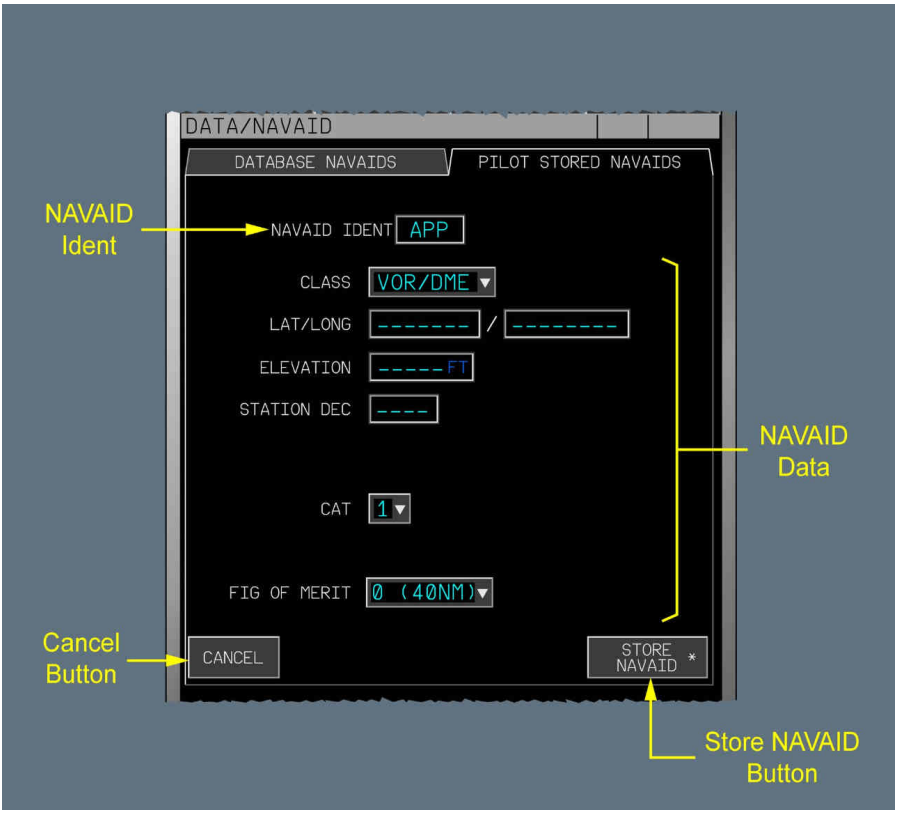
When clicked, displays the page that was displayed before the DATA / NAVAID page.

NEW NAVAID BUTTON

When clicked, displays the new NAVAID function on the PILOT STORED NAVAIDS panel, *Refer to New NAVAID Function* .

NEW NAVAID FUNCTION

New NAVAID Function



NAVAID IDENT ENTRY FIELD

Indicates the NAVAID ident of the new NAVAID.

ENTRY FORMAT

Refer to NAVAID Entry Format .

NAVAID DATA ENTRY FIELDS

The flight crew enters:

- The class of the NAVAID, by using the selection list

L2 The class of the NAVAID can be one of the following:

- VOR
- DME
- LOC
- ILS
- GLS
- NDB
- VOR/DME.

L1 - The latitude/longitude coordinates (LAT / LONG)
- The elevation (ELEVATION)

L2 This label is not displayed for VOR and NDB .

L1 - The ident of the runway that is associated with the NAVAID (RWY IDENT)

L2 This label is only displayed for landing system NAVAIDS.
If the entered runway ident is not a navigation database, nor a pilot created airport, the PILOT STORED RWYS panel is opened, and displays the new runway function. For more information, *Refer to DATA/AIRPORT page* .

L1 - The magnetic declination (STATION DEC)

L2 This label is only displayed for VOR and VOR/DME.
The T letter indicates that the NAVAID is defined in TRUE north reference.

L1 - The frequency (FREQ),
or channel (CHANNEL) for GLS
- The approach category (CAT)

L2 The category may be 1, 2 or 3.

L1 - The figure of merit, (FIG OF MERIT), that indicates the maximum tuning distance of the NAVAID

L2 The FIG OF MERIT may be one of the following:
- 0 (40NM)
- 1 (70NM)
- 2 (130NM)
- 3 (250NM).

L1 - The course (CRS)

L2 This label is only displayed for landing system NAVAIDS.
The T letter indicates that the course is defined in TRUE north reference.

L1 - The slope (SLOPE).

L2 This entry field is only displayed for GLS .

L1 **ENTRY FORMAT**

- Latitude (*Refer to Entry Format*)
- Longitude (*Refer to Entry format*)
- Elevation (*Refer to Entry Format*)
- Runway Ident (*Refer to Entry Format*)
- Station Declination (*Refer to Entry Format*)
- ILS Frequency (*Refer to Entry Format*) or VOR / DME frequency (*Refer to Entry Format*)
- GLS Channel (*Refer to Entry Format*)
- Course (*Refer to Entry Format*)
- Bearing (*Refer to Entry Format*)
- GLS Slope (*Refer to Entry Format*)

STORE NAVAID BUTTON

When clicked, stores the new NAVAID in the pilot-stored elements database.
The pilot-stored NAVAID database has a maximum of 20 NAVAIDS.

L2 If the pilot-stored NAVAIDs database is full, the first created NAVAID that is not part of the flight plan is deleted. If all of the 20 NAVAIDs are used by the FMS , the NAVAID creation is rejected, and the 20 NAVAIDS MAX : ALL IN USE message is displayed, *Refer to Message* .

L3 If the flight crew accesses the PILOT STORED NAVAIDS panel from the PILOT STORED RWYs panel of the DATA/AIRPORT page, the STORE NAVAID + RWY button appears, instead of the STORE NAVAID button.

STORE NAVAID+RWY Button

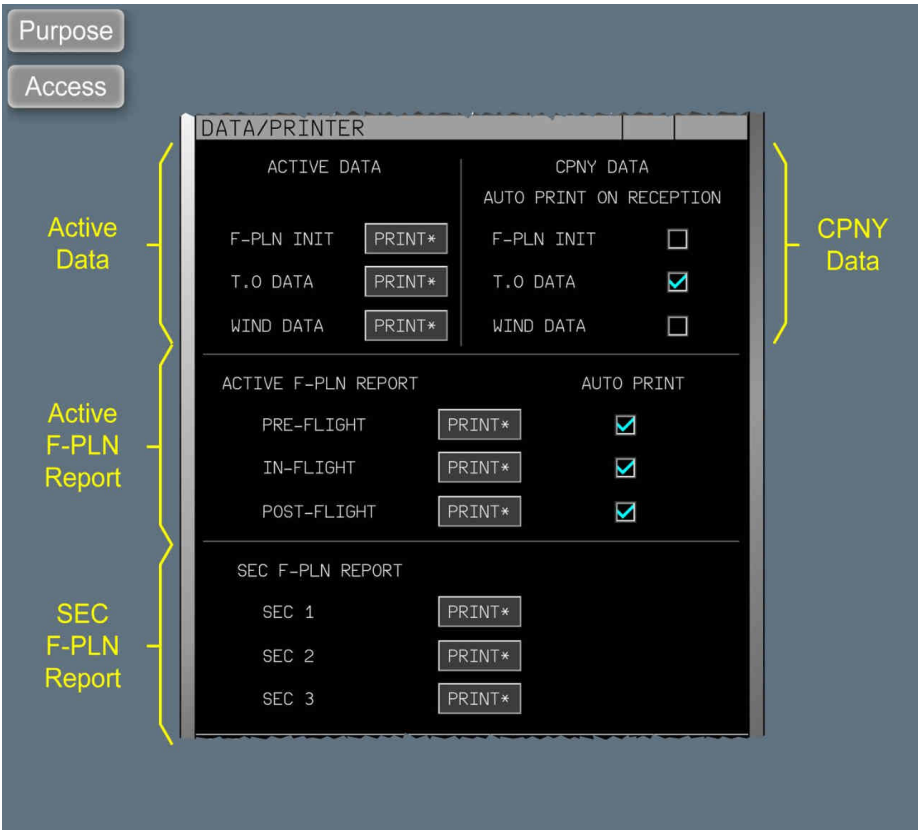
CANCEL BUTTON

When clicked, cancels the new NAVAID function.

DATA / PRINTER PAGE

Applicable to: ALL

PRINTER page



PURPOSE

On the PRINTER page, the flight crew can:

- Start the manual printing of active flight plan data and secondary flight plan reports
- Configure the automatic printing of company data and active flight plan reports.

ACCESS

The flight crew can access the PRINTER page via the General Menu Bar by selecting PRINTER in the DATA menu.

General Menu Bar

ACTIVE DATA

The flight crew clicks on the button to print out the associated data:
- Flight plan initialization data
- Takeoff data
- Wind data.

CPNY DATA

The flight crew selects (or deselects) the option(s) to activate (or deactivate) the automatic printing on reception of:
- Flight plan initialization data
- Takeoff data
- Wind data.

L2 Some options may be selected by default as defined in the AMI file.

ACTIVE F-PLN REPORT

The flight crew clicks on the button to print out the associated active flight plan report, and selects (or deselects) the option to activate (or deactivate) the automatic printing.

L2 Some option(s) may be selected by default as defined in the AMI file.

L1 **PRE-FLIGHT**

PRINT Button

The flight crew clicks on this button to print out the pre-flight report.

L2 This is only possible when the following two conditions are fulfilled:
- The FMS flight phase is PREFLIGHT, and
- The flight plan data is entered.

L1 AUTO PRINT Option

The flight crew selects (or deselects) the pre-flight option to activate (or deactivate) the automatic printing of the pre-flight report.
If activated, the automatic pre-flight report printing will occur at engine start.

IN-FLIGHT

PRINT Button

The flight crew clicks on this button to print out the in-flight report for the active flight plan.

L2 This is only possible when the FMS flight phase is either TAKEOFF, CLIMB, CRUISE, DESCENT, APPROACH, GO AROUND, or DONE and prior to all engine shut down.

L1 AUTO PRINT Option

The flight crew selects (or deselects) the in-flight option to activate (or deactivate) the automatic printing of the in-flight report.
If activated, the automatic in-flight report printing will occur at transition to TAKEOFF.

POST-FLIGHT

PRINT Button

The flight crew clicks on this button to print out the post-flight report for the active flight plan.
This is only possible after all engine shut down.

AUTO PRINT Option

The flight crew selects (or deselects) the post-flight option to activate (or deactivate) the automatic printing of the post-flight report.
If activated, the automatic post-flight report printing will occur at engine shut down.

SEC F-PLN REPORT

The flight crew clicks on the button to print out the associated secondary flight plan report.
This report may be either a pre-flight, or in-flight report.

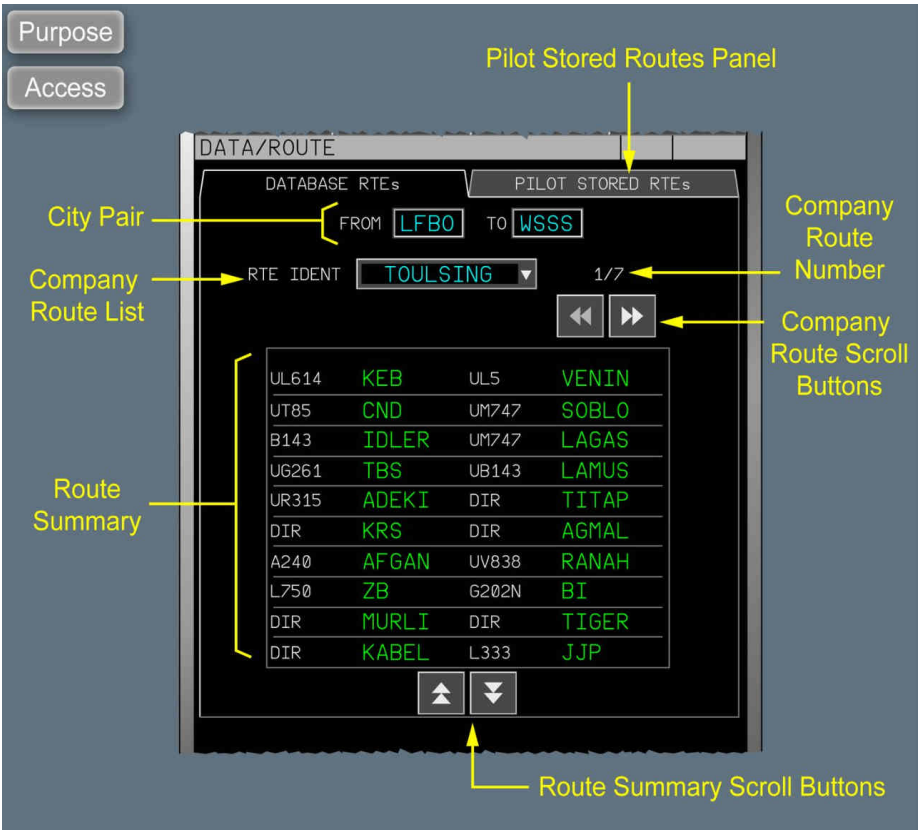
L2 If the secondary flight plan is created by a copy of the active flight plan and, and if this secondary flight plan is sequencing along with the active flight plan (the active leg of the secondary flight plan matches the active leg of the active flight plan) :

- A pre-flight report is available, if the FMS flight phase is PREFLIGHT
- An in-flight report is available in flight, except in the DONE phase.
  In all other cases, the secondary flight plan report is a pre-flight report.

DATA / ROUTE PAGE

Applicable to: ALL

Overview



PURPOSE

On the DATA / ROUTE page, the flight crew can:

- Call up the data for a company route, that is stored in the navigation database, or in the pilot stored elements database
- Create or delete company routes in the pilot stored elements database.

LINKS

Refer to Navigation Database .
Refer to Pilot Stored Elements Database .

ACCESS

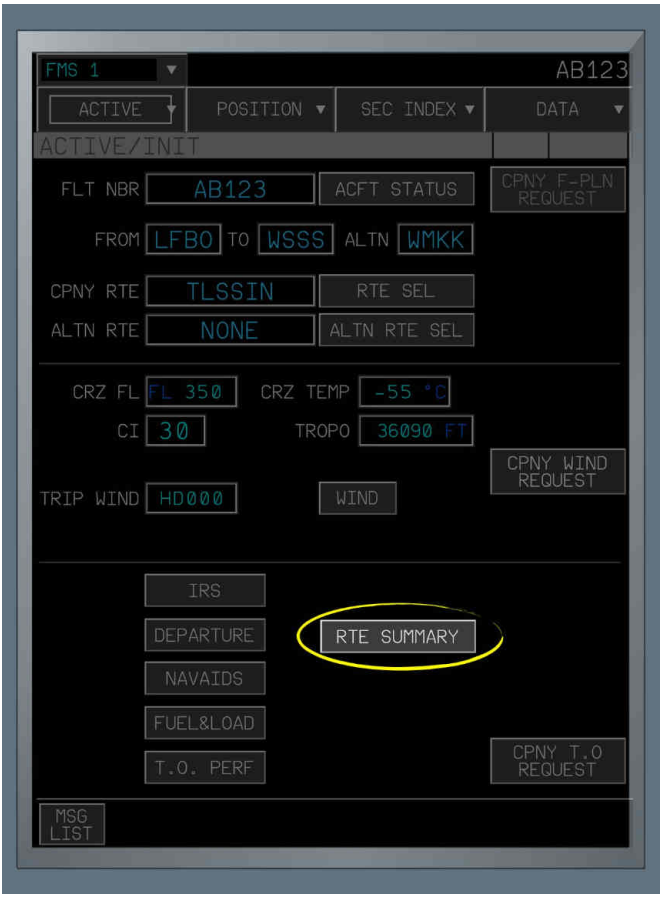
The flight crew can access the DATA / ROUTE page, via:

- The General Menu Bar, by selecting ROUTE in the DATA menu
  The DATABASE RTEs panel is opened by default.

General Menu

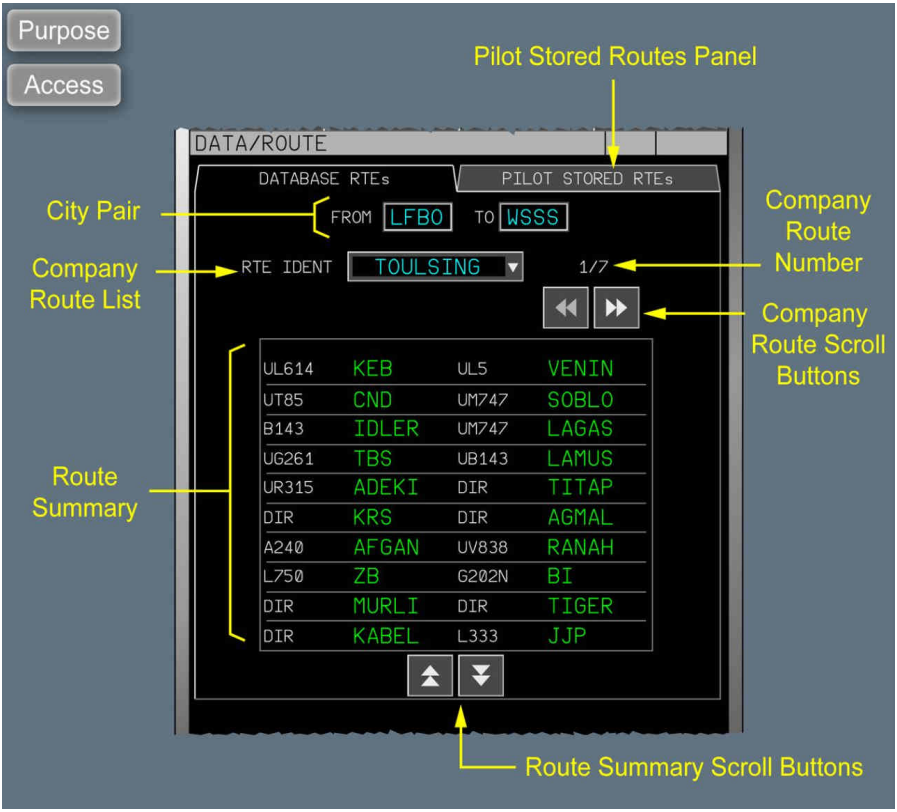
- The ACTIVE / INIT page, by clicking on the RTE SUMMARY button.
  The PILOT STORED RTEs panel is opened by default and the active flight plan is automatically copied as a new route.

RTE SUMMARY Button



DATABASE RTES PANEL

DATABASE RTEs Panel



CITY PAIR ENTRY FIELDS

The flight crew enters the idents of the FROM / TO city pair (origin and destination airports), in the entry fields.

L2 If the entered airport is not a navigation database, nor a pilot created airport, the NOT IN DATABASE message is displayed. *Refer to Message* .

If the entered airport is a pilot created airport, the NOT ALLOWED DATABASE ARPTs ONLY message is displayed. *Refer to Message* .

L1 **ENTRY FORMAT**

Refer to AIRPORT Entry Format .

COMPANY ROUTE LIST

The flight crew enters the company route ident via the keyboard, or by selecting it in the list. The list displays all the navigation database routes, that are associated with the FROM/TO city pair entered by the flight crew.

L2 If the entered route is not a navigation database, nor a pilot created route, the NOT IN DATABASE message is displayed. *Refer to Message .*

If the entered route is a pilot created route, the PILOT STORED RTES panel is opened, and displays the associated data.

L1 **ENTRY FORMAT**

Refer to CO RTE Entry Format

COMPANY ROUTE NUMBER

Indicates the ranking of the displayed route, and the total number of navigation database routes that are associated with the FROM/TO city pair.

COMPANY ROUTE SCROLL BUTTONS

The flight crew uses the scroll buttons to scroll, one by one, through the navigation database routes that are associated with the FROM/TO city pair.

ROUTE SUMMARY

Indicates the route summary of the selected company route.
The summary has to be read from left to right, and from top to bottom.
Company route waypoints are displayed in green big font. Airways and procedures are displayed in small white font.

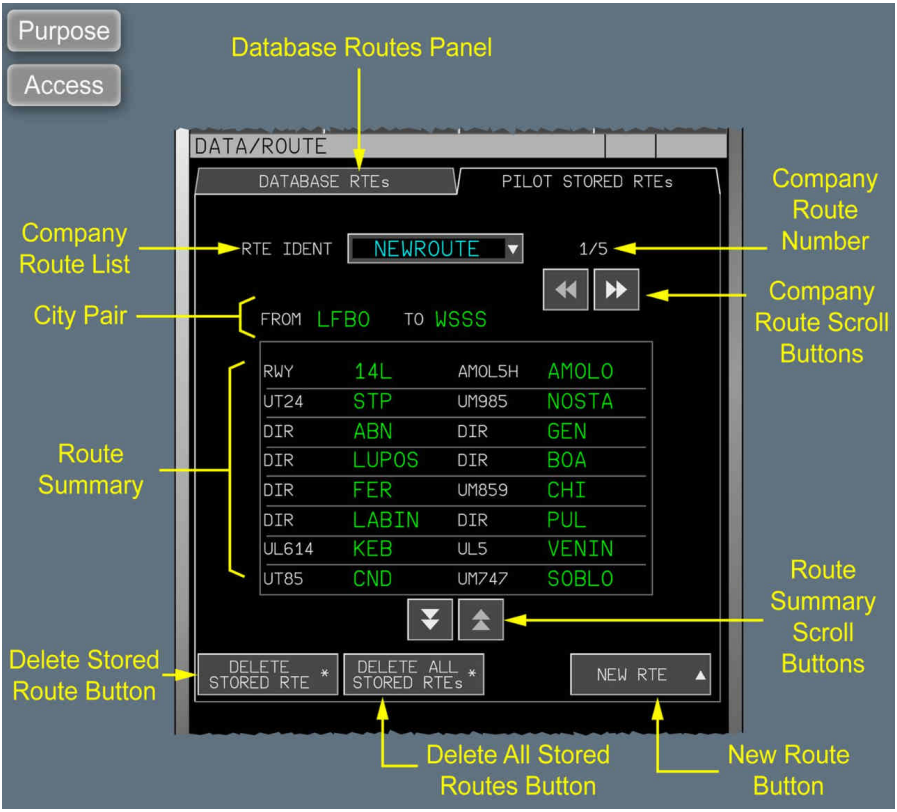
Note:
- *The VIA part of a procedure, and direct legs are indicated with DIR*
- *A runway is indicated with RWY*
- *When the company route has an approach procedure, only the first waypoint and the name of the procedure are displayed in the route summary.*

ROUTE SUMMARY SCROLL BUTTONS

The flight crew uses the scroll buttons to move, page by page, downwards (upwards) through the route summary.

PILOT STORED RTES PANEL

PILOT STORED RTEs Panel



COMPANY ROUTE LIST

Indicates the ident of the consulted pilot stored company route.
The list displays all pilot stored routes.
If the pilot stored routes database is empty, the panel displays " NO PILOT STORED RTEs ".

NO PILOT STORED RTE

ENTRY FORMAT

Refer to CO RTE Entry Format .

CITY PAIR

Indicates the FROM/TO (origin / destination) city pair that is associated with the displayed pilot stored route.

COMPANY ROUTE NUMBER

Indicates the ranking of the displayed route, and the total number of pilot stored routes.
The pilot stored routes database has a maximum of 5 routes.

COMPANY ROUTE SCROLL BUTTONS

The flight crew uses the scroll buttons to scroll, one by one, through the pilot stored routes.

ROUTE SUMMARY

Indicates the route summary of the selected company route.
The summary has to be read from left to right, and from top to bottom.
Company route waypoints are displayed in green big font. Airways and procedures are displayed in small white font.

Note:
- *The VIA part of a procedure, and direct legs are indicated with DIR*
- *A runway is indicated with RWY*
- *When the company route has an approach procedure, only the first waypoint and the name of the procedure are displayed in the route summary.*

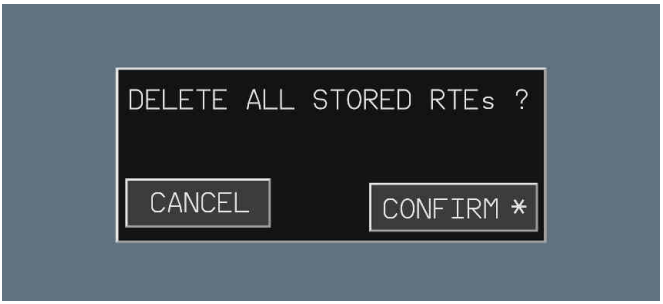
ROUTE SUMMARY SCROLL BUTTONS

The flight crew uses the scroll buttons to move, page by page, downwards (upwards) through the route summary.

DELETE ALL STORED ROUTES BUTTON

When clicked, deletes all pilot stored routes.
A confirmation action is required.

CONFIRM/CANCEL



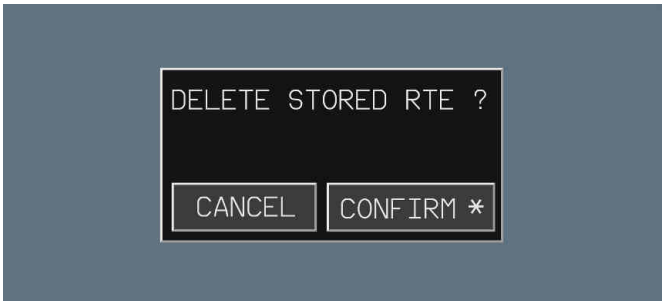
If there are pilot stored routes that are still used by the FMS , they are not deleted. The FMS displays the message F-PLN ELEMENT RETAINED (*Refer to Message).*

L2 The operator can choose (via the AMI file) to have all pilot stored elements automatically deleted at transition to the DONE flight phase.

DELETE STORED ROUTE BUTTON

When clicked, deletes the pilot stored route that is currently displayed.
A confirmation action is required.

CONFIRM/CANCEL



If the pilot stored route is still used by the FMS , it is not deleted. The FMS displays the message F-PLN ELEMENT RETAINED (*Refer to Message)* .

NEW ROUTE BUTTON

When clicked, opens a menu.
With the options of this menu, the flight crew can store a copy of the active or any secondary flight plan in the pilot stored elements database, *Refer to New Route Function* .

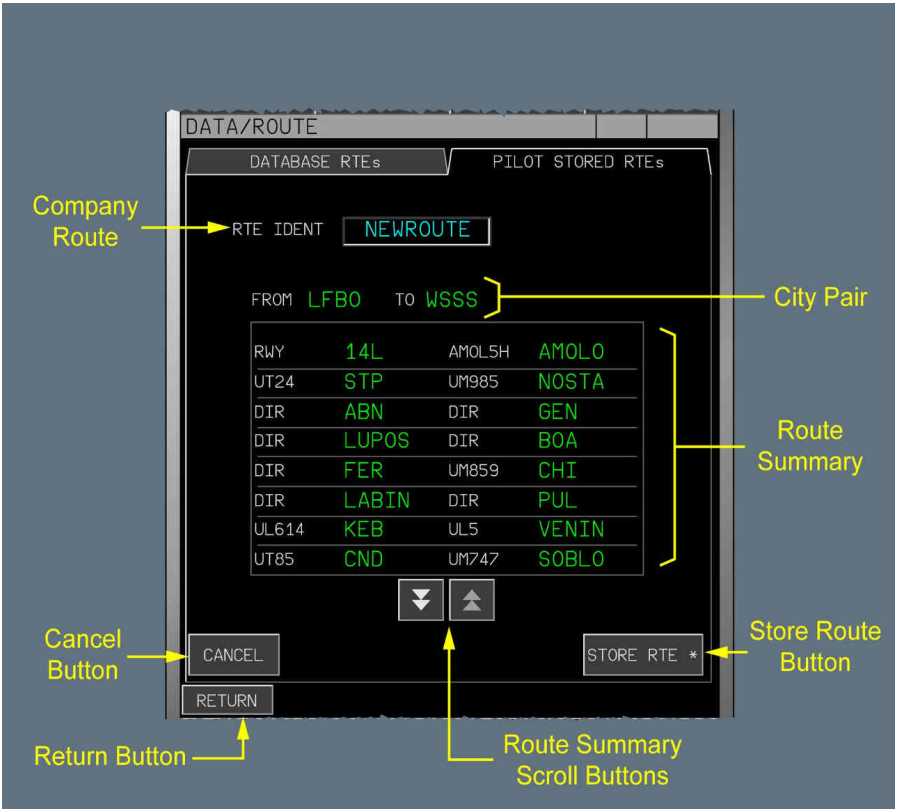
L2 The flight crew can store a copy of the active flight plan, only in pre-flight.

New Route Menu

L1 When the flight crew has copied one of the flight plans, its summary is displayed, and the route can be stored in the pilot stored routes database.

NEW ROUTE FUNCTION

New Route Function



COMPANY ROUTE ENTRY FIELD

Indicates the route ident of the new route.

L2 If the entered route ident already exists in the navigation database, or in the pilot stored routes database, the RTE IDENT ALREADY USED message is displayed. *Refer to DSC-22-FMS-20-110 RTE IDENT ALREADY USED .*

L1 **ENTRY FORMAT**

Refer to CO RTE Entry Format .

CITY PAIR

Indicates the FROM/TO (origin / destination) city pair that is associated with the new pilot stored route.

ROUTE SUMMARY

Indicates the route summary of the copied flight plan.
The summary has to be read from left to right, and from top to bottom.
Company route waypoints are displayed in green big font. Airways and procedures are displayed in small white font.

Note:
- *The VIA part of a procedure, and direct legs are indicated with DIR*
- *A runway is indicated with RWY*
- *When the company route has an approach procedure, only the first waypoint and the name of the procedure are displayed in the route summary.*

ROUTE SUMMARY SCROLL BUTTONS

The flight crew uses the scroll buttons to move, page by page, downwards (upwards) through the route summary.

STORE ROUTE BUTTON

When clicked, stores the new route in the pilot stored elements database.
The pilot stored routes database has a maximum of 5 routes.
L2 If the pilot stored route database is full, the route creation is rejected, and the PILOT RTEs LIST FULL message is displayed. *Refer to Message .*
Each stored route has a maximum size of 30 flight plan elements. When the route is longer, only the first 30 elements are stored, and the SOME REVISIONS NOT STORED message is displayed. *Refer to Message*

CANCEL BUTTON

When clicked, cancels the new route function.

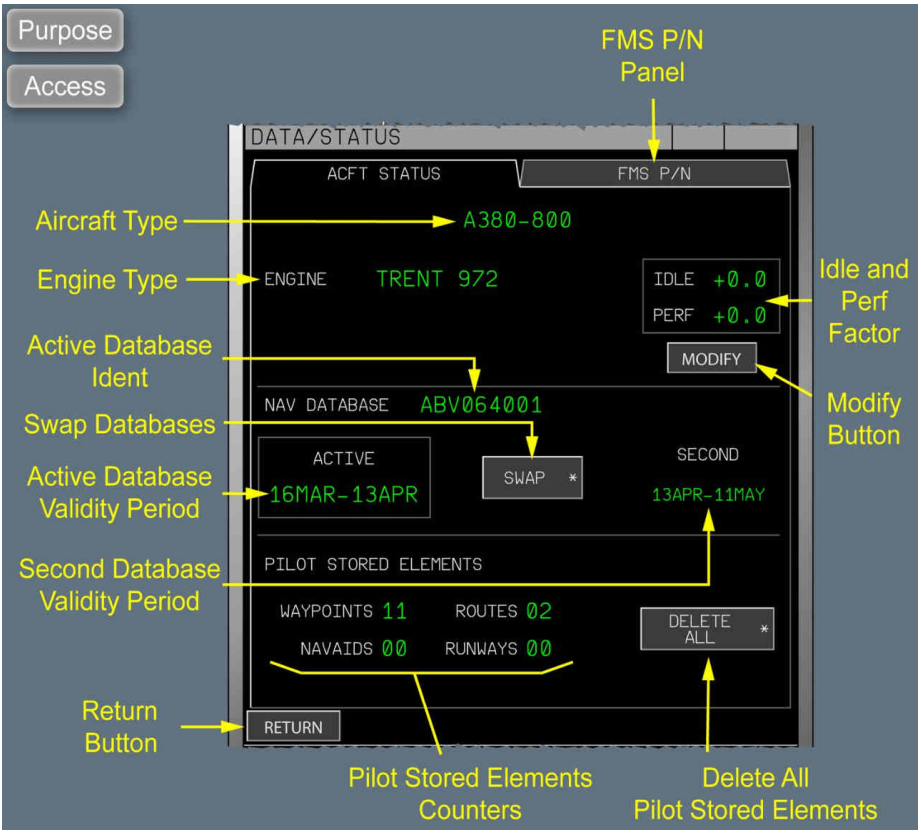
RETURN BUTTON

When clicked, displays the ACTIVE / INIT page.

DATA / STATUS PAGE

Applicable to: ALL

STATUS Page



PURPOSE

On the ACFT STATUS panel of the STATUS page, the flight crew can:

- Check the aircraft model and engine type
- Check the navigation database validity
- Swap navigation database cycles
- Check the number of pilot stored elements

- Delete the pilot stored elements

L2 - Modify the engine PERF and IDLE factors

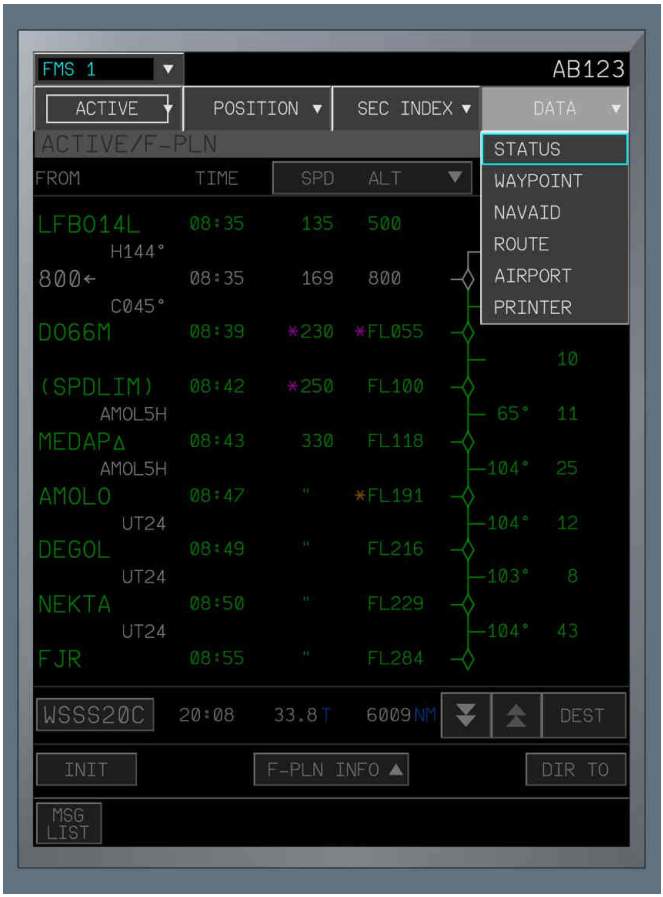
L1 On the FMS P/N panel of the STATUS page, the flight crew can consult the part numbers of the FMS software, the FMC databases, and configuration files.

ACCESS

The flight crew can access the STATUS page:

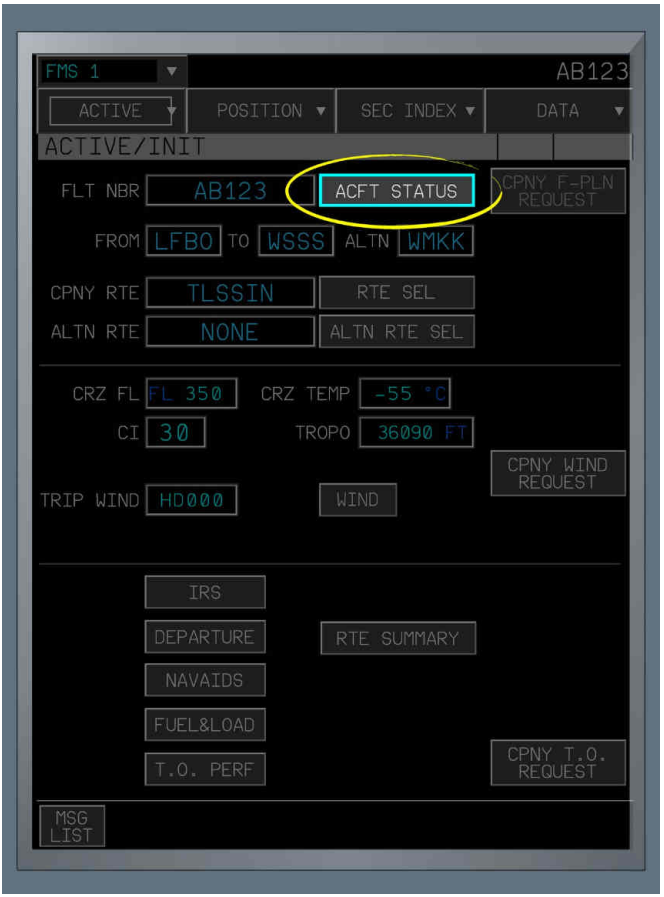
- Via the General Menu Bar, by selecting STATUS in the DATA menu

General Menu Bar



- Via the ACTIVE / INIT page, by clicking on the ACFT STATUS button

ACFT STATUS Button on the INIT page



L2 The ACFT STATUS panel on the STATUS page is automatically displayed:
- At the FMS power up
- After an automatic FMS reconfiguration, or FMC reset, before engine start
- Upon transition to the DONE phase.

The FMS P/N panel on the STATUS page is automatically displayed upon a power transient greater than 5 s, or an FMC reset with part number incompatibilities between the different FMCs.

AIRCRAFT TYPE

Indicates the aircraft type.

L2 The aircraft type is part of the performance database. (*Refer to Performance Database*)

ENGINE TYPE

Indicates the type of engine that is used for performance computations.

L2 The engine type is part of the performance database. (*Refer to Performance Database*)

IDLE AND PERF FACTOR

The idle and perf factor are two correction factors that are used for the FMS performance and predictions computation.

The idle factor is a correction factor of the idle engine rating.

The perf factor is a correction factor of the fuel flow, due to aerodynamics or engine deterioration.

L2 The operator can define a default value for both factors in the AMI file.

L1 Idle and perf factors can be changed via the modify button (*Refer to Modify)* . They can also be uplinked via ACARS .

L2 The manually entered idle and perf factors are stored and retained after transition to the DONE flight phase, or after a long term power cut.

L1 ENTRY FORMAT

Refer to IDLE FACTOR ENTRY FORMAT
Refer to PERF FACTOR ENTRY FORMAT

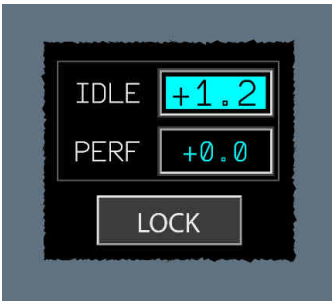
MODIFY BUTTON

When clicked, removes the button and displays the key entry field.

Key Entry Field

After entry of the right key code, the idle and perf entry fields, and the lock button are displayed.

Idle and Perf Entry Fields



The idle and perf factors can now be changed. The entered values are locked by clicking on the lock button.

ACTIVE DATABASE IDENT

Indicates the part number of the currently loaded navigation database.

ACTIVE DATABASE VALIDITY PERIOD

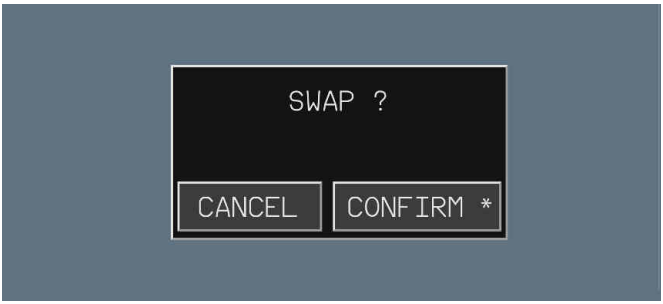
Indicates the validity period of the active navigation database.

SWAP DATABASES BUTTON

When clicked, the second navigation becomes the active one, and vice versa.

L2 *Note: The flight crew has to confirm the database swapping by clicking on the Confirm button in the Confirm/Cancel window.*

CONFIRM/CANCEL Window



L1

CAUTION	Swapping the databases, erases the active and secondary flight plans, as well as the flight crew stored data. The flight crew must never do this in flight.

SECOND DATABASE VALIDITY PERIOD

Indicates the validity period of the second navigation database.

PILOT STORED ELEMENTS COUNTERS

The pilot stored elements counters display the number of pilot stored waypoints, routes, NAVAIDS and runways.

L2 The operator can choose (via the AMI file) to have the pilot stored elements automatically deleted at transition to the DONE flight phase.

L1 All pilot stored elements are deleted when a new navigation database is loaded or when the active and second databases are swapped.

DELETE ALL BUTTON

When clicked, deletes all pilot stored waypoints, routes, NAVAIDS, and runways.

L2 *Note: The flight crew has to confirm the deletion of the pilot stored elements by clicking on the Confirm button in the Confirm/Cancel window.*

CONFIRM/CANCEL Window

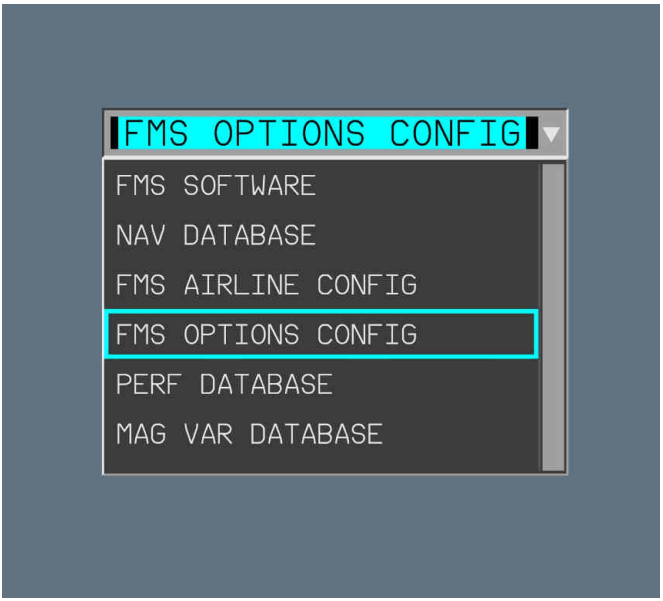
L1 If there are pilot stored elements that are still used by the FMS , they are not deleted. The FMS displays the message F-PLN ELEMENT RETAINED (*Refer to Message).*

L2 The operator can choose (via the AMI file) to have the pilot stored elements automatically deleted at transition to the DONE flight phase.

DATABASE LIST

The flight crew selects in the list the type of database for which he wants to displays the part numbers.

Database List



The database list displays:
- FMS SOFTWARE
- NAV DATABASE (*Refer to Navigation Database)*
- FMS AIRLINE CONFIG *Refer to AMI File)*
- FMS OPTIONS CONFIG (*Refer to OPC File)*
- PERF DATABASE (*Refer to Performance Database)*
- MAG VAR DATABASE (*Refer to Magnetic Variation Database)*

SCROLL BUTTONS

The flight crew uses the Scroll buttons to scroll, one by one, through the Database list. The associated part number data is displayed accordingly.

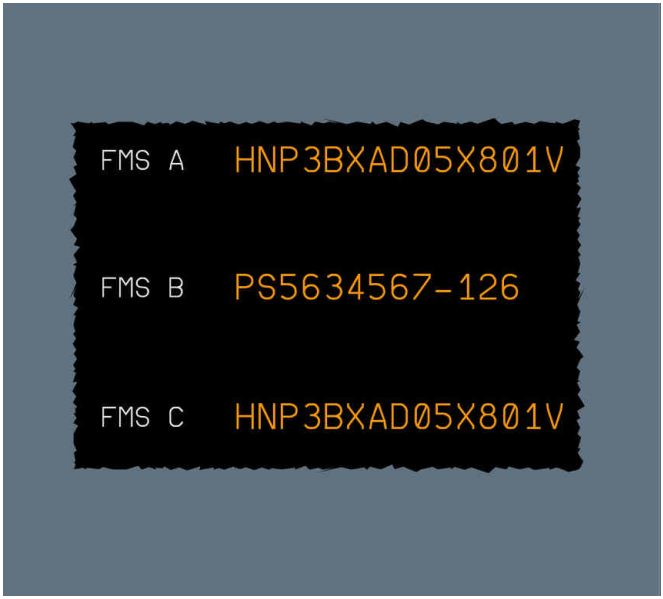
Note: *The wheel of the KCCU has the same functionality as the scroll buttons: Scrolling down (or up) the wheel displays the next (or previous) database and its part number data.*

FMC PART NUMBERS

Indicate for the three FMCs, the part number of the database selected in the database list.

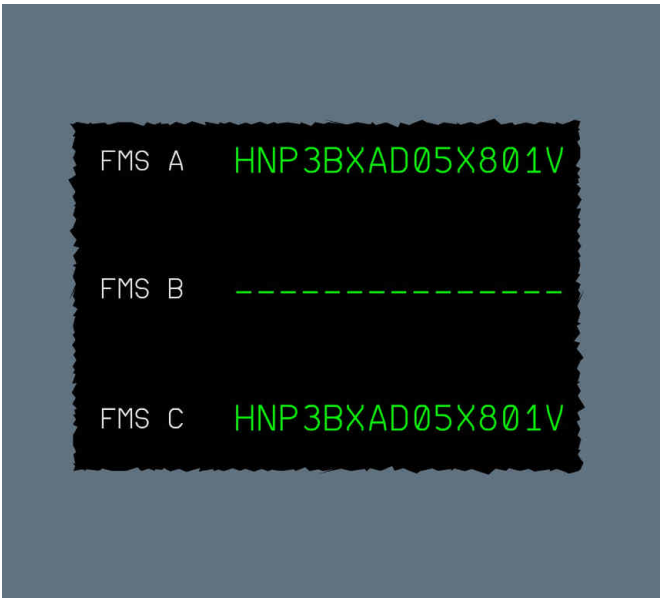
L2 The part numbers are all displayed in amber when there are at least two different numbers for a same database.

Different Part Numbers



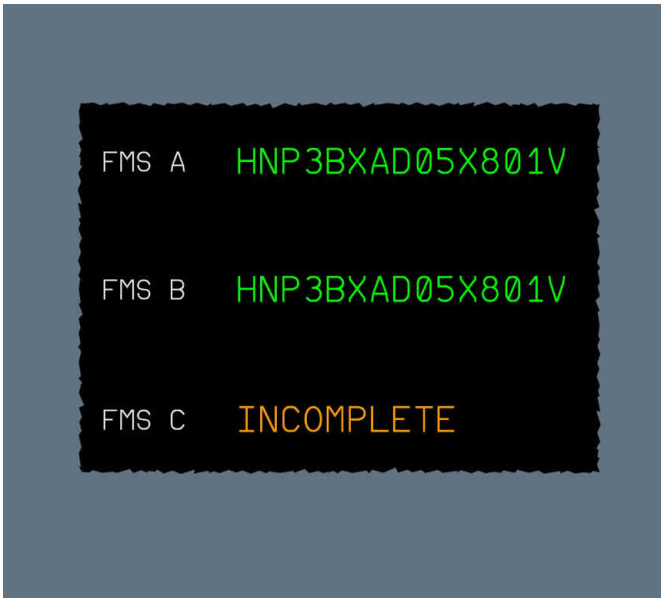
If an FMC is not available (or not connected to the FMC that controls the MFD, on which the STATUS page is displayed), the associated part number displays dashes.

Part Number Not Available



The FMS SOFTWARE, NAV DATABASE, FMS OPTIONS CONFIG, PERF DATABASE, and MAG VAR DATABASE are mandatory: They need to be loaded into the FMC.
If the part number of a mandatory database does not exist, the part number displays INCOMPLETE.

INCOMPLETE

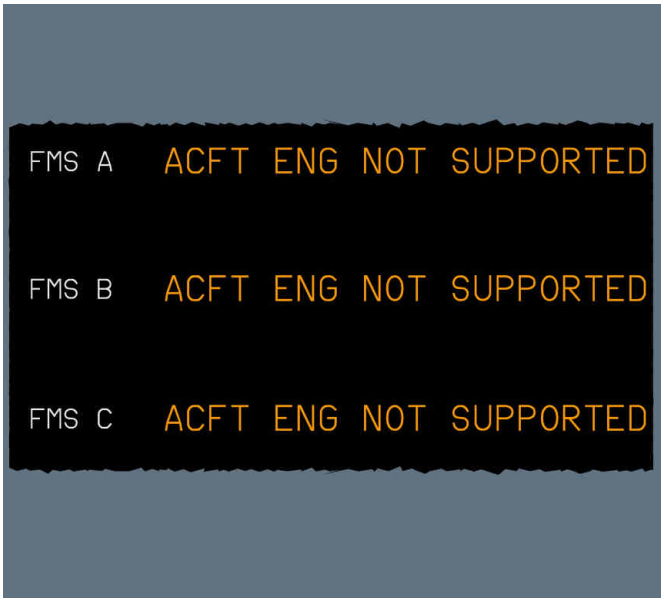


The FMS AIRLINE CONFIG is a not a mandatory database. If the part number for this database does not exist, the part number displays DEFAULT.

DEFAULT

If the PERF DATABASE is selected in the Database list, and there is no performance model associated to the given aircraft and engine type, ACFT ENG NOT SUPPORTED is displayed in amber.

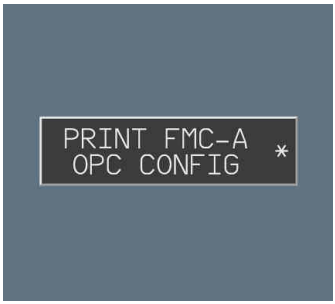
ACFT ENG NOT SUPPORTED



PRINT FMC OPC/AMI CONFIG BUTTON

If the FMS OPTIONS CONFIG is selected in the Database list, the flight crew uses this button to print the content of the OPC file of the FMC that controls the MFD, on which the STATUS page is displayed.

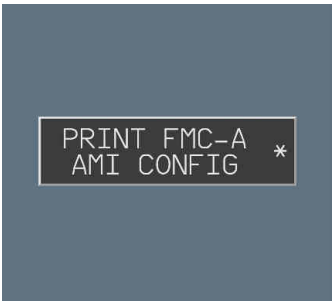
Print OPC Content



In this case, the label of the button may be:
- "PRINT FMC-A OPC CONFIG" (FMC-A controls the current MFD), or
- "PRINT FMC-B OPC CONFIG" (FMC-B controls the current MFD), or
- "PRINT FMC-C OPC CONFIG" (FMC-C controls the current MFD).

If the FMS AIRLINE CONFIG is selected in the Database list, the flight crew uses this button to print the content of the AMI file of the FMC that controls the MFD, on which the STATUS page is displayed.

Print AMI Content



In this case, the label of the button may be:
- "PRINT FMC-A AMI CONFIG" (FMC-A controls the current MFD), or
- "PRINT FMC-B AMI CONFIG" (FMC-B controls the current MFD), or
- "PRINT FMC-C AMI CONFIG" (FMC-C controls the current MFD).

PRINT ALL P/N BUTTON

When clicked, prints the FM P/N STATUS REPORT.

RETURN BUTTON

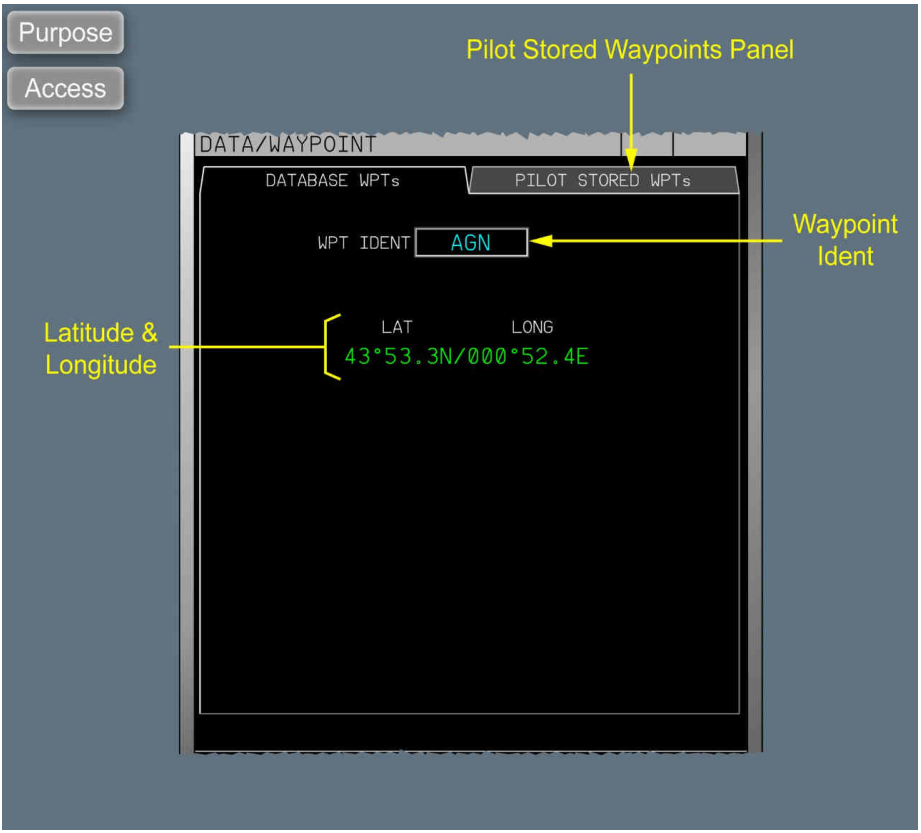
When clicked, displays the ACTIVE / INIT page. (*Refer to Page*)

L2 The Return button is only displayed when the flight crew has accessed the STATUS page via the INIT page.

DATA / WAYPOINT PAGE

Applicable to: ALL

Overview



PURPOSE

On the DATA / WAYPOINT page, the flight crew can:

- Call up the data for a waypoint, a NAVAID, a runway or an airport, that is stored in the navigation database, or in the pilot stored elements database
- Create or delete waypoints in the pilot stored elements database.

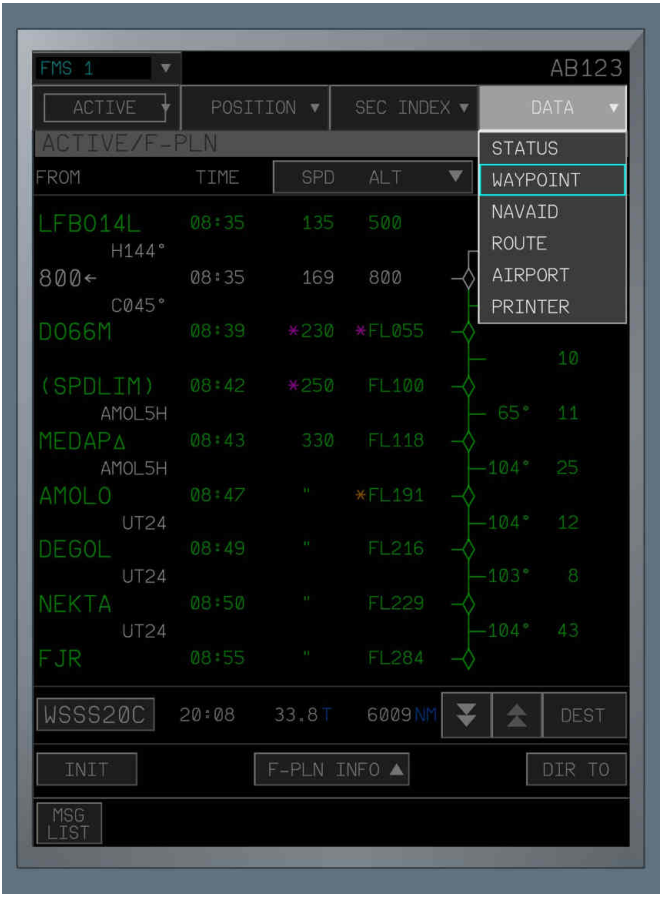
LINKS

Refer to Navigation Database .
Refer to Pilot Stored Elements Database .

ACCESS

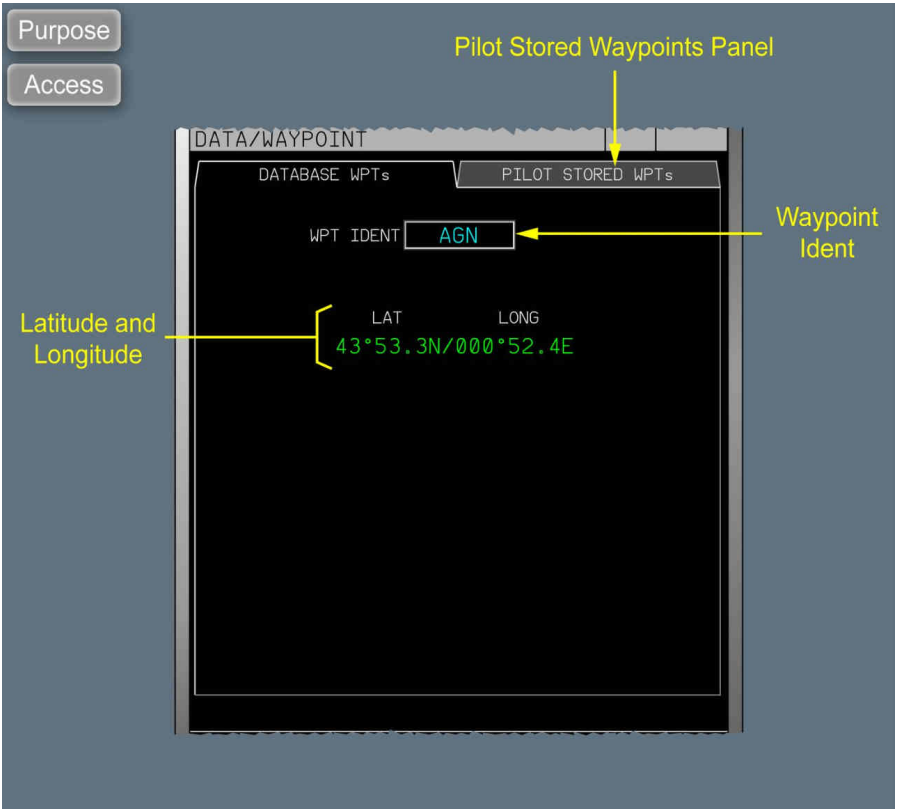
The flight crew can access the DATA / WAYPOINT page, via the General Menu Bar, by selecting WAYPOINT in the DATA menu.
The DATABASE WPTs panel is opened by default.

General Menu Bar



DATABASE WPTS PANEL

DATABASE WPTs Panel



WAYPOINT IDENT ENTRY FIELD

The flight crew enters the ident of a waypoint (or NAVAID, runway, or airport) in the entry field.

L2 If the entered waypoint is a waypoint created by the flight crew, the PILOT STORED WPTs panel is opened, and displays the associated position data.

If the entered waypoint is not a navigation database, nor a pilot created waypoint, the PILOT STORED WPTs panel is opened, and displays the new waypoint function, *Refer to New Waypoint Function* .

L1 **ENTRY FORMAT**

The possible formats for a waypoint ident entry are:

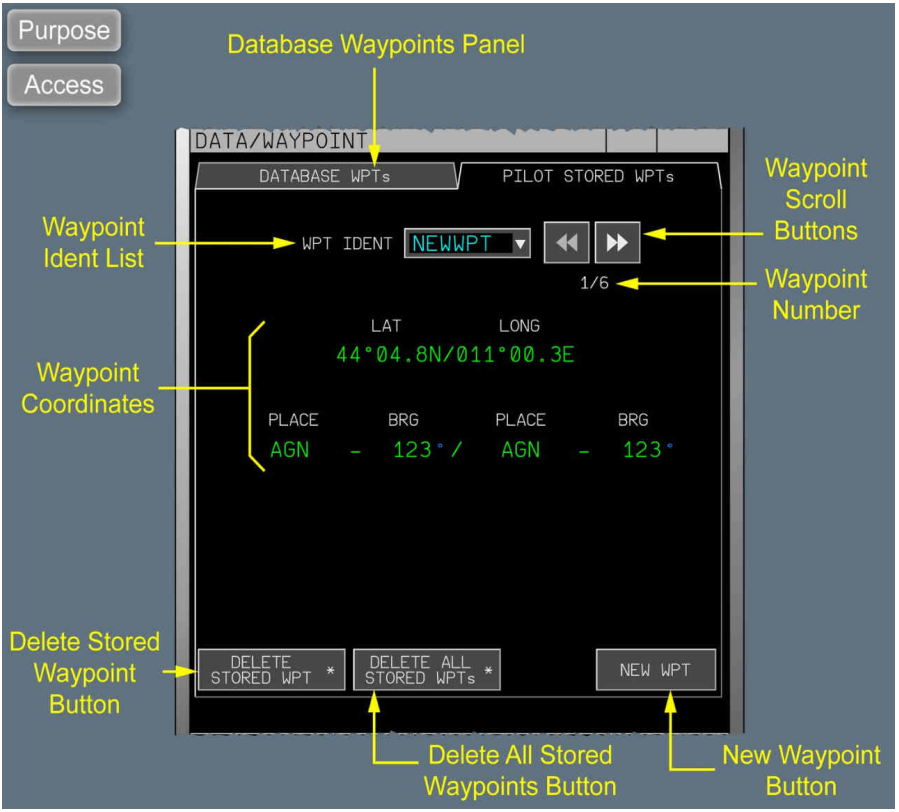
- *Refer to WAYPOINT Entry Format*
- *Refer to NAVAID Entry Format*
- *Refer to AIRPORT Entry Format*
- *Refer to RUNWAY Entry Format*

LATITUDE AND LONGITUDE

Indicates the latitude and longitude coordinates of the navigation database waypoint (or NAVAID, runway, or airport).

PILOT STORED WPTS PANEL

PILOT STORED WPTs Panel



WAYPOINT IDENT LIST

Indicates the ident of the consulted pilot stored waypoint.
The list displays all the pilot stored waypoints.

L2 If the entered waypoint is not a navigation database, nor a pilot created waypoint, the PILOT STORED WPTs panel is opened, and displays the New Waypoint Function, *Refer to New Waypoint Function* .

L1 If the pilot stored waypoints database is empty, the panel displays " NO PILOT STORED WPT ".

NO PILOT STORED WPT

ENTRY FORMAT

The possible formats for a waypoint ident entry are:

- *Refer to WAYPOINT Entry Format*
- *Refer to NAVAID Entry Format*
- *Refer to AIRPORT Entry Format*
- *Refer to RUNWAY Entry Format*

WAYPOINT SCROLL BUTTONS

The flight crew uses the scroll buttons to scroll, one by one, through the pilot stored waypoints.

WAYPOINT NUMBER

Indicates the ranking of the displayed pilot-stored waypoint, and the total number of pilot-stored waypoints.
The pilot-stored waypoints database has a maximum of 50 waypoints.

WAYPOINT COORDINATES

Indicates the position data of the pilot stored waypoint:

- Place/Distance waypoint:

Place/Distance Waypoint

- Place/Bearing/Distance waypoint:

Place/Bearing/Distance Waypoint

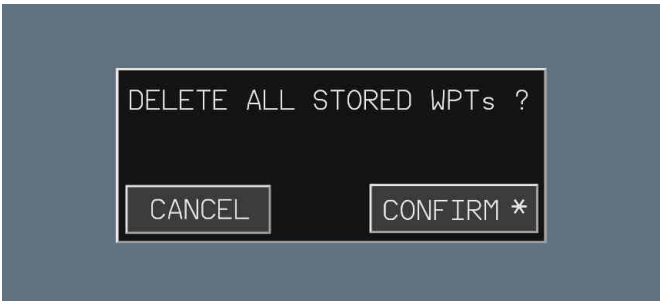
- Place-Bearing/Place-Bearing waypoint:

Place-Bearing/Place-Bearing Waypoint

DELETE ALL STORED WAYPOINTS BUTTON

When clicked, deletes all pilot stored waypoints.
A confirmation action is required.

CONFIRM/CANCEL



If there are pilot stored waypoints that are still used by the FMS , they are not deleted. The FMS displays the message F-PLN ELEMENT RETAINED (*Refer to Message).*

L2 The operator can choose (via the AMI file) to have all pilot stored elements automatically deleted at transition to the DONE flight phase.

DELETE STORED WAYPOINT BUTTON

When clicked, deletes the pilot stored waypoint that is currently displayed.
A confirmation action is required.

CONFIRM/CANCEL

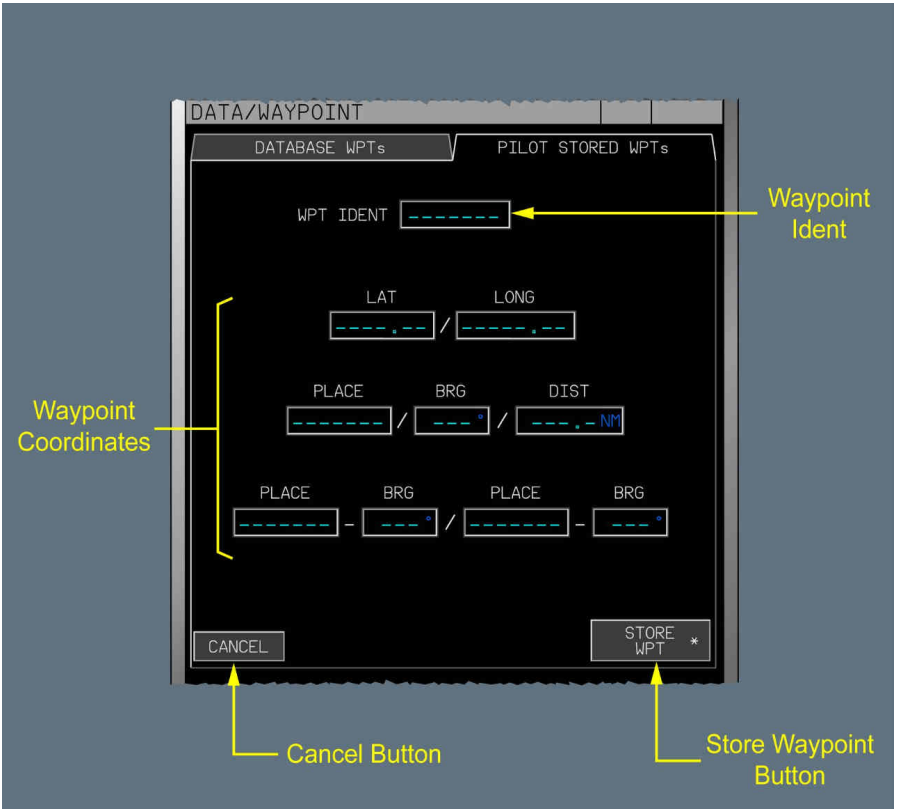
If the pilot stored waypoint is still used by the FMS , it is not deleted. The FMS displays the message F-PLN ELEMENT RETAINED (*Refer to Message)* .

NEW WAYPOINT BUTTON

When clicked, displays the new waypoint function of the PILOT STORED WPTs panel, *Refer to New Waypoint Function* .

NEW WAYPOINT FUNCTION

New Waypoint Function



WAYPOINT IDENT ENTRY FIELD

Indicates the waypoint ident that is associated with the new waypoint.

ENTRY FORMAT

The possible formats for a waypoint ident entry are:

- *Refer to WAYPOINT Entry Format*
- *Refer to NAVAID Entry Format*

- *Refer to AIRPORT Entry Format*
- *Refer to RUNWAY Entry Format*

WAYPOINT COORDINATES ENTRY FIELDS

The flight crew can create a waypoint in the three different ways, by entering:
- A latitude and longitude
- A Place/Bearing/Distance
- A Place-Bearing/Place-Bearing.

ENTRY FORMAT

The possible formats for waypoint coordinates entries are:
- *Refer to LATITUDE Entry Format*
- *Refer to LONGITUDE Entry Format*
- *Refer to PLACE Entry Format*
- *Refer to BEARING Entry Format*
- *Refer to DISTANCE Entry Format* .

STORE WPT BUTTON

When clicked, stores the new waypoint in the pilot-stored elements database.
The pilot-stored waypoints database has a maximum of 50 waypoints.
L2 If the pilot-stored waypoints database is full, the first created waypoint that is not part of the flight plan is deleted. If all of the 50 waypoints are used by the FMS , the waypoint creation is rejected, and the 50 WPTs MAX : ALL IN USE message is displayed, *Refer to Message* .

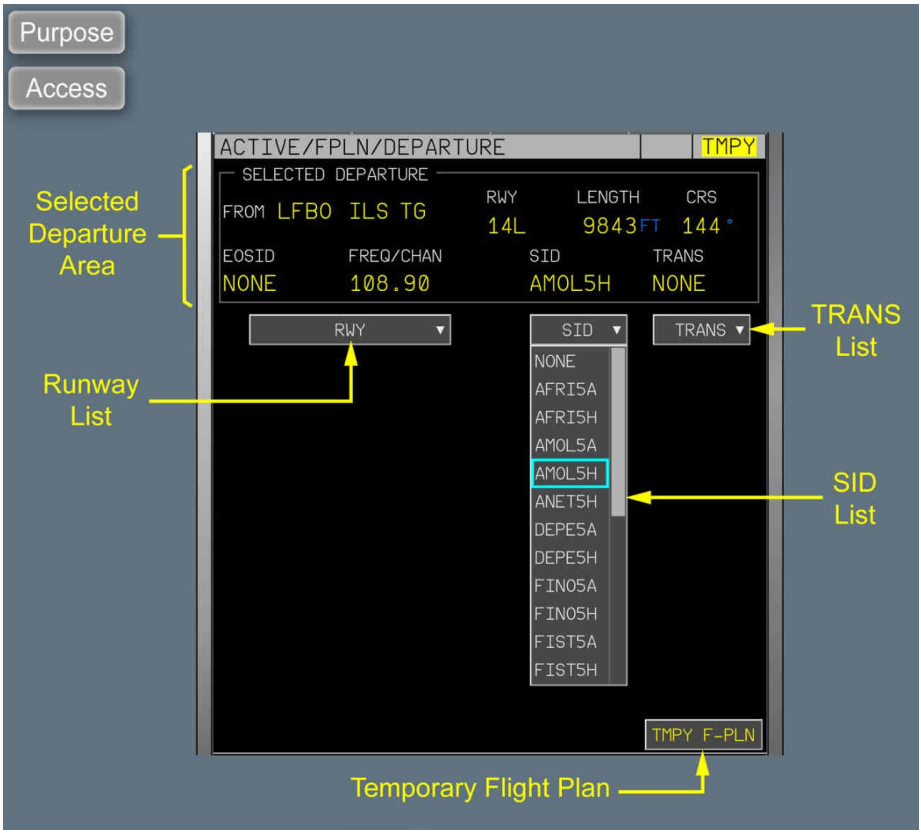
CANCEL BUTTON

When clicked, cancels the new waypoint function.

DEPARTURE PAGE

Applicable to: ALL

DEPARTURE Page



PURPOSE

The DEPARTURE page enables the flight crew to insert or change the departure procedure. The DEPARTURE page is available for the active and secondary flight plans.

LINKS

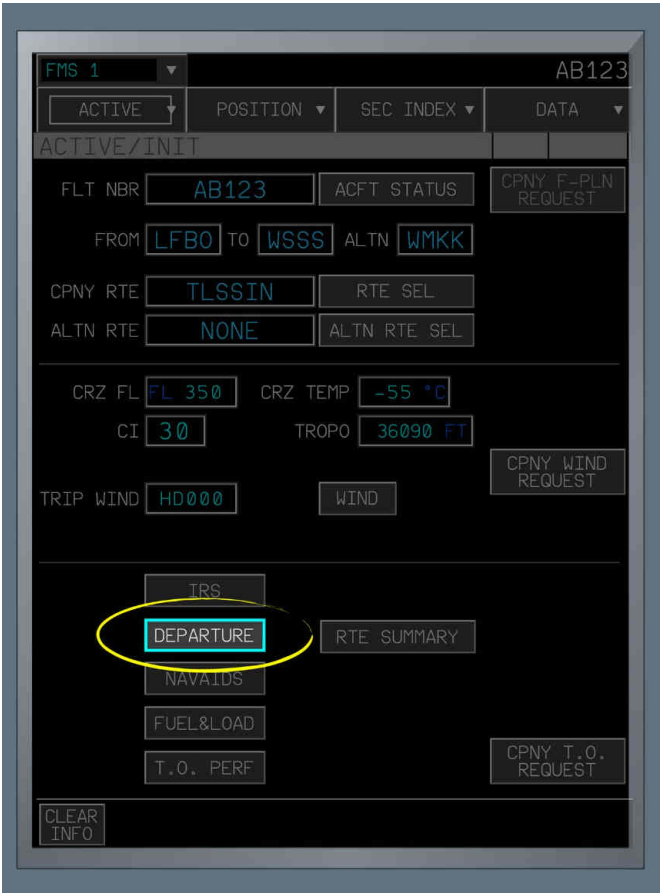
Refer to DEPARTURE Revision

ACCESS

The flight crew can access the DEPARTURE page, via:

- The F-PLN page, by selecting the DEPARTURE revision in the waypoint revisions menu of the primary(alternate) origin airport.

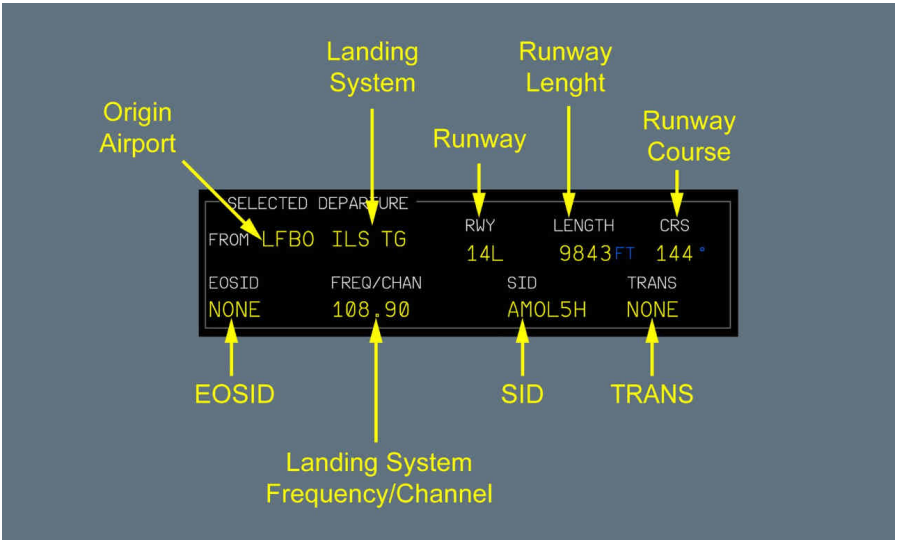
- The INIT page, by clicking on the DEPARTURE button.



Note: *For the secondary flight plans, the flight crew can access the DEPARTURE page only via the SEC 1(2)(3)/F-PLN page.*

SELECTED DEPARTURE AREA

Selected Departure Area



This area displays the selected departure procedure parameters.

L2 The information appears in green, if it is part of the active flight plan. It appears in yellow, if the flight crew created a temporary flight plan, by selecting or changing the departure procedure.

Note: If a temporary flight plan exists, and was created by a revision other than the departure procedure revision, the information is displayed in green.

The arrival information is displayed in a white font for the secondary flight plans.

L1 All fields, except the origin airport, display dashes if the flight crew made no selection.

ORIGIN AIRPORT

Indicates the current origin airport of the primary or alternate flight plan.

EOSID

Indicates the Engine Out Standard Instrument Departure (EOSID), associated with the selected departure runway.
NONE is displayed, if no EOSID exists for the selected departure runway.

LANDING SYSTEM TYPE AND IDENT

Indicates the type and ident of the landing system of the selected departure runway.

LANDING SYSTEM FREQUENCY(CHANNEL)

Indicates the frequency(channel) of the landing system of the selected departure runway.

RUNWAY

Indicates the selected departure runway.

RUNWAY LENGTH

Indicates the navigation database runway length (in meters or feet) of the selected departure runway.

RUNWAY COURSE

Indicates the navigation database runway course (in degrees °) of the selected departure runway.

SID

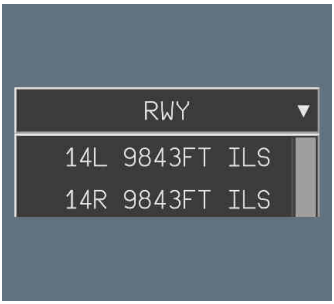
Indicates the SID selected by the flight crew from the SID list.

TRANS

Indicates the TRANS selected by the flight crew from the TRANS list.

RWY LIST

RWY List



Displays all runways that are compatible with the current origin airport of the primary(alternate) flight plan, with their associated length and landing system.

When the flight crew selects a runway, the FMS creates or updates a temporary flight plan, and completes or updates the following fields in the selected departure area:
- The runway
- The runway length

- The runway course
- The EOSID
- The landing system type and ident
- The landing system frequency/channel.

SID LIST

SID List

Displays all SIDs that are compatible with the selected departure runway.

L2 *Note: The flight crew can only open the SID list if a departure runway is selected.*

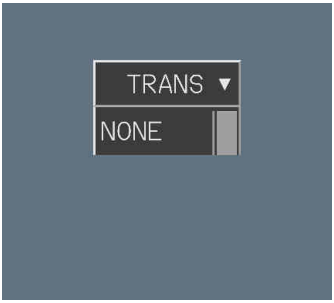
L1 The first element of the SID list is NONE.

L2 *Note: The NONE option is selected automatically, when the flight crew selects a departure runway, and there is no compatible SID.*
When the flight crew selects NONE, or when there is no compatible SID, a default leg, up to 1 500 ft on the runway axis, is created.

L1 When the flight crew selects a SID, or the NONE option, the FMS creates(updates) a temporary flight plan, and completes or updates the SID field in the selected departure area.

TRANS LIST

TRANS List



Displays all TRANS that are compatible with the selected departure runway and SID.

L2 *Note: The flight crew can only open the TRANS list if a departure runway and SID are selected.*

L1 The first option in the TRANS list is NONE.

L2 *Note: The NONE option is selected automatically, when the flight crew selects a departure runway and SID, and there is no compatible TRANS.*

L1 When the flight crew selects a TRANS, or the NONE option, the FMS creates(updates) a temporary flight plan, and completes(updates) the TRANS field in the selected departure area.

TMPY F-PLN BUTTON

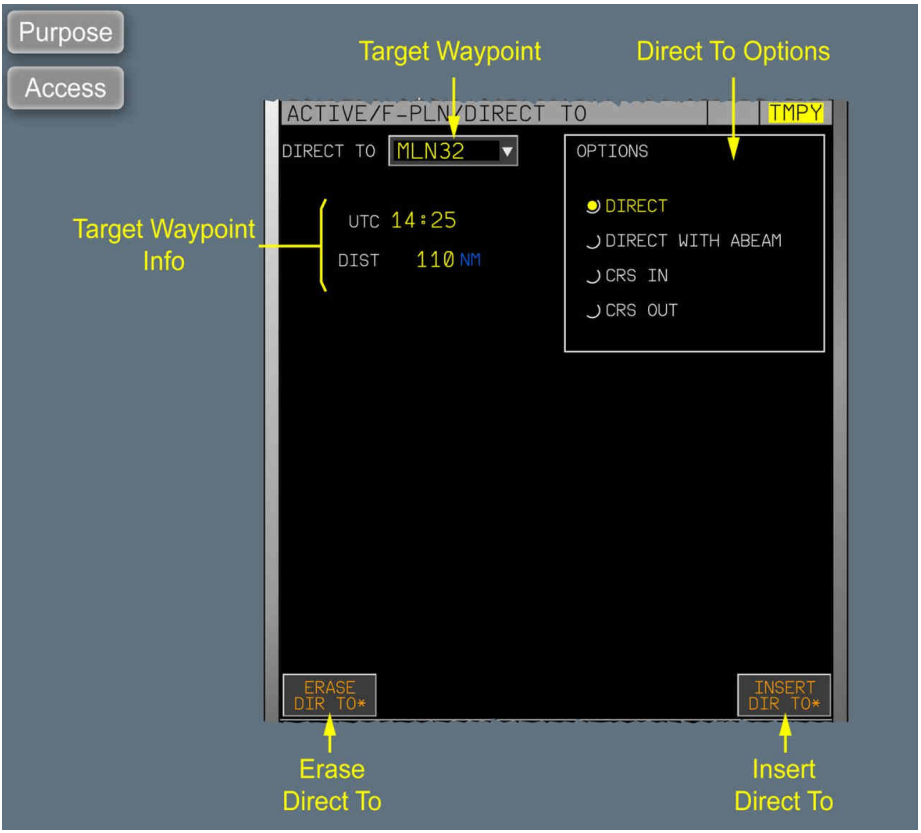
When clicked, displays the ACTIVE/F-PLN page, *Refer to Page* .

L2 The TMPY F-PLN button is only displayed if a temporary flight plan exists. If no temporary flight plan exists, the RETURN button is displayed in the bottom left corner of the page: When clicked, the F-PLN, or INIT page is displayed.

DIRECT TO PAGE

Applicable to: ALL

DIRECT TO Page



PURPOSE

On the DIRECT TO page, the flight crew can insert:

- A DIRECT TO leg (DIRECT)
- A DIRECT TO leg with abeam waypoints (DIRECT WITH ABEAM)
- A DIRECT TO leg with interception of an inbound radial (CRS IN)
- A DIRECT TO leg with interception of an outbound radial (CRS OUT).

The DIRECT TO page is only available for the active flight plan.

LINKS

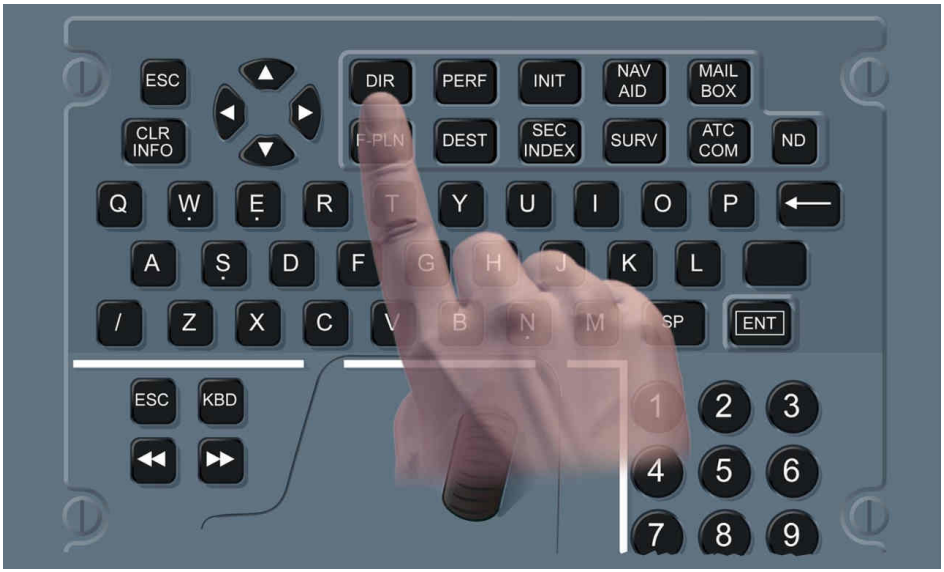
Refer to More Information on the DIR TO Revision

ACCESS

The flight crew can access the DIRECT TO page:

- By pressing the DIR key on the keyboard of the KCCU

DIR Key on the KCCU

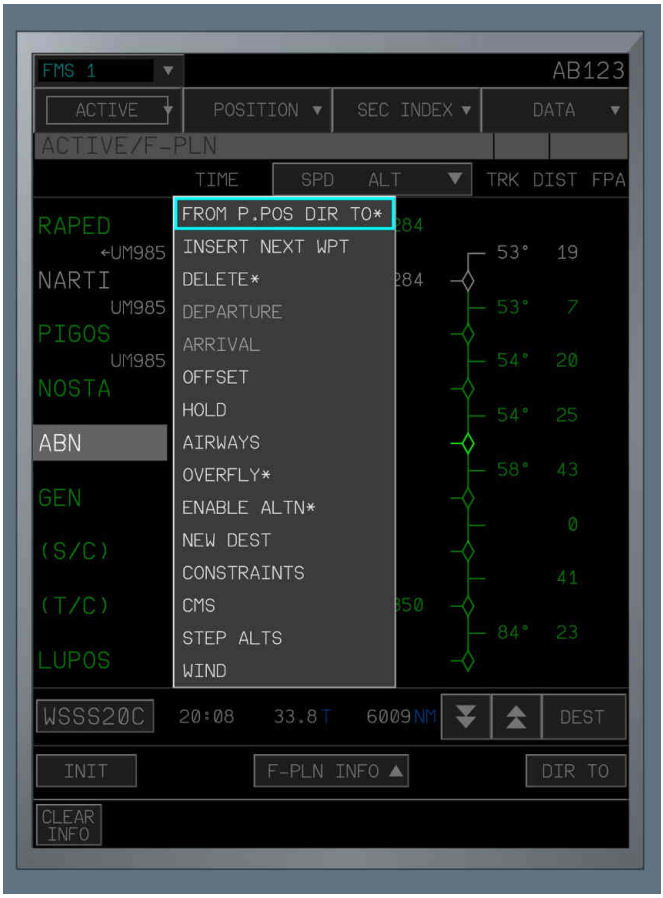


- Via the ACTIVE / F-PLN page, by clicking on the DIR TO button

F-PLN Page

- Via the ACTIVE / F-PLN page, by selecting the direct to revision (FROM P.POS DIR TO) in the waypoint revisions menu of the direct to fix.

F-PLN Page



L2 The flight crew cannot access the DIRECT TO page, when:

- A temporary flight plan (that is not created by a direct to) is pending.
  The FMS displays the message INSERT OR ERASE TMPY F-PLN FIRST. (*Refer to Message)*
- The FMS aircraft position is not valid.
  The FMS displays the message ACFT POSITION NOT VALID. (*Refer to Message)*

TARGET WAYPOINT LIST

Target Waypoint

Indicates the DIR TO target waypoint.
The flight crew enters the target waypoint via the keyboard, or by selecting it in the list. The list displays all flight plan waypoints between the FROM waypoint and the primary destination.
The target waypoint is automatically set to the revised waypoint, when the flight crew has accessed the DIRECT TO page via the waypoint revisions menu.

ENTRY FORMAT

The possible formats for a manual waypoint entry are:

- The ident of a navigation database, or pilot stored waypoint, NAVAID, airport, or runway
  Refer to Waypoint Entry Format
  Refer to NAVAID Entry Format
  Refer to Airport Entry Format
  Refer to Runway Entry Format
- Latitude/longitude (*Refer to Entry Format*)
- Place/bearing/distance (*Refer to Entry Format*)
- Place-bearing/place-bearing (*Refer to Entry Format).*

If the flight crew inserts a DIR TO a latitude/longitude, place/bearing/distance, or place-bearing/place-bearing waypoint, this waypoint is registered in the pilot-stored elements database (*Refer to Pilot Stored Elements Database*).

DIRECT TO OPTIONS

The flight crew can select the DIRECT TO option.

L2 The default DIR TO option is DIRECT, or DIRECT WITH ABEAM, depending on the Operator's selection. The AMI files defines the default DIRECT TO option. (*Refer to AMI file)*

L1 When the flight crew selects the CRS IN or the CRS OUT option the ND displays an associated entry field.

CRS ENTRY FIELD

If the DIRECT TO target waypoint is a flight plan waypoint, the FMS enters a default value for the inbound or outbound radial.
The default CRS IN is the course from the flight plan waypoint that precedes the target waypoint, to the target waypoint.
The default CRS OUT is the course from the target waypoint to the flight plan waypoint that follows the target waypoint.

ENTRY FORMAT

Refer to CRS IN (CRS OUT) ENTRY FORMAT

TARGET WAYPOINT INFO

The ND displays the UTC time of arrival at the target waypoint, and the distance between the current position of the aircraft and the target waypoint.

INSERT DIRECT TO BUTTON

When clicked, the temporary flight plan is inserted, and the ND displays the new active flight plan.

ERASE DIRECT TO BUTTON

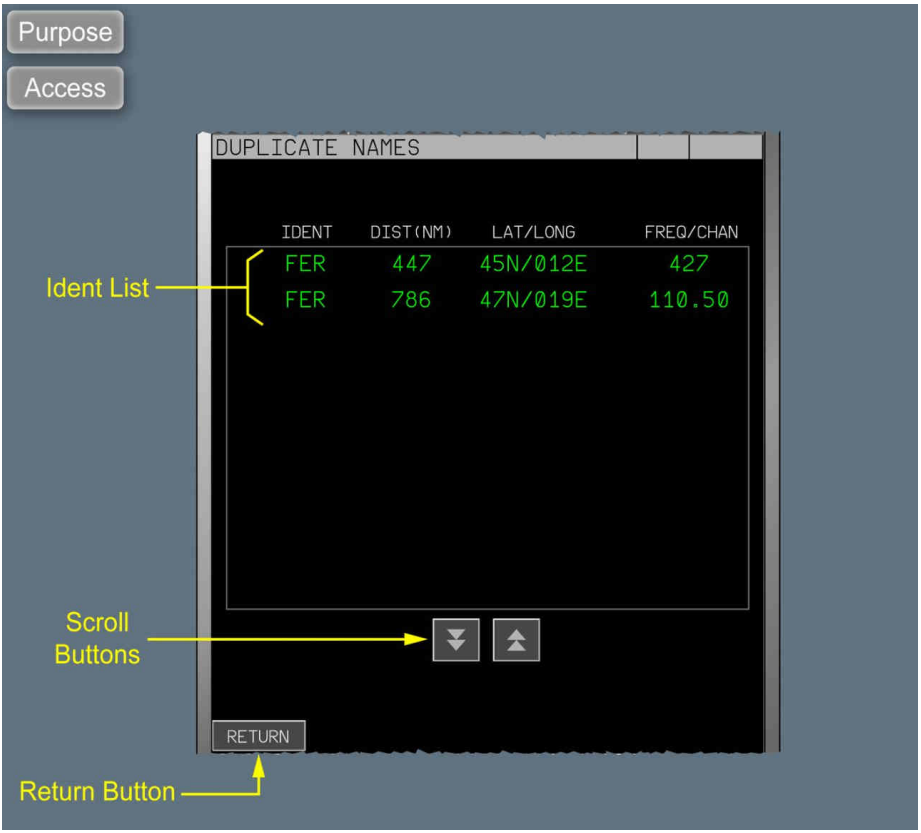
When clicked, the temporary flight plan is deleted, and the ND displays the active flight plan. (*Refer to Page*)

L2 The Erase Direct To button is only displayed if a temporary flight plan exists. If no temporary flight plan exists, the Return button is displayed. Clicking on the Return button, displays the ACTIVE / F-PLN page.

DUPLICATE NAMES PAGE

Applicable to: ALL

DUPLICATE NAMES page



PURPOSE

On the DUPLICATE NAMES page, the flight crew can select the desired waypoint, airport, runway, or NAVAID, when its ident is not unique in the navigation and pilot stored elements database.

ACCESS

The DUPLICATE NAMES page is displayed automatically when the flight crew enters the ident of a database element that is not unique in the database.

IDENT LIST

Indicates the following data of the database element:
- The ident (IDENT)
- The direct distance to the aircraft (DIST)
- The latitude and longitude (LAT/LONG)
- The frequency (FREQ), only for NAVAIDS
- The channel (CHAN), only for GLS.

The elements are ranked in increasing order of direct distance from the present position.

SCROLL BUTTONS

The flight crew uses the scroll buttons to move, page by page, downwards (upwards) through the list.

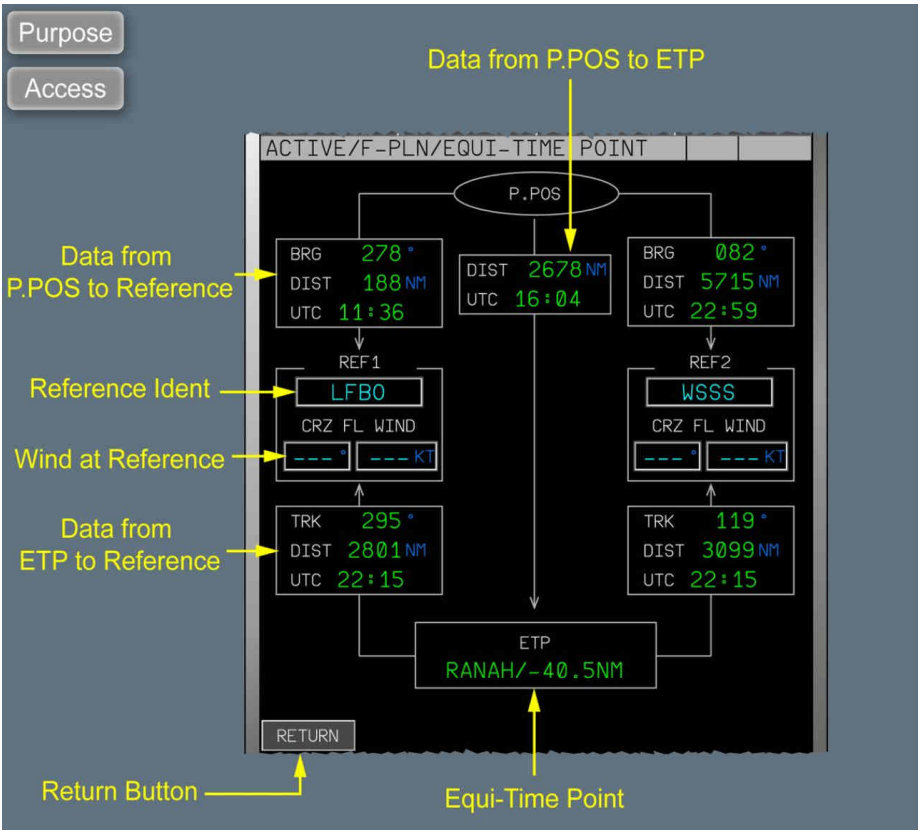
RETURN BUTTON

When clicked, displays the page that was displayed before the DUPLICATE NAMES page.

EQUI-TIME POINT PAGE

Applicable to: ALL

EQUI-TIME POINT Page



PURPOSE

On the EQUI-TIME POINT page, the flight crew can compute the pseudo waypoint called Equi-Time Point (ETP). The ETP is the point on the flight plan from where the time to reach both selected references is the same.

The FMS computes by default the ETP between the origin and the destination airports.

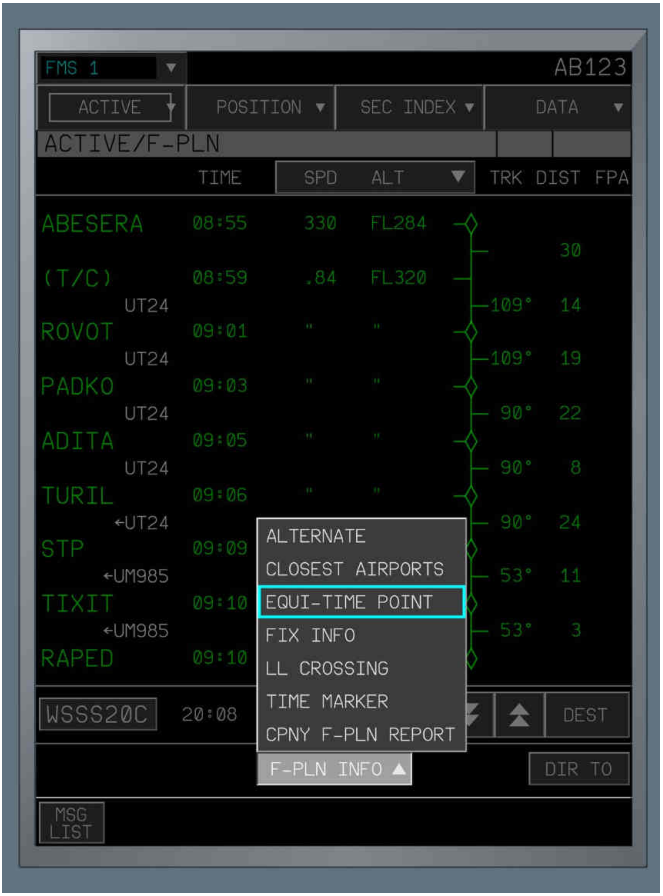
L2 *Note: The FMS computation of the ETP takes into account the cost index, the speed/Mach control and the entered wind at the reference points.*

L1 The EQUI-TIME POINT page is only available for the active flight plan.

ACCESS

The flight crew can access the EQUI-TIME page via the ACTIVE / F-PLN page by selecting EQUI-TIME POINT in the F-PLN INFO menu.

ACTIVE / F-PLN page



DATA FROM P.POS TO REFERENCE 1 (2)

Indicates:

- The bearing, between the current aircraft position and the reference point
L2 The T letter indicates that the bearing is defined in TRUE north reference.
L1 - The direct distance, from the current aircraft position to the reference point
- The estimated time of arrival (or flight time if the clock is not valid) at the reference point. This considers a direct trajectory to the reference.

Impacted DU: 00016694 EQUI-TIME POINT page - Reference Ident

REF1(2)

Indicates the ident of the reference waypoint, airport, NAVAID or runway.
The default REF1 is the origin airport. The default REF2 is the destination airport. The flight crew can overwrite the default value at any time.

L2 If the entered ident is already selected in the other reference ident entry field, the FMS displays the NOT ALLOWED message, *Refer to DSC-22-FMS-20-110 NOT ALLOWED* .

L1 *Note:* *When the flight crew tries to enter a reference ident in REF 1(2) field, the FMS may erroneously reject the entered ident and display the NOT ALLOWED message.*

If such behavior is suspected, the flight crew can:

- *Enter the desired reference ident on the other MFD . When both MFD s synchronize, the flight crew will get the EQUI-TIME POINT computation results on both MFD s, or*
- *Temporarily enter and validate two other valid reference idents in REF 1 and REF 2 fields on the affected MFD . This will properly "erase" the reference ident from the FMS memory. Then, the flight crew will be able to enter again the desired reference idents in REF 1 and REF 2 fields.*

ENTRY FORMAT

The possible formats for an ident entry are:

- *Refer to WAYPOINT Entry Format*
- *Refer to NAVAID Entry Format*
- *Refer to AIRPORT Entry Format*
- *Refer to RUNWAY Entry Format* .

Impacted by TDU: 00023579 EQUI-TIME POINT page - Reference Ident

REF1(2)

Indicates the ident of the reference waypoint, airport, NAVAID or runway.
The default REF1 is the origin airport. The default REF2 is the destination airport. The flight crew can overwrite the default value at any time.

L2 If the entered ident is already selected in the other reference ident entry field, the FMS displays the NOT ALLOWED message, *Refer to DSC-22-FMS-20-110 NOT ALLOWED* .

L1 **ENTRY FORMAT**

The possible formats for an ident entry are:
- *Refer to WAYPOINT Entry Format*
- *Refer to NAVAID Entry Format*
- *Refer to AIRPORT Entry Format*
- *Refer to RUNWAY Entry Format* .

WIND AT REFERENCE ENTRY FIELD

The flight crew enters the wind direction and velocity for the cruise flight level at the reference point, in the entry field.

ENTRY FIELD

- *Refer to WIND DIRECTION Entry Format*
- *Refer to WIND VELOCITY Entry Format* .

DATA FROM ETP TO REFERENCE 1 (2)

Indicates:
- The track, from the ETP to the reference point

L2 The T letter indicates that the track is defined in TRUE north reference.

L1
- The direct distance, from the ETP to the reference point
- The estimated time of arrival (or flight time, if the clock is not valid) at the reference point. This considers an overfly of the ETP, and a direct trajectory between the ETP and the reference.

EQUI-TIME POINT

Indicates the equi-time point.
The ETP is a place/distance waypoint. The place reference is the waypoint that follows the ETP.
If the FMS can not compute any ETP, the panel displays "ETP NOT FOUND".
When the ETP is sequenced, the panel displays "ETP SEQUENCED".

DATA FROM P.POS TO ETP

Indicates the distance between P.POS and the ETP, along the flight plan. It also indicates the estimated time of arrival (or flight time if the clock is not valid) at the ETP.

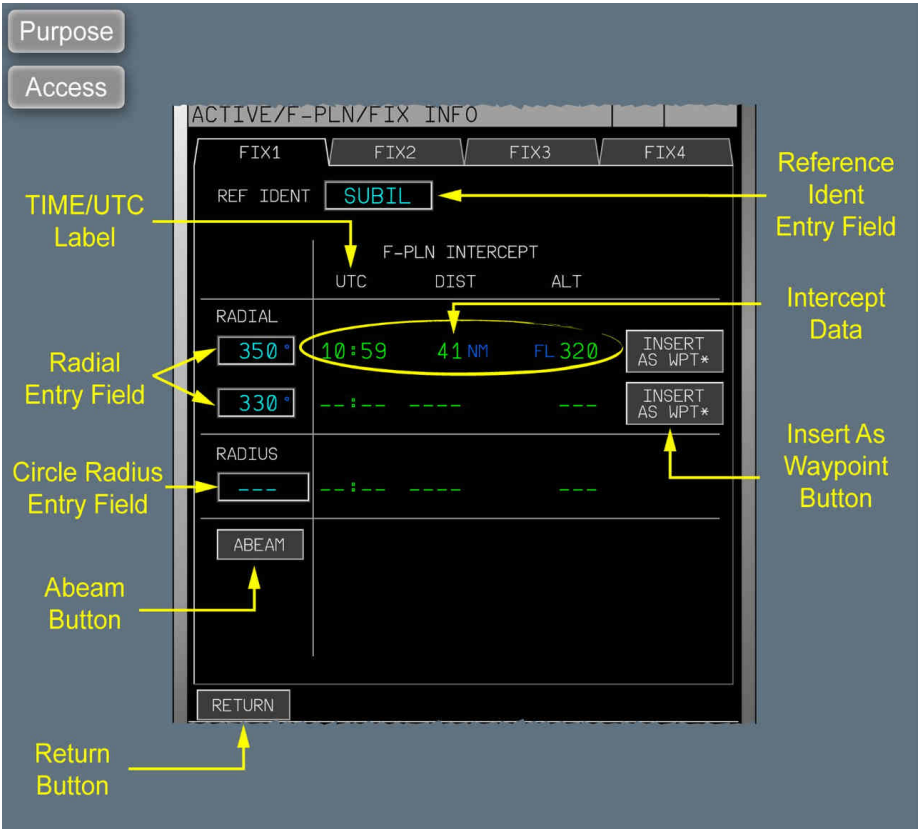
RETURN BUTTON

When clicked, displays the ACTIVE / F-PLN page.

FIX INFO PAGE

Applicable to: ALL

FIX INFO Page



PURPOSE

On the FIX INFO page, the flight crew can:
- Define a reference fix for display on the ND
- Define two radials, and one circle associated to the selected reference fix, for display on the ND
- Compute the abeam line from the reference fix on the flight plan, for display on the ND
- Insert into the flight plan the intersection points between the defined radial(s), circle and abeam line and the flight plan.

The flight crew can do this for four reference fixes on the four identical panels of the FIX INFO page.
The FIX INFO page is not available for the secondary flight plans.

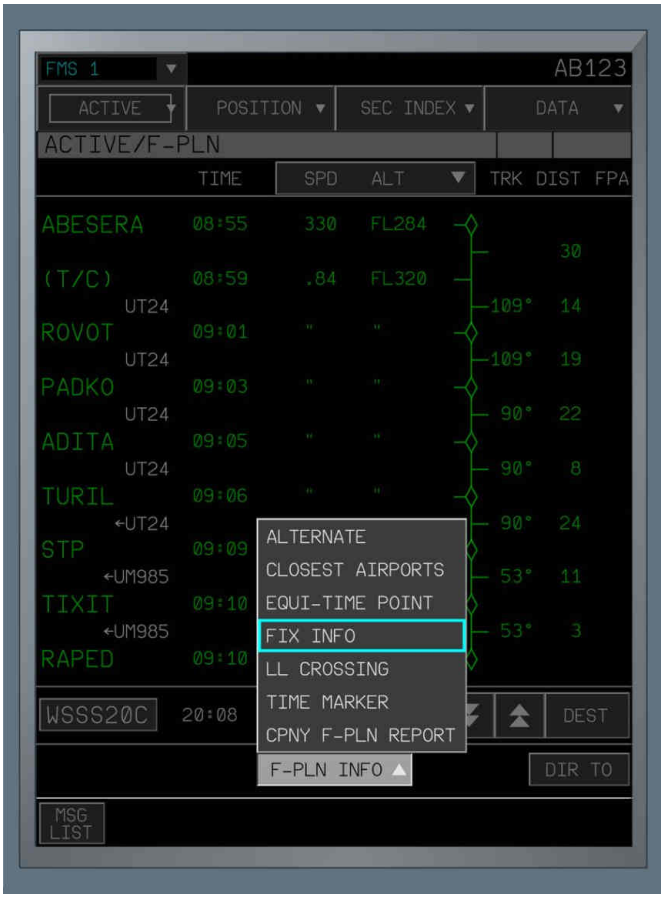
LINKS

Refer to More Information on the FIX INFO Revision

ACCESS

The flight crew can access the FIX INFO page via the ACTIVE / F-PLN page by selecting the FIX INFO revision in the F-PLN INFO menu.

F-PLN Info on the F-PLN Page



REF IDENT ENTRY FIELD

The flight crew enters the reference fix ident in the entry field.
The reference fix ident may be:

- Any navigation database
- Waypoint
- NDB
- Airport

- Runway
- Pilot stored element (*Refer to Pilot stored element database*).

ENTRY FORMAT

The possible formats for the reference fix ident are:

- NAVAID (*Refer to Entry Format*)
- Waypoint (*Refer to Entry Format*)
- Airport (*Refer to Entry Format*)
- Runway (*Refer to Entry Format*).

TIME / UTC LABEL

Indicates whether the time reference is Universal Time Coordinates (UTC), or flight time (TIME).

L2 The time reference is flight time (TIME) when:

- In preflight, and the flight crew has not entered the Estimated Takeoff Time (ETT).
  The flight crew enters the ETT on the RTA panel of the VERT REV page. (*Refer to VERT REV page)*
- In flight, and the FMS UTC time is not valid.

RADIAL ENTRY FIELD

The flight crew enters a radial of the reference fix in the entry field.
The FMS displays the data from the intersection point (between the radial and the flight plan) on the same line. (*Refer to Intercepted Point Data*)
If no intersection is found, dashes are displayed.

Note: *When the intersection is inserted as a waypoint in the active flight plan, the radial and intercept data are no longer displayed on the page.*

ENTRY FORMAT

Refer to Radial Entry Format

INTERCEPT POINT DATA

This line indicates for each computed intersection point:

- The ETA (or flight time) at the intersection point
- The estimated distance along the flight plan between the aircraft present position and the intersection point
- The estimated altitude (in flight level) at the intersection point.

INSERT AS WAYPOINT BUTTON

When clicked, inserts into the temporary flight plan a waypoint at the intersection between the defined radial, radius, or abeam line, and the active (respectively temporary) flight plan.

RADIUS ENTRY FIELD

The flight crew enters a circle radius from the reference fix in the entry field.
The FMS displays the data from the intersection point (between the circle and the flight plan) on the same line. (*Refer to Intercepted Point Data*)
If no intersection is found, dashes are displayed.

ENTRY FORMAT

Refer to Radius Entry Format

ABEAM/CLOSE BUTTON

When clicked, the FMS computes and displays the abeam radial, the associated intersection point data and the button CLOSE instead of ABEAM.
When the flight crew clicks on the CLOSE button, the ABEAM data on the page and (or) the ND are removed.

ABEAM DATA

RETURN BUTTON

When clicked, displays the F-PLN page.

L2 The Return button is displayed if no temporary flight plan is pending.
If a temporary flight plan exists, the Temporary Flight Plan button is displayed.

F-PLN PAGE

Applicable to: ALL

F-PLN Page

PURPOSE

The F-PLN page displays textual lateral and vertical flight plan data, including:

- All flight plan waypoints and legs
- Time, speed, altitude, fuel, and wind predictions for each waypoint
- Track, and distance between waypoints

- Flight path angle for approach waypoints
- Access to all lateral and vertical flight plan revisions

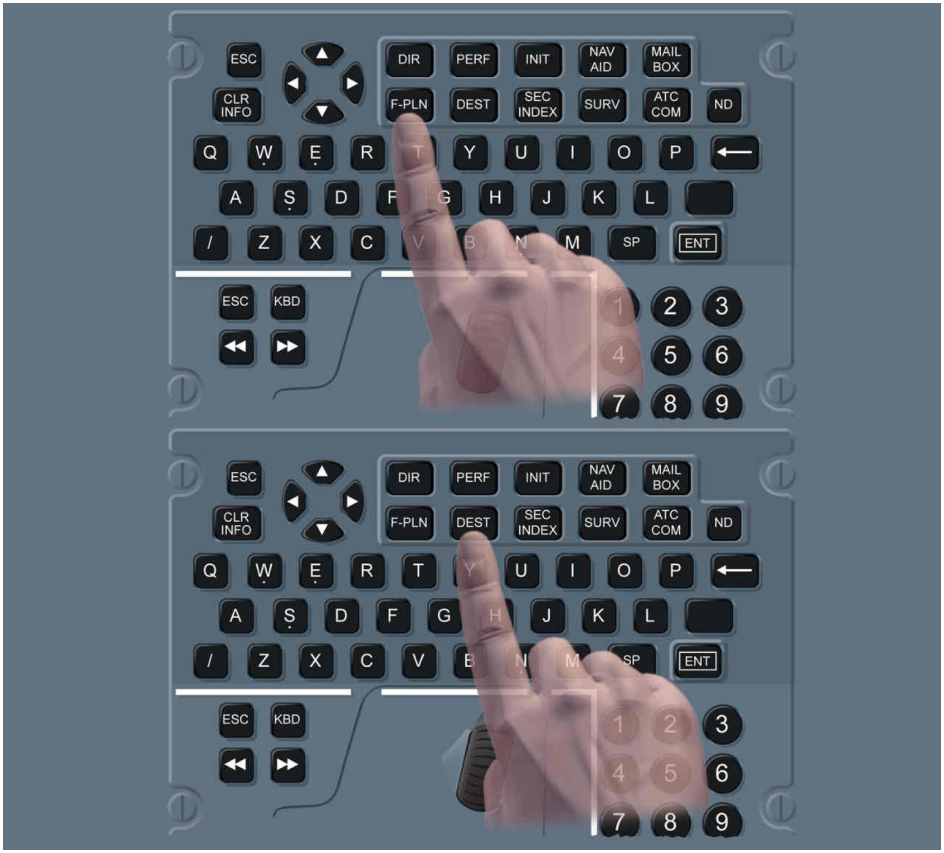
The F-PLN page is available for the active and secondary flight plans.

ACCESS

The flight crew can access the F-PLN page, via:

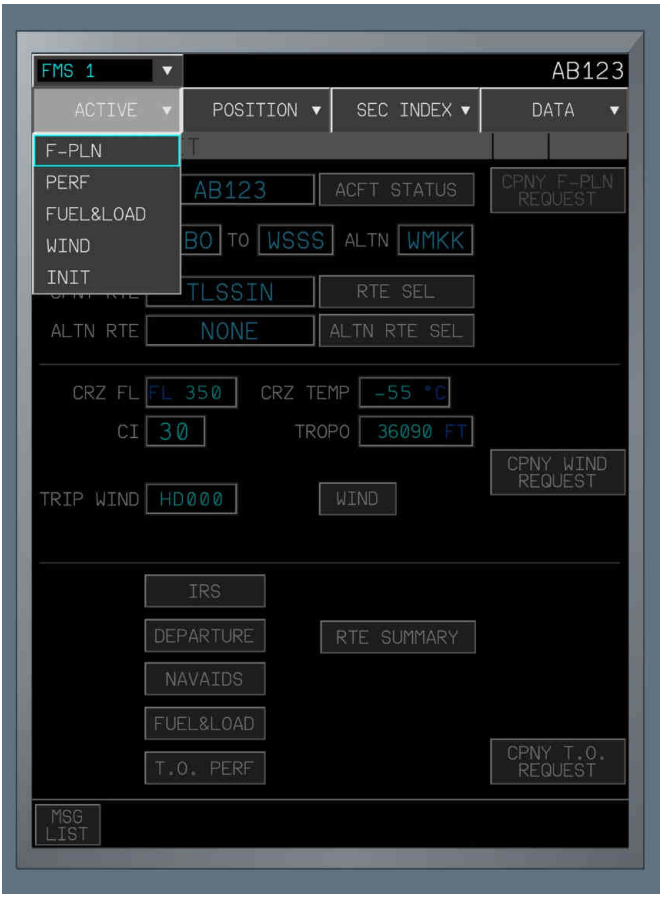
- The KCCU, by pressing the F-PLN, or DEST key on the keyboard
  Pressing the F-PLN key, displays the first page of the F-PLN (FROM waypoint on the first line).
  Pressing the DEST key, displays the last page of the primary flight plan (destination on the last line).

F-PLN, DEST Key on the KCCU



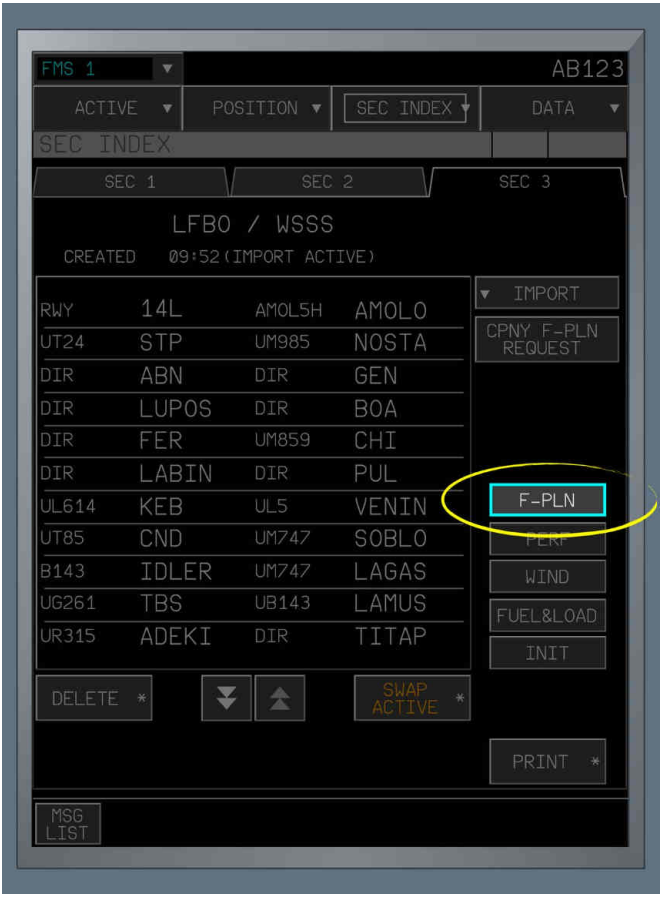
- The General Menu Bar, by selecting F-PLN in the ACTIVE menu:

General Menu Bar



Note: *The flight crew can access the secondary flight plan page (SEC 1(2)(3)/F-PLN), via the SEC INDEX page, by clicking on the F-PLN button.*

SEC INDEX Page



FROM LABEL

Indicates that the first line of the F-PLN page is the FROM waypoint.
The FROM label disappears when the first line of the F-PLN page displays a waypoint that is not the FROM waypoint.

TIME / UTC LABEL

Indicates whether the time reference is Universal Time Coordinates (UTC), or flight time (TIME).

L2 The time reference is flight time (TIME) when:

- In preflight, and the flight crew has not entered the Estimated Takeoff Time (ETT).
  The flight crew enters the ETT on the RTA panel of the VERT REV page. (*Refer to VERT REV page)*
- In flight, and the FMS UTC time is not valid.

OFFSET INDICATOR

When the aircraft is flying an offset, the header displays OFFSET NNX, where NN is the offset distance, and X is the offset side (example: OFFSET 10R).

SPEED-ALT/EFOB-WIND BUTTON

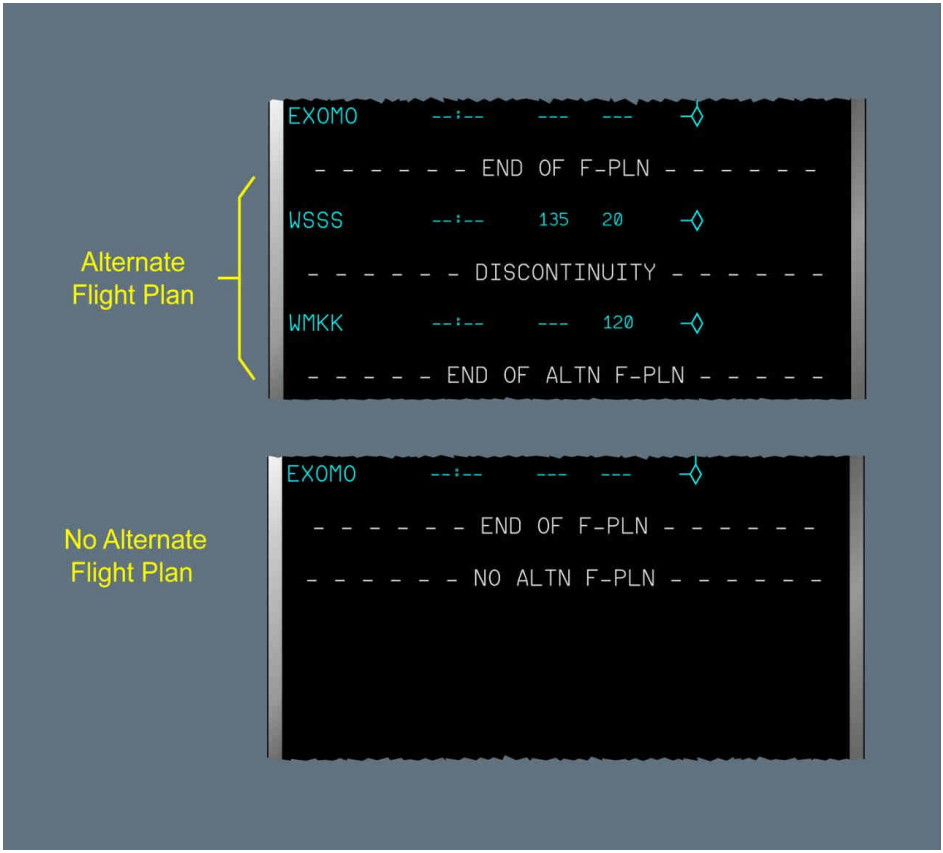
SPEED-ALT/EFOB-WIND Button

The flight crew uses this button to display either the speed and altitude predictions, or the EFOB and wind predictions.

FLIGHT PLAN LIMIT

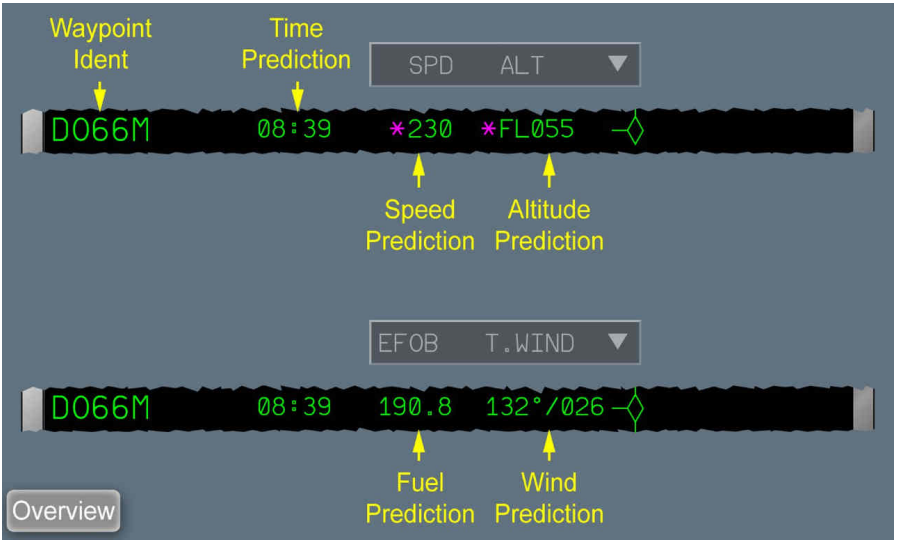
- END OF F-PLN:
  Indicates the end of the active (or secondary) primary flight plan. (*Refer to Primary Flight Plan)*
- END OF ALTN F-PLN:
  Indicates the end of the alternate flight plan. (*Refer to Alternate Flight Plan)*
  If no alternate flight plan exists, NO ALTN F-PLN is displayed after the END OF F-PLN limit.

ALTN F-PLN



WAYPOINT

Waypoint Data



The waypoint data line gives for each waypoint:
- The waypoint ident
- The time prediction
- The speed prediction
- The altitude prediction
- The estimated fuel on board
- The wind prediction

The F-PLN page displays 9 waypoint data lines maximum.
If a temporary flight plan is pending, only 8 waypoint data lines are displayed.

COLOUR

The waypoint data is displayed in:
- White, for the TO waypoint
- Green, for the active primary flight plan waypoints, or
- Cyan, for the missed approach and alternate flight plan waypoints.

When a temporary flight plan is pending, all waypoint data is displayed in yellow.
The waypoint data of all secondary flight plan waypoints is displayed in white.

WAYPOINT IDENT

Indicates the ident of the flight plan waypoints, and airports.

A navigation database airport is indicated by its 4 character ICAO code, followed by the selected runway, if any.

A navigation database waypoint is indicated by its ident (max 7 characters).

A triangle next to the waypoint ident indicates that the waypoint will be overflown.
(*Refer to Revision)*

A left, or right arrow next to the waypoint ident indicates the turn direction of a procedure turn (that is stored in the navigation database).

A pseudo-waypoint is displayed between brackets.
(*Refer to Pseudo-Waypoints)*

L2

A latitude/longitude waypoint is displayed in the XDDYDDD format, where X is “N” for North or “S” for South, and Y is “E” for East, or “W” for West. The latitude is abbreviated to its two degree characters (DD), and the longitude is abbreviated to its three degree characters (DDD). (example: N32°45.5W170°23.3 is abbreviated to N32W170)
(*Refer to Revision)*

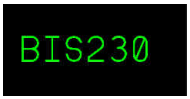
A place/bearing/distance waypoint is displayed in the PBDNN format, where NN is a number from 01 to 20, defining the chronological position in the pilot defined waypoints list. (example: AMB/320/5 is identified with the PBD03 ident, when this waypoint is the third pilot defined waypoint)
(*Refer to Revision)*

A place-bearing/place-bearing waypoint is displayed in the PBXNN format, where NN is a number from 01 to 20, defining the chronological position in the pilot defined waypoints list. (example: AMB–320/DVL–180) is identified with the PBX04 ident, when this waypoint is the fourth pilot defined waypoint)
(*Refer to Revision)*

A place/distance waypoint is displayed in the PDNN format, where NN is a number from 01 to 20, defining the chronological position in the pilot defined waypoints list. (example: AMB/10) is identified with the PD05 ident, when this waypoint is the fifth pilot defined waypoint)
(*Refer to Revision)*

A latitude crossing waypoint is displayed in the XNN format, where X is “N” for North or “S” for South. NN is the degrees of latitude.
(*Refer to Revision)*

A longitude crossing waypoint is displayed in the YNNN format, where Y is “E” for East, or “W” for West. NNN is the degrees of longitude.
(*Refer to Revision)*



A radial intercept waypoint is displayed in the XXXNNN format, where XXX are the first three characters of the reference fix, and NNN the radial.
(*Refer to Revision)*

A circle intercept waypoint is displayed in the DNNNXXX format, where XXX are the first three characters of the reference fix, and NNN the radius of the circle.
(*Refer to Revision)*

An abeam intercept waypoint is displayed in the ABXXXXX format, where XXXXX are the first five characters of the reference fix.
(*Refer to Fix Info Revision)*
(*Refer to Direct To Revision)*

An altitude waypoint is displayed in the NNNNN, where NNNNN is the altitude where the leg terminates.

Indicates a turning point. A turning point is inserted in the temporary flight plan, as the FROM waypoint, when a direct to, or holding pattern at the present position is pending. The turning point becomes a fix waypoint with the latitude/longitude of the position where the temporary flight plan is inserted.
(*Refer to Direct To Revision)*
(*Refer to Hold Revision)*

IN-BND is inserted in the temporary flight plan, as the FROM waypoint, when a direct to/inbound intercept is pending. It becomes a fix waypoint with the latitude/longitude of the position where the temporary flight plan is inserted.
(*Refer to Direct To Revision)*

OUT-BND is inserted in the temporary flight plan, as the FROM waypoint, when a direct to/outbound intercept is pending. It becomes a fix waypoint with the latitude/longitude of the position where the temporary flight plan is inserted.
(*Refer to Direct To Revision)*

Indicates the aircraft present position. PPOS is displayed, as the FROM waypoint, when the aircraft is in a discontinuity.

INTCPT indicates where the aircraft will intercept the planned lateral flight plan.

Indicates a manual leg. The leg needs to be terminated manually by a flight crew action. (example: DIRECT TO).

L1 **WAYPOINT REVISIONS**

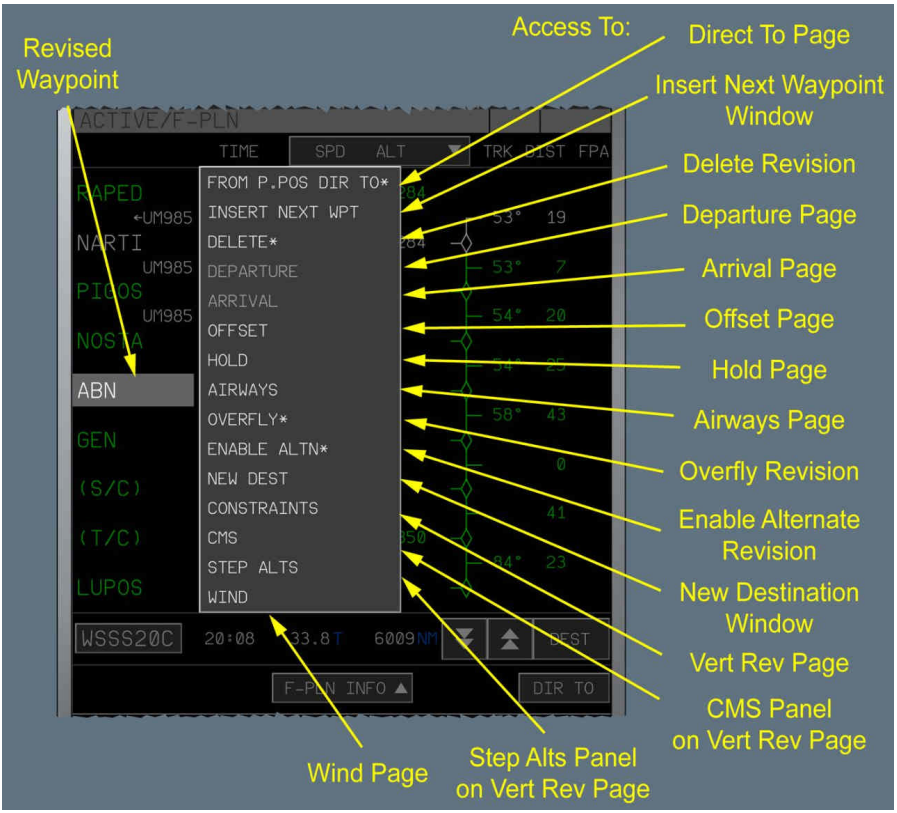
The waypoint ident is interactive: When clicked, opens the waypoint revisions menu.
Refer to Waypoint Revisions Menu

WAYPOINT REVISIONS MENU

The waypoint revisions menu gives access to the lateral, and vertical flight plan revisions pages.

Note: The revisions with a star (example; DELETE), create a temporary flight plan when clicked.*
The other revisions, without a star, give access to a page or window, associated with the selected revision.

Waypoint Revisions Menu



FROM P.POS DIR TO*

When selected, displays the DIRECT TO page, and creates a temporary flight plan with a direct leg to the revised waypoint.
Refer to Page

INSERT NEXT WAYPOINT

When selected, opens the Insert Next Waypoint window on the F-PLN page.
Refer to Insert Next Waypoint Window

DELETE*

When selected, deletes the revised waypoint and creates or updates the temporary flight plan.

Refer to More Information on the Insert Next Waypoint revision

DEPARTURE

When selected, displays the DEPARTURE page.
Refer to Page

ARRIVAL

When selected, displays the ARRIVAL page.
Refer to Page

OFFSET

When selected, displays the OFFSET page.
Refer to Page

HOLD

When selected, displays the HOLD page.
Refer to Page

AIRWAYS

When selected, displays the AIRWAYS page.
Refer to AIRWAYS page

OVERFLY*

When selected, defines an overfly on the revised waypoint, and creates or updates the temporary flight plan.
When an overfly exists on the revised waypoint, the waypoint revisions menu displays DELETE OVERFLY*. When selected, removes the overfly from the revised waypoint, and creates or updates the temporary flight plan.
Refer to More Information on the Overfly revision

ENABLE ALTN*

When selected, activates the alternate flight plan, and creates or updates the temporary flight plan.
Refer to More Information on the Enable Alternate revision

NEW DEST

When selected, displays the New Destination window on the F-PLN page.
Refer to New Destination Window

CONSTRAINTS

When selected, displays the ALT panel of the VERT REV page.

Refer to Page

CMS

When selected, displays the CMS panel of the VERT REV page.
Refer to Page

STEP ALTS

When selected, displays the STEP ALTs panel of the VERT REV page.
Refer to Page

WIND

When selected, and the revised waypoint is a climb waypoint, displays the CLB panel of the WIND page.
When selected, and the revised waypoint is a cruise waypoint, displays the CRZ panel of the WIND page.
When selected, and the revised waypoint is a descent waypoint, displays the DES panel of the WIND page.
Refer to Page

TIME PREDICTION

Indicates the Estimated Time of Arrival (ETA) at the waypoint.
Refer to More Information on the Flight Plan Predictions
In preflight, and an Estimated Takeoff Time (ETT) exists, the time reference of the time predictions is UTC. If no ETT exists, the time predictions are “flight times”, starting at 00:00.
In flight, the time reference is the aircraft UTC clock time. If the aircraft clock is not valid, the time predictions are “flight times”, starting at 00:00.

TIME CONSTRAINT

The time prediction is interactive: When clicked, displays the RTA panel of the VERT REV page, where the flight crew can check, add, or change a time constraint on the revised waypoint. (*Refer to Page)*
If a time constraint exists on a waypoint, a star is displayed to the left of the time prediction. (*Refer to Time Constraint)*

The color of the star is magenta, if the time constraint will be respected.

The color of the star is amber, if the time constraint will be missed.

If a time constraint exists on a waypoint, and time predictions are not available, the time constraint value is displayed in magenta big font.
The constraint value is preceded by a plus (or minus) sign for an AT or AFTER (or AT or BEFORE) constraint.

FROM WAYPOINT

In flight, the time prediction of the FROM waypoint displays the time when the FROM waypoint was sequenced.
In preflight, the time prediction of the FROM waypoint displays the ETT in magenta. If no ETT exists, the time prediction displays 00:00.
When clicked, opens the RTA panel of the VERT REV page, where the flight crew can change the ETT , if necessary. (*Refer to Page)*
If the ETT is exceeded, it is replaced by the aircraft clock time in green.

SPEED PREDICTION

Indicates the predicted speed, or Mach, at the waypoint.
Refer to More Information on the Flight Plan Predictions

L2 If the speed prediction has the same value as the one for the waypoint just above, a ditto character is displayed.

L1 SPEED CONSTRAINT / CMS

The speed prediction is interactive:
When the flight crew clicks on the speed prediction of a climb, descent, or approach waypoint, the SPD panel of the VERT REV page is displayed.
When the flight crew clicks on the speed prediction of a cruise waypoint, the CMS panel of the VERT REV page is displayed.
Refer to VERT REV page
If a speed constraint exists on a waypoint, or the waypoint is part of a CMS , a star is displayed to the left of the speed prediction. (*Refer to Speed Constraint* , *Refer to Speed Limit* , *Refer to Constant Mach Segment*)

The color of the star is magenta, if the speed constraint will be respected.

The color of the star is amber, if the speed constraint will be missed.

L2

If a speed constraint exists on a waypoint, and speed predictions are not available, the speed constraint value is displayed in magenta big font.

L1 **FROM WAYPOINT**

In preflight, the speed prediction of the FROM waypoint displays V1 .

ALTITUDE PREDICTION

Indicates the predicted altitude at the waypoint.
Refer to More Information on the Flight Plan Predictions

L2 If the altitude prediction has the same value as the one for the waypoint just above, a ditto character is displayed.

L1 **ALTITUDE CONSTRAINT / STEP ALTS**

The altitude prediction is interactive:
When the flight crew clicks on the altitude prediction of a climb, descent, or approach waypoint, the ALT panel of the VERT REV page is displayed.
When the flight crew clicks on the altitude prediction of a cruise waypoint, the STEP ALTS panel of the VERT REV page is displayed.
Refer to VERT REV page
If an altitude constraint exists on a waypoint, a star is displayed to the left of the altitude prediction. (*Refer to Altitude Constraint* , *Refer to Step Altitudes)*

The color of the star is magenta, if the altitude constraint will be respected.

The color of the star is amber, if the altitude constraint will be missed.

L2

If an altitude constraint exists on a waypoint, and altitude predictions are not available, the altitude constraint value (or “WINDOW”) is displayed instead, in magenta color. The constraint value is preceded by a plus (or minus) sign for an AT or ABOVE (or AT or BELOW) constraint.

L1 **FROM WAYPOINT**

In flight, the altitude prediction of the FROM waypoint displays the altitude of the aircraft when the FROM waypoint was sequenced.

EFOB

Indicates the Estimated Fuel On Board (EFOB), at the waypoint.
Refer to More Information on the Flight Plan Predictions

L2 If the fuel prediction has the same value as the one for the waypoint just above, a ditto character is displayed.

L1 **FROM WAYPOINT**

In flight, the fuel prediction of the FROM waypoint displays the Fuel On Board (FOB) when the FROM waypoint was sequenced.

WIND PREDICTION

Indicates the predicted true wind (direction and velocity), at the waypoint.

Note: *The F-PLN page displays the wind prediction that is not corrected with the measured wind. However, the FMS uses the corrected wind to compute the other flight plan predictions, such as time, altitude, fuel, etc ...*

Refer to More Information on the Wind Predictions

L2 If the wind direction, and/or velocity has the same value as the one for the waypoint just above, a ditto character is displayed.

L1 **TRIP WIND**

If the flight crew only has entered a trip wind, it is displayed as the wind prediction for each flight plan waypoint, in the format HD/NNN, or TL/NNN.

WIND ENTRY

The wind prediction is interactive:
When the flight crew clicks on the wind prediction of a climb waypoint, the CLB panel of the WIND page is displayed.
When the flight crew clicks on the wind prediction of a cruise waypoint, the CRZ panel of the WIND page is displayed.
When the flight crew clicks on the wind prediction of a descent waypoint, the DES panel of the WIND page is displayed.
Refer to VERT REV Page
Refer to Wind Revision

FROM WAYPOINT

The wind prediction of the FROM waypoint displays the trip wind, or predicted wind.

SPECIAL FLIGHT LABELS

FLIGHT PLAN DISCONTINUITY

DISCONTINUITY

Indicates a flight plan discontinuity. (*Refer to Flight Plan Discontinuity)*

When clicked, opens the waypoint revisions menu, from which the following revisions can be selected:

- INSERT NEXT WAYPOINT (*Refer to Revision)*
- DELETE (*Refer to Revision)*
- OFFSET (*Refer to Revision)*
- ENABLE ALTERNATE (*Refer to Revision)*
- NEW DESTINATION (*Refer to Revision)*

TOO STEEP PATH

TOO STEEP PATH

Indicates the start of a too steep path in the vertical descent profile.
When clicked, opens the waypoint revisions menu, from which only the INSERT NEXT WAYPOINT revision can be selected. (*Refer to Revision)*

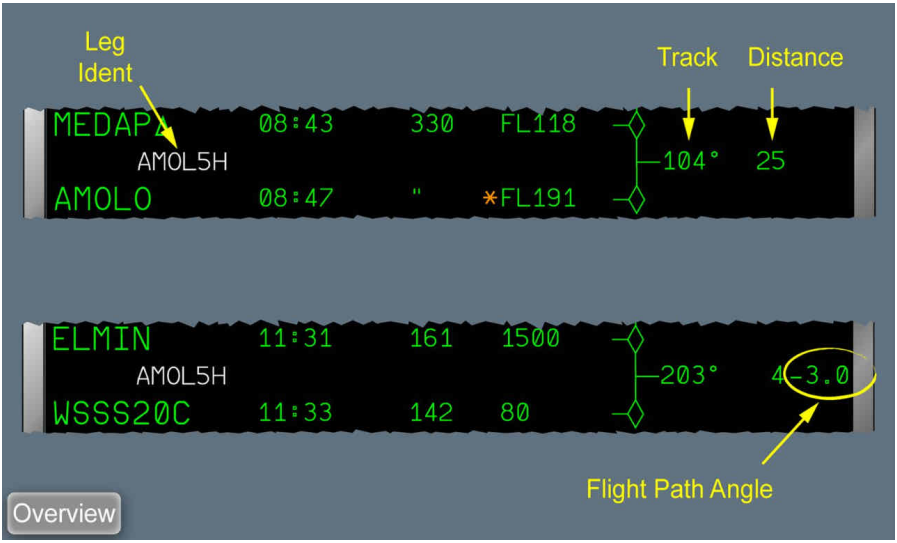
ABEAM PTS

ABEAM PTS

The indicator ABEAM PTS is displayed in the temporary flight plan, when a direct to with abeam is pending. When the temporary flight plan is inserted, the indicator is removed and the fix abeam waypoints are displayed. (*Refer to Revision)*

LEG DATA

Leg Data



The leg data gives for each leg between two waypoints:
- The leg ident
- The distance between the two waypoints
- The leg track
- The flight path angle (only for legs of the arrival procedure)

The F-PLN page displays 8 leg data lines maximum.
If a temporary flight plan is pending, only 7 leg data lines are displayed.

L2 **COLOUR**

The leg ident is displayed in white for all waypoints of the active flight plan.

The other leg data is displayed in:
- White, for the active leg
- Green, for the active primary flight plan legs, or
- Cyan, for the missed approach and alternate flight plan legs.

When a temporary flight plan is pending, all leg data is displayed in yellow.
The leg data of all secondary flight plan waypoints is displayed in white.

L1 **HOLD LEG**

A hold leg is displayed on one entire line between the holding entry, and holding exit, fix waypoints.

Hold Leg

The specific display for the different holding pattern types, is described in the hold revision chapter. (*Refer to Revision)*

LEG IDENT

Indicates the ident of the flight plan leg.

A leg that takes part of a departure, or arrival procedure, has the name of that procedure.

A leg that takes part of an airway, has the name of that airway.

An offset leg is indicated with a left, or right arrow, next to the leg ident. The arrow indicates the offset side.

L2

A course leg is displayed in the CNNN° format, where NNN is the course. When the FCU TRUE/MAG setting is TRUE, a “T” is displayed after the degree symbol.

A heading leg is displayed in the HNNN° format, where NNN is the heading. When the FCU TRUE/MAG setting is TRUE, a “T” is displayed after the degree symbol.

An arc leg is displayed in the NN XXX format, where NN is the arc distance, and XXX is the NAVAID ident.

A radius leg is displayed in the NN ARC format, where NN is the arc distance.

A leg with a manual or altitude termination point, is displayed in the XXXNNN format, where XXX are the first three characters of the waypoint ident, and NNN the outbound course. When the FCU TRUE/MAG setting is TRUE, a "T" is displayed after the outbound course.

A procedure turn is displayed in the PROC X format, where X is "L" for Left, or "R" for Right, depending on the turn direction.

TRACK

Indicates the track between two waypoints.
It is a magnetic, or true track, depending on the FCU TRUE/MAG setting.

Magnetic Track

True Track

ACTIVE LEG

In flight, the track of the active leg displays the direct bearing between the aircraft present position and the TO waypoint.

DISTANCE

Indicates the distance between two waypoints.

ACTIVE LEG

In flight, the distance of the active leg displays the distance between the aircraft present position and the TO waypoint.

FLIGHT PATH ANGLE

Indicates the flight path angle (FPA), in degrees, at a leg of the arrival procedure.
The FPA is associated with the leg in the navigation database. It can not be changed by the flight crew.

DESTINATION IDENT

Indicates the ident of the destination airport, followed by the selected runway, if any.
The destination ident is interactive: When clicked, opens the ARRIVAL page. (*Refer to Page)*

DESTINATION ETA

Indicates the estimated time of arrival (ETA) at destination.
In preflight, and an Estimated Takeoff Time (ETT) exists, the time reference of the destination ETA is UTC. If no ETT exists, the ETA is a flight time.
In flight, the time reference is the aircraft UTC clock time. If the aircraft clock is not valid, the ETA is a flight time.

DESTINATION EFOB

Indicates the estimated fuel on board (EFOB) at destination.
The destination EFOB is displayed in amber, when its value is lower than the minimum fuel at destination, displayed on the FUEL&LOAD page. (*Refer to Page)*

DISTANCE TO DESTINATION

The distance to destination is the sum of the direct distance to the TO waypoint and the distance, along the flight plan, from the TO waypoint to the destination.
L2 If a discontinuity exists in the flight plan, the system assumes that the aircraft will fly a direct leg between the waypoints that define the discontinuity.

SCROLL BUTTONS

SCROLL DOWN / UP

The flight crew uses the scroll down (up) button to move, page per page, downwards (upwards) through the flight plan.

L2 The flight crew can move, line by line, through the flight plan with:
- The scroll wheel of the cursor control unit, or with
- The arrow keys of the keyboard

Refer to More Information on the KCCU Controls
Whatever the means of scroll, the scroll down (up) stops at the last (first) flight plan waypoint.

L1 **SCROLL TO DESTINATION (DEST)**

When clicked, displays the last page of the primary flight plan, with the primary destination on the last line.

L2 The flight crew can display the “first” page of the primary flight plan, by:
- Pressing the F-PLN key of the KCCU , or by
- Selecting F-PLN in the ACTIVE menu of the General Menu Bar.

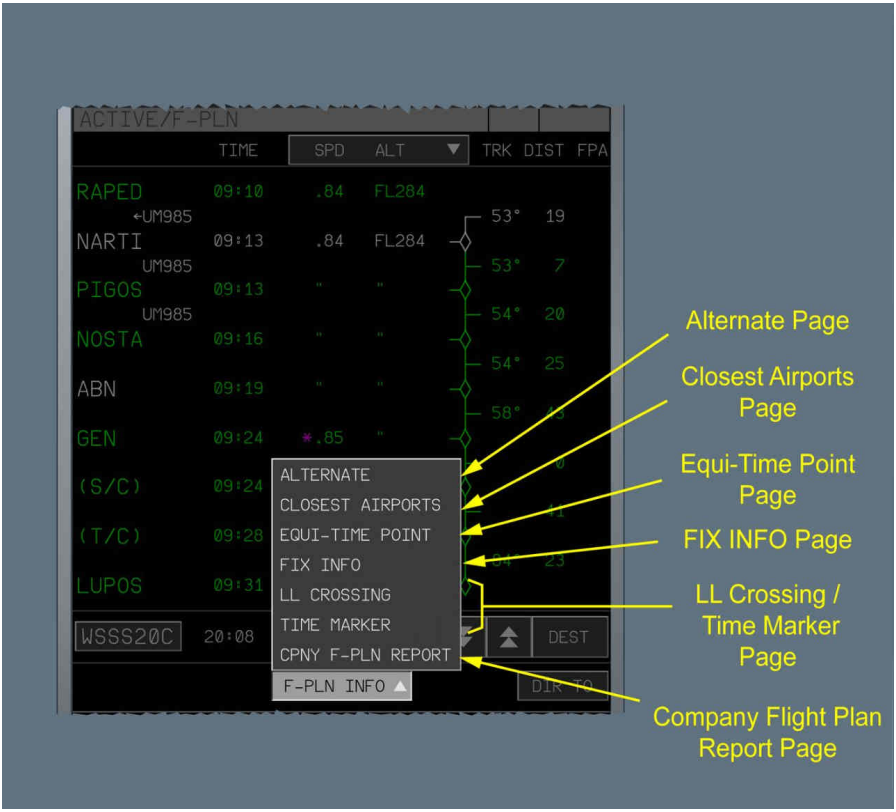
INIT BUTTON

When clicked, displays the INIT page. (*Refer to Page*)

L2 The INIT button is only displayed in preflight.

F-PLN INFO MENU

Flight Plan Info Menu



ALTERNATE

When selected, displays the ALTERNATE page.
Refer to Page

CLOSEST AIRPORTS

When selected, displays the CLOSEST AIRPORTS page.
Refer to Page

EQUI-TIME POINT

When selected, displays the EQUI-TIME POINT page.
Refer to Page

FIX INFO

When selected, displays the FIX INFO page.
Refer to Page

LL CROSSING / TIME MARKER

When selected, displays the LL XING — TIME MKR page.
Refer to Page

CPNY F-PLN REPORT

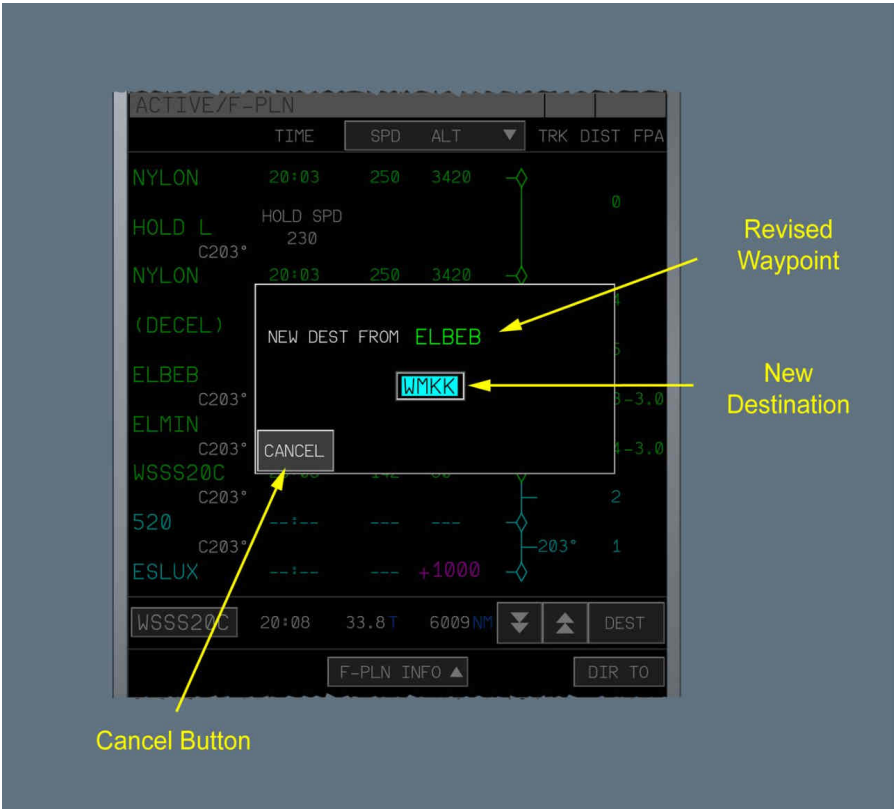
When selected, sends via ACARS an active flight plan report to the company ground station. If the Free Text AMI option is activated, selecting CPNY F-PLN REPORT will display the COMPANY F-PLN REPORT page. (*Refer to Page*)

DIR TO BUTTON

When clicked, displays the DIRECT TO page. (*Refer to Page*)

NEW DESTINATION WINDOW

New Destination Window



REVISED WAYPOINT

The revised waypoint is the waypoint from which the flight crew has selected the new destination revision.

NEW DESTINATION ENTRY FIELD

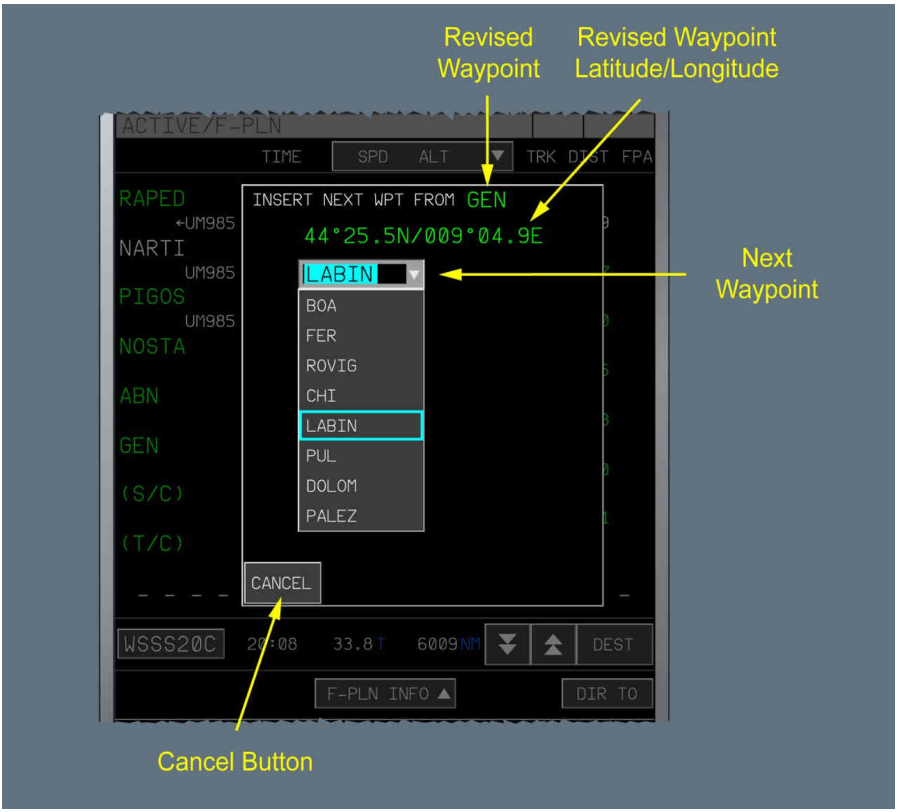
The flight crew enters the 4 character ICAO code of the new destination airport in the entry field. *Refer to AIRPORT Entry Format*

CANCEL BUTTON

When clicked, closes the new destination window, without inserting a new destination.

INSERT NEXT WAYPOINT WINDOW

Insert Next Waypoint Window



REVISED WAYPOINT

The revised waypoint is the waypoint from which the flight crew has selected the insert next waypoint revision.

REVISED WAYPOINT LATITUDE/LONGITUDE

Indicates the latitude and longitude of the revised waypoint.

NEXT WAYPOINT

The flight crew enters the next waypoint via the keyboard, or by selecting it in the list.
The list displays all flight plan waypoints between the revised waypoint and the primary destination.

L2 If the revised waypoint is a missed approach waypoint, the last waypoint of the list is the last missed approach waypoint.
If the revised waypoint is a part of the alternate flight plan, the last waypoint of the list is the last missed approach waypoint.

L1 ENTRY FORMAT

The possible formats for a manual waypoint entry are:
- The ident of the navigation database, or pilot stored waypoint (*Refer to Entry Format*)
- Latitude/longitude (*Refer to Entry Format*)
- Place/bearing/distance (*Refer to Entry Format*)
- Place-bearing/place-bearing (*Refer to Entry Format)*
- Place/distance (*Refer to Entry Format)*

Note: The flight crew can enter a place/distance waypoint, relative to the revised waypoint, by entering:
- *The distance value only, mandatory preceded by a plus or minus sign (example:+15), or*
- *The distance value, preceded by a slash, and a plus or minus sign, the plus sign is not mandatory if the slash is used (example: /15).*

If the flight crew inserts a latitude/longitude, place/bearing/distance, place-bearing/place-bearing, or place/distance waypoint, this waypoint is stored in the pilot stored elements database (*Refer to Pilot Stored Elements Database*).

CANCEL BUTTON

When clicked, closes the insert next waypoint window without inserting any waypoint.

TEMPORARY FLIGHT PLAN INDICATOR

Indicates that a temporary flight plan is pending.

INSERT TEMPORARY BUTTON

When clicked, inserts the temporary flight plan.

ERASE TEMPORARY BUTTON

When clicked, erases the temporary flight plan.

When a temporary flight plan with multiple revisions is pending, the button displays UNDO*. When clicked, erases the last revision from the temporary flight plan.

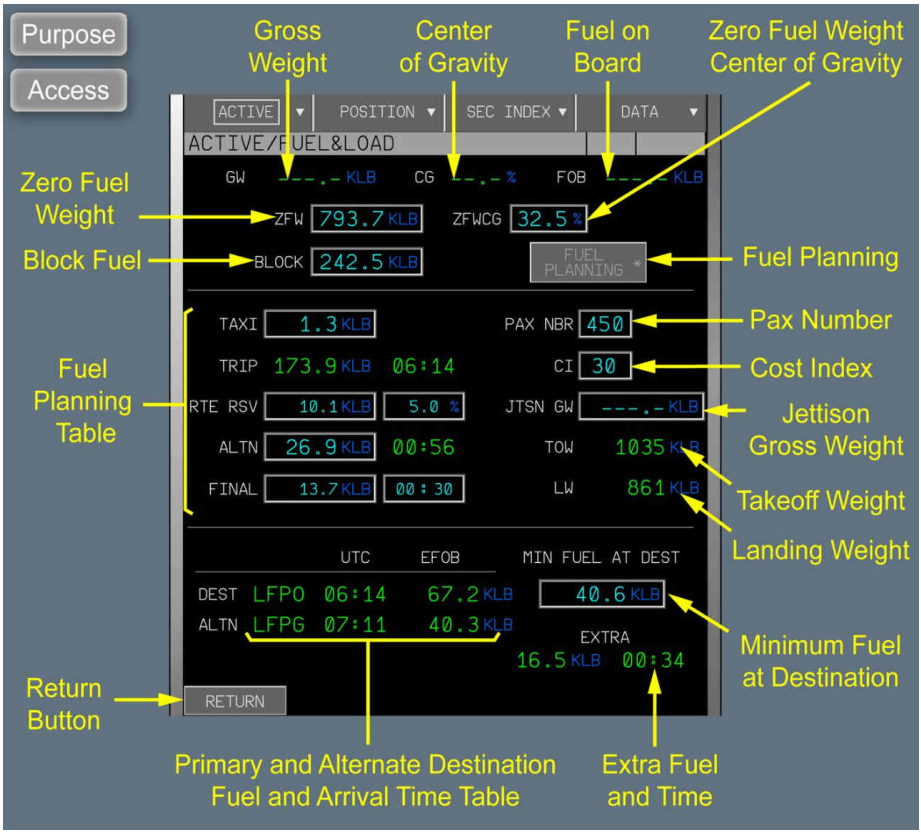
Note: *The flight crew can only undo the "last" flight plan revision. When the flight crew has clicked once on the UNDO button, the button displays ERASE*.*

UNDO Button

FUEL AND LOAD PAGE

Applicable to: ALL

FUEL & LOAD Page



PURPOSE

The FUEL&LOAD page enables the flight crew to:

- Enter and consult the aircraft load data
- Enter and consult the flight fuel planning.

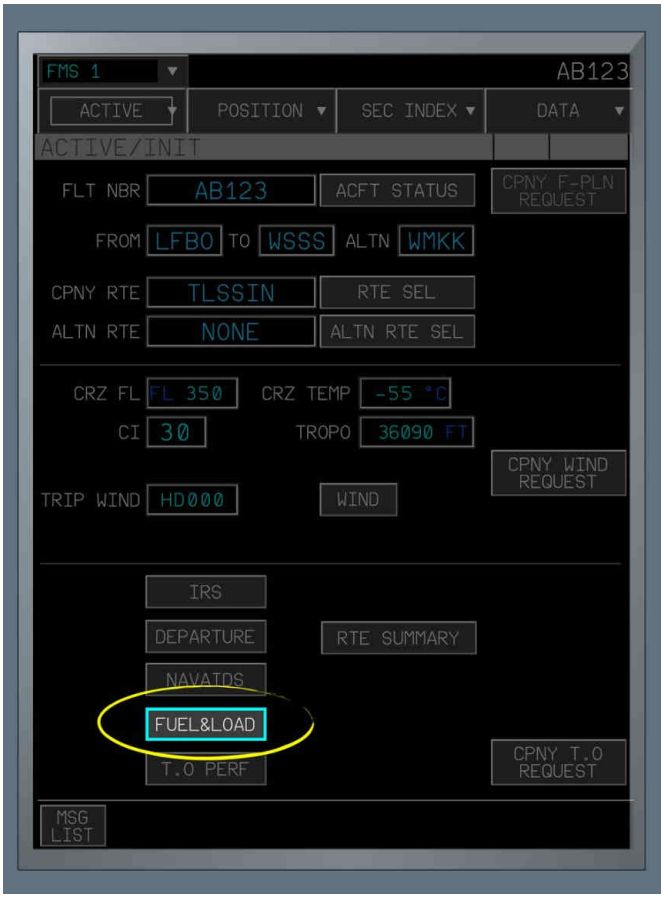
The FUEL&LOAD page is available for the active and secondary flight plans.

ACCESS

The flight crew can access the FUEL&LOAD page, via:

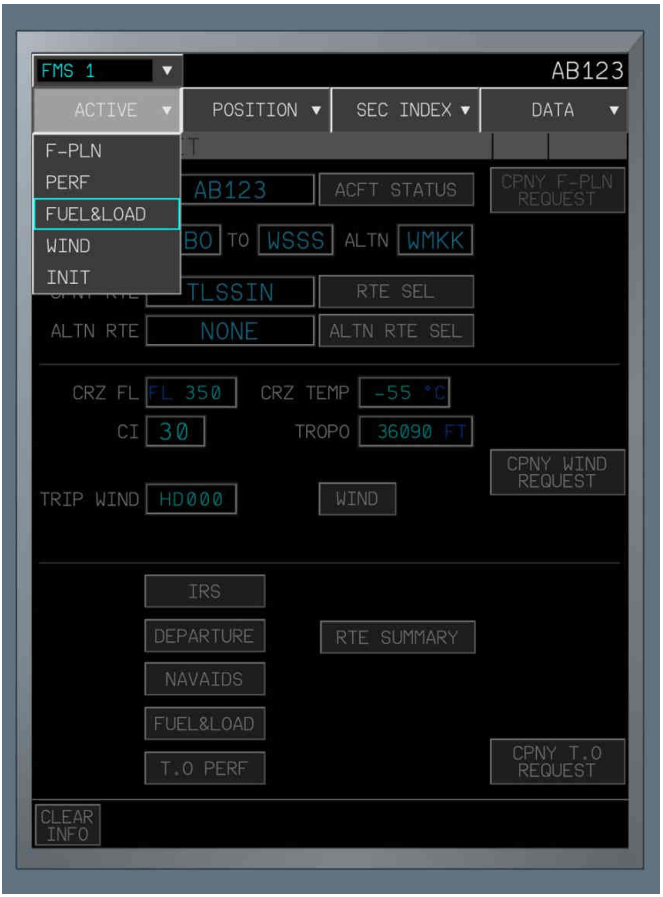
- The INIT page, by clicking on the FUEL&LOAD button:

INIT Page



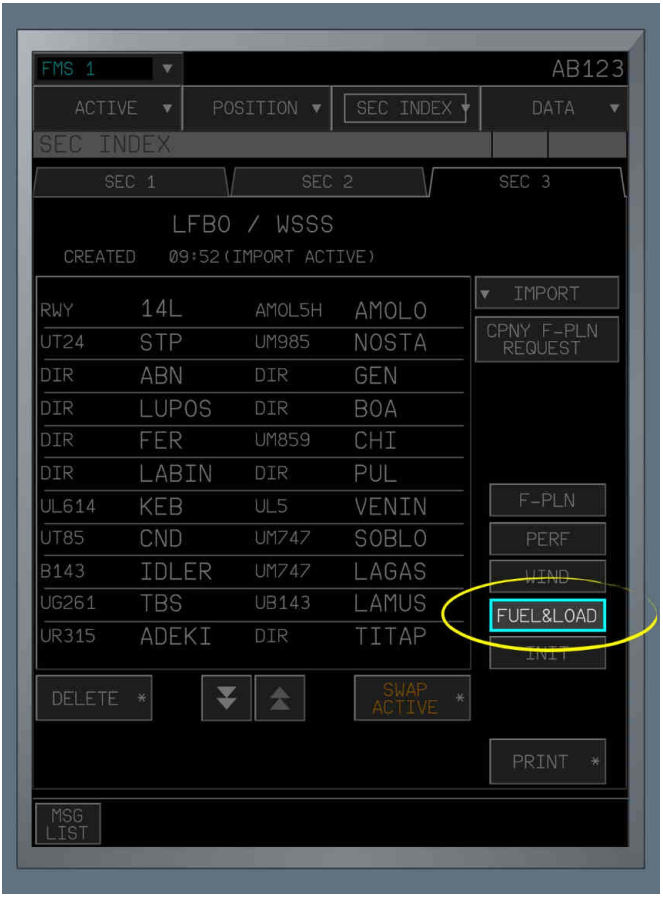
- The General Menu Bar, by selecting FUEL&LOAD in the ACTIVE menu:

General Menu Bar



Note: For the secondary flight plans, the flight crew can access the FUEL&LOAD page only via the SEC INDEX page, by clicking on the FUEL&LOAD button.

SEC INDEX Page



GW

Indicates, only after engine start, the aircraft Gross Weight (GW).
The FMS displays the GW, that is provided by the FQMS.

L2 If the GW from the FQMS is no longer available, the FMS computes and displays the GW, based on the entered ZFW and on:
- The current FOB provided by the FQMS, if available, or
- The FOB stored by the FQMS just after engine start and the current fuel used provided by the 4 FADECs and the APU (when the APU is ON).

CG

Indicates the aircraft Center of Gravity (CG).
The CG is displayed after engine start.
The FMS displays the CG, that is provided by the FQMS.
L2 If the FQMS is failed, the FMS displays the CG, provided by the WBBC.

FOB

Indicates the quantity of Fuel On Board (FOB).
The FOB is displayed after engine start.
The FMS displays the FOB, that is provided by the FQMS.

L2 If the FOB from the FQMS is no longer available, the FMS computes and displays the FOB, based on:
- The FOB stored by the FQMS just after engine start, and
- The current fuel used provided by the 4 FADECs and the APU (when the APU is ON).

ZFW ENTRY FIELD

Indicates the aircraft Zero Fuel Weight (ZFW).
The ZFW entry field is mandatory, and is entered by the flight crew.
L2 The FQMS uses this value to compute the aircraft gross weight.
The flight crew cannot clear the entry field.

L1 *Note: The FMS rejects the entered ZFW value and displays the ENTRY OUT OF RANGE message (Refer to Message), if the flight crew enters a ZFW value that exceeds the acceptable range, as defined in the performance database.*

ENTRY FORMAT

Refer to ZFW Entry Format

ZFWCG ENTRY FIELD

Indicates the aircraft Zero Fuel Weight Center of Gravity (ZFWCG).
The ZFWCG entry field is mandatory, and is entered by the flight crew.
L2 The FQMS uses this value to compute the aircraft CG .

The flight crew cannot clear the entry field.

L1 **ENTRY FORMAT**

Refer to ZFWCG Entry Format

FUEL PLANNING BUTTON

When clicked, starts the fuel planning computation.
The fuel planning function first computes the TRIP fuel in accordance with the entered flight plan. The fuel planning function then uses the TRIP fuel value, together with the default, or flight crew entered values for the TAXI, RTE RSV, and MIN FUEL AT DEST, to compute the minimum BLOCK fuel.
BLOCK = TAXI + TRIP + RTE RSV + MIN FUEL AT DEST

L2 If the flight crew did not manually enter a MIN FUEL AT DEST, the FMS uses the default or flight crew entered values for the ALTN and FINAL fuel to compute a MIN FUEL AT DEST value. In this case:
MIN FUEL AT DEST = ALTN + FINAL

L1 *Note: The fuel planning function assumes an EXTRA FUEL equal to zero.*

L2 The fuel planning computation is possible:
- Before engine start, and
- The flight crew has defined a flight plan and entered a cruise flight level, and
- The flight crew has entered the ZFW and ZFWCG, and
- No BLOCK fuel is entered by the flight crew.

L1 The resulting minimum BLOCK fuel is displayed in yellow next to the BLOCK entry field.

Fuel Planning Block Fuel

The flight crew can now confirm the computed BLOCK fuel, by clicking on the fuel planning button, that displays CONFIRM BLOCK.
When the flight crew confirms the computed BLOCK fuel, the value automatically appears in the BLOCK entry field.

Note: The FMS-computed BLOCK fuel automatically disappears, when the flight crew manually enters a block fuel in the BLOCK fuel entry field.

BLOCK ENTRY FIELD

Indicates the BLOCK fuel.

The BLOCK entry field is mandatory, and entered:
- Manually by the flight crew, or
- Automatically, when the flight crew confirms the FMS-computed BLOCK fuel.

The BLOCK entry field disappears after engine start.

L2 Before engine start, the FMS uses the BLOCK fuel to compute the fuel predictions. After engine start, the FMS uses the FOB , provided by the FQMS .

L1 **ENTRY FORMAT**

Refer to BLOCK Entry Format

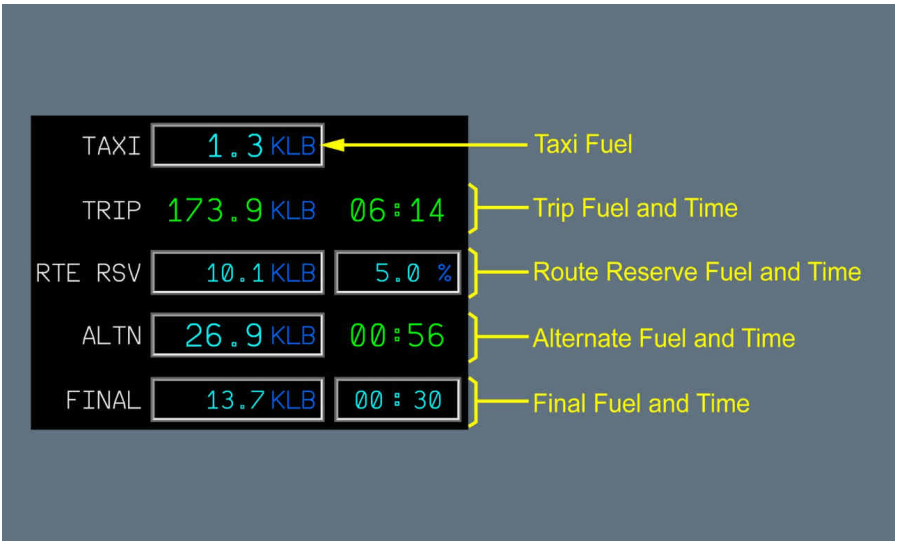
FUEL PLANNING TABLE

The fuel planning table provides the results of the fuel planning computation.
The fuel planning computation is performed after a BLOCK entry, or after clicking on the FUEL PLANNING button (in this last case, the minimum BLOCK fuel is computed for an EXTRA fuel equal to zero).

L2 The fuel planning table is also updated, when:
- The ZFW , ZFWCG , MIN FUEL AT DEST, or any value in the fuel planning table is changed
- A lateral or vertical flight plan revision is performed

L3
- The cost index is changed
- The maximum cabin rate is changed
- The cruise temperature, SAT , or tropopause altitude are changed
- A preselected speed is entered, or changed.

Fuel Planning Table



L1 **TAXI FUEL ENTRY FIELD**

Indicates the TAXI fuel.
The TAXI fuel is the fuel quantity necessary for taxi.
The default value for the taxi fuel is defined in the fuel policy of the AMI file. The flight crew can override the default value.

L2 At takeoff, the TAXI fuel entry field displays dashes, and can no longer be changed.

L1 ENTRY FORMAT

Refer to TAXI Entry Format

TRIP FUEL AND TIME

Indicates the TRIP fuel quantity and TRIP time.
The TRIP fuel (time) is the fuel quantity (time) necessary for the trip between takeoff at the origin airport (or from the P.POS in flight) to landing at the primary destination.

ROUTE RESERVE FUEL AND TIME ENTRY FIELDS

Indicates the RTE RSV fuel quantity and RTE RSV percentage.
The way the RTE RSV is computed, and the default value, are defined in the company fuel policy of the AMI file. The RTE RSV is either a percentage of the TRIP fuel, or a percentage of the (TRIP + ALTN) fuel.

The flight crew can override the default value.

L2 At takeoff, the RTE RSV is set to 0. The RTE RSV fuel is now included in the EXTRA FUEL.

L1 ENTRY FORMAT

Refer to RTE RSV Entry Format
Refer to RTE RSV% Entry Format

ALTERNATE FUEL ENTRY FIELD AND TIME

Indicates the ALTN fuel quantity and ALTN time.
The ALTN fuel (time) is the fuel quantity (time) necessary for the trip between the primary destination airport and landing at the alternate destination.

L2 The computation of the default value considers:
- A cost index equal to zero (minimum fuel consumption)
- A flight level FL 220 , if the alternate flight plan distance is less than 200 nm , or a flight level FL 310 , if the alternate flight plan distance is 200 nm or more.

L1 The flight crew can override the default value.

ENTRY FORMAT

Refer to ALTN FUEL Entry Format

FINAL FUEL AND TIME ENTRY FIELDS

Indicates the FINAL fuel and FINAL time.
The FINAL fuel (time) is the fuel quantity (time) planned for a holding pattern that could be flown at either the primary or alternate destination.
The parameters used to compute the FINAL fuel (time), and the default values, are defined in the company fuel policy of the AMI file.
The flight crew can override the default values.

ENTRY FORMAT

Refer to FINAL FUEL Entry Format
Refer to FINAL TIME Entry Format

TOW

Indicates the Takeoff Weight (TOW).
Before engine start, the TOW is:
TOW = ZFW + BLOCK - TAXI
After engine start, the takeoff weight is:
TOW = GW - TAXI

L2 In flight, the takeoff weight is equal to the gross weight.

LW

Indicates the Landing Weight (LW).
Before engine start, the LW is computed as follows:
LW = TOW - TRIP Fuel
After engine start, the landing weight is:
LW = GW - TRIP Fuel - TAXI Fuel
In flight, the landing weight is:
LW = GW - TRIP Fuel

PAX NBR ENTRY FIELD

Indicates the number of passengers (PAX NBR).
The PAX number entry field is mandatory, and is entered by the flight crew.
L2 The FMS PAX number is used by the air conditioning system.

L1 **ENTRY FORMAT**

Refer to PAX NBR Entry Format

CI ENTRY FIELD

Indicates the Cost Index (CI).

The completion of the CI entry field is mandatory. It can be completed either:
- Manually, by the flight crew, or
- Automatically, when the flight crew enters a CPNY RTE in the CPNY RTE entry field, or when a received company or ATC flight plan is inserted, and a CI is associated with the entered company route.

The CI entry field reflects the CI entry, made on the PERF or INIT page. (*Refer to PERF page* , *Refer to INIT page*)
For more information, *Refer to Cost Index* .

ENTRY FORMAT

Refer to CI Entry Format

DEFAULT VALUE

When there is no CI entered at engine start, the field is completed with the default value.
The default value is the last CI of the previous flight, stored in the DONE phase (or 0, if there is no CI).

L2 **LIMITATIONS**

The flight crew cannot enter the CI , when the aircraft is in the DESCENT, APPROACH, or GO AROUND flight phase.

JTSN GW ENTRY FIELD

Indicates the Jettison Gross Weight (JTSN GW).
The JTSN GW is entered by the flight crew, and corresponds to the aircraft GW that the flight crew wants to obtain after fuel jettison.
The JTSN GW is used by the FQMS to automatically stop the jettison when the aircraft GW reaches the JTSN GW .
For more information, *Refer to DSC-28-40 Fuel Jettison* .

ENTRY FORMAT

Refer to JTSN GW Entry Format

MIN FUEL AT DEST

Indicates the minimum fuel quantity at the primary destination.

The MIN FUEL AT DEST can be either:
- Entered by the flight crew, or
- Computed by the FMS , if the flight crew did not enter any MIN FUEL AT DEST value. In this case, the MIN FUEL AT DEST = ALTN + FINAL fuel.

If the flight crew manually enters a MIN FUEL AT DEST value and this value is below ALTN + FINAL fuel, the FMS displays the message CHECK MIN FUEL AT DEST (*Refer to CHECK MIN FUEL AT DEST*).
If the flight crew tries to clear the MIN FUEL AT DEST entry field without entering any value, the FMS displays the message NOT ALLOWED (*Refer to NOT ALLOWED*).

ENTRY FORMAT

Refer to MIN FUEL AT DEST Entry Format

EXTRA FUEL AND TIME

Indicates the EXTRA fuel and EXTRA time.
The EXTRA fuel (time) is the fuel quantity (time) that will remain after landing at the primary destination, minus the MIN FUEL AT DEST.
In PREFLIGHT, the EXTRA fuel is computed as follows:
EXTRA = BLOCK (or FOB, after engine start) - TAXI - TRIP - MIN FUEL AT DEST - RTE RSV
In flight, the EXTRA fuel is:
EXTRA = FOB - TRIP - MIN FUEL AT DEST

L2 At takeoff, the FMS sets the RTE RSV to 0 and includes the RTE RSV fuel in the EXTRA fuel.

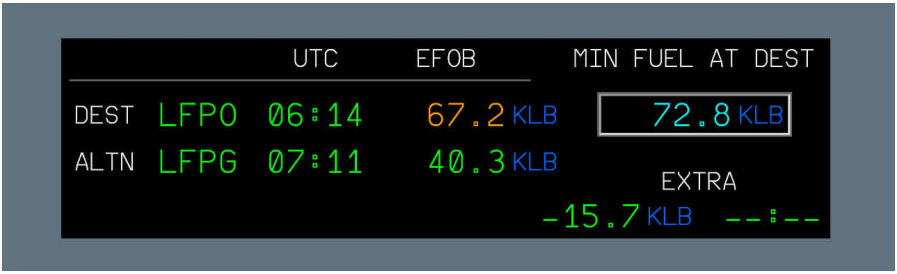
PRIMARY AND ALTERNATE DESTINATION FUEL AND ARRIVAL TIME TABLE

This table provides the estimated time of arrival (UTC), and the Estimated Fuel on Board (EFOB), at the primary and alternate destination.

Note: During the PREFLIGHT phase, if there is no ETT , the time prediction is not a UTC time, but a "flight time".

The EFOB at destination is displayed amber, when it is below the MIN FUEL AT DEST. In this case, the FMS also displays the message DEST EFOB BELOW MIN (*Refer to DEST EFOB BELOW MIN*).

EFOB at Destination lower than MIN FUEL AT DEST



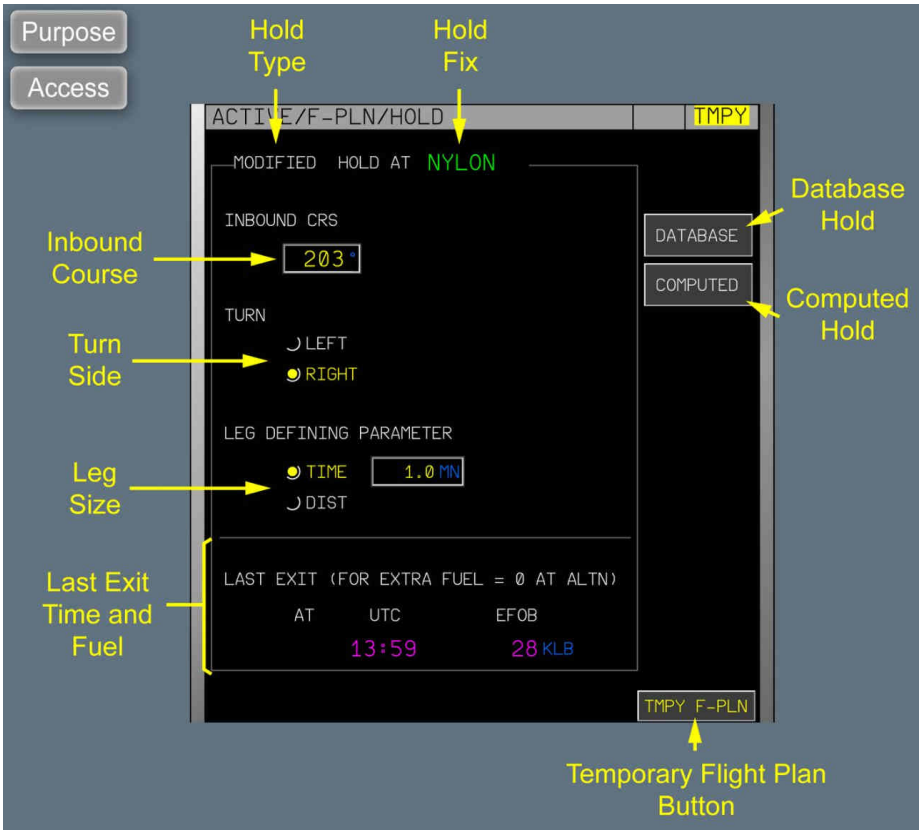
RETURN BUTTON

When clicked, displays the ACTIVE/INIT page.
Refer to Page

HOLD PAGE

Applicable to: ALL

HOLD Page



PURPOSE

On the HOLD page, the flight crew can:
- Check the parameters of a holding pattern defined on the revised waypoint, or
- Define a holding pattern (with manual termination) on the revised waypoint.

The flight crew insert:
- A hold, stored in the navigation database
- A hold, computed by the FMS
- A hold, defined by the flight crew.

The revised flight plan waypoint is called the “hold fix”. The hold fix is the start and end waypoint of the holding pattern.
The HOLD page is available for the active and secondary flight plans.

LINKS

Refer to More Information on the HOLD Revision

ACCESS

The flight crew can access the HOLD page via the F-PLN page, by selecting the HOLD revision in the waypoint revisions menu.

LIST

HOLD TYPE

Indicates the origin of the holding pattern:

- DATABASE:
  The hold is stored in the navigation database. The flight crew selects the database hold, associated with the revised waypoint, by clicking on the Database Hold button. (*Refer to Button*)
- COMPUTED:
  The hold is computed by the FMS. The flight crew selects a computed hold by clicking on the COMPUTED Hold button. (*Refer to Button*)
- MODIFIED:
  The hold is created by the flight crew, by entering the parameters in the entry fields. As soon as the flight crew changes a parameter of a database, or computed hold, the hold becomes a modified hold.
- The hold type label is blanked when no hold exists on the revised waypoint, or when the hold is inserted with a departure or arrival procedure, or with a flight plan uplink.

HOLD FIX

Indicates the start, and end waypoint of the holding pattern.
The hold fix is the flight plan waypoint from which the flight crew has selected the HOLD revision.

INBOUND COURSE ENTRY FIELD

Indicates the inbound course of the holding pattern.
The inbound course is completed automatically (in small font) when the flight crew selects a database, or computed hold.
The flight crew can always manually change the automatically entered value. The flight crew entered inbound course is displayed in big font.

ENTRY FORMAT

Refer to Inbound Course Entry Format
(revoir la DU Entry Format)

TURN SIDE OPTION

Indicates the hold turn side.
The flight crew selects the turn side by clicking on the turn side option.

LEG SIZE OPTION

The flight crew selects whether the leg size is defined by a time or distance.
The flight crew enters the time, or distance, in the associated entry field.

The leg size is completed automatically (in small font) when the flight crew selects a database, or computed hold.
The flight crew can always manually change the automatically entered value. The flight crew entered leg size is displayed in big font.

ENTRY FORMAT

Refer to HOLD TIME Entry Format
Refer to HOLD DISTANCE Entry Format

LAST EXIT TIME AND FUEL

Indicates the estimated UTC time (or flight time), and amount of fuel remaining, at which the aircraft must exit the holding pattern, so as to comply with the fuel policy. The fuel policy considers an extra fuel = 0 at landing at the primary destination.

DATABASE HOLD BUTTON

When clicked, displays the database hold, associated to the revised waypoint, and updates the temporary flight plan with this hold.
If no database hold exists for the selected waypoint, the button cannot be selected.

COMPUTED HOLD BUTTON

When clicked, computes and displays the computed hold, associated to the revised waypoint, and updates the temporary flight plan with this hold.

L2 The computed hold has the following parameters:
- Inbound course: Track of the flight plan leg preceding the holding fix, or the aircraft bearing if the holding fix is P.POS
- Turn side: RIGHT
- Leg size: 1 minute if the predicted aircraft altitude at the hold is below 14 000 ft , or 1.5 min if the altitude is above 14 000 ft.

TEMPORARY FLIGHT PLAN BUTTON

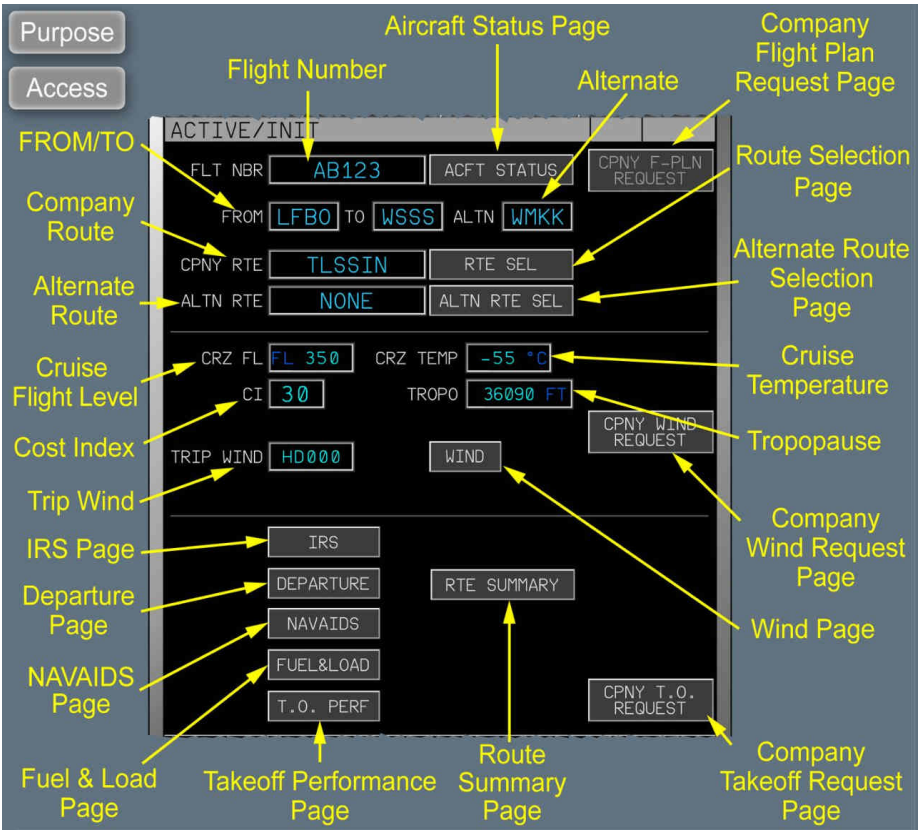
When clicked, displays the ACTIVE / F-PLN page. (*Refer to Page*)

L2 The Temporary Flight Plan button is only displayed if a temporary flight plan exists. If no temporary flight plan exists, the Return button is displayed in the lower left corner of the page: When clicked, displays the F-PLN page.

INIT PAGE

Applicable to: ALL

INIT Page



PURPOSE

On the INIT page, the flight crew can:
- Initialize the flight plan
- Access the company request pages (flight plan, wind and takeoff data requests)
- Insert company flight plan, and load data uplinks

Note:
- *The uplinked wind data is inserted on the WIND page (Refer to Page)*
- *The uplinked wind data is inserted on the RECEIVED COMPANY T.O DATA page (Refer to Page)*

The INIT page also guides the flight crew through the FMS initialization via the buttons on the lower part of the page: IRS, DEPARTURE, NAVAIDS, FUEL&LOAD, T.O PERF.
The INIT page is available for the active and secondary flight plans. The SEC / INIT page doesn't display the navigation buttons on the lower part of the page.

ACCESS

The flight crew can access the INIT page, by:

- Pressing the INIT key on the keyboard of the KCCU

INIT Key on the KCCU

- Selecting INIT in the ACTIVE menu on the General Menu Bar

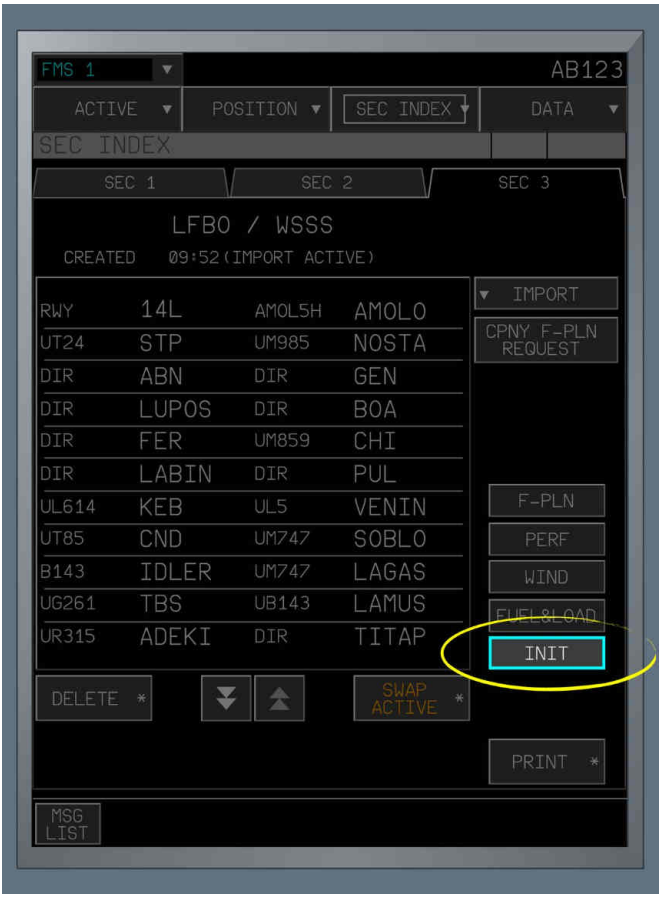
General Menu Bar

- Clicking on the INIT button, on the F-PLN page (this is only possible in PREFLIGHT)

INIT Button on the F-PLN Page

Note: *For the secondary flight plans, the flight crew can access the INIT page only via the SEC INDEX page, by clicking on the INIT button on this page. In that case, the SEC / INIT page displays the Return button to return to the SEC INDEX page.*

SEC INDEX Page



FLIGHT NUMBER ENTRY FIELD

Indicates the FMS flight number.
The flight number entry field is mandatory, and is entered by the flight crew.

L2 After flight crew entry, the flight number is displayed in the upper right corner of the MFD , even when the MFD does not display an FMS page.
The FMS sends the flight number to the ATC system for use in the ATC downlink messages.

L1 **ENTRY FORMAT**

Refer to FLT NBR Entry Format

AIRCRAFT STATUS BUTTON

Pressing the aircraft status button, displays the ACFT STATUS panel on the DATA / STATUS page.
Refer to STATUS page — ACFT STATUS panel

Impacted by TDU: 00019651 INIT page - FROM TO entry fields

FROM / TO ENTRY FIELDS

Indicate the ICAO origin / destination city-pair.

The FROM / TO entry fields are mandatory. They are entered:
- Manually, by the flight crew, or
- Automatically, when the flight crew enters a company route in the company route entry field, or when a received company or ATC flight plan is inserted.

A manual city-pair entry calls up the ROUTE SELECTION page, if, for the given city-pair, at least one company route exists. (*Refer to Page*)

CAUTION	Entering the city-pair re-initializes the flight plan, and deletes the existing flight plan, if any.

ENTRY FORMAT

Refer to AIRPORT Entry Format

Note: If the format is correct but the entered airport is not in the navigation database, the PILOT STORED RWYs panel on the DATA / AIRPORT page is displayed. This gives the flight crew the opportunity to add the selected airport to the pilots stored elements database.
Refer to DATA AIRPORT - PILOT STORED RWYs panel
Refer to Pilot Stored Elements Database

L2 **LIMITATIONS**

The flight crew can not enter the city-pair (on the ACTIVE / INIT page) when:
- The aircraft is not in the PREFLIGHT phase, or
- When a temporary flight plan is pending.

~~The flight crew can not clear the fields.~~

Impacted DU: 00003510 INIT page - FROM TO entry fields

FROM / TO ENTRY FIELDS

Indicate the ICAO origin / destination city-pair.

The FROM / TO entry fields are mandatory. They are entered:
- Manually, by the flight crew, or
- Automatically, when the flight crew enters a company route in the company route entry field, or when a received company or ATC flight plan is inserted.

A manual city-pair entry calls up the ROUTE SELECTION page, if, for the given city-pair, at least one company route exists. (*Refer to Page*)

CAUTION	Entering the city-pair re-initializes the flight plan, and deletes the existing flight plan data (except the performance data), if any.

ENTRY FORMAT

Refer to AIRPORT Entry Format

Note: If the format is correct but the entered airport is not in the navigation database, the PILOT STORED RWYs panel on the DATA / AIRPORT page is displayed. This gives the flight crew the opportunity to add the selected airport to the pilots stored elements database.
Refer to DATA AIRPORT - PILOT STORED RWYs panel
Refer to Pilot Stored Elements Database

L2 **LIMITATIONS**

The flight crew can not enter the city-pair (on the ACTIVE / INIT page) when:
- The aircraft is not in the PREFLIGHT phase, or
- When a temporary flight plan is pending.

The flight crew can not clear the fields.

ALTERNATE ENTRY FIELD

Indicates the ICAO code of the alternate airport.

The alternate entry field is mandatory, and entered:
- Manually, by the flight crew, or
- Automatically, when the flight crew enters a company route in the company route entry field, or when a received company or ATC flight plan is inserted, and an alternate airport is associated with the entered company route.

A manual alternate airport entry calls up the ROUTE SELECTION page, if, for the given primary and alternate destination pair, at least one company route exists. (*Refer to Page*)
The alternate destination can also be entered via the ALTERNATE revision. The Alternate entry field reflects the alternate airport selection, made on the ALTERNATE page.
Refer to More Information on the ALTERNATE Revision
Refer to ALTERNATE Page

CAUTION	Entering the alternate destination re-initializes the alternate flight plan, and deletes the existing alternate flight plan, if any.

ENTRY FORMAT

Refer to ALTN Entry Format

Note: *If the entered airport is not in the navigation database, the PILOT STORED RWYs panel on the DATA / AIRPORT page is displayed. This gives the flight crew the opportunity to add the selected airport to the pilots stored elements database.*
Refer to DATA AIRPORT - PILOT STORED RWYs panel
Refer to Pilot Stored Elements Database

DEFAULT VALUE

The alternate entry field displays the alternate airport, associated with the defined primary destination, if any. If no associated alternate airport exists, the alternate field displays NONE.

COMPANY ROUTE ENTRY FIELD

Indicates the company route.
The company route entry field is mandatory, if there is no FROM/TO city-pair defined.

The alternate entry field is entered:
- Manually, by the flight crew, or
- Automatically, when the flight crew selects a company route on the ROUTE SELECTION page. (*Refer to Page*)

CAUTION	Entering a company route re-initializes the flight plan, and deletes the existing flight plan, if any.

If a FROM / TO city-pair is defined, and no company route has been selected, then the company route field displays NONE.

ENTRY FORMAT

Refer to CO RTE Entry Format

L2 **LIMITATIONS**

The flight crew can not enter the company route (on the ACTIVE / INIT page) when:
- The aircraft is not in the PREFLIGHT phase, or
- When a temporary flight plan is pending.

The flight crew cannot clear the field.

ALTERNATE ROUTE ENTRY FIELD

Indicates the alternate company route.

The alternate company route is entered:
- Manually, by the flight crew, or
- Automatically, when the flight crew selects an alternate company route on the ALTERNATE ROUTE SELECTION page. (*Refer to Page*)

The alternate route can also be entered via the ALTERNATE revision. The alternate route entry field reflects the alternate route selection, made on the ALTERNATE page.
Refer to More Information on the ALTERNATE Revision
Refer to ALTERNATE Page

CAUTION	Entering an alternate route re-initializes the alternate flight plan, and deletes the existing alternate flight plan, if any.

If a primary destination is defined, and no alternate route has been selected, then the Alternate Route field displays NONE.

ENTRY FORMAT

Refer to ALTN RTE Entry Format

L2 **LIMITATIONS**

The flight crew can not enter the alternate company route (on the ACTIVE / INIT page) when:
- No primary destination is defined, or
- A temporary flight plan is pending.

The flight crew cannot clear the field.

ROUTE SELECTION BUTTON

Pressing the route selection button, displays the ROUTE SELECTION page. (*Refer to Page*)

ALTERNATE ROUTE SELECTION BUTTON

When clicked, displays the ROUTE SELECTION page. (*Refer to Page*)

CRUISE FLIGHT LEVEL ENTRY FIELD

Indicates the cruise flight level.

The cruise flight level entry field is mandatory, and entered:
- Manually, by the flight crew, or
- Automatically, when the flight crew enters a company route in the company route entry field, or when a received company or ATC flight plan is inserted, and a cruise flight level is associated with the entered route.

The Cruise Flight Level field reflects the cruise flight level entry, made on the PERF page. (*Refer to Page*)

ENTRY FORMAT

Refer to CRZ FL Entry Format

AUTOMATIC UPDATE

L2 If no cruise flight level is defined, and the TAKEOFF flight phase becomes active, the cruise flight level is set to the highest of the following two values:
- The FCU clearance altitude
- The highest climb altitude constraint in the primary flight plan.

L1 When the flight crew sets the AFS CP selected altitude above the cruise flight level, the cruise flight level is set to the AFS CP selected altitude.
When the flight crew enters a cruise flight level lower than the AFS CP selected altitude, the entry is not accepted and the cruise flight level is set to the AFS CP selected altitude.
The cruise flight level displays dashes when the descent, or approach phase becomes active.

L2 LIMITATIONS

The flight crew can not enter the cruise flight level (on the ACTIVE / INIT page) when no FROM / TO city-pair is defined.
The flight crew cannot clear the field.

CRUISE TEMPERATURE ENTRY FIELD

Indicates the cruise temperature.

ENTRY FORMAT

Refer to CRZ TEMP Entry Format

DEFAULT VALUE

If a cruise flight level is entered, or when the cruise temperature entry field is cleared, the cruise temperature is set to the ISA temperature.

AUTOMATIC UPDATE

For automatic cruise temperature updates, (link to the Performance Parameters chapter)

L2 **LIMITATIONS**

The flight crew can not enter the cruise temperature (on the ACTIVE / INIT page) when no cruise flight level is defined.

COST INDEX ENTRY FIELD

Indicates the cost index.

The cost index entry field is mandatory, and entered:
- Manually, by the flight crew, or
- Automatically, when the flight crew enters a company route in the company route entry field, or when a received company or ATC flight plan is inserted, and a cost index is associated with the entered company route.

The cost index field reflects the cost index entry, made on the PERF and FUEL&LOAD page. (*Refer to PERF page* , *Refer to FUEL&LOAD page*)
For more information on the use of the cost index, *Refer to Cost Index* .

ENTRY FORMAT

Refer to CI Entry Format

DEFAULT VALUE

When there is no cost index defined at engine start, the field is completed with the default value. The default value is the last cost index of the previous flight, stored in the DONE phase (or 0, if there is no cost index).

L2 **LIMITATIONS**

The flight crew can not enter the cost index (on the ACTIVE / INIT page), when the aircraft is in the DESCENT, APPROACH, or GO AROUND flight phase.

TROPOPAUSE ENTRY FIELD

Indicates the tropopause altitude.

ENTRY FORMAT

Refer to TROPO Entry Format

DEFAULT VALUE

The default tropopause altitude is 36 090 ft .

TRIP WIND ENTRY FIELD

Indicates the trip wind.

L2 The trip wind is the mean effective wind component for the trip from the origin to the destination airport.

L1 The trip wind is entered manually by the flight crew.
When the flight crew enters any of the climb, cruise, or descent winds on the WIND page, then the FMS does not use the trip wind value any more. In that case, the trip wind entry field is disabled and displays dashes.

ENTRY FORMAT

Refer to TRIP WIND Entry Format

DEFAULT VALUE

The default trip wind value is HD000.

L2 **LIMITATIONS**

The flight crew can not enter the trip wind when no FROM / TO city-pair is defined.

WIND BUTTON

When clicked, displays the WIND page. (*Refer to Page*)

IRS BUTTON

When clicked, displays the POSITION / IRS page. (*Refer to Page*)

DEPARTURE BUTTON

When clicked, displays the DEPARTURE page. (*Refer to Page*)
The DEPARTURE button can be selected only in PREFLIGHT, and when an origin airport exists.

ROUTE SUMMARY BUTTON

When clicked, displays the DATA / ROUTE page. (*Refer to page*)

NAVAID S BUTTON

When clicked, displays the POSITION / NAVAIDS page. (*Refer to Page*)

FUEL&LOAD BUTTON

When clicked, displays the FUEL&LOAD page. (*Refer to Page*)

TAKEOFF PERFORMANCE BUTTON

When clicked, displays the TO panel of the PERF page. (*Refer to Page*)

COMPANY FLIGHT PLAN REQUEST BUTTON

When clicked, displays the COMPANY F-PLN REQUEST page. (*Refer to Page*)

L2 The company flight plan request button can only be selected before engine start, when:
- No active flight plan is defined, and
- No secondary flight plan request is pending.

L1 When an active flight plan request is pending, the button displays REQUEST PENDING ... . The button gives still access to the COMPANY F-PLN REQUEST page.

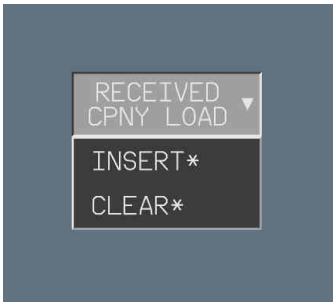
REQUEST PENDING ...

When an active company flight plan is received, the button displays RECEIVED CPNY F-PLN . When clicked, opens a menu that allows the flight crew to insert, or clear the received company flight plan.

RECEIVED CPNY F-PLN

When the received company message contains only the flight plan load data, and not the flight-plan itself, the button displays RECEIVED CPNY LOAD. When clicked, opens a menu that allows the flight crew to insert, or clear the received company load data.

RECEIVED CPNY LOAD



COMPANY WIND REQUEST BUTTON

When clicked, sends via ACARS a company wind request to the company ground station.
If the Free Text AMI option is activated, clicking on the CPNY WIND REQUEST button will display the COMPANY WIND DATA REQUEST page. (*Refer to Page*)
On this page, the flight crew can enter any free text that will be sent with the wind request.
When an active wind request is pending, the button displays REQUEST PENDING ... . The button gives still access to the COMPANY WIND DATA REQUEST page.

REQUEST PENDING ...

COMPANY TAKEOFF REQUEST BUTTON

When clicked, displays the COMPANY T.O DATA REQUEST page.
Refer to Page

L2 The company flight plan request button can only be selected when the flight phase is PREFLIGHT or DONE.

L1 When an active takeoff data request is pending, the button displays REQUEST PENDING ... . The button gives still access to the COMPANY T.O DATA REQUEST page.

REQUEST PENDING ...

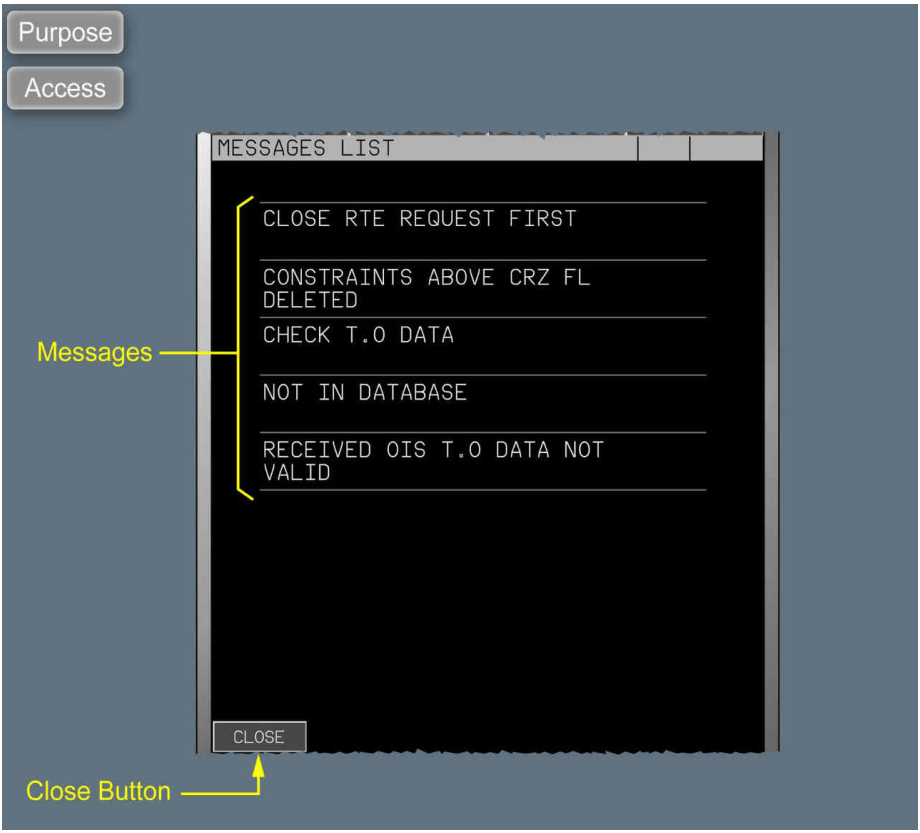
When the active company takeoff data is received, the button displays RECEIVED CPNY T.O. When clicked, displays the RECEIVED CPNY T.O DATA page.
Refer to Page

RECEIVED CPNY T.O.

MESSAGES LIST PAGE

Applicable to: ALL

MESSAGES LIST page



PURPOSE

On the MESSAGES LIST page, the flight crew can review the type II messages history.

LINKS

Refer to FMS Messages .

ACCESS

The flight crew can access the MESSAGES LIST page, via the MSG LIST button of the FMS Message Area. (*Refer to FMS Message Area*)
The MSG LIST button is only available when all messages are cleared.

MESSAGES

Indicates the first-in / first-out message list of type II messages.
A message is automatically removed from the list as soon as the display conditions of the message no longer apply.
The list has a maximum of 5 messages.

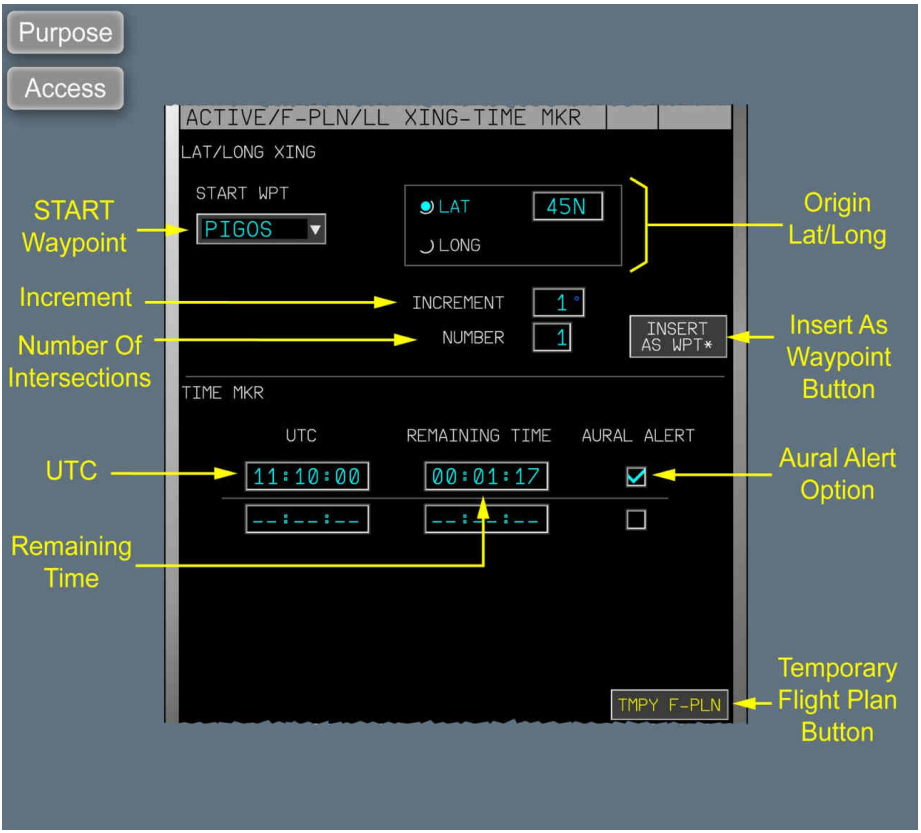
CLOSE BUTTON

When clicked, displays the page that was displayed before the MESSAGES LIST page.

LL XING - TIME MKR PAGE

Applicable to: ALL

LL XING — TIME MKR Page



PURPOSE

On the LL XING - TIME MKR page, the flight crew can:

- Create LAT / LONG CROSSING points, and insert them as waypoints in the temporary flight plan
- Define up to 4 time marker.

The LL XING - TIME MKR page is available for the active and secondary flight plans. However, for the secondary flight plans, the LL XING - TIME MKR page only displays the LAT / LONG CROSSING function.

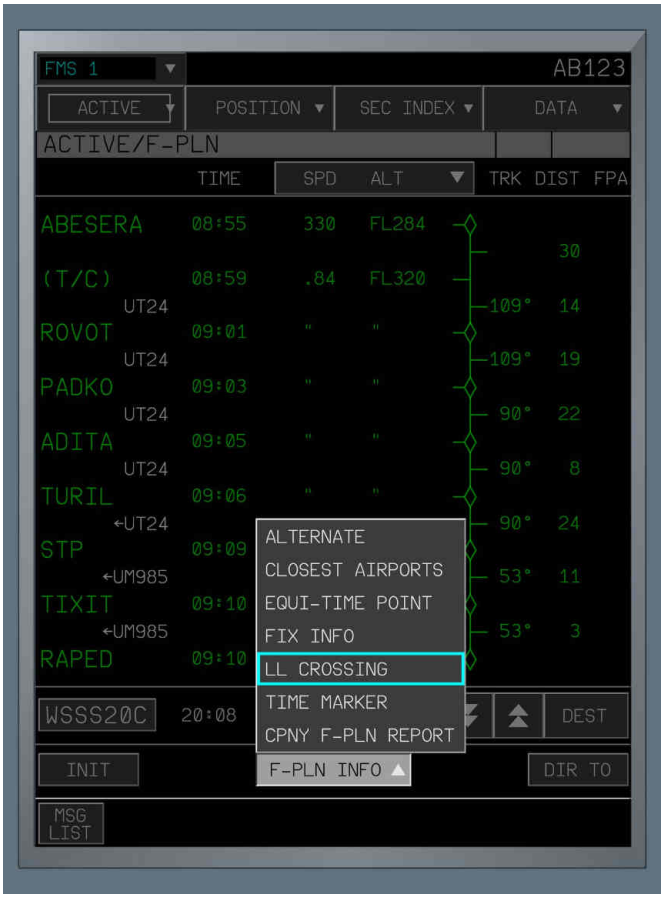
LINKS

Refer to DSC-22-FMS-10-40-50-22FMS4030N LAT/LONG CROSSING - Purpose LAT/LONG CROSSING - Revision Description

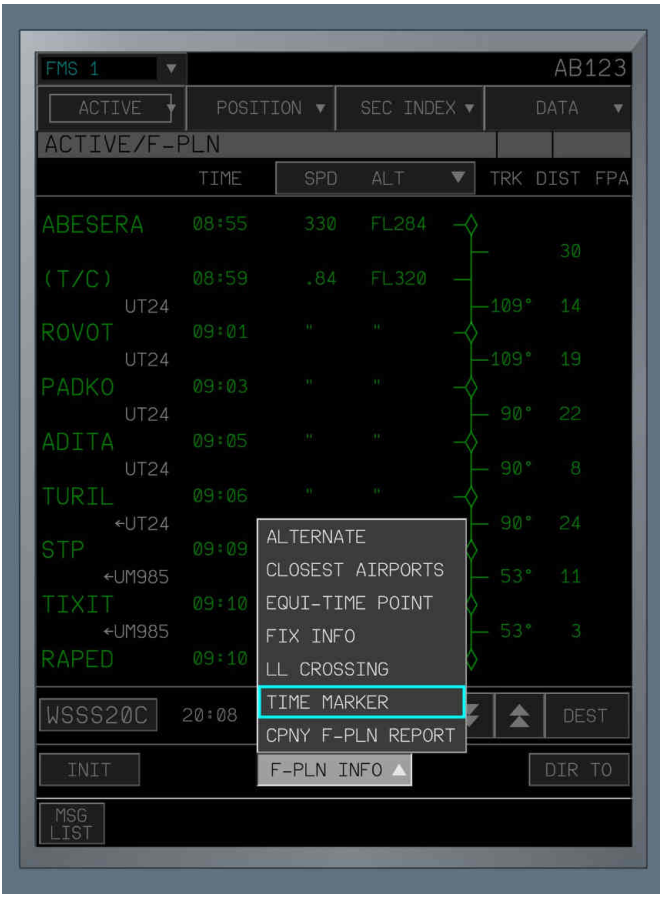
ACCESS

The flight crew can access the LL XING — TIME MKR page via the F-PLN page by selecting LL CROSSING or TIME MARKER in the F-PLN INFO menu.

Access via the LL CROSSING option



Access via the TIME MARKER option



START WAYPOINT ENTRY FIELD AND LIST

Indicates the first waypoint along the flight plan taken by the FMS to compute LAT/LONG crossing point series.
The flight crew enters the target waypoint via the keyboard, or by selecting it in the list.
The start waypoint can be defined between the origin and:

- The last enroute waypoint (excluded), or
- The waypoint associated to the first descent constraint in the primary flight plan (excluded).

ENTRY FORMAT

Refer to Waypoint entry format

ORIGIN LATITUDE/LONGITUDE

The flight crew selects wether the crossing points are intersections with a latitude, or with a longitude.
The default selection is latitude.
The flight crew enters the origin latitude (or longitude) in the entry field.
The default value is the rounded latitude (or longitude) of the waypoint in the flight plan following the first waypoint of the start waypoint list. If the FMS does not find latitude (or longitude) corresponding to this flight plan point, the default value will be the rounded latitude (or longitude) of the first waypoint of the start waypoint list

ENTRY FORMAT

Refer to LAT Entry Format
Refer to LONG Entry Format

INCREMENT ENTRY FIELD

The flight crew enters the increment (in degrees) between the crossing latitudes (or longitudes).
The default value is 1.

ENTRY FORMAT

Refer to Increment entry format

NUMBER OF INTERSECTIONS

The flight crew enters the maximum desired number of intersections in the entry field.

ENTRY FORMAT

Refer to Number entry format

INSERT AS WAYPOINT BUTTON

When clicked, inserts the intersections as waypoints in the temporary flight plan.

UTC ENTRY FIELD

The flight crew enters the UTC time of the time marker in the entry field.
The ND displays the associated pseudo waypoint on the lateral flight plan.
The entry field is entered automatically when the time marker is defined by a remaining time entry.

ENTRY FORMAT

Refer to TIME MARKER UTC Entry Format

REMAINING TIME ENTRY FIELD

The flight crew enters the remaining time to reach the desired time marker position from the present position in the entry field.
The ND displays the associated pseudo waypoint on the lateral flight plan.
The entry field is entered automatically when the remaining time is defined by a UTC entry.

ENTRY FORMAT

Refer to Remaining Time entry format

AURAL ALERT OPTION

The flight crew selects this option if he wants to be alerted aurally when the time marker is reached.

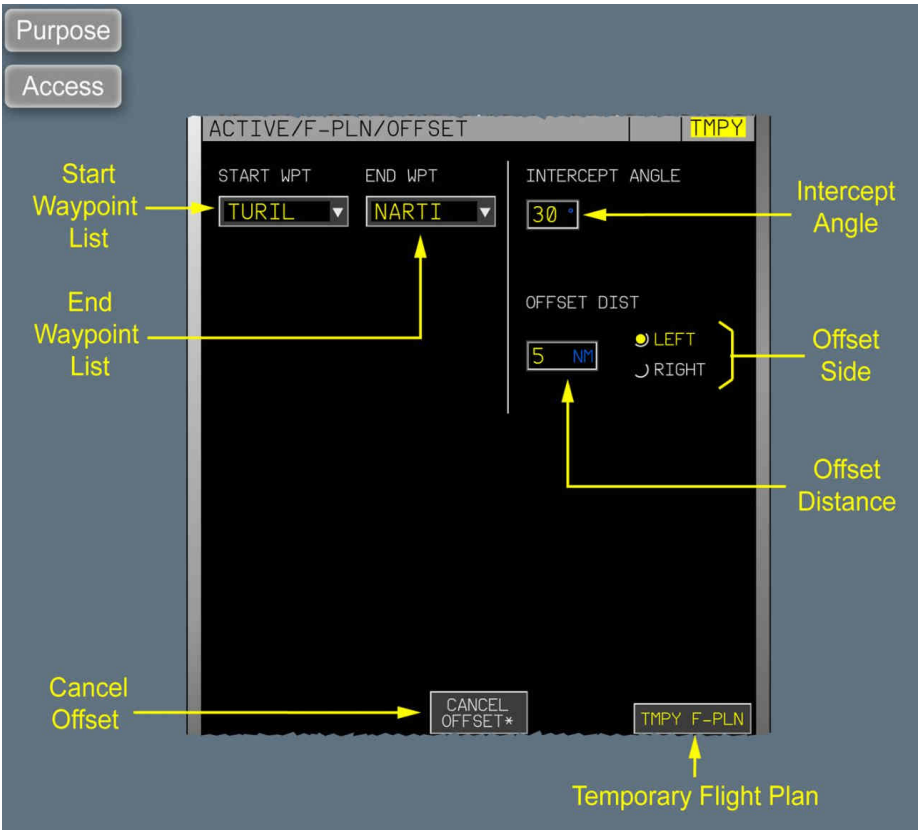
TEMPORARY FLIGHT PLAN BUTTON

When clicked, displays the ACTIVE / F-PLN page. (*Refer to Page*)
L2 The Temporary Flight Plan button is only displayed if a temporary flight plan exists. If no temporary flight plan exists, the Return button is displayed: Clicking on the Return button, displays the ACTIVE / F-PLN page.

OFFSET PAGE

Applicable to: ALL

OFFSET Page



PURPOSE

On the OFFSET page, the flight crew can insert, change, or delete an offset segment. The OFFSET page is available for the active and secondary flight plans.

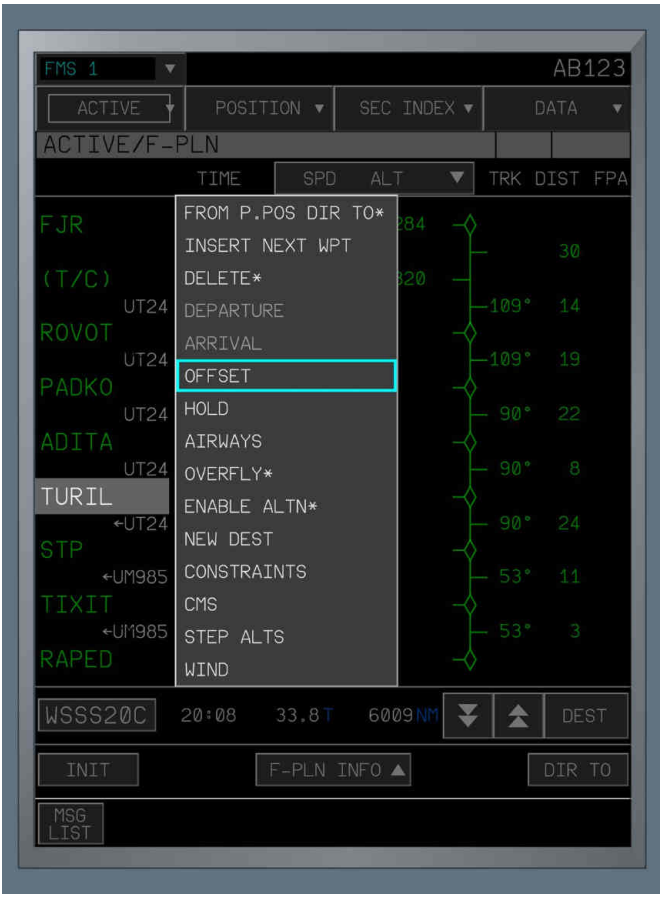
LINKS

Refer to More Information on the OFFSET Revision

ACCESS

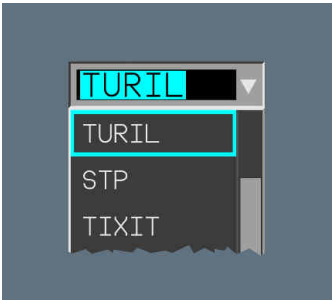
The flight crew can access the OFFSET page via the F-PLN page, by selecting the OFFSET revision in the waypoint revision menu.

Offset access



START WAYPOINT LIST

Start Waypoint List



The start waypoint list displays all flight plan waypoints from the aircraft present position to the primary destination.
The flight crew selects the offset start waypoint in the list, or enters it into the entry field using the keyboard.
Some flight plan waypoints cannot be part of the offset segment (example: holding fix). These waypoints are not displayed in the start waypoint list.

The default start waypoint is:
- The revised waypoint, if there is no offset segment in the flight plan.

  Note: - *If the revised waypoint is the FROM waypoint, the default start waypoint is P.POS .*
  - *If the revised waypoint cannot be part of an offset segment (example: a holding fix), the default start waypoint is the first valid flight plan waypoint downpath the revised waypoint.*

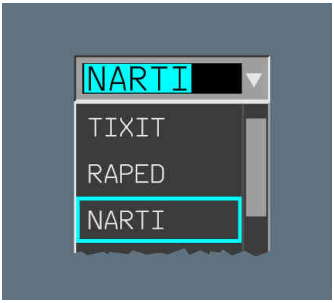
- The start waypoint of the offset segment, if there is an offset segment in the flight plan
- P.POS , if the aircraft is currently flying the offset segment
  In this case, the flight crew cannot change the start waypoint.

ENTRY FORMAT

Refer to WAYPOINT Entry Format

END WAYPOINT LIST

End Waypoint List



The end waypoint list displays all flight plan waypoints from the selected start waypoint to the primary destination.
The flight crew selects the offset end waypoint in the list, or enters it into the entry field using the keyboard.
Some flight plan waypoints cannot be part of the offset segment (example: holding fix). The end waypoint list only displays the flight plan waypoints between the selected start waypoint, and the first not valid waypoint.

The default start waypoint is:
- The last waypoint of the flight plan before the primary destination, or the last waypoint before the first not valid waypoint, if there is no offset segment in the flight plan
- The end waypoint of the offset segment, if there is one.

ENTRY FORMAT

Refer to WAYPOINT Entry Format

OFFSET DISTANCE ENTRY FIELD

Indicates the offset distance.
The flight crew can enter the offset side (L or R) with the offset distance (example: 15L, or L15)
After validation of the entry, the offset distance entry field only displays the offset distance, and the offset side option is automatically updated.

ENTRY FORMAT

Refer to OFFSET DISTANCE ENTRY FORMAT

OFFSET SIDE OPTION

Indicates the offset side.
The flight crew selects the offset side by clicking on the offset side option.

INTERCEPT ANGLE ENTRY FIELD

Indicates the angle between the original flight plan, and the transition trajectory from the original flight plan to the offset path (or vice versa).
The default intercept angle is 30 ° (this value can be changed by the operator in the AMI file).
The flight crew can change the default value.

ENTRY FORMAT

Refer to ANGLE ENTRY FORMAT

CANCEL OFFSET BUTTON

When clicked, cancels the offset segment in the temporary flight plan and displays the F-PLN page.
L2 The flight crew can also cancel the offset segment by entering 0 in the offset distance field.

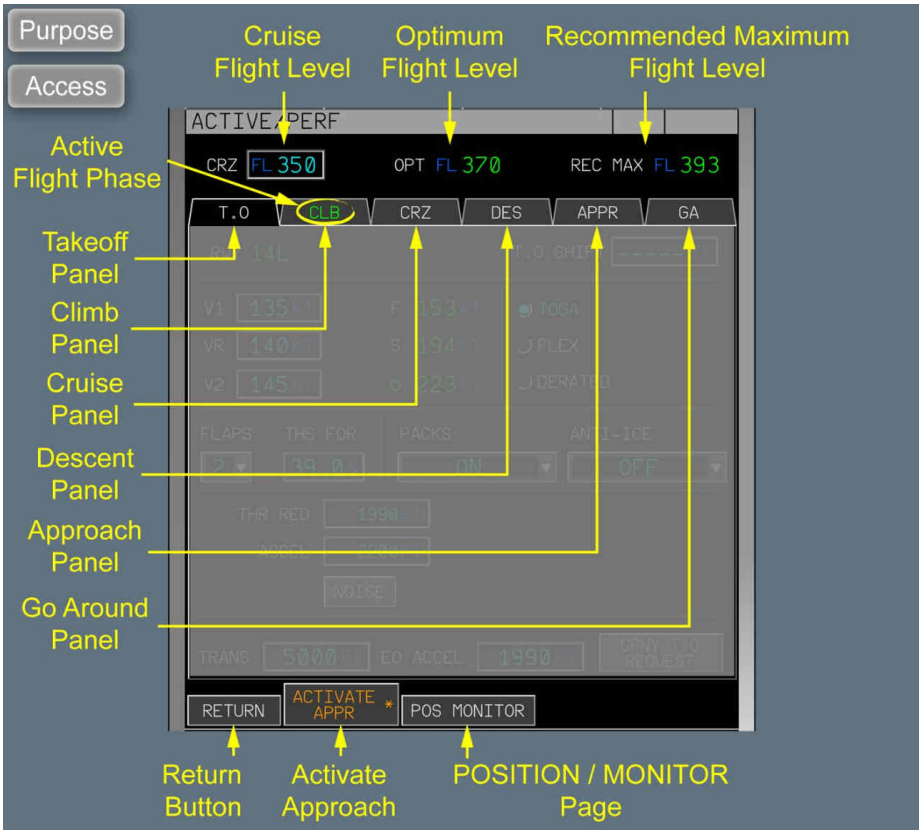
TEMPORARY FLIGHT PLAN BUTTON

When clicked, displays the ACTIVE / F-PLN page. (*Refer to Page*)
L2 The Temporary Flight Plan button is only displayed if a temporary flight plan exists. If no temporary flight plan exists, the Return button is displayed in the lower left corner of the page: When clicked, displays the F-PLN page.

PERF PAGE

Applicable to: ALL

PERF Page - Overview



PURPOSE

On the PERF page, the flight crew can:

- Change the cruise flight level,
- Consult the optimum and recommended maximum flight levels,
- Display, change, or complete the performance data for the following FMS flight phases: Takeoff (T.O), climb (CLB), cruise (CRZ), descent (DES), approach (APPR), and go-around (GA),

- Change the cost index,
- Activate the APPR $_{phase}$,
- Clear the engine-out state.

The PERF page is available for the active and secondary flight plans.

LINKS

Refer to FMS Performance Computation
Refer to FMS Engine-out

ACCESS

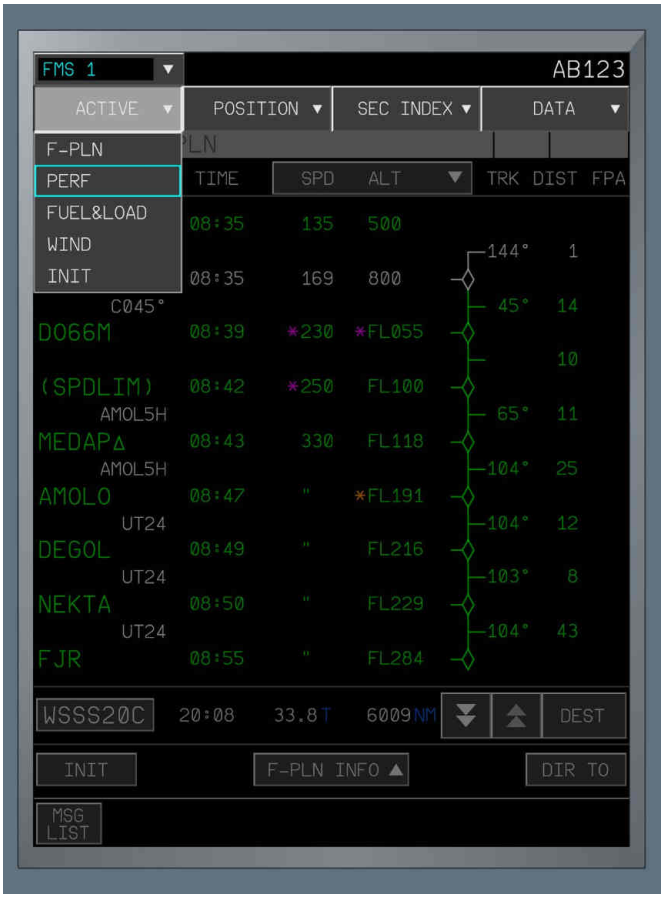
The flight crew can access the PERF page, via:

- The KCCU, by pressing the PERF key on the keyboard, the panel of the active flight phase is opened by default,

KCCU

- The General Menu Bar, by selecting PERF in the ACTIVE menu, the panel of the active flight phase is opened by default,

General Menu Bar



- The ACTIVE / INIT page, by clicking on the T.O PERF button, the T.O panel is opened by default,

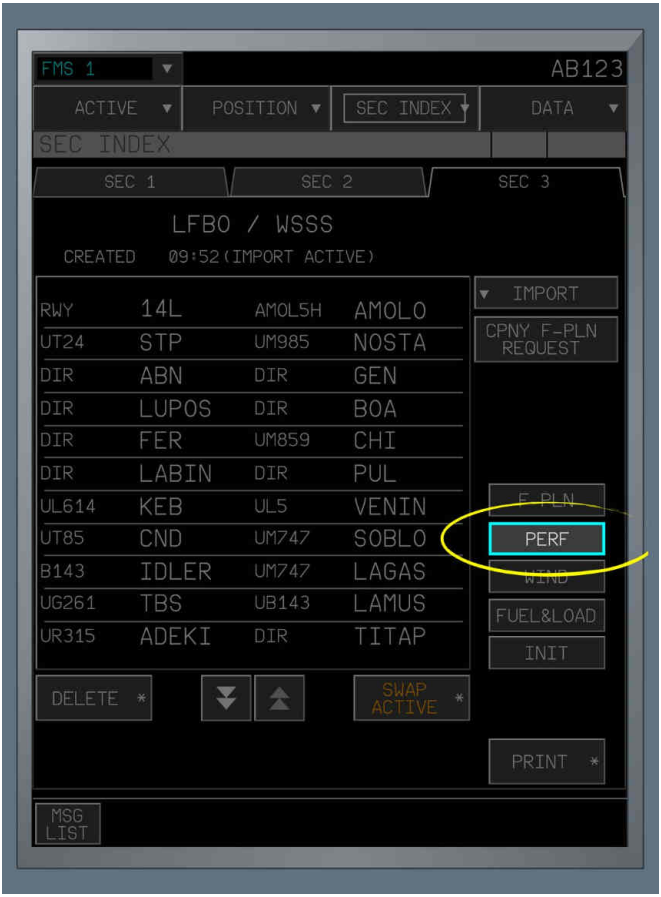
ACTIVE / INIT Page

- The RECEIVED COMPANY T.O DATA page, by clicking on the T.O PERF button, the T.O panel is opened by default,

RECEIVED COMPANY T.O DATA Page

Note: *For the secondary flight plans, the flight crew can access the PERF page via the SEC INDEX page, by clicking on the PERF button.*

SEC INDEX Page



CRUISE FLIGHT LEVEL ENTRY FIELD

Indicates the cruise flight level.
The Cruise Flight Level field reflects the cruise flight level entry, made on the INIT page. (*Refer to Page*)

ENTRY FORMAT

Refer to CRZ FL Entry Format

AUTOMATIC UPDATE

L2 When the T.O $_{phase}$ becomes active, and no cruise flight level is defined by the flight crew, the cruise flight level is automatically set to the highest of the following two values:
- The AFS CP clearance altitude,
- The highest climb altitude constraint in the primary flight plan.

L1 When the flight crew sets the AFS CP selected altitude above the cruise flight level, the cruise flight level is set to the AFS CP selected altitude.
When the flight crew enters a cruise flight level lower than the AFS CP selected altitude, the entry is not accepted and the cruise flight level is set to the AFS CP selected altitude.
The cruise flight level displays dashes when the descent, or approach phase becomes active.

OPTIMUM FLIGHT LEVEL

Indicates the current optimum flight level.
Refer to Optimum Flight Level

L2 The label displays dashes:
- In DES $_{phase}$ and APPR $_{phase}$,
- In the engine-out state.

RECOMMENDED MAXIMUM FLIGHT LEVEL

Indicates the recommended maximum flight level.
Refer to Recommended Maximum Flight Level

L2 In engine-out, the label displays EO MAX in amber. It indicates the engine-out maximum flight level.
Refer to Engine-Out Maximum Flight level

EO MAX

RETURN BUTTON

When clicked, displays the INIT page. (*Refer to Page*)

POSITION MONITOR BUTTON

When clicked, displays the POSITION / MONITOR page. (*Refer to Page*)

ACTIVATE APPROACH BUTTON

The flight crew uses the button to activate the APPR $_{phase}$.
A confirmation action is required.

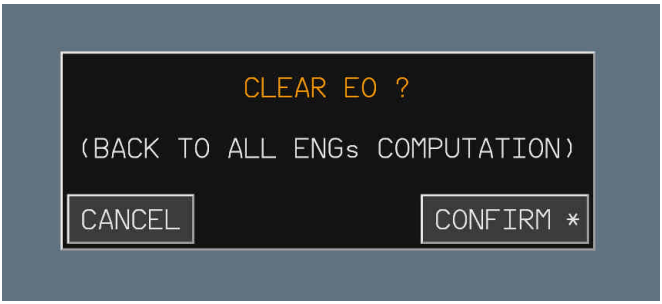
CONFIRM / CANCEL

The flight crew can activate the APPR $_{phase}$ with this button during the CLB $_{phase}$, CRZ $_{phase}$, DES $_{phase}$, or GA $_{phase}$. Otherwise, the button is not displayed.
For more information on the flight phase switching, *Refer to FMS Flight Phases*

CLEAR ENGINE-OUT BUTTON

The flight crew uses the button to deactivate the FMS engine-out state.
A confirmation action is required.

CONFIRM / CANCEL



ACTIVE FLIGHT PHASE

The name of the active flight phase is displayed in green. The other flight phases are white.
For more information on the flight phase switching, *Refer to FMS Flight Phases*

TAKEOFF RUNWAY

Indicates the flight plan takeoff runway.

TAKEOFF SPEEDS ENTRY FIELDS

Indicate the takeoff speeds:
- V1 (*Refer to Definition*)
- VR (*Refer to Definition*)
- V2 (*Refer to Definition*)

The takeoff speeds are mandatory, and entered manually by the flight crew.

Note: - *If the flight crew does not enter V1 or VR, the ECAM triggers the NAV T.O SPEEDS NOT INSERTED alert, when the TO CONFIG pb of the ECP is pressed, or when the engines are set to takeoff power.*
- *If the flight crew does not enter V2, the SRS mode will not be available at takeoff.*

L2 The takeoff speed are completed automatically, when the flight crew inserts the received company takeoff data. (*Refer to RECEIVED COMPANY T.O DATA Page*)

L1 The FMS Message Area displays V1/VR/V2 DISAGREE (*Refer to Message)* , if the inserted V1, VR, V2 speeds do not satisfy the condition V1 ≤ VR ≤ V2.

The FMS Message Area displays T.O SPEED TOO LOW - CHECK TOW & T.O DATA (*Refer to Message)* , if the inserted V1, VR, V2 speeds do not satisfy the existing regulatory conditions regarding VMC and VS1G speeds.

If the flight crew has already entered the takeoff speeds, and then changes the takeoff runway, the takeoff speeds need to be confirmed again, or changed if necessary:

- The FMS Message Area displays CHECK T.O DATA to alert the flight crew (*Refer to Message*),
- On the T.O panel, the old takeoff speeds are displayed in yellow next to the entry fields. The flight crew can accept these speeds by clicking on the CONFIRM T.O SPDs button. If the takeoff speeds have changed, the flight crew enters the new values in the entry fields.

Confirm Takeoff Speeds

L2 If the flight crew has already entered the takeoff speeds, and then changes the flaps setting, or takeoff shift, or when the flight crew activates a secondary flight plan (in preflight), the old takeoff speeds are not cleared. However, the CHECK T.O DATA message is displayed.

L1 **ENTRY FORMAT**

Refer to V1 Entry Format
Refer to VR Entry Format
Refer to V2 Entry Format

OPERATING SPEEDS

Indicate:

- The Flaps retraction speed F: The minimum recommended speed at which the flaps may be retracted from CONF 2 or 3 to CONF 1+F after takeoff,
- The Slats retraction speed S: The minimum recommended speed at which the slats may be retracted,
- The Green Dot speed O: The recommended speed with the best climb performance, and the minimum fuel consumption.

Note: The FMS uses estimated weight, CG, and altitude to compute the operating speeds. The operating speeds that are displayed on the PFD, are computed by the PRIMs, based on the current weight, CG, and altitude. Therefore, the operating speeds displayed on the PFD may be different from the speeds displayed on the TO panel of the PERF page.

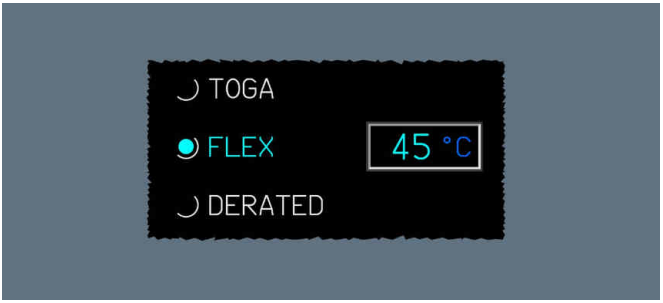
TAKEOFF THRUST OPTION

The flight crew selects the desired takeoff thrust rating:

- TOGA
- FLEX

  When selected, displays the flex temperature entry field: *Refer to FLEX Entry Format*

Flex Temperature

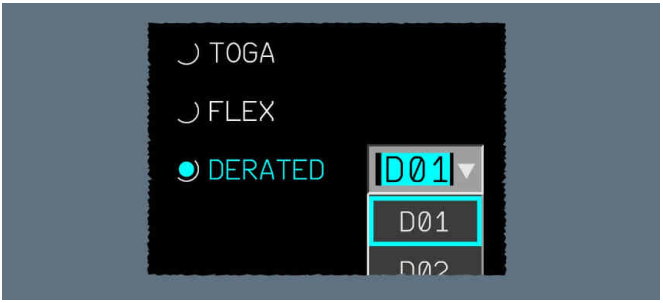


- DERATED

  When selected, displays the list with the different derated thrust levels. The list may have maximum 9 derated levels. The number of available thrust levels depends on the selected engine type.

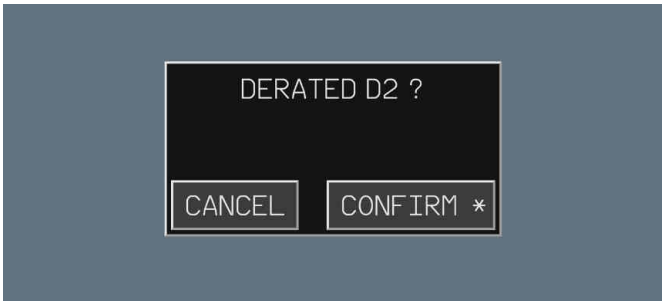
  The flight crew can select the desired level in the list or can enter it via the keyboard. (*Refer to DERATED Entry Format*)

Derated Thrust



A confirmation action is required.

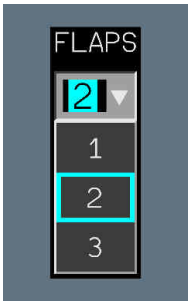
CONFIRM / CANCEL



L2 The thrust setting is set automatically when the flight crew inserts the received company takeoff data. (*Refer to RECEIVED COMPANY T.O DATA Page*)

FLAPS SETTING

Flaps Lever Position



Indicates the flaps lever position for takeoff.
The list displays the three possible lever settings for takeoff: 1, 2, or 3.
The flight crew can select the desired setting in the list or can enter it via the keyboard.

L2 The flaps setting is entered automatically when the flight crew inserts the received company takeoff data. (*Refer to RECEIVED COMPANY T.O DATA Page*)

L1 If the actual flaps lever position differs from the value that is entered on the TO panel of the PERF page, and the flight crew presses the TO CONFIG pb of the ECP , the ECAM displays the F/CTL T.O FLAPS/FMS DISAGREE alert. (*Refer to Caution*)

ENTRY FORMAT

Refer to FLAPS Entry Format

THS SETTING ENTRY FIELD

Indicates the CG for takeoff.
The CG setting is mandatory. The flight crew computes the CG with the load application and enters it manually in the entry field.
The FMS sends the CG to the FWS for the takeoff trim check. When the check fails, the ECAM displays the F/CTL PITCH TRIM/FMS/CG DISAGREE caution.
For more information on the trim check and the ECAM caution, *Refer to Caution*

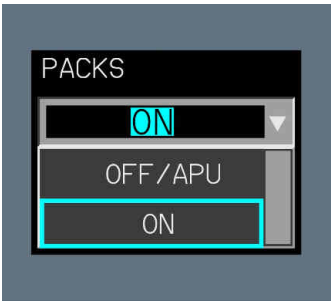
L2 When the flight crew inserts the received company takeoff data, the THS setting is cleared and the entry field displays amber boxes. The flight crew needs to enter the THS setting again. (*Refer to RECEIVED COMPANY T.O DATA Page*)

L1 **ENTRY FORMAT**

Refer to THS Entry Format

PACKS SETTING

Packs Setting



Indicates the packs setting for takeoff.

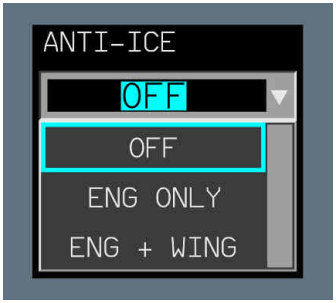
The list displays the two possible packs settings for takeoff:
- OFF / APU : Packs are OFF or supplied by APU bleed
- ON : Packs are ON and supplied by engine bleed.

The flight crew selects the desired setting in the list.
After engine start, if the flight crew modifies the packs setting on the T.O panel of the PERF page, the message CHECK T.O DATA appears in the FMS Message Area (*Refer to Check T.O Data*).

L2 The packs setting on the T.O panel of the PERF page is not used:
- Neither by the FMS to compute the flight plan predictions,
- Nor by the XCHECK WITH AVNCS function to crosscheck the packs setting with the OIS takeoff performance application.

ANTI-ICE SETTING

Anti-Ice Setting



Indicates the anti-ice setting for takeoff.

The list displays the three possible anti-ice settings for takeoff:
- OFF : Anti-ice is OFF
- ENG ONLY: Only the engine anti-ice is ON
- ENG + WING: Both engine and wing anti-ice are ON.

The flight crew selects the desired setting in the list.
After engine start, if the flight crew modifies the anti-ice setting on the T.O panel of the PERF page, the message CHECK T.O DATA appears in the FMS Message Area (*Refer to CHECK T.O Data*).

L2 The anti-ice setting on the T.O panel of the PERF page is not used:
- Neither by the FMS to compute the flight plan predictions,
- Nor by the XCHECK WITH AVNCS function to crosscheck the anti-ice setting with the OIS takeoff performance application.

TAKEOFF SHIFT ENTRY FIELD

Indicates the runway shift for takeoff.
The takeoff shift is the distance in meters (or feet) between the runway threshold and the aircraft's takeoff position.

If the FMS navigation mode is not IRS / GPS , the FMS position is updated (at takeoff) on the position of the runway threshold + entered takeoff shift.

L2 The takeoff shift is entered automatically when the flight crew inserts the received company takeoff data. (*Refer to RECEIVED COMPANY T.O DATA Page*)

L1 **ENTRY FORMAT**

Refer to T.O SHIFT Entry Format

THRUST REDUCTION ALTITUDE ENTRY FIELD

Indicates the thrust reduction altitude.
This is the altitude at which the flight crew should reduce the thrust from TOGA (or FLX) to CLB.

DEFAULT VALUE

The default value for the thrust reduction altitude is either:
- The value, associated to the origin airport, that is stored in the navigation database, or
- The value, that is the sum of the origin airport elevation (stored in the navigation database) and the thrust reduction height (defined by the operator in the AMI file, default value is 1 500 ft).

The flight crew can always overwrite the default value.

L2 The thrust reduction altitude is completed automatically, when the flight crew inserts the received company takeoff data. (*Refer to RECEIVED COMPANY T.O DATA Page*)

AUTOMATIC UPDATE

When the flight crew enters on a climb waypoint an AT, or AT OR BELOW altitude constraint, that induces a level-off below the thrust reduction altitude, the constraint altitude becomes the new thrust reduction altitude. In this case, the FMS Message Area displays NEW THR RED ALT : HHHHH, with HHHHH the altitude constraint altitude. (*Refer to Message*)
In the T.O $_{phase}$, and the AFS CP selected altitude is set below the thrust reduction altitude, the AFS CP selected altitude becomes the new thrust reduction altitude.

L1 **ENTRY FORMAT**

Refer to THR RED Entry Format

ACCELERATION ALTITUDE ENTRY FIELD

Indicates the acceleration altitude.
This is the altitude at which the aircraft accelerates towards the initial climb speed (or noise speed, if any noise procedure is entered, or PRESEL speed, if any).
At the acceleration altitude, the FMS flight phase becomes CLB.

DEFAULT VALUE

The default value for the acceleration altitude is either:
- The value, associated to the origin airport, that is stored in the navigation database, or
- The value, that is the sum of the origin airport elevation (stored in the navigation database) and the acceleration height (defined by the operator in the AMI file, default value is 1 500 ft).

The flight crew can always overwrite the default value.

L2 The acceleration altitude is completed automatically, when the flight crew inserts the received company takeoff data. (*Refer to RECEIVED COMPANY T.O DATA Page*)

AUTOMATIC UPDATE

When the flight crew enters on a climb waypoint an AT, or AT OR BELOW altitude constraint, that induces a level-off below the acceleration altitude, the constraint altitude becomes the new acceleration altitude. In this case, the FMS Message Area displays NEW ACC ALT : HHHHH, with HHHHH the altitude constraint altitude. (*Refer to Message*)
In the $T.O_{phase}$, when the flight crew sets the AFS CP selected altitude below the acceleration altitude, the AFS CP selected altitude becomes the new acceleration altitude.

L1 **ENTRY FORMAT**

Refer to ACCEL ALT Entry Format

ENGINE-OUT ACCELERATION ALTITUDE ENTRY FIELD

Indicates the acceleration altitude in engine-out.
The engine-out acceleration altitude is only a reminder. There is no specific system behavior associated to this altitude.

DEFAULT VALUE

The default value for the acceleration altitude is either:
- The value, associated to the origin airport, that is stored in the navigation database, or
- The value, that is the sum of the origin airport elevation (stored in the navigation database) and the engine-out acceleration height (defined by the operator in the AMI file, default value is 1 500 ft).

The flight crew can always overwrite the default value.

L2 The engine-out acceleration altitude is completed automatically, when the flight crew inserts the received company takeoff data. (*Refer to RECEIVED COMPANY T.O DATA Page*)

L1 **ENTRY FORMAT**

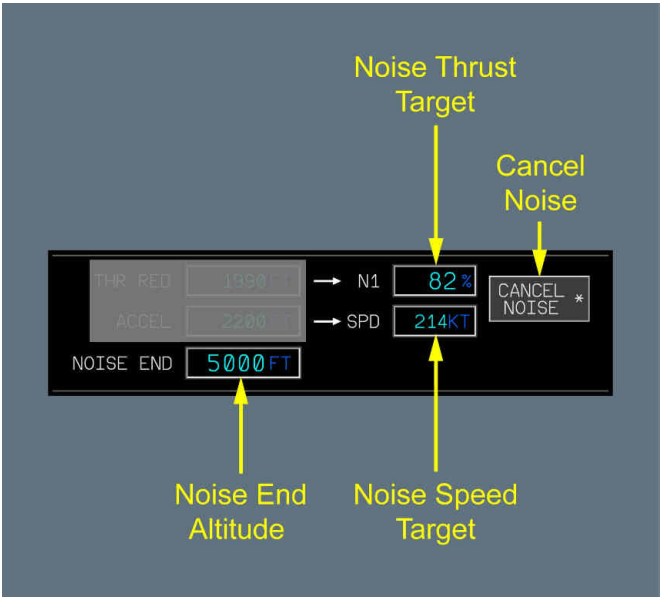
Refer to EO ACCEL Entry Format

NOISE BUTTON

When clicked, displays the Noise Parameters.

NOISE PARAMETERS

Noise Parameters



NOISE END ALTITUDE ENTRY FIELD

Indicates the noise end altitude.
This is the altitude at which the noise restrictions end. Below the noise end altitude, a speed restriction, and thrust restriction may apply.
For more information, *Refer to Noise Parameters*
Refer to NOISE END Entry Format

L2 The noise end altitude is completed automatically, when the flight crew inserts the received company takeoff data. (*Refer to RECEIVED COMPANY T.O DATA Page*)

L1 NOISE THRUST (N1) ENTRY FIELD

Indicates the noise thrust.
The noise thrust is the thrust that will apply (in A/THR mode) between the thrust reduction altitude and the noise end altitude.

If the flight crew does not enter any noise thrust, the climb thrust will apply.
For more information, *Refer to Noise Parameters*
Refer to N1 (NOISE) Entry Format

L2 The noise thrust is completed automatically, when the flight crew inserts the received company takeoff data. (*Refer to RECEIVED COMPANY T.O DATA Page*)

L1 **NOISE SPEED ENTRY FIELD**

Indicates the noise speed.
The noise speed is the speed that the aircraft will fly (in managed speed mode) between the acceleration altitude and the noise thrust ramp.
When the flight crew enters a noise end altitude, the entry field is completed with the noise speed default value.
The flight crew can always overwrite the default value.
For more information, *Refer to Noise Parameters*
Refer to SPD Entry Format

L2 The noise speed is completed automatically, when the flight crew inserts the received company takeoff data. (*Refer to RECEIVED COMPANY T.O DATA Page*)

L1 **CANCEL NOISE BUTTON**

When clicked, cancels the noise abatement procedure.

TRANSITION ALTITUDE ENTRY FIELD

Indicates the climb transition altitude.
The entry field reflects the transition altitude entry, made on the CLB panel of the PERF page.

DEFAULT VALUE

The default value is the transition altitude, associated to the origin airport departure procedure, that is stored in the navigation database. If no transition altitude exists in the navigation database, the entry field displays dashes.
The flight crew can always overwrite the default value.

ENTRY FORMAT

Refer to TRANS Entry Format

COMPANY TAKEOFF REQUEST BUTTON

When clicked, displays the COMPANY T.O DATA REQUEST page.
Refer to Page

L2 The CPNY T.O REQUEST button can only be selected when the flight phase is PREFLIGHT or DONE.

L1 When an active takeoff data request is pending, the button displays REQUEST PENDING ... . The button still provides access to the COMPANY T.O DATA REQUEST page.

REQUEST PENDING ...

When the active company takeoff data is received, the button displays RECEIVED CPNY T.O. When clicked, displays the RECEIVED CPNY T.O DATA page.
Refer to Page

RECEIVED CPNY T.O.

COST INDEX ENTRY FIELD

Indicates the cost index.

The cost index entry field is mandatory, and entered:
- Manually, by the flight crew, or
- Automatically, when the flight crew enters a company route, or when a received company or ATC flight plan is inserted, and a cost index is associated with the entered company route.

The cost index field reflects the cost index entry, made on the INIT, FUEL&LOAD page, or CRZ and DES panels of the PERF page. (*Refer to INIT page* , *Refer to FUEL&LOAD page)*
For more information on the cost index, *Refer to Performance - Cost Index*

ENTRY FORMAT

Refer to CI Entry Format

DERATED CLIMB THRUST LIST

Indicates the derated climb thrust setting.
The flight crew can select the desired level in the list or can enter it via the keyboard. The list displays NONE (no derated climb thrust), and maximum five derated climb levels (01, 02, etc ...).

ENTRY FORMAT

Refer to DERATED CLB Entry Format

PREDICTIONS REFERENCE ALTITUDE ENTRY FIELD

The FMS computes the time and distance predictions from the aircraft present position to reach the reference altitude, displayed in this entry field.
In PREFLIGHT $_{phase}$, the entry field displays dashes by default.
When the T.O $_{phase}$ becomes active, the entry field displays the AFS CP selected altitude by default.
The flight crew can always overwrite the default value.

L2 **AUTOMATIC UPDATE**

When the flight crew changes the AFS CP selected altitude to a value above the aircraft altitude, the predictions reference altitude is set to the AFS CP selected altitude. This update is only done when no flight crew entry exists for the reference altitude.
When the aircraft is still below the AFS CP selected altitude, and the aircraft altitude becomes higher than the predictions reference altitude, the predictions reference altitude is set to the AFS CP selected altitude.

L3 When the aircraft is above the AFS CP selected altitude, and above the predictions reference altitude, the entry field displays dashes.

L1 **ENTRY FORMAT**

Refer to PRED TO (ALTITUDE) Entry Format

SPEED MODE TABLE (BEFORE CLB)

Before the CLB phase becomes active, the speed mode table displays the following speed modes:

Note: The speed mode that will be set when the CLB phase becomes active is displayed in green font.

PRESEL

The flight crew uses the entry field to preset a selected speed target for the CLB phase.
After a speed entry, the FMS computes the preselected Mach, and the time and speed predictions to reach the entered reference altitude.
When the flight crew has preset a selected speed, and the CLB phase becomes active, the selected speed control engages automatically if the selected speed control was not active before, and the flight guidance targets this preselected speed.

Note: *The preselected speed has priority over the noise speed.*

The flight crew can always cancel the preselection by clearing the entry field.

ENTRY FORMAT

Refer to SPD Entry Format

MANAGED

Indicates the managed speed target for the CLB phase and its associated time and distance predictions to reach the entered reference altitude.
When there is no preselected speed, the flight guidance targets this managed speed when the CLB phase becomes active and the managed speed control is engaged.

ECON

Indicates the predicted ECON climb speed/Mach.
The ECON speed is the FMS optimized speed based on the cost index.
For more information on the ECON climb speed, *Refer to Climb Speed Profile* .

Note: *The table displays this line only if the planned managed climb speed is different from the ECON speed.*

CLIMB SPEED LIMIT

Indicates the climb speed limit, if any.

SPEED MODE TABLE (IN CLB)

In the CLB phase, the first line of the speed mode table displays the active speed mode: selected or managed.
If the selected speed control is active, the second line of the table displays the managed climb speed.
The table also displays the ECON(RTA) speed on a separate line if the managed climb speed is different from the ECON(RTA) speed.

SELECTED

Indicates the speed/Mach, selected on the AFS CP .
The FMS computes the associated time and speed predictions to reach the entered reference altitude.

MANAGED

Indicates the managed climb speed target and its associated time and distance predictions to reach the entered reference altitude.
The flight guidance targets the managed climb speed if the flight crew engages the managed speed control.
If there is no speed restriction, the managed climb speed is the ECON speed, the FMS optimized speed, based on the cost index. For more information on the ECON climb speed, *Refer to Climb Speed Profile* .
If there is a speed restriction, the table indicates the type of restriction that is currently applicable.
The following speed restrictions may apply, in decreasing order of priority:

- NOISE SPD:
  The managed speed is the noise speed.
  For more information, *Refer to Noise Parameters* .
- SPD CSTR:
  The managed speed is the speed constraint. The Speed Restriction label displays the end waypoint of the speed constraint.
  For more information, *Refer to Speed Constraint Refer to Speed Restriction Label* .
- SPD LIM:
  The managed speed is the climb speed limit. The Speed Restriction label displays the end altitude of the speed limit.
  For more information, *Refer to Speed Limit* and *Refer to Speed Restriction Label* .
- HOLD SPD:
  The managed speed is the hold speed. The Speed Restriction label displays the hold entry/exit waypoint.
  For more information, *Refer to Hold Speed* and *Refer to Speed Restriction Label* .
- PROC SPD:
  The managed speed is the ICAO hold speed limit of a procedure hold. The Speed Restriction label displays the hold entry/exit waypoint.
  For more information, *Refer to Hold Speed* and *Refer to Speed Restriction Label* .
- RTA:
  The managed speed is the FMS optimized speed, based on a time constraint (RTA).
  For more information, *Refer to Time Constraint (RTA)* .

ECON(RTA)

Indicates the predicted ECON climb speed/Mach, or the predicted RTA climb speed/Mach.
The ECON speed is the FMS optimized speed based on the cost index.
The RTA speed is the FMS optimized speed based on a time constraint.
For more information on the ECON climb speed, *Refer to Climb Speed Profile* .
For more information on the time constraint, *Refer to Time Constraint (RTA)* .

Note: The table displays this line only if the planned managed climb speed is different from the ECON(RTA) speed.

SPEED RESTRICTION (IN CLB)

Indicates in the CLB phase the type of restriction that applies to the managed speed, if any.

The constraint may be one of the following:

- Speed Constraint (SPD CSTR)
  Indicates the speed constraint and the end waypoint.
  For more information, *Refer to Speed Constraint* .

SPD CSTR

- Climb Speed Limit (CLB SPD LIM)
  Indicates the climb speed limit and the end altitude.
  For more information, *Refer to Speed Limit* .

CLB SPD LIM

- Hold Speed (HOLD SPD)
  Indicates the hold speed and the hold exit waypoint.
  For more information, *Refer to Hold Speed* .

HOLD SPD

- Procedure Speed (PROC SPD)
  Indicates the ICAO hold speed limit and the hold entry/exit waypoint.
  For more information, *Refer to Hold Speed* .

PROC SPD

SPEED MODE TABLE (EO)

In engine-out, the first line of the speed mode table displays the active speed mode: selected or managed.
If the selected speed control is active, the second line of the table displays the managed engine-out climb speed.

SELECTED

Indicates the speed/Mach, selected on the AFS CP .

The FMS computes the associated time and speed predictions to reach the entered reference altitude.

MANAGED

Indicates the managed engine-out speed target and its associated time and distance predictions to reach the entered reference altitude.
The flight guidance targets the managed engine-out speed if the flight crew engages the managed speed control.

On the same line, the table displays the managed speed type:
- EO-GDOT:
  The managed speed is the EO-GDOT speed, when the aircraft is climbing or descending.
- EO-LRC:
  The managed speed is the EO-LRC speed, when the aircraft is in level flight.

For more information, *Refer to Engine-out in CLB phase* .

EO-ECON

Indicates the EO-ECON speed, when the aircraft is in level flight.
The FMS displays the EO-ECON speed for information only.

SPEED CONSTRAINT BUTTON

When clicked, displays the SPD panel of the VERT REV page. (*Refer to Page*)
On the SPD panel of the VERT REV page, the flight crew may consult, create, or delete a speed constraint or speed limit.

TRANSITION ALTITUDE ENTRY FIELD

Indicates the climb transition altitude.
The entry field reflects the transition altitude entry, made on the TO panel of the PERF page.

DEFAULT VALUE

The default value is the transition altitude, associated to the origin airport departure procedure, that is stored in the navigation database. If no transition altitude exists in the navigation database, the entry field displays dashes.
The flight crew can always overwrite the default value.

ENTRY FORMAT

Refer to TRANS Entry Format

COST INDEX ENTRY FIELD

Indicates the cost index.

The cost index entry field is mandatory, and entered:
- Manually, by the flight crew, or
- Automatically, when the flight crew enters a company route, or when a received company or ATC flight plan is inserted, and a cost index is associated with the entered company route.

The cost index field reflects the cost index entry, made on the INIT, FUEL&LOAD page, or CLB and DES panels of the PERF page. (*Refer to INIT page* , *Refer to FUEL&LOAD page)*
For more information on the cost index, *Refer to Performance - Cost Index*

ENTRY FORMAT

Refer to CI Entry Format

PREDICTIONS REFERENCE LABEL

The FMS computes the time and distance predictions from the aircraft present position to reach the reference point, that is indicated by this label:

- The reference point is the Top of Descent (T/D),

T/D

- The reference is the starting point of the next step climb , or step descent,

Step Climb / Descent

- The STEP AHEAD label Indicates that the aircraft is at less than 20 nm from the step starting waypoint. The reference for the time and distance predictions is the step starting waypoint,

Step Ahead

L2 - The reference is the point of reaching the drift down altitude.

Note: *This label is only displayed when in engine-out, and the aircraft is above the green dot level-off altitude, Refer to Engine-out in CRZ phase .*

Drift Down

SPEED MODE TABLE (BEFORE CRZ)

Before the CRZ phase becomes active, the speed mode table displays the following speed modes:

Note: *The speed mode that will be set when the CRZ phase becomes active is displayed in green font.*

PRESEL

The flight crew uses the entry fields to preset a selected Mach or speed target for the CRZ phase.

After a Mach or speed entry, the FMS computes the time and speed predictions to reach the T/D .

When the flight crew has preset a selected Mach or speed, and the CRZ phase becomes active while the managed speed control is active:
- The selected speed control automatically engages, and
- The flight guidance targets this preselected speed.

The flight crew can always cancel the preselection by clearing the entry fields.

ENTRY FORMAT

Refer to MACH Entry Format
Refer to SPD Entry Format

MANAGED

Indicates the managed speed target for the CRZ phase and its associated time and distance predictions to reach the entered reference altitude.
When there is no preselected speed, the flight guidance targets this managed speed when the CRZ phase becomes active and the managed speed control is active.

ECON

Indicates the predicted ECON climb speed/Mach.
The ECON speed is the FMS optimized speed based on the cost index.
For more information on the ECON climb speed, *Refer to Climb Speed Profile* .

Note: The table displays this line only if the planned managed climb speed is different from the ECON speed.

LRC

Indicates the predicted Long Range Cruise (LRC) Mach/speed.
For more information on the LRC speed, *Refer to Cruise Speed Profile* .
The LRC Mach/speed is for information only. This speed cannot be activated via the PERF page. To fly the LRC Mach/speed, the flight crew engages the selected speed control, and sets the LRC Mach/speed as selected target speed.

MAX TURB

Indicates the predicted MAX TURB Mach/speed. The MAX TURB Mach/speed is the maximum Mach/speed to fly safely in a turbulent atmosphere.
For more information on the MAX TURB Mach/speed, *Refer to Cruise Speed Profile* .
The MAX TURB speed is for information only. This speed cannot be activated via the PERF page. To fly the MAX TURB speed, the flight crew engages the selected speed control, and sets the MAX TURB speed as selected target speed.

For more information, *Refer to Severe Turbulence in Cruise* .

SPEED MODE TABLE (IN CRZ)

In the CRZ phase, the first line of the speed mode table displays the active speed mode: selected or managed.
If the selected speed control is active, the second line of the table displays the managed cruise speed.
The table also displays:

- The ECON speed on a separate line if the managed cruise speed is different from the ECON speed
- The long range cruise speed (LRC)
- The maximum turbulence speed (MAX TURB).

SELECTED

Indicates the Mach/speed, selected on the AFS CP .
The FMS computes the associated time and speed predictions to reach the T/D .

MANAGED

Indicates the managed cruise speed target and its associated time and distance predictions to reach the T/D .
The flight guidance targets the managed cruise speed if the flight crew engages the managed speed control.
If there is no speed restriction, the managed cruise speed is the ECON speed, the FMS optimized speed, based on the cost index. For more information on the ECON cruise speed, *Refer to Cruise Speed Profile* .
If there is a speed restriction, the table indicates the type of restriction that is currently applicable.

The following speed restrictions may apply, in decreasing order of priority:

- SPD LIM:
  The managed speed is the climb speed limit. The Managed Speed Information label displays the end altitude of the speed limit.
  For more information, *Refer to Speed Limit* and *Refer to Speed Restriction Label* .
- CMS:
  The managed speed is a constant Mach.
  For more information, *Refer to Constant Mach Segment* .
- HOLD SPD:
  The managed speed is the hold speed. The Managed Speed Information label displays the hold exit waypoint.
  For more information, *Refer to Hold Speed* and *Refer to Speed Restriction Label* .

- PROC SP:
  The managed speed is the ICAO hold speed limit of a procedure hold. The Speed Restriction label displays the hold entry/exit waypoint.
  For more information, *Refer to Hold Speed* and *Refer to Speed Restriction Label* .
- RTA:
  The managed speed is the FMS optimized speed, based on a time constraint (RTA).
  For more information, *Refer to Time Constraint (RTA)* .

ECON(RTA)

Indicates the predicted ECON climb speed/Mach, or the predicted RTA climb speed/Mach.
The ECON speed is the FMS optimized speed based on the cost index.
The RTA speed is the FMS optimized speed based on a time constraint.
For more information on the ECON climb speed, *Refer to Climb Speed Profile* .
For more information on the time constraint, *Refer to Time Constraint (RTA)* .

Note: *The table displays this line only if the planned managed climb speed is different from the ECON(RTA) speed.*

LRC

Indicates the predicted Long Range Cruise (LRC) Mach/speed.
For more information on the LRC speed, *Refer to Cruise Speed Profile* .
The LRC Mach/speed is for information only. This speed cannot be activated via the PERF page. To fly the LRC Mach/speed, the flight crew engages the selected speed control, and sets the LRC Mach/speed as selected target speed.

MAX TURB

Indicates the predicted MAX TURB Mach/speed. The MAX TURB Mach/speed is the maximum Mach/speed to fly safely in a turbulent atmosphere.
For more information on the MAX TURB Mach/speed, *Refer to Cruise Speed Profile* .
The MAX TURB speed is for information only. This speed cannot be activated via the PERF page. To fly the MAX TURB speed, the flight crew engages the selected speed control, and sets the MAX TURB speed as selected target speed.
For more information, *Refer to Severe Turbulence in Cruise* .

SPEED RESTRICTION (IN CRZ)

Indicates in the CRZ phase the type of restriction that applies to the managed speed, if any.

The constraint may be one of the following:

- Climb Speed Limit (CLB SPD LIM)
  Indicates the climb speed limit and the end altitude.
  For more information, *Refer to Speed Limit* .

CLB SPD LIM

- Hold Speed (HOLD SPD)
  Indicates the hold speed and the hold exit waypoint.
  For more information, *Refer to Hold Speed* .

HOLD SPD

- Procedure Speed (PROC SPD)
  Indicates the ICAO hold speed limit and the hold entry/exit waypoint.
  For more information, *Refer to Hold Speed* .

PROC SPD

EO CRZ MODE

Engine-Out Cruise Mode

Indicates the engine-out strategy for the CRZ phase.
The flight crew can select the EO-ECON or EO-LRC strategy.
For more information, *Refer to Engine-out in CRZ phase* .

DRIFT DOWN ALTITUDE

Indicates the drift down altitude, *Refer to Green dot drift down altitude* .
This label is only displayed when in engine-out the aircraft is above the green dot level-off altitude.

SPEED MODE TABLE (EO)

In engine-out, the first line of the speed mode table displays the active speed mode: selected or managed.
If the selected speed control is active, the second line of the table displays the managed engine-out climb speed.

SELECTED

Indicates the speed/Mach, selected on the AFS CP .
The FMS computes the associated time and speed predictions to reach the entered reference altitude.

MANAGED

Indicates the managed engine-out speed target and its associated time and distance predictions to reach the drift down altitude or the T/D .
The flight guidance targets the managed engine-out speed if the flight crew engages the managed speed control.

The table also displays the managed speed type:

- EO-GDOT:
  The managed speed is the EO-GDOT speed. The EO-GDOT speed is the target when the aircraft is climbing or descending.
- EO-LRC:
  The managed speed is the EO-LRC speed. The EO-LRC speed is the target when the aircraft is in level flight and the flight crew selected the EO-LRC strategy in the EO CRZ MODE list.
- EO-ECON:
  The managed speed is the EO-ECON speed. The EO-ECON speed is the target when the aircraft is in level flight and the flight crew selected the EO-ECON strategy in the EO CRZ MODE list.

For more information, *Refer to Engine-out in CRZ phase* .

MAX TURB

Indicates the predicted MAX TURB Mach/speed. The MAX TURB Mach/speed is the maximum Mach/speed to fly safely in a turbulent atmosphere.
For more information on the MAX TURB Mach/speed, *Refer to Cruise Speed Profile* .
The MAX TURB speed is for information only. This speed cannot be activated via the PERF page. To fly the MAX TURB speed, the flight crew engages the selected speed control, and sets the MAX TURB speed as selected target speed.
For more information, *Refer to Severe Turbulence in Cruise* .

DESTINATION DATA

Indicates:
- The ident of the destination airport,
- The Estimated Time of Arrival (ETA) at destination,

L2 In PREFLIGHT $_{phase}$, and if an Estimated Takeoff Time (ETT) exists, the time reference of the destination ETA is UTC . If no ETT exists, the ETA is a flight time.
In flight, the time reference is the aircraft UTC clock time. If the aircraft clock is not valid, the ETA is a flight time.

L1 - The Estimated Fuel on Board (EFOB) at destination.

L2 The destination EFOB is displayed in amber, when its value is lower than the minimum fuel at destination, displayed on the FUEL&LOAD page. (*Refer to Page)*

CONSTANT MACH SEGMENT BUTTON

When clicked, displays the CMS panel of the VERT REV page. (*Refer to Page*)
On the CMS panel of the VERT REV page, the flight crew may consult, create, or delete a constant mach segment.

STEP ALTITUDES BUTTON

When clicked, displays the STEP ALTs panel of the VERT REV page. (*Refer to Page*)
On the STEP ALTs panel of the VERT REV page, the flight crew may consult, create, or delete step altitudes.

COST INDEX ENTRY FIELD

Indicates the cost index.

The cost index entry field is mandatory, and entered:
- Manually, by the flight crew, or
- Automatically, when the flight crew enters a company route, or when a received company or ATC flight plan is inserted, and a cost index is associated with the entered company route.

The cost index field reflects the cost index entry, made on the INIT, FUEL&LOAD page, or CLB and CRZ panels of the PERF page. (*Refer to INIT page* , *Refer to FUEL&LOAD page)*
For more information on the cost index, *Refer to Performance - Cost Index*

ENTRY FORMAT

Refer to CI Entry Format

L2 ### DEFAULT VALUE

When there is no cost index defined at engine start, the field is completed with the default value.

The default value is the last cost index of the previous flight, stored in the DONE phase (or 0, if there is no cost index).

DESCENT CABIN RATE ENTRY FIELD

Indicates the maximum descent cabin rate.

The maximum descent cabin rate is the maximum of the following two values:

- The mean descent rate of the cabin:
  This value is computed by the FMS, and based on the difference between the pressure at cruise flight level, and the pressure at destination.
- The maximum descent rate of the cabin:
  The maximum descent rate is 350 ft/min by default. The flight crew can overwrite the default value in the Descent Cabin Rate Entry Field.

Note: To define the maximum of the two values, the FMS considers the absolute values (without the minus sign).

A value computed by the FMS, is displayed in small font. A value, entered by the flight crew is displayed in big font.
The FMS computes the T/D in order to respect the maximum descent cabin rate.

ENTRY FORMAT

Refer to DES CABIN RATE Entry Format

PREDICTIONS REFERENCE ALTITUDE ENTRY FIELD

The FMS computes the time and distance predictions from the aircraft present position to reach the reference altitude, displayed in this entry field.
The flight crew can only use this field when the DES $_{phase}$ is active.

L2 **AUTOMATIC UPDATE**

When the flight crew changes the AFS CP selected altitude to a value below the aircraft altitude, the predictions reference altitude is set to the AFS CP selected altitude. This update is only done when no flight crew entry exists for the reference altitude.
When the aircraft is still above the AFS CP selected altitude, and the aircraft altitude becomes lower than the predictions reference altitude, the predictions reference altitude is set to the AFS CP selected altitude.

L3 When the aircraft is below the AFS CP selected altitude, and below the predictions reference altitude, the entry field displays dashes.

L1 **ENTRY FORMAT**

Refer to PRED TO (ALTITUDE) Entry Format

SPEED MODE TABLE (BEFORE DES)

Before the DES phase becomes active, the flight crew can enter the managed Mach/speed target for the DES phase in these entry fields.
The FMS computes the time and speed predictions for the entered Mach/speed.
The default values for these entry fields are the ECON speed (or RTA speed when there is a time constraint in the flight plan).
The flight crew can always set the ECON (RTA) speed again, by clearing one of the entry fields.
When the DES becomes active, and the managed speed control is active, the flight guidance targets the Mach/speed that was entered in the entry fields.

ENTRY FORMAT

Refer to MACH Entry Format
Refer to SPD Entry Format

SPEED MODE TABLE (IN DES)

In the DES phase, the first line of the speed mode table displays the active speed mode: selected or managed.
If the selected speed control is active, the second line of the table displays the managed descent speed.
The table also displays the ECON speed on a separate line if the managed descent speed is different from the ECON speed.

SELECTED

Indicates the speed/Mach, selected on the AFS CP .
The FMS computes the associated time and speed predictions to reach the entered reference altitude.

MANAGED

Indicates the managed descent speed target and its associated time and distance predictions to reach the entered reference altitude.
The flight guidance targets the managed descent speed if the flight crew engages the managed speed control.
If there is no speed restriction, the managed descent speed is the ECON speed, the FMS optimized speed, based on the cost index. For more information on the ECON descent speed, *Refer to Descent Speed Profile* .
If there is a speed restriction, the table indicates the type of restriction that is currently applicable.

The following speed restrictions may apply, in decreasing order of priority:

- SPD LIM:
  The managed speed is the descent speed limit. The Managed Speed Information label displays the start altitude of the speed limit.
  For more information, *Refer to Speed Limit* and *Refer to Speed Restriction Label* .
- SPD CSTR:
  The managed speed is the speed constraint. The Managed Speed Information label displays the start waypoint of the speed constraint.
  For more information, *Refer to Speed Constraint* and *Refer to Speed Restriction Label* .
- HOLD:
  The managed speed is the hold speed. The Managed Speed Information label displays the hold exit waypoint.
  For more information, *Refer to Hold Speed* and *Refer to Speed Restriction Label* .
- PROC SP:
  For more information, *Refer to Hold Speed* and *Refer to Speed Restriction Label* .
- RTA:
  The managed speed is the FMS optimized speed, based on a time constraint (RTA).
  For more information, *Refer to Time Constraint (RTA)* .

SPEED RESTRICTION (DES)

Indicates in the DES phase the type of restriction that applies to the managed speed, if any.

The constraint may be one of the following:

- Speed Constraint (SPD CSTR)
  Indicates the speed constraint and the end waypoint.
  For more information, *Refer to Speed Constraint* .

SPD CSTR

- Descent Speed Limit (DES SPD LIM)
  Indicates the descent speed limit and the end altitude.
  For more information, *Refer to Speed Limit* .

DES SPD LIM

- Hold Speed (HOLD SPD)
  Indicates the hold speed and the hold exit waypoint.
  For more information, *Refer to Hold Speed* .

HOLD SPD

- Procedure Speed (PROC SPD)
  Indicates the ICAO hold speed limit and the hold entry/exit waypoint.
  For more information, *Refer to Hold Speed* .

PROC SPD

TRANSITION FLIGHT LEVEL ENTRY FIELD

Indicates the descent transition flight level.
The entry field reflects the transition flight level entry, made on the APPR panel of the PERF page.

DEFAULT VALUE

The default value is the transition flight level, associated to the destination airport arrival procedures, that is stored in the navigation database. If no transition flight level exists in the navigation database, the entry field displays dashes.
The flight crew can always overwrite the default value.

ENTRY FORMAT

Refer to TRANS Entry Format

VERTICAL DEVIATION

Indicates the altitude error between the aircraft current altitude and the altitude at which the aircraft would be if it was on the theoretical descent (or approach) path.

DESTINATION DATA

Indicates:
- The ident of the destination airport,
- The Estimated Time of Arrival (ETA) at destination,

L2 In PREFLIGHT $_{phase}$, and if an Estimated Takeoff Time (ETT) exists, the time reference of the destination ETA is UTC. If no ETT exists, the ETA is a flight time.
In flight, the time reference is the aircraft UTC clock time. If the aircraft clock is not valid, the ETA is a flight time.

L1 - The Estimated Fuel on Board (EFOB) at destination.

L2 The destination EFOB is displayed in amber, when its value is lower than the minimum fuel at destination, displayed on the FUEL&LOAD page. *Refer to Page*)

SPEED CONSTRAINT BUTTON

When clicked, displays the SPD panel of the VERT REV page. (*Refer to Page*)
On the SPD panel of the VERT REV page, the flight crew may consult, create, or delete a speed constraint or speed limit.

APPROACH IDENT

Indicates the ident of the approach procedure.
The flight crew can check, select, or change the approach procedure on the ARRIVAL page. (*Refer to Page*)

DESTINATION IDENT

Indicates the ident of the destination airport.

LANDING WEIGHT

Indicates the landing weight.
Before engine start, the landing weight is computed as follows:
LW = TOW — TRIP Fuel
After engine start, the landing weight is:

LW = GW — TRIP Fuel — TAXI Fuel
In flight, the landing weight is:
LW = GW — TRIP Fuel

WIND AT DESTINATION

The flight crew enters in the entry fields the wind direction and velocity of the magnetic ground wind at destination.
The entered ground wind is automatically copied on the DES panel of the WIND page, and vice versa: the entered ground wind on the DES panel of the WIND page is copied on the APPR panel of the PERF page.

Note: *The winds on the WIND page are true north winds, while the wind on the PERF page is a magnetic wind. The FMS uses the magnetic variation at the destination airport to make the conversion.*

When there is a valid ground wind, the FMS computes the headwind and crosswind components and displays them right below the entry fields.

ENTRY FORMAT

Refer to WIND DIRECTION Entry Format
Refer to WIND VELOCITY Entry Format

OAT AT DESTINATION ENTRY FIELD

Indicates the Outside Air Temperature (OAT).

The FMS uses this temperature to:
- Refine the computation of the descent profile
- To correct the FLS beam in cold weather, *Refer to Cold Weather Correction* .

ENTRY FORMAT

Refer to OAT Entry Format

QNH AT DESTINATION ENTRY FIELD

Indicates the QNH at destination.

The FMS uses the QNH to:
- Compute the descent profile
- Compute the FLS beam, *Refer to Baro Correction*

The pressurization system also uses the QNH , in order to automatically control the cabin pressurization. Therefore, an incorrect QNH entry may result in an incorrect cabin pressurization profile.

ENTRY FORMAT

Refer to QNH Entry Format

MINIMUM ENTRY FIELDS

The flight crew enters the required minimum altitude in the BARO or RADIO entry field.
The FMS considers a BARO entry as an MSL altitude. Generally, the flight crew enters the minimum descent altitude of a non-precision approach in the BARO entry field.
The FMS considers a RADIO entry as a radio altitude (height). Generally, the flight crew enters the decision height of a precision approach in the RADIO entry field.

ENTRY FORMAT

Refer to BARO Entry Format
Refer to RADIO Entry Format

OPERATING SPEEDS

Indicate:
- The green dot speed O : The target speed in managed speed control, when in CONF 0, when the APPR phase is active
- The Slats retraction speed S: The target speed in managed speed control, when in CONF 1 or CONF 1+F
- The Flaps retraction speed F: The target speed in managed speed control, when in CONF 2 or CONF 3
- The reference speed for approach and landing VREF : This speed is used to compute the regulatory landing performance of the aircraft.

Refer to APPR Speed Profile

Note: The FMS uses estimated weight, CG , and altitude to compute the operating speeds. The operating speeds that are displayed on the PFD , are computed by the PRIM s, based on the current weight, CG , and altitude. Therefore, the operating speeds displayed on the PFD may be different from the speeds displayed on the TO panel of the PERF page.

LANDING CONFIGURATION AND VLS

The flight crew selects the landing configuration and the FMS computes the VLS associated with the selected configuration.
FULL is selected by default.
The displayed VLS is the estimated lowest selectable speed for landing.

The FMS computes the VLS estimation, depending on:
- The selected landing configuration,
- The estimated landing weight and CG,
- The destination airport elevation.

L3 When the APPR $_{phase}$ is active, the FMS uses the current weight and CG , received from the FQMS .

L1 *Note: The VLS , that is displayed on the PFD , is computed by the PRIM s, and is based on the current weight, CG , flaps configuration, and altitude. (Refer to VLS from PRIM s) Therefore, the VLS displayed on the PFD may be different from the VLS , displayed on the APPR panel of the PERF page.*

VAPP

Indicates the approach speed VAPP .

To compute VAPP , the FMS takes into account:
- VLS , that depends on the selected landing configuration
- The wind at the destination airport.

L3 - Constants, defined in different tables, that are selected by OPC option.

L1 VAPP , computed by the FMS , is displayed in small font.
The flight crew can always overwrite the FMS computed value.
VAPP , entered by the flight crew, is displayed in big font.

ENTRY FORMAT

Refer to VAPP Entry Format

VERTICAL DEVIATION

Indicates the altitude error between the aircraft current altitude and the altitude at which the aircraft would be if it was on the theoretical descent (or approach) path.

TRANSITION FLIGHT LEVEL ENTRY FIELD

Indicates the descent transition flight level.
The entry field reflects the transition flight level entry, made on the DES panel of the PERF page.

DEFAULT VALUE

The default value is the transition flight level, associated to the destination airport arrival procedures, that is stored in the navigation database. If no transition flight level exists in the navigation database, the entry field displays dashes.
The flight crew can always overwrite the default value.

ENTRY FORMAT

Refer to TRANS Entry Format

OPERATING SPEEDS

Indicate:
- The Flaps retraction speed F: The minimum recommended speed at which the flaps may be retracted from CONF 2 or 3 to CONF 1+F after takeoff
- The Slats retraction speed S: The minimum recommended speed at which the slats may be retracted
- The Green Dot speed O: The recommended speed with the best climb performance, and the minimum fuel consumption.

Note: *The FMS uses estimated weight, CG, and altitude to compute the operating speeds. The operating speeds that are displayed on the PFD, are computed by the PRIMs, based on the current weight, CG, and altitude. Therefore, the operating speeds displayed on the PFD may be different from the speeds displayed on the TO panel of the PERF page.*

THRUST REDUCTION ALTITUDE ENTRY FIELD

Indicates the thrust reduction altitude.
This is the altitude at which the flight crew should reduce the thrust from TOGA to CLB.

DEFAULT VALUE

The default value for the thrust reduction altitude is either:
- The value, associated to the destination airport, that is stored in the navigation database, or
- The value, that is the sum of the destination airport elevation (stored in the navigation database) and the thrust reduction height (defined by the operator in the AMI file, default value is 1 500 ft).

The flight crew can always overwrite the default value.

L2 **AUTOMATIC UPDATE**

When the flight crew enters on a climb waypoint an AT, or AT OR BELOW altitude constraint, that induces a level-off below the thrust reduction altitude, the constraint altitude becomes the new thrust reduction altitude. In this case, the FMS Message Area displays NEW THR RED ALT : HHHHH, with HHHHH the altitude constraint altitude. (*Refer to Message*)
In flight, when the flight crew sets the AFS CP selected altitude below the thrust reduction altitude, the AFS CP selected altitude becomes the new thrust reduction altitude.

L1 **ENTRY FORMAT**

Refer to THR RED Entry Format

ACCELERATION ALTITUDE ENTRY FIELD

Indicates the acceleration altitude.
This is the altitude at which the aircraft accelerates towards the initial climb speed.
At the acceleration altitude, the FMS flight phase becomes CLIMB.

DEFAULT VALUE

The default value for the acceleration altitude is either:
- The value, associated to the destination airport, that is stored in the navigation database, or
- The value, that is the sum of the destination airport elevation (stored in the navigation database) and the acceleration height (defined by the operator in the AMI file, default value is 1 500 ft).

The flight crew can always overwrite the default value.

L2 **AUTOMATIC UPDATE**

When the flight crew enters on a climb waypoint an AT, or AT OR BELOW altitude constraint, that induces a level-off below the acceleration altitude, the constraint altitude becomes the new acceleration altitude. In this case, the FMS Message Area displays NEW ACC ALT : HHHHH, with HHHHH the altitude constraint altitude. (*Refer to Message*)
In flight, when the flight crew sets the AFS CP selected altitude below the acceleration altitude, the AFS CP selected altitude becomes the new acceleration altitude.

L1 **DEFAULT VALUE**

Refer to ACCEL ALT Entry Format

ENGINE-OUT ACCELERATION ALTITUDE ENTRY FIELD

Indicates the acceleration altitude in engine-out.
The engine-out acceleration altitude is only a reminder. There is no specific system behavior associated to this altitude.

DEFAULT VALUE

The default value for the acceleration altitude is either:
- The value, associated to the destination airport, that is stored in the navigation database, or
- The value, that is the sum of the destination airport elevation (stored in the navigation database) and the engine-out acceleration height (defined by the operator in the AMI file, default value is 1 500 ft).

The flight crew can always overwrite the default value.

DEFAULT VALUE

Refer to EO ACCEL Entry Format

TRANSITION ALTITUDE ENTRY FIELD

Indicates the climb transition altitude.
The entry field reflects the transition altitude entry, made on the APPR panel of the PERF page.

DEFAULT VALUE

The default value is the transition altitude, associated to the destination airport departure procedures, that is stored in the navigation database. If no transition altitude exists in the navigation database, the entry field displays dashes.
The flight crew can always overwrite the default value.

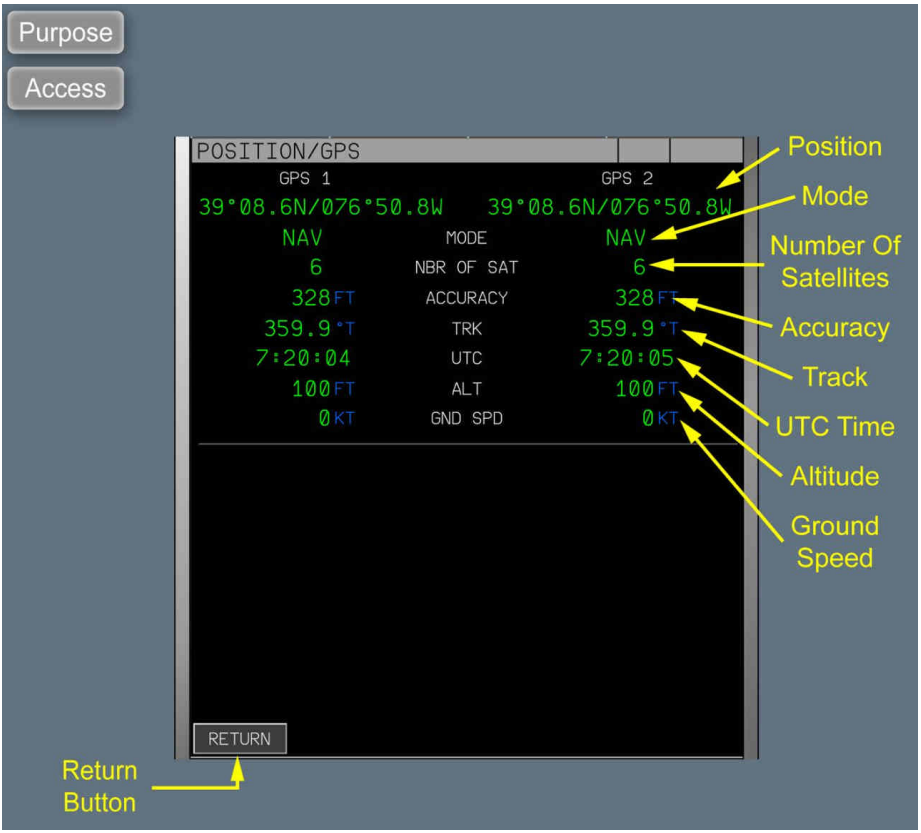
ENTRY FORMAT

Refer to TRANS Entry Format

POSITION / GPS PAGE

Applicable to: ALL

POSITION / GPS Page



PURPOSE

The POSITION / GPS page displays the GPS 1 and GPS 2 data.
The ADIRS receive the GPS data from the MMR, and send it to the FMS.

LINKS

Refer to For More Information on the GPS Receiver

ACCESS

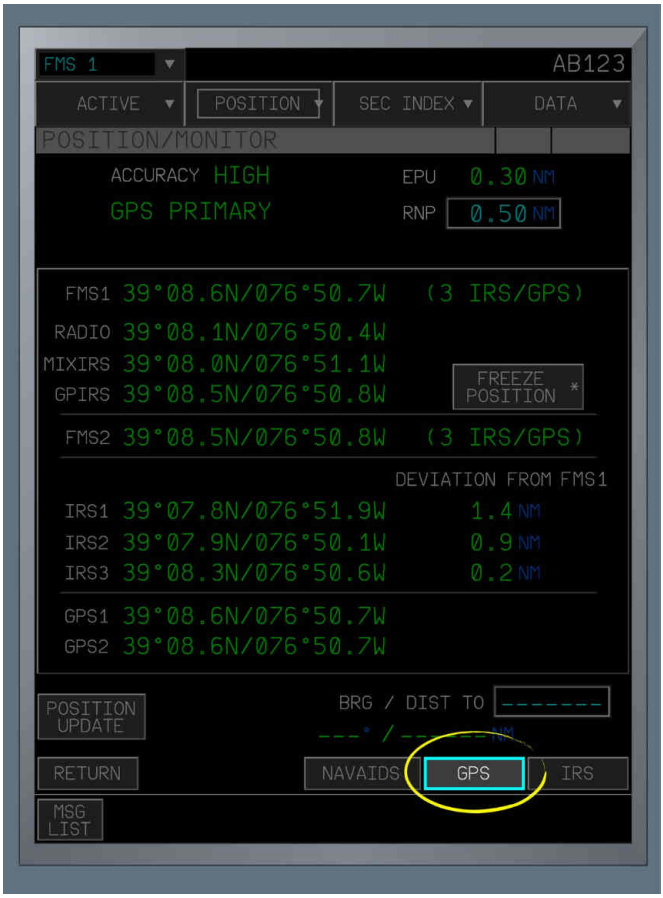
The flight crew can access the POSITION / GPS page, via:

- The General Menu Bar, by selecting GPS in the POSITION menu

General Menu Bar

- The POSITION / MONITOR page, by clicking on the GPS button

POSITION / MONITOR Page



POSITION

Indicates the GPS 1(2) position latitude and longitude.

MODE

Indicates the GPS 1(2) mode.

The mode may be:
- INIT
- ACQ
- NAV
- TEST
- FAULT
- ALTAID
- AIDED
- DIFF

Refer to For More Information on the GPS Modes

NUMBER OF SATELLITES

Indicates the number of satellites available for GPS 1(2).

ACCURACY

Indicates the GPS 1(2) Horizontal Figure Of Merit (HFOM), in meter.

TRACK

Indicates the GPS 1(2) true track.

UTC TIME

Indicates the GPS 1(2) UTC time.

ALTITUDE

Indicates the GPS 1(2) altitude.

GROUND SPEED

Indicates the GPS 1(2) ground speed, in knots.

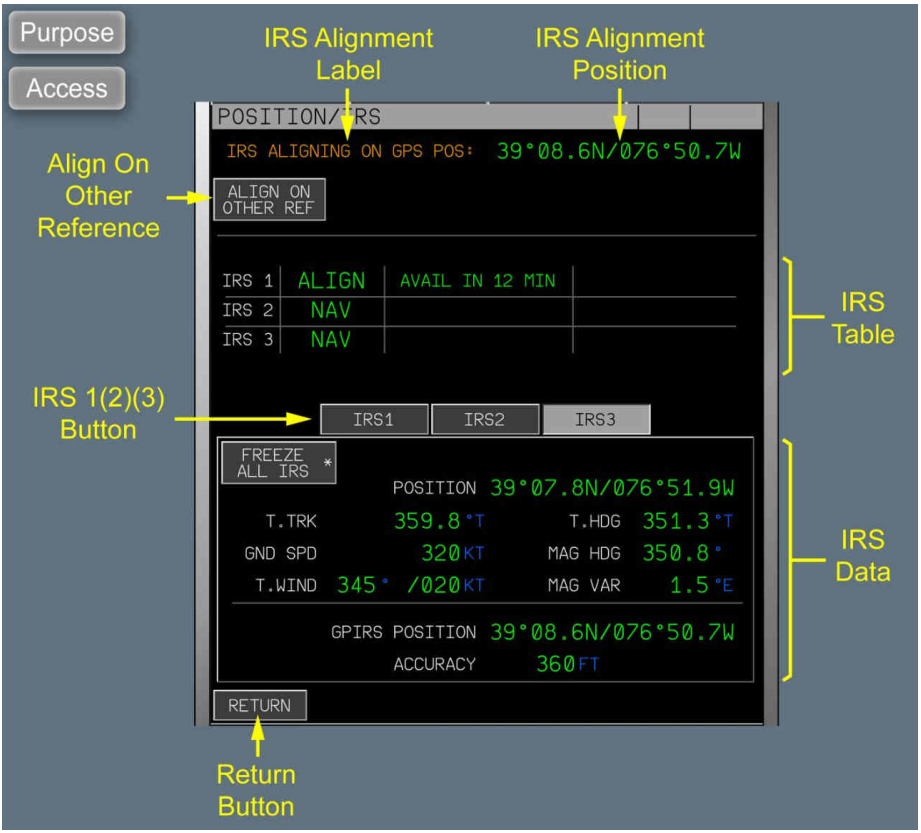
RETURN BUTTON

When clicked, displays the POSITION / MONITOR page. (*Refer to Page*)

POSITION / IRS PAGE

Applicable to: ALL

POSITION / IRS Page



PURPOSE

On the POSITION / IRS page, the flight crew can:

- Define and monitor the IRS alignment reference position
- Monitor the IRS mode and status
- Enter the heading when one (or more) IRS is in ATT mode

- Monitor the IRS 1(2)(3) data
- Monitor the IRS 1(2)(3) drift in the DONE phase

LINKS

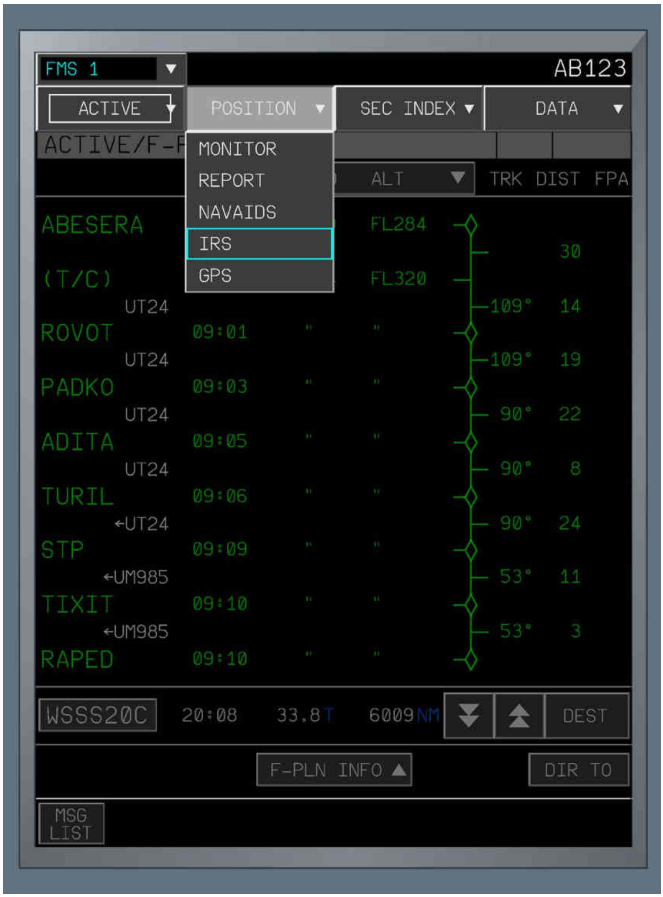
Refer to More Information on the IRS position
Refer to For More Information on the ADIRU

ACCESS

The flight crew can access the POSITION / IRS page, via:

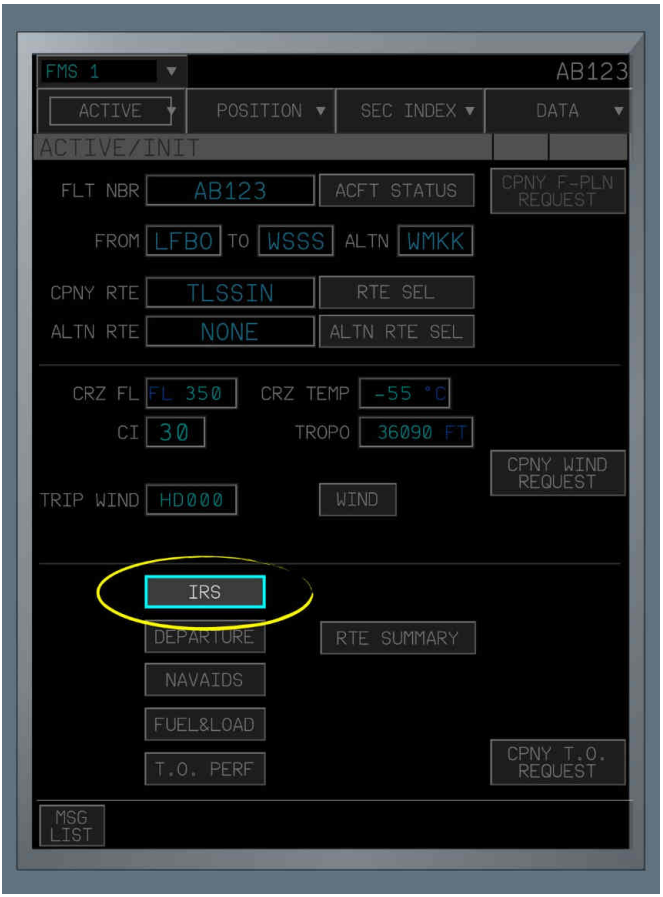
- The General Menu Bar, by selecting IRS in the POSITION menu

General Menu Bar



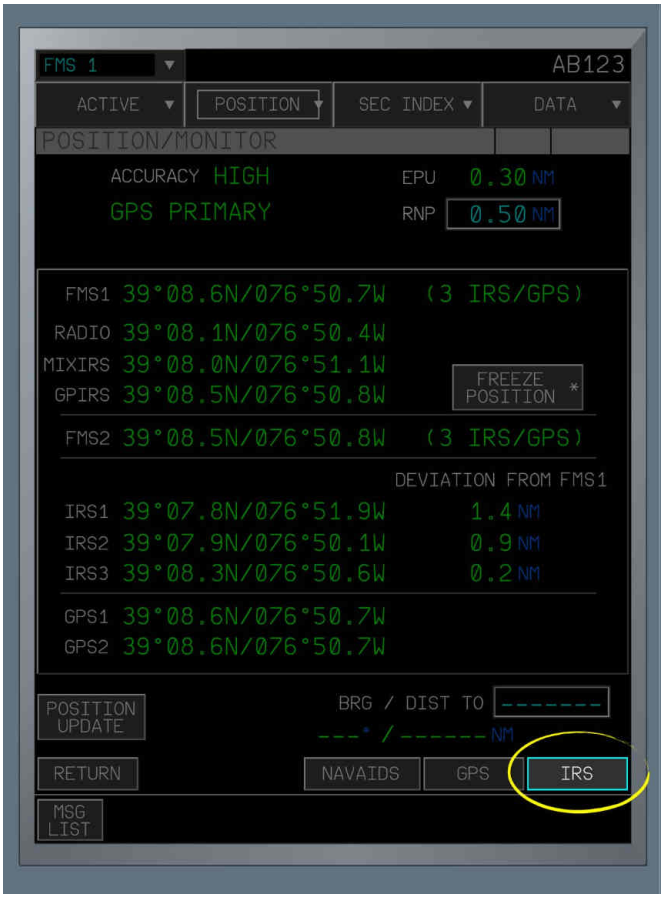
- The ACTIVE / INIT page, by clicking on the IRS button

ACTIVE / INIT Page



- The POSITION / MONITOR page, by clicking on the IRS button

POSITION / MONITOR Page



IRS ALIGNMENT POSITION

Indicates the latitude and longitude of the IRS alignment position.
The ADIRS send this position to the FMS , at the IRS alignment.

L2 This label displays dashes, if:
- The IRS are not aligned
- The FMC s power up after the IRS alignment: The FMS does not have the IRS alignment position, because the FMS was not available when it was sent
- Both active FMC s reset simultaneously after the IRS alignment: The FMS does not keep the IRS alignment position in its memory.

Note: *If only one active FMC powers up (or resets) after the IRS alignment, the affected FMC will recover the IRS alignment position during the resynchronization with the not affected FMC .*

L1 *Refer to More Information on the IRS Alignment*

IRS ALIGNMENT LABEL

Indicates whether the IRS are aligned, or still aligning, on the GPS position or on an other reference position:
- IRS ALIGNING ON GPS POS :
  Indicates that the IRS are aligning on the GPS position
- IRS ALIGNED ON GPS POS:
  Indicates that the IRS are aligned on the GPS position
- IRS ALIGNING ON REF POS :
  Indicates that the IRS are aligning on a reference position, different from the GPS position. The flight crew defines the other reference position on the Align On Other Reference panel. (*Refer to Panel)*
- IRS ALIGNED ON REF POS:
  Indicates that the IRS are aligned on a reference position, different from the GPS position. The flight crew defines the other reference position on the Align On Other Reference panel. (*Refer to Panel)*

ALIGN ON OTHER REFERENCE BUTTON

When clicked, displays the Align On Other Reference panel.

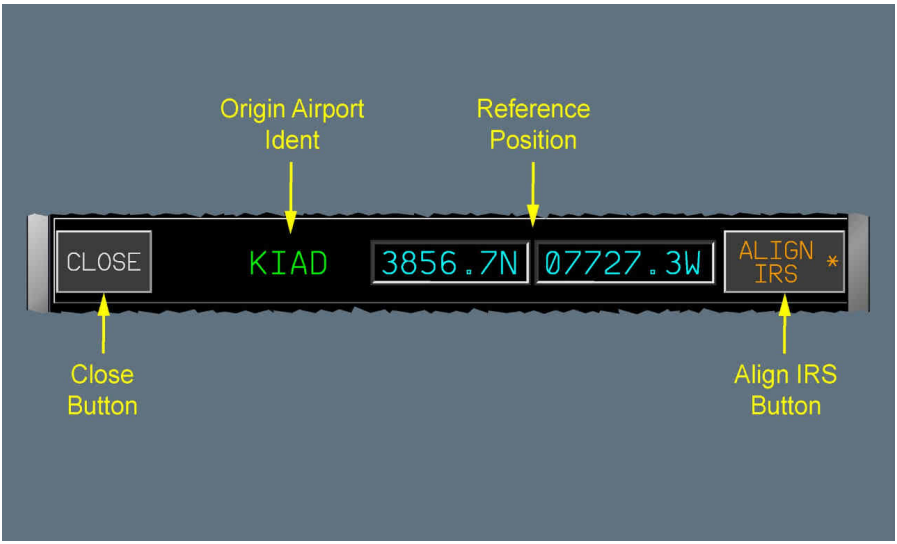
L2 The flight crew can only define an other reference position in the PREFLIGHT, or DONE flight phase.

ALIGN ON OTHER REFERENCE PANEL

On this panel, the flight crew defines a reference position for the IRS alignment.

L2 The flight crew uses this function to define an IRS reference position, other than the GPS position.

Align On Other Reference Panel



CLOSE BUTTON

When clicked, removes the Align On Other Reference Panel.

ORIGIN AIRPORT IDENT

Indicates the ident of the origin airport.

L2 This label is only displayed when the values in the entry fields are the latitude and longitude of the origin airport reference point.

REFERENCE POSITION ENTRY FIELDS

The flight crew enters the latitude and longitude of the new reference position in the entry fields. The default position is the origin airport of the active flight plan, if any.

ENTRY FORMAT

Refer to Latitude Entry Format
Refer to Longitude Entry Format

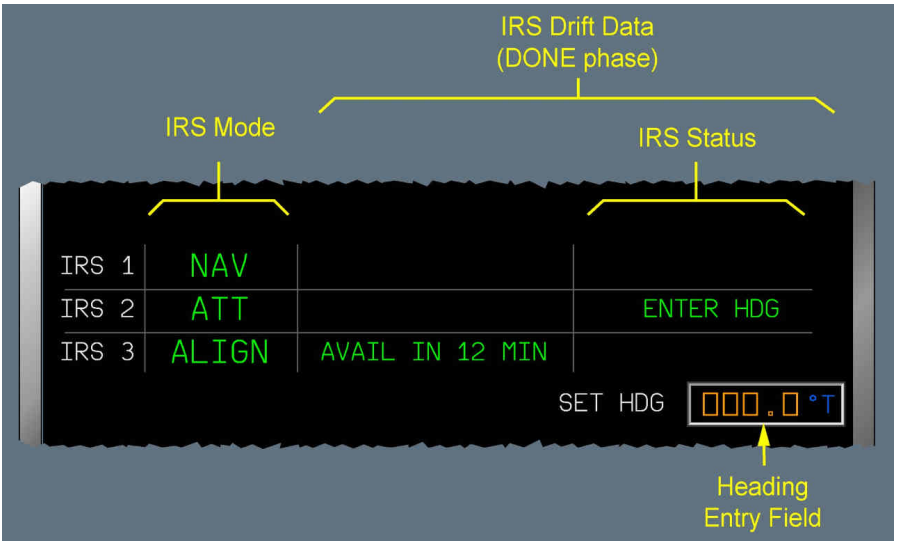
ALIGN IRS BUTTON

When clicked, sends the new reference position to the ADIRS, for IRS alignment.

IRS TABLE

The IRS table displays:
- In the first column: The IRS mode
- In the third column: The IRS status
- In the second and third column (in the DONE phase): The IRS drift data.

IRS Table



IRS MODE

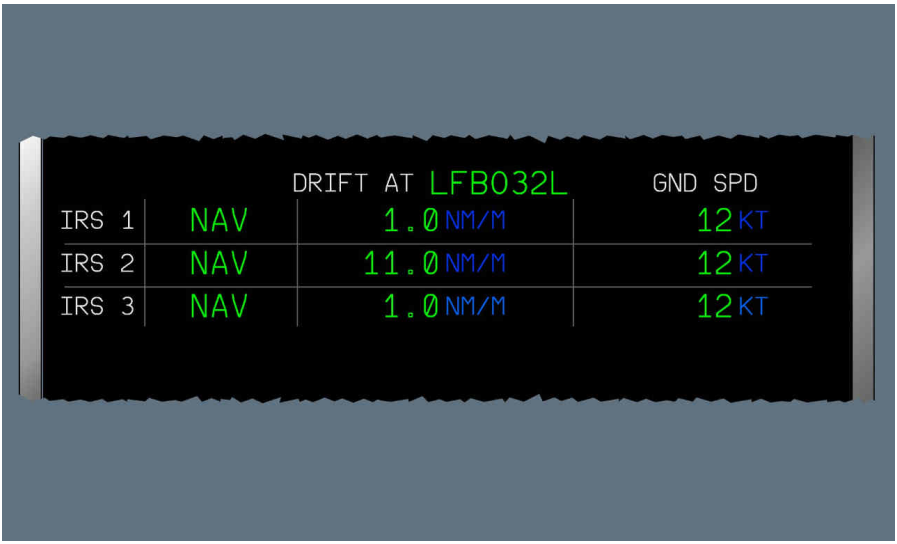
The first column of the table displays the IRS mode:
- NAV: This is the normal mode, the IRS is in navigation.
- ALIGN: The IRS is waiting for an alignment reference position, or the IRS is aligning. When the IRS is aligning, the second column of the table displays the estimated time to complete IRS alignment.
- ATT: The IRS is in attitude mode. (*Refer to More Information on the ATT mode*) When one of the three IRS is in the attitude mode, the third column of the table displays ENTER HDG, and the Heading entry field is displayed just below the table. *Refer to Heading Entry Field*
- INVALID: The IRS is invalid.

IRS DRIFT DATA

In the DONE phase, the second and third column of the IRS table display, respectively:

- The average drift in nautical miles per hour,
  Refer to More Information on the Average Drift Computation
- The residual ground speed in knots.

IRS Drift Data



IRS STATUS DATA

The third column of the table displays the IRS status:

- The label displays blanks when the status is normal
- IR FAULT
- DELAYED MAINT
- ENTER P.POS
- SELECT ATT
- EXCESS MOTION
- SWITCH ADR
- CHECK C/B
- ENTER HDG

- REENTER P.POS
- SYS BELOW —15°

HEADING ENTRY FIELD

The flight crew enters the heading in the entry field.
The entered heading initializes the IRS in ATT mode.

ENTRY FORMAT

Refer to Heading Entry Field

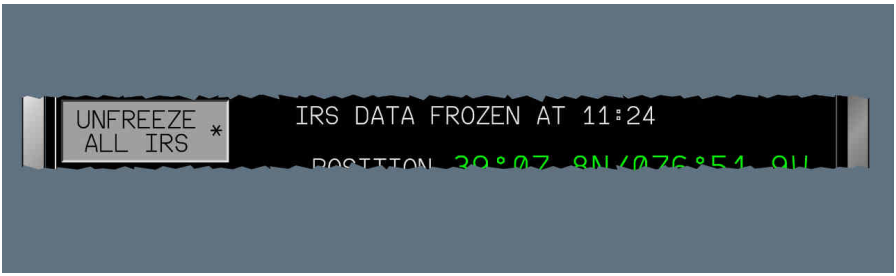
IRS 1(2)(3) BUTTON

When clicked, displays the IRS 1(2)(3) data panel.
When clicked again, removes the data panel from display.

FREEZE ALL IRS BUTTON

When clicked, freezes the display of all IRS data on the IRS 1, IRS 2, and IRS 3 panel.
A label indicates the UTC time (or flight time), when the IRS data has been frozen.
The flight crew can unfreeze the position data by clicking on the same button, that now displays UNFREEZE ALL IRS.

Unfreeze All IRS Button



IRS 1(2)(3) DATA PANEL

Displays the following IRS 1(2)(3) data:
- Position latitude and longitude
- True track
- Ground Speed
- True wind
- True heading

- Magnetic heading
  This label displays dashes when the aircraft is at extreme latitudes.
- Magnetic variation:
  The magnetic variation is difference between the IRS true heading and the IRS magnetic heading.
- GPIRS position
- GPIRS position accuracy
  Is the Horizontal Figure Of Merit (HFOM) of the GPIRS position.

L2 When the IRS is in ATT mode:
- The position and true track are not available and display dashes
- The magnetic variation is equal to 0, so that the magnetic heading is equal to the true heading
- The other data of the IRS Data panel is available as long as the GPS is valid.

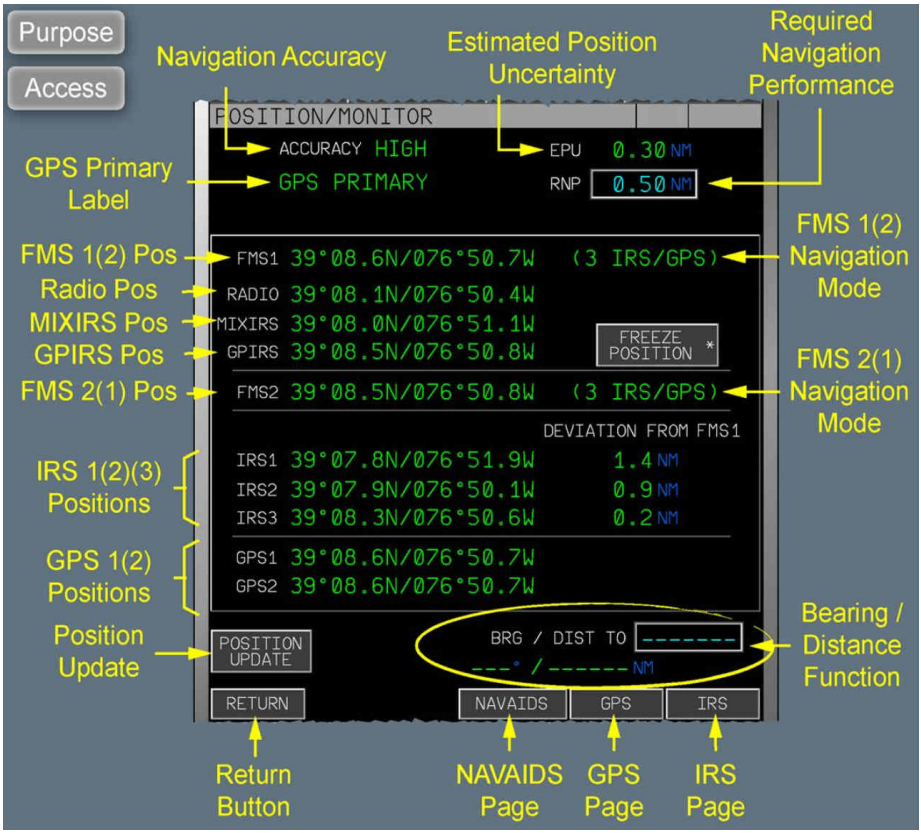
RETURN BUTTON

When clicked, displays the POSITION / MONITOR, or the INIT page, depending on the page that was displayed before.
Refer to POSITION / MONITOR page
Refer to INIT page

POSITION / MONITOR PAGE

Applicable to: ALL

POSITION / MONITOR Page



PURPOSE

On the POSITION / MONITOR page, the flight crew can:

- Monitor the navigation accuracy
- Monitor the FMS, Radio, MIXIRS, GPIRS, IRS, and GPS positions

- Manually update the FMS position
- Compute the bearing and distance from the aircraft present position to a waypoint, NAVAID, runway, etc .. .

Via the POSITION / MONITOR page, the flight crew can access:
- The POSITION / NAVAIDS page, for more information on the radio position
- The POSITION / GPS page, for more information on the GPS position(s)
- The POSITION / IRS page, for more information on the IRS position(s).

LINKS

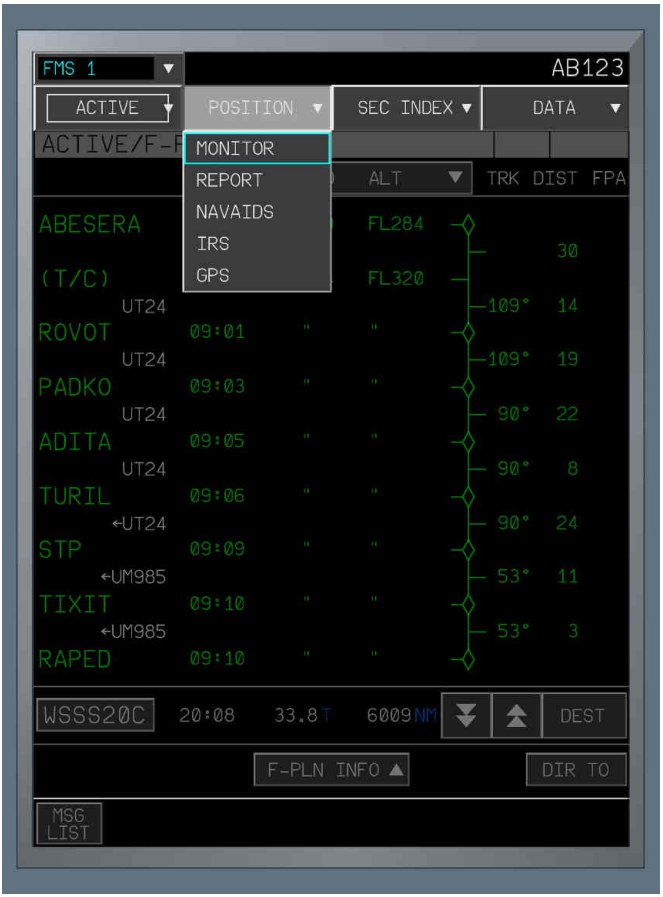
Refer to More Information on the Aircraft Position Computation

ACCESS

The flight crew can access the POSITION / MONITOR page, via:

- The General Menu Bar, by selecting MONITOR in the POSITION menu

General Menu Bar



- The ACTIVE / PERF page, by clicking on the POS MONITOR button.
  Refer to Page

PERF Page

NAVIGATION ACCURACY

Indicates whether the navigation accuracy is HIGH, or LOW.
Refer to More Information on the Navigation Accuracy

GPS PRIMARY LABEL

Indicates that the navigation mode is GPS PRIMARY.
Refer to More Information on GPS PRIMARY

EPU

Indicates the Estimated Position Uncertainty (EPU).
Refer to More Information on the EPU

RNP ENTRY FIELD

Indicates the Required Navigation Performance (RNP).
There is a default RNP value, that depends on the flight phase. The default value is displayed in small font.
The flight crew can always change the default value. The RNP entered by the flight crew is displayed in big font.
Refer to More Information on the RNP

ENTRY FORMAT

Refer to RNP Entry Format

FMS 1(2) POSITION

Indicates the latitude/longitude position computed by the onside FMS (when the FMS selector is set to NORM):
- FMS1 on Captain's side
- FMS2 on FO's side

Refer to More Information on the FMS Position Computation
The navigation mode, that is used to compute this FMS position, is displayed between brackets on the same line.

FMS 1(2) NAVIGATION MODE

Indicates the navigation mode that is used to compute the onside FMS position.

The navigation mode may be:
- N IRS/GPS
- N IRS/DME/DME
- N IRS/VOR/DME
- N IRS
- N IRS/DME/LOC
- N IRS/VOR/LOC
- N IRS/LOC

N (= 3 or 1) indicates whether 3 or 1 IRS are used to compute the IRS position. (*Refer to More Information on the IRS Position*)
Refer to More Information on the FMS Navigation Modes

RADIO POSITION

Indicates the latitude/longitude radio position, computed by the onside FMS.
Refer to More Information on the Radio Position

MIXIRS POSITION

Indicates the latitude/longitude MIXIRS position, computed by the onside FMS.
L2 If the MIXIRS position is not available, the FMS only uses the IRS 1(2)(3) position. In that case, this line displays the IRS 1(2)(3) position, instead of the MIXIRS position.
L1 *Refer to More Information on the MIXIRS Position*

GPIRS POSITION

Indicates the latitude/longitude GPIRS position, selected by the onside FMS.
The ADIRS computes the GPIRS position and sends it to the FMS.
Refer to More Information on the GPIRS Position

FMS 2(1) POSITION

Indicates the latitude/longitude position computed by the offside FMS (when the FMS selector is set to NORM):
- FMS2 on Captain's side
- FMS1 on FO's side

Refer to More Information on the FMS Position Computation
The navigation mode, that is used to compute this FMS position, is displayed between brackets on the same line.
L2 If the FMSs are in INDEPENDENT mode, this line is empty. (*Refer to More Information on the INDEPENDENT Mode*)

FMS 2(1) NAVIGATION MODE

Indicates the navigation mode that is used to compute the offside FMS position.

The navigation mode may be:
- N IRS/GPS
- N IRS/DME/DME
- N IRS/VOR/DME
- N IRS
- N IRS/DME/LOC
- N IRS/VOR/LOC
- N IRS/LOC

N (= 3 or 1) indicates whether 3 or 1 IRS are used to compute the IRS position. (*Refer to More Information on the IRS Position*)
Refer to More Information on the FMS Navigation Modes
L2 If the FMSs are in INDEPENDENT mode, this label is not displayed. (*Refer to More Information on the INDEPENDENT Mode*)

IRS 1(2)(3) POSITIONS

Indicate the three latitude/longitude IRS positions, and their deviation (in nautical miles) from the FMS 1(2) position.
Each ADIRS has its IRS position and sends it to both FMSs.
Refer to More Information on the IRS Position

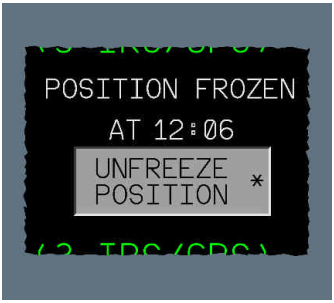
GPS 1(2) POSITIONS

Indicate the two latitude/longitude GPS positions.
The MMR sends the GPS positions to the FMS, via the ADIRS.
Refer to More Information on the GPS Position

FREEZE POSITION BUTTON

When clicked, freezes the display of all position data on the onside POSITION / MONITOR page.
A label indicates the UTC time (or flight time), when the position data has been frozen.
The flight crew can unfreeze the position data by clicking on the same button, that now displays UNFREEZE POSITION.

Unfreeze Position Button



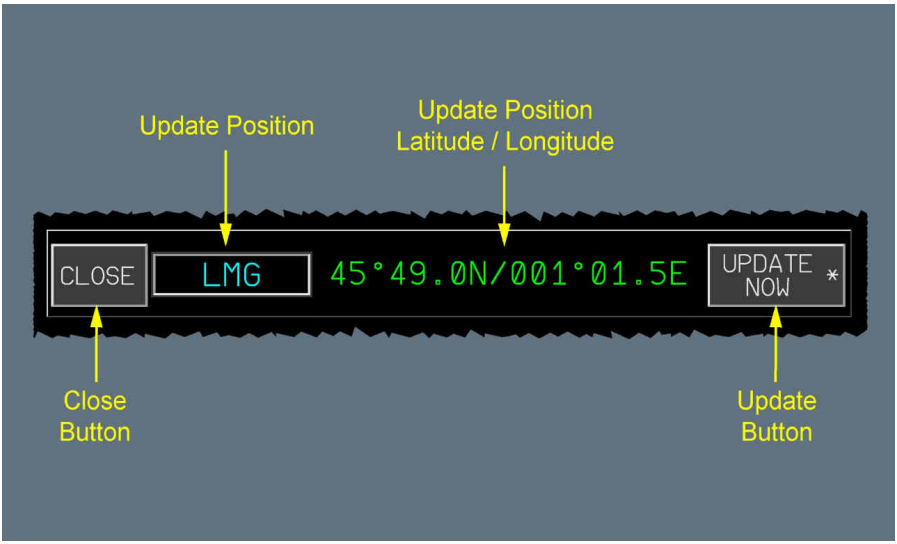
Note: *When the flight crew navigates to another FMS page, the position data is automatically unfrozen.*

POSITION UPDATE BUTTON

When clicked, displays the Position Update panel.
The Position Update button can only be selected when the FMS navigation mode is not IRS/GPS.

POSITION UPDATE PANEL

Position Update Panel



Note: *The Position Update panel closes automatically when the FMS navigation mode becomes IRS/GPS.*
Refer to More Information on the FMS Navigation Modes

CLOSE BUTTON

When clicked, closes the Position Update panel.

UPDATE POSITION ENTRY FIELD

The flight crew enters the update position in the entry field.

The possible entry formats are:

- The ident of a navigation database, or pilot stored waypoint, NAVAID, airport, or runway
  Refer to Waypoint Entry Format
  Refer to NAVAID Entry Format
  Refer to Airport Entry Format
  Refer to Runway Entry Format
- Latitude/longitude (*Refer to Entry Format*)
- Place/bearing/distance (*Refer to Entry Format*)
- Place-bearing/place-bearing (*Refer to Entry Format).*

If the flight crew has entered a valid latitude/longitude, place/bearing/distance, or place-bearing/place-bearing, the entry field displays “ENTRY”.

UPDATE POSITION LATITUDE / LONGITUDE

Indicates the latitude and longitude of the update position.

UPDATE BUTTON

When clicked, updates the FMS position with the position entered in the position entry field. The flight crew clicks on this button when the aircraft overflies the location.

BEARING / DISTANCE FUNCTION

The flight crew enters a location in the entry field , to compute the bearing and distance, from the aircraft's present FMS position to the entered location.
The FMS displays the result of the computation just below the entry field.

Bearing / Distance Function

ENTRY FORMAT

The possible entry formats for the location, are:

- The ident of a navigation database, or pilot stored waypoint, NAVAID, airport, or runway
  Refer to Waypoint Entry Format
  Refer to NAVAID Entry Format
  Refer to Airport Entry Format
  Refer to Runway Entry Format
- Latitude/longitude (*Refer to Entry Format*)
- Place/bearing/distance (*Refer to Entry Format*)
- Place-bearing/place-bearing (*Refer to Entry Format).*

If the flight crew has entered a valid latitude/longitude, place/bearing/distance, or place-bearing/place-bearing, the entry field displays “ENTRY”.

RETURN BUTTON

When clicked, displays the ACTIVE / PERF page. (*Refer to Page*)

L2 The Return button is only displayed when the flight crew has accessed the page via the ACTIVE / PERF page.

NAVAIDS BUTTON

When clicked, displays the POSITION / NAVAIDS page. (*Refer to Page*

GPS BUTTON

When clicked, displays the POSITION / GPS page. (*Refer to Page*)

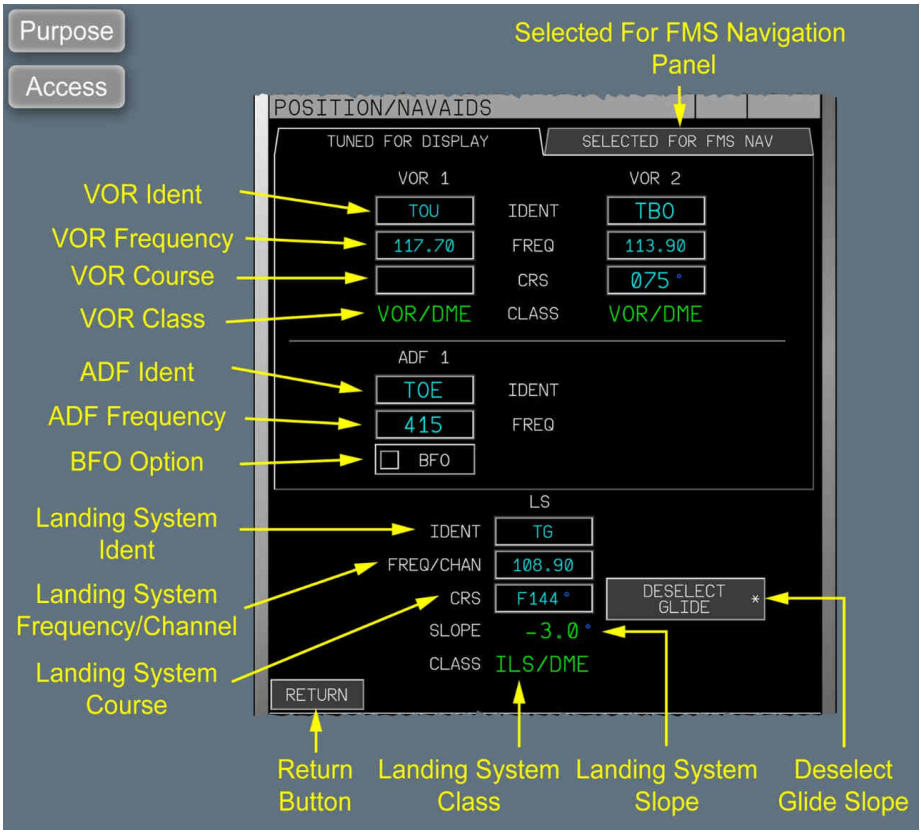
IRS BUTTON

When clicked, displays the POSITION / IRS page. (*Refer to Page*)

POSITION / NAVAIDS PAGE

Applicable to: ALL

POSITION / NAVAIDS page



PURPOSE

On the POSITION / NAVAIDS page, the flight crew can:

- Tune the VOR s and ADF for display on the ND (TUNED FOR DISPLAY panel)
- Check the NAVAIDS , that are automatically tuned to compute the radio position (SELECTED FOR FMS NAV panel)
- Check the radio position, and radio navigation mode (SELECTED FOR FMS NAV panel)

- Deselect a NAVAID , or GPS
- Tune the landing system NAVAID .

Note: *When the STANDBY RAD NAV mode of the RMP is active, all entry fields on the POSITION / NAVAIDS page are cleared, and cannot be selected.*

LINKS

Refer to Radio Navigation Tuning
Refer to Radio Position

ACCESS

The flight crew can access the POSITION / NAVAIDS page, via:

- The KCCU, by pressing the NAVAID key on the keyboard

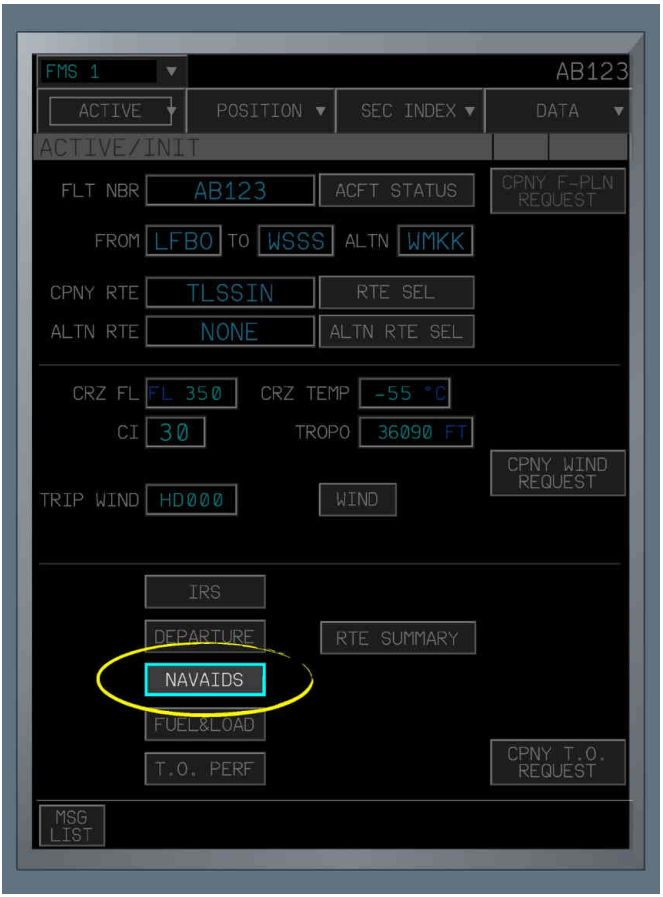
Access via the KCCU

- The General Menu Bar, by selecting NAVAIDS in the POSITION menu

Access via the General Menu Bar

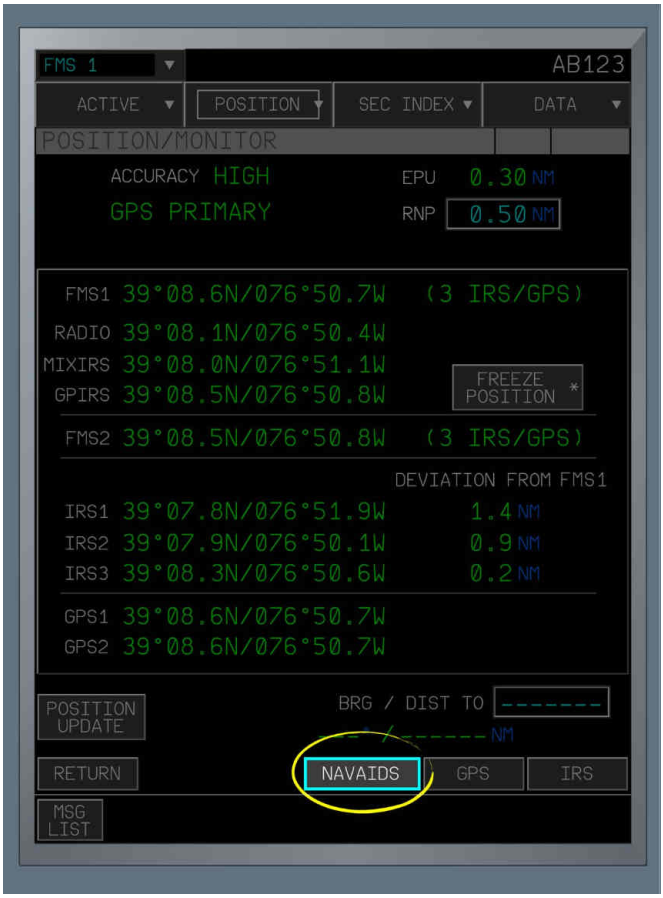
- The ACTIVE / INIT page, by clicking on the NAVAIDS button
  The TUNED FOR DISPLAY panel is opened by default.

Access via the ACTIVE / INIT Page



- The POSITION / MONITOR page, by clicking on the NAVAIDS button
  The SELECTED FOR FMS NAV panel is opened by default.

Access via the POSITION / MONITOR Page



VOR IDENT ENTRY FIELDS

Indicate the ident of the VOR s, that are tuned for display on the ND .
In normal operation, VOR 1 is tuned by FMS 1, and VOR 2 is tuned by FMS 2.
A VOR , that is automatically selected by the FMS , is displayed in small font.
The flight crew can always overwrite an automatically-selected VOR . A VOR , that is entered by the flight crew, is displayed in big font.

Note: *If the flight crew enters a NAVAID that has been deselected, the XXX IS DESELECTED message is displayed in the FMS Message Area.*

To revert to automatic VOR selection, the flight crew has to clear the entry field.

ENTRY FORMAT

Refer to NAVAID Entry Format

Note: *If the entered NAVAID is not in the navigation database, the PILOT STORED NAVAIDS panel, on the DATA / NAVAID page, is displayed. This provides the flight crew with the opportunity to add the selected NAVAID to the pilot stored elements database.*
Refer to DATA / NAVAID Page — PILOT STORED NAVAIDS Panel
Refer to Pilot Stored Elements Database

VOR FREQUENCY ENTRY FIELDS

Indicate the frequency of the VOR s, that are tuned for display on the ND .
VOR 1 is tuned by FMS 1. VOR 2 is tuned by FMS 2.
The frequency entry field is completed automatically, when the VOR ident is entered.
A frequency, that is automatically selected by the FMS , is displayed in small font.
The flight crew can always overwrite an automatically-selected frequency. A frequency entered by the flight crew, is displayed in big font.

Note: *The flight crew should use the VOR ident rather than the VOR frequency, to manually tune a NAVAID , unless the NAVAID is not in the database.*
When the flight crew manually enters a frequency, the VOR Ident entry field is blanked.

To revert to automatic VOR selection, the flight crew has to clear the entry field.

ENTRY FORMAT

Refer to VOR FREQ Entry Format

VOR COURSE ENTRY FIELDS

Indicate the course of the VOR s, that are tuned for display on the ND .
The flight crew can enter a course when the NAVAID , that is entered in the VOR Identity entry field, is a VOR , VOR / DME or VOR / TAC .

ENTRY FORMAT

Refer to VOR Course Entry Format

VOR CLASS

Indicates the class of the NAVAID, that is entered in the VOR ident entry field.

The class can be:
- VOR
- DME (or TACAN)
- VOR/DME (or VOR/TACAN)

ADF IDENT ENTRY FIELD

Indicates the identity of the NDB , that is tuned for display on the ND .
In normal operation, FMS 1 tunes ADF 1.
An NDB , that is automatically selected by the FMS , is displayed in small font.
The flight crew can always overwrite an automatically selected NDB . An NDB , entered by the flight crew, is displayed in big font.
To revert to automatic NDB selection, the flight crew has to clear the entry field.

ENTRY FORMAT

Refer to NAVAID Entry Format

Note: *If the entered NAVAID is not in the navigation database, the PILOT STORED NAVAIDS panel on the DATA / NAVAID page is displayed. This provides the flight crew with the opportunity to add the selected NAVAID to the pilot stored elements database.*
Refer to DATA / NAVAID Page — PILOT STORED NAVAIDS Panel
Refer to Pilot Stored Elements Database

ADF FREQUENCY ENTRY FIELD

Indicates the frequency of the NDB , that is tuned for display on the ND .
In normal operation, FMS 1 tunes ADF 1.
The frequency entry field is completed automatically, when the ADF ident is entered.
A frequency, that is automatically selected by the FMS , is displayed in small font.
The flight crew can always overwrite an automatically-selected frequency. A frequency, that is entered by the flight crew, is displayed in big font.

Note: *The flight crew should use the ADF ident, rather than the ADF frequency, to manually tune a NAVAID , unless the NAVAID is not in the database.*
When the flight crew manually enters a frequency, the ADF Ident entry field is blanked.

To revert to automatic NDB selection, the flight crew has to clear the entry field.

ENTRY FORMAT

Refer to ADF Frequency Entry Format

BFO OPTION

Indicates whether the BFO coding is selected or not.
By default, the BFO option is deselected.

LANDING SYSTEM IDENT ENTRY FIELD

Indicates the ident of the tuned landing system (ILS / GLS).
The entry field is completed automatically, when an ILS / GLS approach is selected. A landing system, that is automatically selected by the FMS , is displayed in small font.
The flight crew can always overwrite an automatically-selected landing system. A landing system, that is entered by the flight crew, is displayed in big font.

Note:
- *If the flight crew enters a landing system that has been deselected, the XXXX IS DESELECTED message is displayed on the FMS Message Area.*
- *If the flight crew manually tunes a landing system, that does not match the runway selected in the flight plan, the RUNWAY / LS DISAGREE message is displayed on the FMS Message Area.*
- *If the flight crew manually tunes an ILS / GLS , that does not correspond with the approach selected in the flight plan, the CHECK APPR SEL message is selected on the MFD FMS Message Area and on the PFD.*

L2 The ident entry field is completed automatically, when the frequency or channel of the landing system, that is part of the flight plan arrival (or departure) procedure, is entered in the frequency/channel entry field.
To revert to an automatic landing system selection, the flight crew has to clear the entry field.

L1 **ENTRY FORMAT**

Refer to LS IDENT Entry Format

Note: If the entered landing system is not in the navigation database, the PILOT STORED NAVAIDS panel, on the DATA/NAVAID page, is displayed. This gives the flight crew the opportunity to add the entered landing system to the pilots stored elements database.
Refer to DATA / NAVAID Page - PILOT STORED NAVAIDS Panel
Refer to Pilot Stored Elements Database

LANDING SYSTEM FREQUENCY/CHANNEL ENTRY FIELD

Indicates the frequency (for ILS), or channel (for GLS), of the tuned landing system.

The entry field is completed automatically, when the landing system ident is entered.
A frequency(channel), that is automatically selected by the FMS , is displayed in small font.
The flight crew can always overwrite an automatically-selected frequency(channel). A frequency(channel), that is entered by the flight crew, is displayed in big font.

Note: *The flight crew should use the landing system ident, rather than the landing system frequency(channel), to manually tune a landing system, unless the landing system is not in the database.*
When the flight crew manually enters a frequency(channel), the landing system ident entry field is completed automatically.

To revert to automatic landing system selection, the flight crew has to clear the entry field.

ENTRY FORMAT

Refer to LS FREQ Entry Format
Refer to CHANNEL (GLS) Entry Format

LANDING SYSTEM COURSE ENTRY FIELD

Indicates the course of the tuned landing system.
The course entry field may be completed automatically, when the landing system is tuned.
A course, that is automatically selected by the FMS , is displayed in small font.
The flight crew can always overwrite an automatically-selected course. A course, that is entered by the flight crew, is displayed in big font.
To revert to automatic course selection, the flight crew has to clear the entry field.

ENTRY FORMAT

Refer to LS Course Entry Format

LANDING SYSTEM SLOPE

Indicates the slope of the tuned landing system.

LANDING SYSTEM CLASS

Indicates the class of the tuned landing system.

The class may be:
- ILS
- ILS/DME (or ILS/TACAN)
- GLS

DESELECT GLIDE SLOPE BUTTON

When clicked, deselects the use of the glide slope data, during the ILS approach.
Deselection of the glide slope data may be required in case of partial loss, or during maintenance, of the ILS ground station.

L2 This function is only available for ILS approaches, when the FLS and Mix LOC/VNAV OPC options are activated.

L1 When the flight crew deselects glide slope data, the approach can be flown in LOC/FLS guidance mode.

When the flight crew deselects glide slope data, and when one of the following modes is active: LOC armed, LOC*, LOC, LAND armed, and LAND; the label GLIDE DESELECTED label is displayed to highlight the glide slope deselection.

GLIDE DESELECTED Label

When the glide slope data is deselected, the flight crew can re-select it by clicking on the same button. The button now displays SELECT GLIDE.
For both deselection and selection of the glide slope data, a confirmation action is required.

CONFIRM / CANCEL

NAVAID IDENT BUTTONS

Indicate the ident of the NAVAIDS , that are used for the radio position computation.
When clicked, opens a menu. Selecting DATA NAVAID opens the DATABASE NAVAIDS panel of the DATA / NAVAID page. Selecting the DATA NAVAID option opens the DATABASE NAVAIDS panel on the DATA / NAVAID page.
Refer to DATA / NAVAID Page — DATABASE NAVAIDS Panel

Note: If a landing system has been defined, the landing system NAVAID is displayed in the third row of the table, even when the landing system is not used for the radio position computation.

NAVAID FREQUENCY/CHANNEL

Indicates the frequency of the NAVAID that is automatically tuned for the radio position computation.
For more information, *Refer to Radio Position Computation* .

NAVAID CLASS

Indicates the class of the NAVAID, that is used for the radio position computation.

The class may be:
- VOR/DME (or VOR/TACAN)
- DME (or TACAN)
- ILS
- ILS/DME (or ILS/TACAN)

RADIO NAVIGATION MODE

The radio navigation mode indicates the combination of NAVAID types, that are used to compute the radio position.

The radio navigation mode can be:
- DME / DME
- VOR / DME
- DME / DME - LOC , displayed as DME / LOC
- VOR / DME - LOC , displayed as VOR / LOC
- LOC

Refer to More Information on the Radio Position Computation

RADIO POSITION LABEL

Indicates the radio position.
Refer to More Information on the Radio Position Computation

DESELECTED NAVAIDS ENTRY FIELDS

The flight crew deselects a NAVAID by entering its ident in one of the 6 entry fields.
When deselected, the NAVAID can no longer be tuned for radio position computation or for display on the ND.

The deselection is cancelled:
- Manually: By clearing the entry field
- Automatically: On transition to the DONE or PREFLIGHT flight phase, or after cycling the navigation database.

ENTRY FORMAT

Refer to NAVAID Ident Entry Format

GPS OPTION

The flight crew can use these option to select, or deselect, the GPS source for the FMS aircraft position computation.

L2 If the GPS source is deselected, the GPS DESELECTED message is displayed in the FMS Message Area, when the aircraft is at 80 nm from the top of descent, or when the aircraft enters in the APPROACH phase.
On transition to the DONE flight phase, the option is automatically set to SELECTED.

L1 *Refer to More Information on the FMS Position Computation*

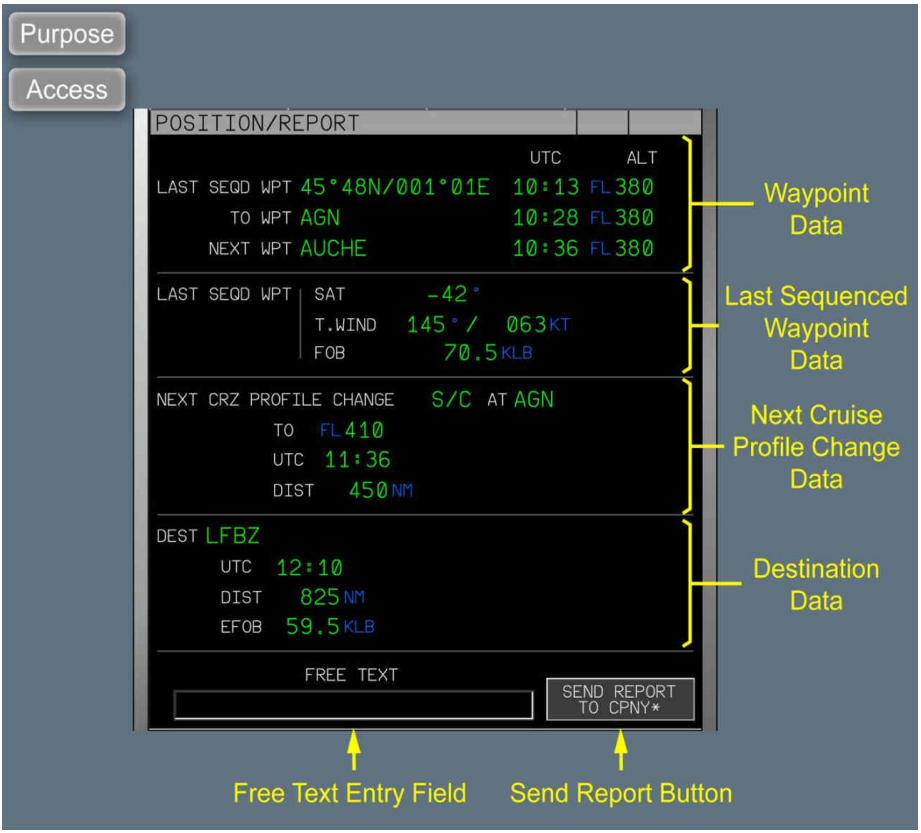
RETURN BUTTON

When clicked, displays the POSITION / MONITOR, or the INIT page, depending on the page that was displayed before.
Refer to POSITION / MONITOR page
Refer to INIT page

POSITION / REPORT PAGE

Applicable to: ALL

POSITION / REPORT Page



PURPOSE

On the POSITION / REPORT page, the flight crew can check and send the position report. The position report has stored and predicted data of:

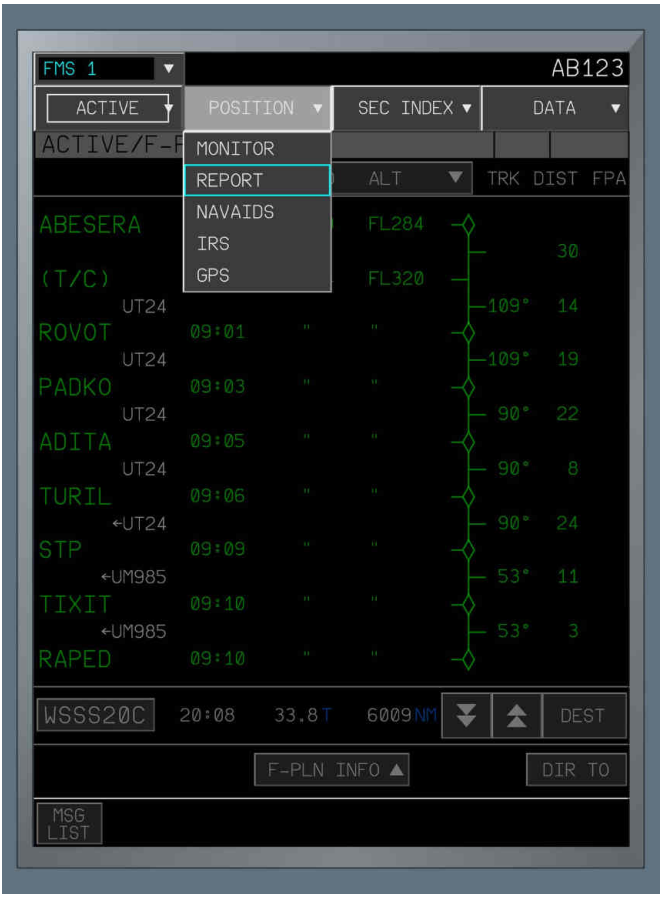
- The last sequenced waypoint
- The TO waypoint
- The NEXT waypoint

- The next cruise vertical profile change
- The destination.

ACCESS

The flight crew can access the POSITION / REPORT page via the General Menu Bar, by selecting REPORT in the POSITION menu.

General Menu Bar



WAYPOINT DATA

Displays the recorded UTC time (or flight time) and altitude at the last sequenced waypoint.

L2 The last sequenced waypoint is the last navigation database, or pilot stored waypoint, that has been sequenced. The last sequenced waypoint may not be identical to the flight plan FROM waypoint when the FROM waypoint is for example T-P, PPOS, IN-BND, etc ...

L1 Displays the predicted time of arrival (UTC or flight time) and altitude for the TO and NEXT waypoint.

L2 The TO and NEXT waypoint are database, or pilot stored waypoints. Flight plan pseudo-waypoints are excluded.

LAST SEQUENCED WAYPOINT DATA

Displays the following data, recorded at the last sequenced waypoint:

- Static Air Temperature (SAT)
- True Wind
- Fuel on Board (FOB).
  The FQMS provides the FOB.

NEXT CRUISE PROFILE CHANGE DATA

Displays (only in CRUISE) the following data for the next vertical profile change:

- The type of vertical change
  The type may be: S/C (Start of Climb), S/D (Start of Descent), T/D (Top of Descent).
  When no vertical change is planned in the flight plan, NONE is displayed.
- The start waypoint
- The target altitude (or current altitude)
- The predicted time of arrival (UTC or flight time) at the start waypoint
- The distance to the start waypoint, along the flight plan.

DESTINATION DATA

Displays the following data for the destination airport:

- The predicted time of arrival (UTC or flight time) at destination
- The distance to the destination, along the flight plan
- The estimated fuel on board at destination.

FREE TEXT ENTRY FIELD

The flight crew can enter a free text, of maximum 24 characters, in the entry field. The free text is sent with the position report to the airline.

SEND REPORT BUTTON

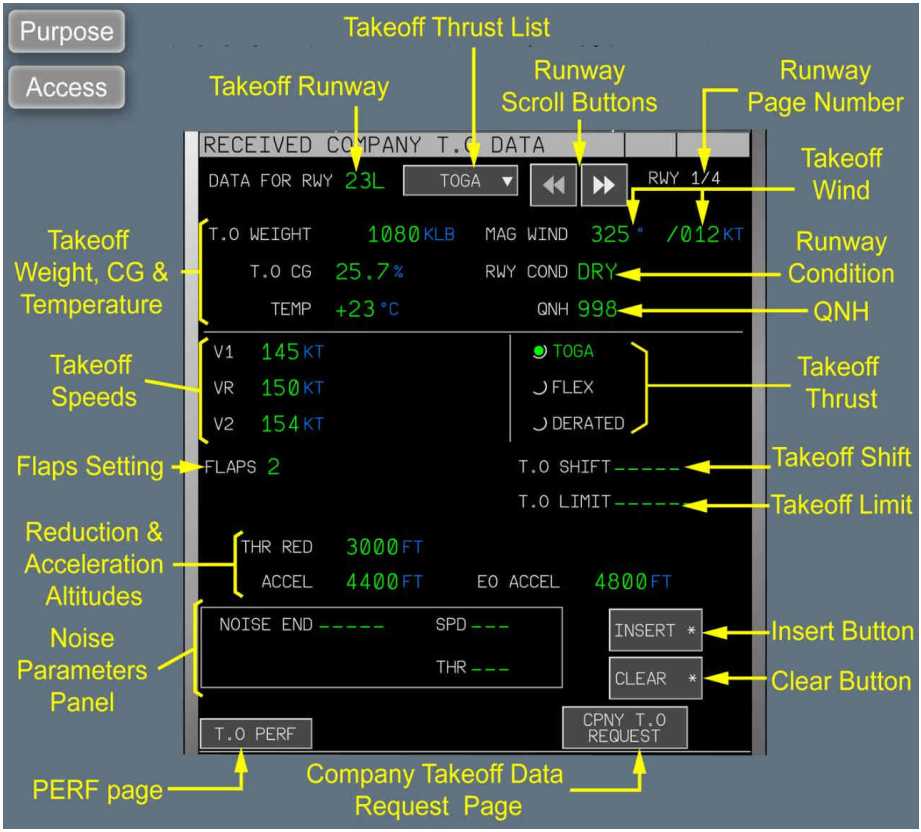
When clicked, sends the position report to the airline, via ACARS.

L2 During the transmission of the position report to the ACR, the button displays SENDING ... .

RECEIVED COMPANY T.O DATA PAGE

Applicable to: ALL

RECEIVED COMPANY T.O DATA Page



PURPOSE

On the RECEIVED COMPANY T.O DATA page, the flight crew can:

- Check the received company takeoff data,
- Delete or insert the received takeoff data in the flight plan.

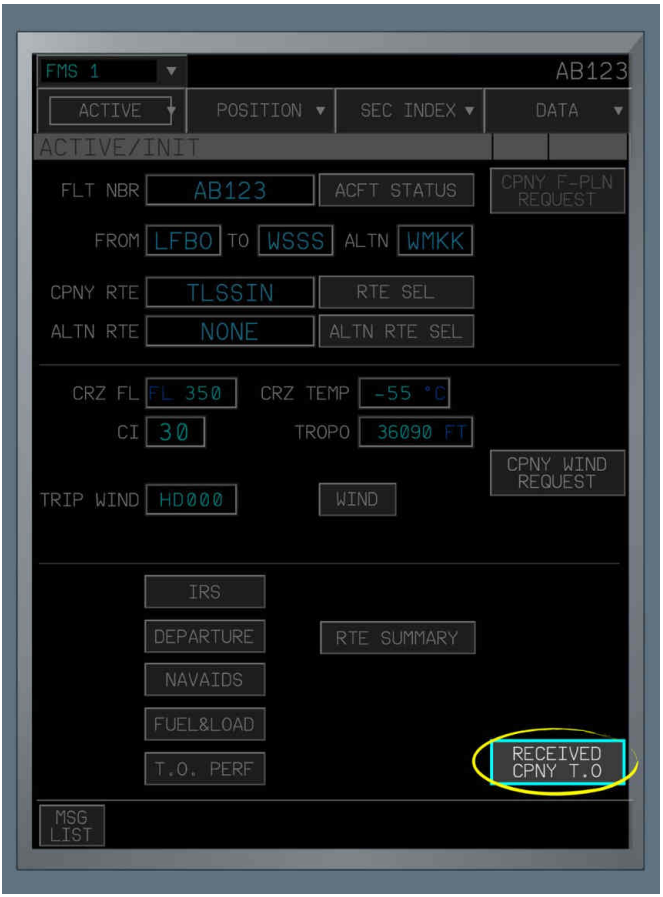
The flight crew can display takeoff data for up to four runways, and for two different takeoff thrust settings per runway.
The RECEIVED COMPANY T.O DATA page is only available for the active flight plan.

ACCESS

The flight crew can access the RECEIVED COMPANY T.O DATA page, via:

- The INIT page, by clicking on the RECEIVED CPNY T.O button

INIT page

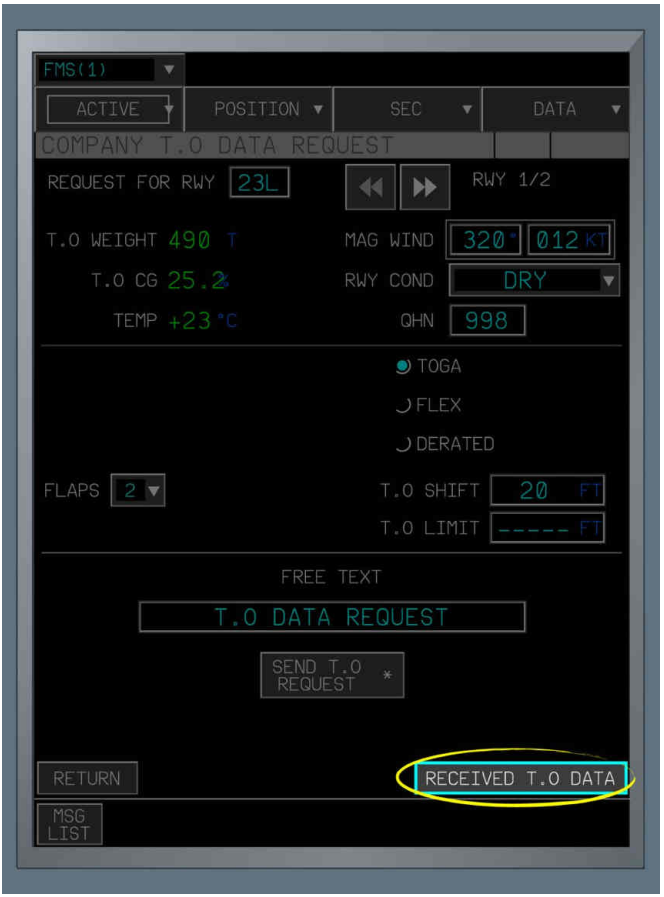


- The T.O panel on the ACTIVE / PERF page, by clicking on the RECEIVED CPNY T.O button

ACTIVE / PERF page

- The COMPANY T.O DATA REQUEST page, by clicking on the RECEIVED T.O DATA button.

COMPANY T.O DATA REQUEST page



TAKEOFF RUNWAY

Indicates the runway that is associated with the takeoff data displayed on the page.
Appears in amber, if the runway is different from the runway selected in the active flight plan.

TAKEOFF THRUST LIST

Takeoff Thrust List

Displays the takeoff thrust that is associated with the takeoff data of the page.
When the flight crew selects a takeoff thrust, the page displays the corresponding takeoff data.

RUNWAY SCROLL BUTTONS

The flight crew uses the scroll buttons to scroll, one by one, through the four takeoff runway pages.

RUNWAY PAGE NUMBER

Indicates the ranking of the takeoff runway page.

TAKEOFF WEIGHT, CG & TEMPERATURE

Indicate:
- The aircraft weight and CG, that are associated with the takeoff data
- The outside temperature, that is associated with the takeoff runway, when the TOGA thrust setting is selected. When the flight crew has selected a FLEX or a DERATED thrust, green dashes replace the temperature value.

L12

Note: *The FMS crosschecks the received takeoff weight with the FMS takeoff weight.*
If the received takeoff weight is outside an acceptable margin, the takeoff weight value appears in amber on the RECEIVED COMPANY T.O DATA page.
The received takeoff weight is within the acceptable margin if $TOW_{FMS} - 2\ t \leq TOW_{Received} \leq TOW_{FMS} + 7\ t$.
In this case, if the received runway matches the active runway, the UPLINK/ACTIVE TOW DISAGREE message also appears on the RECEIVED COMPANY T.O DATA page.

TAKEOFF WIND

Indicate the wind direction and velocity, that are associated with the takeoff runway.

RUNWAY CONDITION

Indicates the takeoff runway condition.

QNH

Indicates the QNH that is associated with the takeoff runway.

TAKEOFF THRUST

Indicates the takeoff thrust.
The flight crew can display the takeoff data for two different takeoff thrust settings per runway.
The possible thrust settings are: TOGA, FLEX, or DRT.

TAKEOFF SPEEDS

Indicates V1, VR and V2 that are associated with the takeoff runway.

FLAPS SETTING

Indicates the flaps setting, that is associated with the takeoff runway.

TAKEOFF SHIFT

Indicates the runway shift, that is associated with the takeoff runway.

TAKEOFF LIMIT

Indicates the remaining takeoff runway length.

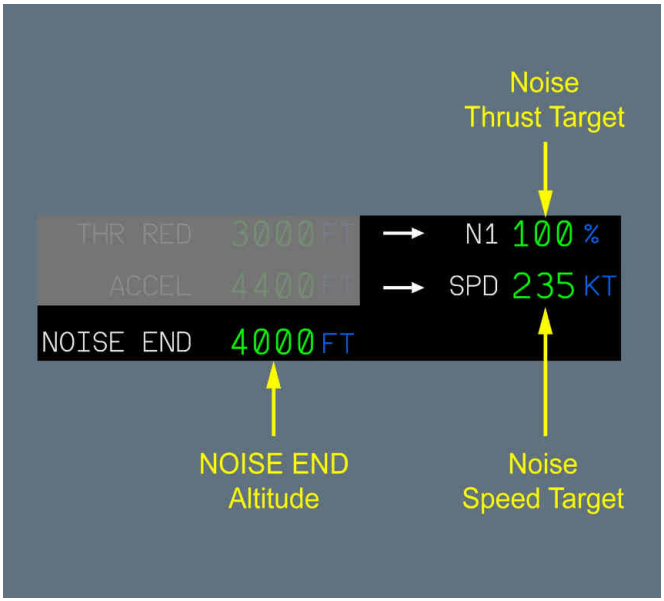
REDUCTION & ACCELERATION ALTITUDES

Indicates for the takeoff runway:
- The thrust reduction altitude (THR RED)
- The acceleration altitude all engines operative (ACCEL)
- The acceleration altitude in engine-out (EO ACCEL).

NOISE PARAMETERS

Indicate the parameters for the noise procedure that is associated with the takeoff runway.
For more information, *Refer to DSC-22-FMS-20-30-22FMS502BC PERF page - Noise Parameters Panel* .

Noise Procedure Data



COMPANY TAKEOFF DATA REQUEST PAGE

When clicked, displays the COMPANY T.O DATA REQUEST page.
Refer to Page

PERF PAGE

When clicked, displays the T.O panel of the ACTIVE / PERF page.
Refer to PERF page

INSERT BUTTON

When clicked:

- Inserts the following takeoff data in the active flight plan:
  - Takeoff speeds (V1, VR, V2),
  - Flaps setting,
  - Takeoff thrust,
  - Takeoff shift,
  - Thrust reduction and acceleration altitudes,
  - Noise parameters.
- Displays the T.O panel of the ACTIVE / PERF page. The T.O panel now displays the inserted takeoff data.

L2 The insertion is not possible when:

- The received runway does not match the active runway, or
- The received takeoff weight differs from the takeoff weight on the FUEL&LOAD page (*Refer to TOW, CG & TEMPERATURE)* , or
- One of the following received takeoff data is not defined :
  - Takeoff speeds (V1, VR, V2)
  - Takeoff runway
  - TOW
  - T.O CG
  - Takeoff wind
  - Runway condition
  - Baro setting
  - Temperature.

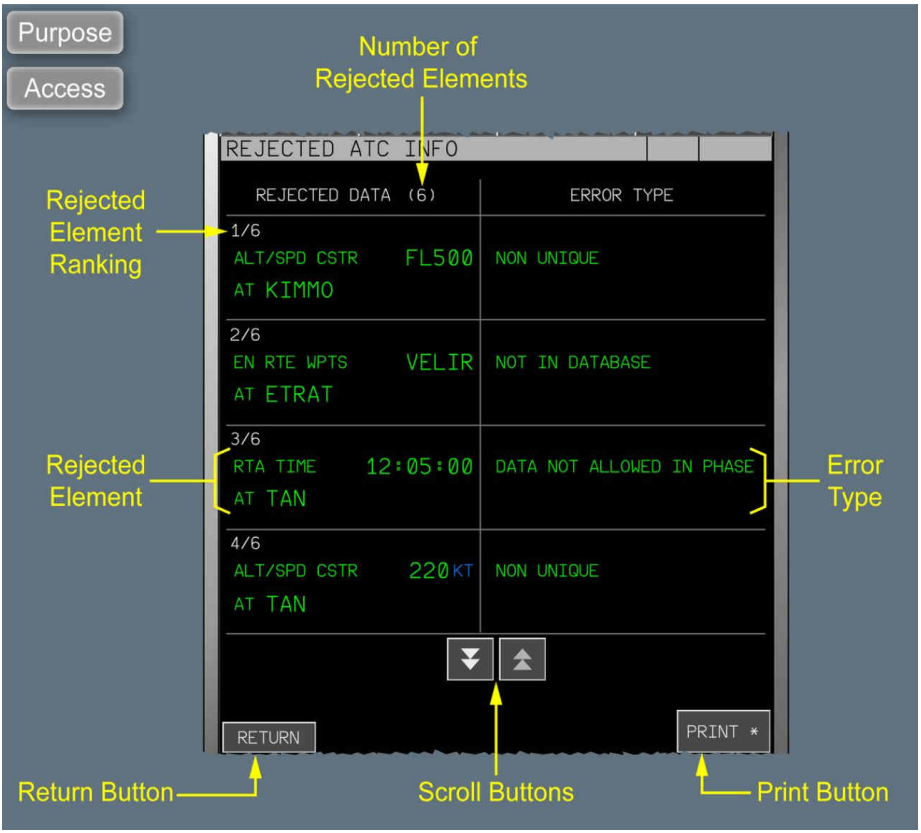
CLEAR BUTTON

When clicked, deletes the received takeoff data, that are associated with all the takeoff runways.

REJECTED ATC INFO PAGE

Applicable to: ALL

REJECTED ATC INFO page



PURPOSE

On the REJECTED ATC INFO page, the flight crew can check the rejected elements of the ATC flight plan, that is inserted in SEC 3.

ACCESS

The flight crew can access the REJECTED ATC INFO page via the SEC 3 panel of the SEC INDEX page, by clicking on the REJECTED ATC INFO button.

SEC / INDEX page

NUMBER OF REJECTED ELEMENTS

Indicates the number of rejected elements.

REJECTED ELEMENT RANKING

Indicates the ranking of the rejected element.

REJECTED ELEMENT

Indicates the description of the rejected element.

ERROR TYPE

Indicates the error type (reason for rejection), that is associated with the rejected element.

SCROLL BUTTONS

The flight crew uses the scroll down (up) button to move, page per page, downwards (upwards) through the rejected data.

PRINT BUTTON

When clicked, prints the third secondary flight plan (SEC 3) and the associated rejected elements.

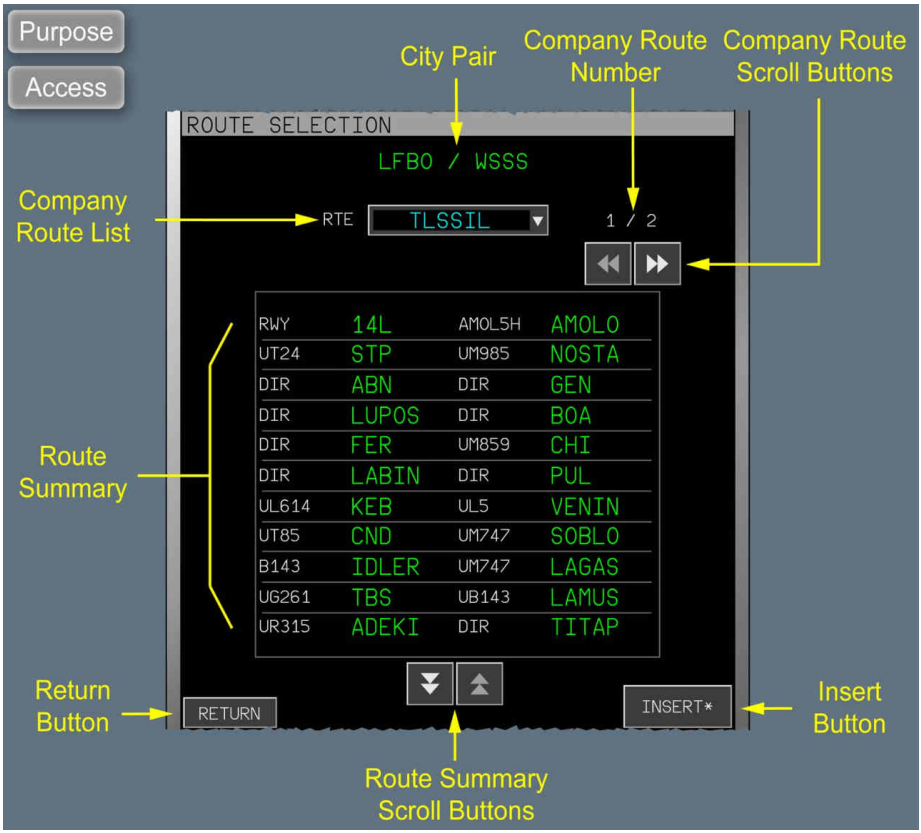
RETURN BUTTON

When clicked, displays the SEC 3 panel of the SEC INDEX page.

ROUTE SELECTION PAGE

Applicable to: ALL

ROUTE SELECTION Page



PURPOSE

On the ROUTE SELECTION page, the flight crew can:

- Display the summary of all company routes (or alternate company routes) of a defined FROM/TO (or TO/ALTN) city pair
- Select a company route and insert it in the flight plan.

The ROUTE SELECTION page is available for the active and secondary flight plans.

ACCESS

The flight crew can access to the ROUTE SELECTION page via:

- The INIT page:
  - By clicking on the (ALTN) RTE SEL button

(ALTN) RTE SEL button on the INIT Page

  - By entering a FROM/TO city pair
    The ROUTE SELECTION page is displayed automatically when at least one company route exists for the city pair.
  - By changing the alternate destination

The ROUTE SELECTION page is displayed automatically when at least one company route exists for the TO/ALTN city pair.

- The ALTERNATE page:
  - By selecting the RTE SELECTION option of the airport option menu
  - By entering an airport in the Other Alternate Entry Field:
    The ROUTE SELECTION page is displayed automatically when at least one alternate company list exists for the TO/ALTN city pair.

CITY PAIR

Indicates the FROM/TO (origin / primary destination) or TO/ALTN (primary destination / alternate destination) ICAO city pair.

COMPANY ROUTE NUMBER

Indicates the ranking of the displayed company route in the list of available company routes.

COMPANY ROUTE LIST

Indicates the ident of the displayed (alternate) company route.
The flight crew selects the company route that he wants to display by choosing in the list, or by using the company route scroll buttons.
The company route list displays all (alternate) company routes, that are in the navigation or pilot stored elements database, associated with the defined FROM/TO (or TO/ALTN) city pair.

COMPANY ROUTE SCROLL BUTTONS

The flight crew uses the Scroll buttons to scroll, one by one, through the company route list.
The flight crew can also scroll through the list with the scroll wheel of the KCCU.

ROUTE SUMMARY

Indicates the route summary of the (alternate) company route that is selected in the company route list.
The summary has to be read from left to right and from top to bottom.
Company route waypoints are displayed in green big font. Airways and procedures are displayed in small white font.

Note: - *The VIA part of a procedure, and direct legs are indicated with DIR*
- *A runway is indicated with RWY*
- *When the company route has an approach procedure, only the first waypoint and the name of the procedure are displayed in the route summary.*

RETURN BUTTON

When clicked, displays the page that was displayed before the ROUTE SELECTION page without selection of the displayed company route.

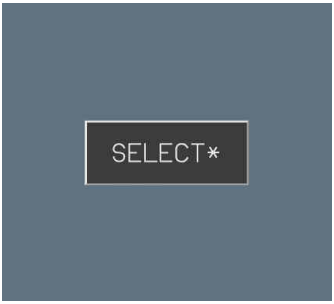
INSERT BUTTON

When clicked:

- Inserts the selected company route, and
- Displays the INIT page. (*Refer to Page)*

L2 If the page was accessed via the ALTERNATE page, the button displays SELECT.

Select button



When clicked:
- Selects the company route, and
- Displays the ALTERNATE page. (*Refer to Page)*

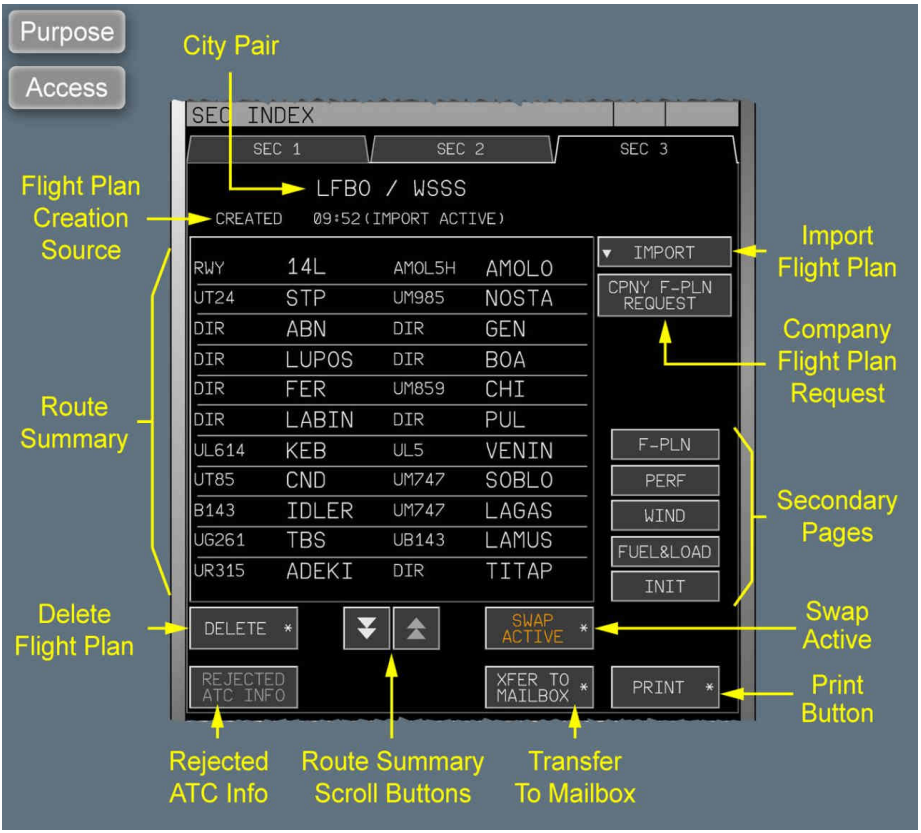
ROUTE SUMMARY SCROLL BUTTONS

The flight crew uses the scroll buttons to move, page by page, downwards (upwards) through the route summary.

SEC INDEX PAGE

Applicable to: ALL

SEC / INDEX Page



PURPOSE

On the SEC INDEX page, the flight crew can manage the three secondary flight plans on three identical panels: SEC 1(2)(3).

On each panel, the flight crew can:

- Check the origin and route summary of the secondary flight plan
- Import the active, or any other secondary flight plan, as a new secondary flight plan

- Request a secondary flight plan to the ground station, and insert it when received
- Swap the secondary and active flight plan
- Transfer the secondary flight plan to the ATC mailbox
- Print the secondary flight plan
- Access the secondary pages: F-PLN, PERF, WIND, FUEL&LOAD, and INIT.

LINKS

Refer to More Information On the Secondary Flight Plans

ACCESS

The flight crew can access the SEC INDEX page, via:

- The KCCU, by pressing the SEC INDEX key on the keyboard

Access via the KCCU

- The General Menu Bar, by selecting SEC 1(2)(3) in the SEC INDEX menu.

Access via the General Menu Bar

CITY PAIR

Indicates the FROM/TO (origin / primary destination) ICAO city pair.

FLIGHT PLAN CREATION SOURCE

Indicates the UTC time of creation and the source of creation of the secondary flight plan:

- (IMPORT ACTIVE)
  The flight crew created the secondary flight plan by importing the active flight plan.
- (IMPORT ACTIVE-MODIFIED)
  The flight crew created the secondary flight plan by importing the active flight plan, and changed it via a lateral or vertical flight plan revision.
- (SWAP ACTIVE)
  The flight crew created the secondary flight plan by swapping the active flight plan.
- (SWAP ACTIVE-MODIFIED)
  The flight crew created the secondary flight plan by swapping the active flight plan, and changed it via a lateral or vertical flight plan revision.
- (MANUAL)
  The flight crew created the secondary flight plan manually via the SEC 1(2)(3) / INIT, and/or SEC 1(2)(3) / F-PLN pages.
- (CPNY F-PLN)
  The flight crew created the secondary flight plan by inserting a received company flight plan.
- (CPNY F-PLN-MODIFIED)
  The flight crew created the secondary flight plan by inserting a received company flight plan, and changed it via a lateral or vertical flight plan revision.
- (ATC F-PLN)
  The flight crew created the secondary flight plan by uploading a received ATC flight plan.

  Note: An ATC flight plan can only be uploaded in the third secondary flight plan (SEC 3).

- (ATC F-PLN-MODIFIED)
  The flight crew created the secondary flight plan by uploading a received ATC flight plan, and changed it via a lateral or vertical flight plan revision.

  Note: An ATC flight plan can only be uploaded in the third secondary flight plan (SEC 3).

When the flight crew imports a secondary flight plan into an other secondary flight plan, the source of creation of the new secondary flight plan is the source of flight plan that has been imported.

ROUTE SUMMARY

Indicates the route summary of the secondary flight plan.
The summary has to be read from left to right and from top to bottom.
Waypoints are displayed in big font. Airways and procedures are displayed in small font.

Note: - *The VIA part of a procedure, and direct legs are indicated with DIR*
- *A runway is indicated with RWY*
- *When the route has an approach procedure, only the first waypoint and the name of the procedure are displayed in the route summary.*

ROUTE SUMMARY SCROLL BUTTONS

The flight crew uses the Scroll buttons to move, page by page, downwards (upwards) through the route summary.

FLIGHT PLAN IMPORT MENU

When clicked, opens a menu:

Import Menu

The flight crew creates the secondary flight plan by importing (making a copy of) the active flight plan, or one of the two other secondary flight plans.
Refer to More Information on the Secondary Flight Plan Initialization

COMPANY FLIGHT PLAN REQUEST BUTTON

When clicked, displays the COMPANY F-PLN REQUEST page.
Refer to Page

L2 The company flight plan request button can only be selected when no other flight plan request is pending.

L1 When a flight plan request is pending, the button displays REQUEST PENDING ... . The button still gives access to the COMPANY F-PLN REQUEST page.

REQUEST PENDING ...

When a company flight plan is received, the button displays RECEIVED CPNY F-PLN . When clicked, opens a menu that allows the flight crew to insert, or clear the received company flight plan.

RECEIVED CPNY F-PLN

SECONDARY PAGES BUTTONS

F-PLN BUTTON

When clicked, opens the SEC 1(2)(3) / F-PLN page. (*Refer to Page*)

PERF BUTTON

When clicked, opens the SEC 1(2)(3) / PERF page. (*Refer to Page*)

WIND BUTTON

When clicked, opens the SEC 1(2)(3) / WIND page. (*Refer to Page*)

FUEL&LOAD BUTTON

When clicked, opens the SEC 1(2)(3) / FUEL&LOAD page. (*Refer to Page*)

INIT BUTTON

When clicked, opens the SEC 1(2)(3) / INIT page. (*Refer to Page*)

SWAP ACTIVE BUTTON

When clicked, swaps the secondary and the active flight plan. The secondary flight plan becomes the active flight plan, and the active the secondary flight plan.
The flight crew cannot select this button when the swapping conditions are not fulfilled.
Refer to More Information on the Flight Plan Swapping

DELETE FLIGHT PLAN BUTTON

When clicked, deletes the secondary flight plan and its associated data.

TRANSFER TO MAILBOX BUTTON

When clicked, sends the flight plan to the ATC mailbox.
When sending, the buttons displays XFER... , and cannot be selected any more.

XFER...

If the Free Text AMI option is activated, clicking on the XFER TO MAILBOX button will display the TRANSFER TO MAILBOX page. (*Refer to Page*)
On this page, the flight crew can enter any free text that will be sent with the flight plan.

PRINT BUTTON

When clicked, prints the secondary flight plan.

REJECTED ATC INFO BUTTON

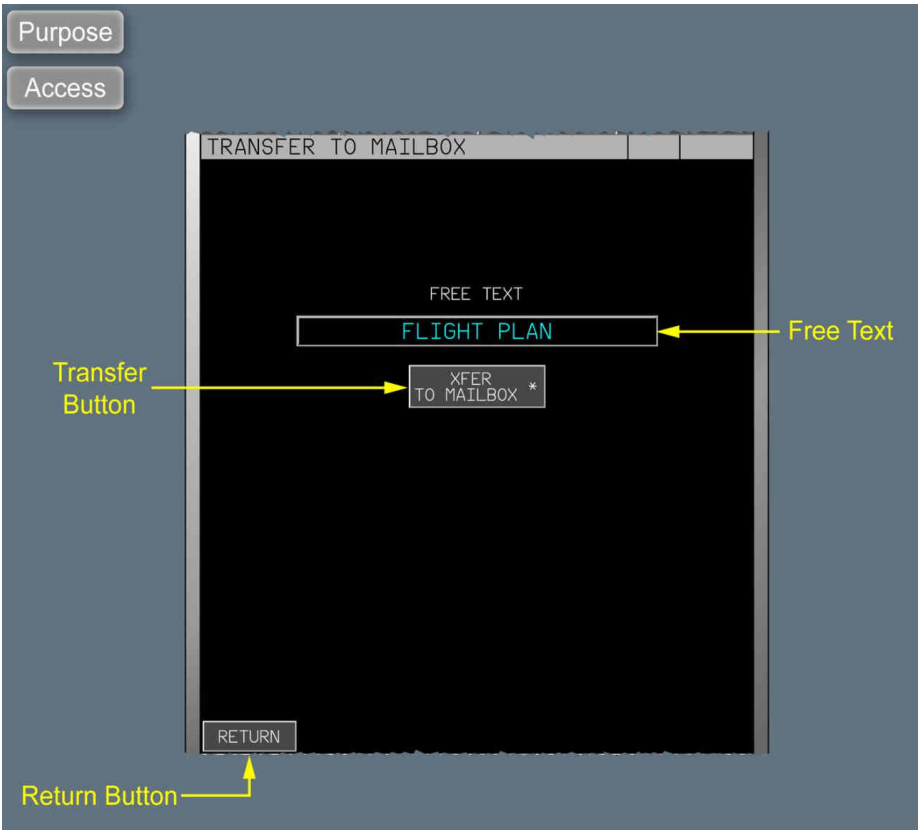
When clicked, displays the REJECTED ATC INFO page. (*Refer to Page*)
This button is displayed (only on the SEC 3 panel) when an ATC flight plan is loaded, and the FMS has rejected ATC data. The flight crew can consult this data on the REJECTED ATC INFO page.

Note: *The flight crew can load an ATC flight plan only in the third secondary flight plan (SEC 3).*

TRANSFER TO MAILBOX PAGE

Applicable to: ALL

TRANSFER TO MAILBOX page



PURPOSE

On the TRANSFER TO MAILBOX page, the flight crew can send a secondary flight plan to the ATC mailbox, before sending it to the ATC ground station.

If the Free Text AMI option is not activated, the TRANSFER TO MAILBOX page is not available. In this case, the flight crew sends the secondary flight plan by clicking on the XFER TO MAILBOX button on the SEC INDEX page.
The TRANSFER TO MAILBOX page is only available for the secondary flight plans.

ACCESS

The flight crew can access the TRANSFER TO MAILBOX page via the SEC INDEX page, by clicking on the XFER TO MAILBOX button.

SEC INDEX page

FREE TEXT

The flight crew can enter a free text, of maximum 24 characters, in the entry field. The free text is sent with the flight plan request to the ATC mailbox.

ENTRY FORMAT

Refer to FREE TEXT Entry Format .

TRANSFER BUTTON

When clicked, sends the secondary flight plan to the ATC mailbox.

L2 During the flight plan transmission to the ATC mailbox, the button displays XFER ... .

XFER

RETURN BUTTON

When clicked, displays the SEC INDEX page.

VERT REV PAGE

Applicable to: ALL

Overview

PURPOSE

The VERT REV page has 5 panels: RTA, SPD, CMS, ALT, and STEP ALTs.

On the RTA panel of the VERT REV page, the flight crew can:

- Insert, modify, or delete a time constraint (RTA) on a waypoint
- Insert, modify, or delete the Estimated Takeoff Time (ETT).

On the SPD panel of the VERT REV page, the flight crew can:
- Insert, modify, or delete a speed constraint on a waypoint
- Insert, modify, or delete the climb and descent speed limit.

On the CMS panel of the VERT REV page, the flight crew can insert, modify, or delete a Constant Mach Segment (CMS).
On the ALT panel of the VERT REV page, the flight crew can insert, modify, or delete a climb or descent altitude constraint on a waypoint.

On the STEP ALTS panel of the VERT REV page, the flight crew can:
- Insert, modify, or delete a step climb, or step descent on a waypoint
- Insert a step climb with optimum step start point.

The VERT REV page is available for the active and secondary flight plans.

LINKS

Refer to TIME CONSTRAINT Revision
Refer to SPEED CONSTRAINT Revision
Refer to SPEED LIMIT Revision
Refer to CONSTANT MACH SEGMENT Revision
Refer to ALTITUDE CONSTRAINT Revision
Refer to STEP ALTITUDES Revision

ACCESS

The flight crew can access the desired panel of the VERT REV page, as described in the following chapters:

ACCESS - RTA PANEL

The flight crew can access the RTA panel of the VERT REV page, via the F-PLN page, by:

- Clicking on the time prediction, associated to a waypoint.

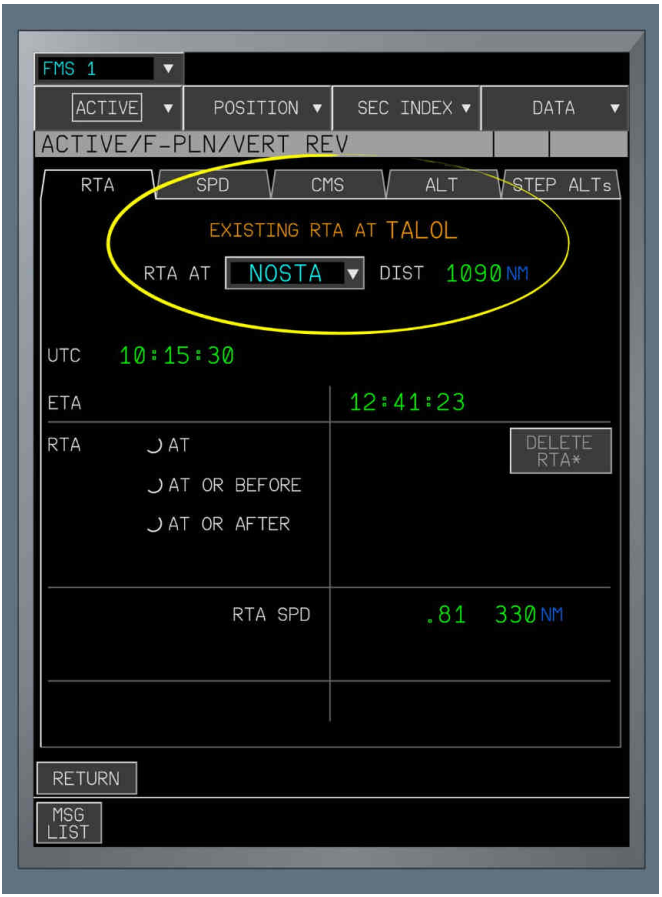
Time Prediction

- Selecting CONSTRAINTS in the waypoint revisions menu (followed by clicking on the RTA tab).

Waypoint Revisions Menu

L3 *Note: When an RTA already exists in the flight plan, and the flight crew accesses the RTA panel via a waypoint, other than the one with the RTA , the RTA panel displays EXISTING RTA AT (ident of the waypoint).*

EXISTING RTA AT



When the flight crew accesses the RTA panel via a waypoint on which it is not possible to insert a RTA , the RTA panel displays RTA NOT ALLOWED AT (ident of the waypoint).

RTA NOT ALLOWED AT

ACCESS - SPD PANEL

The flight crew can access the SPD panel of the VERT REV page, via:

- The F-PLN page by clicking on the speed prediction associated to a takeoff, climb, descent or approach waypoint

Speed Prediction

- The F-PLN page, by selecting CONSTRAINTS in the waypoint revisions menu (followed by clicking on the SPD tab of the VERT REV page).

Waypoint Revisions Menu

- The CLB or DES panel of the PERF page, by clicking on the SPD CSTR button.

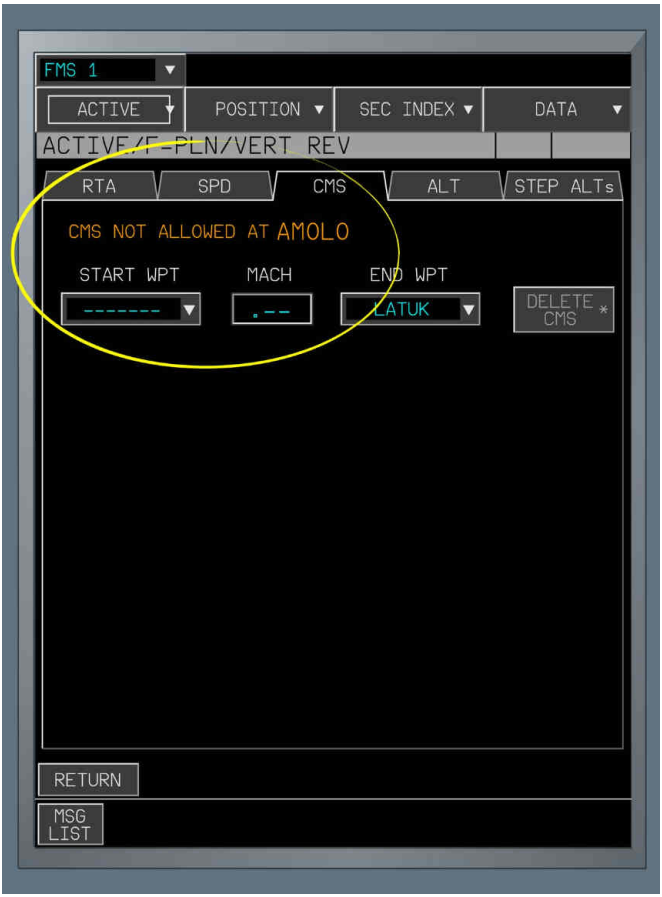
CMS NOT ALLOWED AT



When the flight crew accesses the CMS panel and it is not possible to insert a CMS, due to a special condition, the CMS panel will be empty, with a message that gives the reason of the unavailability of the function.

The possible messages are:
- *CMS NOT ALLOWED IN EO*
- *CMS NOT ALLOWED IN ALTN F-PLN*

CMS NOT ALLOWED IN EO

ACCESS - ALT PANEL

The flight crew can access the ALT panel of the VERT REV page, via the F-PLN page, by:

- Clicking on the altitude prediction associated to a takeoff, climb, descent, or approach waypoint

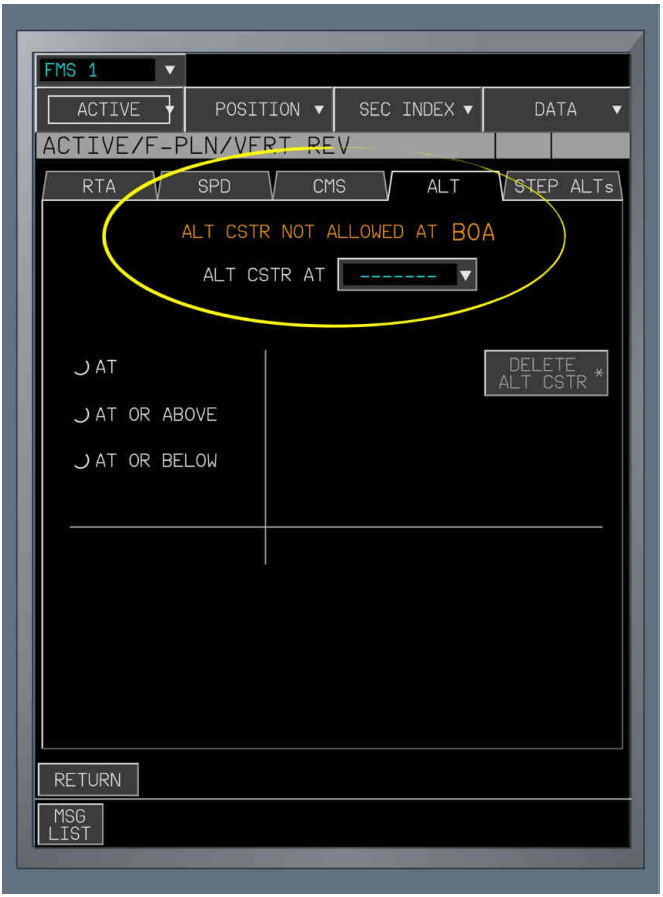
Altitude Prediction

- Selecting CONSTRAINTS in the waypoint revisions menu.

Waypoint Revision Menu

L3 *Note:* *When the flight crew accesses the ALT panel via a waypoint on which it is not possible to insert an altitude constraint, the ALT panel displays the message ALT CSTR NOT ALLOWED AT (ident of the waypoint).*

ALT CSTR NOT ALLOWED AT



When the flight crew accesses the ALT panel via a waypoint belonging to a too steep path segment, the ALT panel displays TOO STEEP PATH AHEAD.

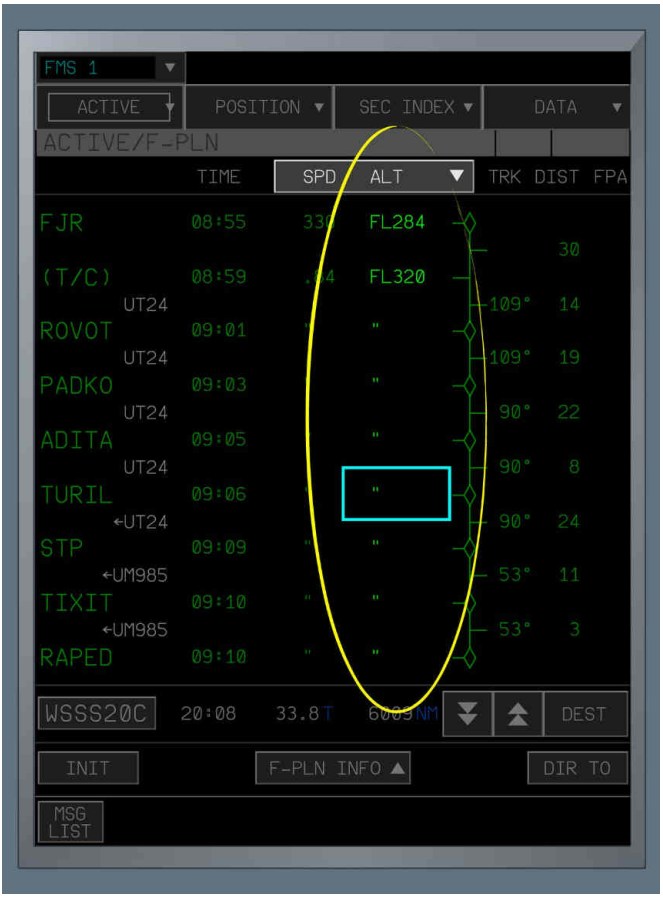
TOO STEEP PATH AHEAD

ACCESS - STEP ALTS PANEL

The flight crew can access the STEP ALTs panel of the VERT REV page, via:

- The F-PLN page, by clicking on the altitude prediction of a cruise waypoint

Altitude Prediction



- The F-PLN page, by selecting STEP ALTs in the waypoint revisions menu.

Waypoint Revisions Menu

- The CRZ panel of the PERF page, by clicking on the STEP ALTs button.

RETURN BUTTON

When clicked, displays the page that was displayed before the VERT REV page.

TEMPORARY FLIGHT PLAN BUTTON

When clicked, displays the F-PLN page.

RTA PANEL

RTA Panel

RTA MESSAGE AREA

This area may display one of the following labels:

- RTA NOT ALLOWED AT XXXXXXX (XXXXXXX is the revised waypoint ident):
  Indicates that the flight crew cannot create a time constraint on the revised waypoint.
- EXISTING RTA AT XXXXXXX (XXXXXXX is a waypoint ident):
  Indicates that the flight plan already has a time constraint on the waypoint XXXXXXX. This waypoint is different from the waypoint selected in the revised waypoint list.
  Only one time constraint can exist in the flight plan. If the flight crew creates a new time constraint on the selected waypoint, the FMS will delete the time constraint on the waypoint XXXXXXX.
- EXISTING RTA AT XXXXXXX DELETED IN TMPY (XXXXXXX is a waypoint ident):
  Indicates that the FMS has deleted the time constraint on the waypoint XXXXXXX.
  Only one time constraint can exist in the flight plan. If there is a time constraint on the waypoint XXXXXXX, and the flight crew creates a new time constraint on another waypoint, the FMS deletes the time constraint on the waypoint XXXXXXX.

REVISED WAYPOINT LIST

Waypoint List

The flight crew selects the waypoint in the list, or enters it into the entry field using the keyboard.
The list displays all possible waypoints, on which a time constraint can be defined.

L2 By default, the revised waypoint is selected.

L3 When an RTA already exists in the flight plan, and the flight crew selects a waypoint in the list, other than the one with the RTA , the panel displays EXISTING RTA AT (ident of the waypoint).

L1 **ENTRY FORMAT**

Refer to WAYPOINT Entry Format

WAYPOINT DISTANCE

Indicates the distance, along the flight plan, between the aircraft present position and the revised waypoint.
Dashes are displayed when no waypoint has been selected in the Waypoint list.

AIRCRAFT TIME

Indicates the UTC aircraft time, in flight.
In preflight, the Estimated Takeoff Time (ETT) entry field is displayed.

ETT

L2 The entered ETT will be the time reference for the flight plan time predictions.
Refer to More Information on the ETT

L1 **ENTRY FORMAT**

Refer to ETT Entry Format

WAYPOINT ETA

Indicates the Estimated Time of Arrival (ETA) at the revised waypoint.

RTA OPTION

The flight crew selects the type of time constraint:
- AT
- AT or BEFORE
- AT or AFTER

When one of the three options is selected, the associated RTA entry field is displayed.

RTA ENTRY FIELD

The flight crew enters in the entry field the Required Time of Arrival (RTA).
The default value for the RTA is the ETA at the revised waypoint.

ENTRY FORMAT

Refer to RTA Entry Format

RTA MACH/SPEED

Indicates the Mach number and CAS of the managed RTA SPD.
The RTA SPD is the managed speed when an RTA is defined in the flight plan.

L2 When a RTA is defined but not yet inserted in the active flight plan (the temporary flight plan is still pending), the displayed RTA SPD is the target speed of the managed speed mode after insertion of the temporary flight plan.

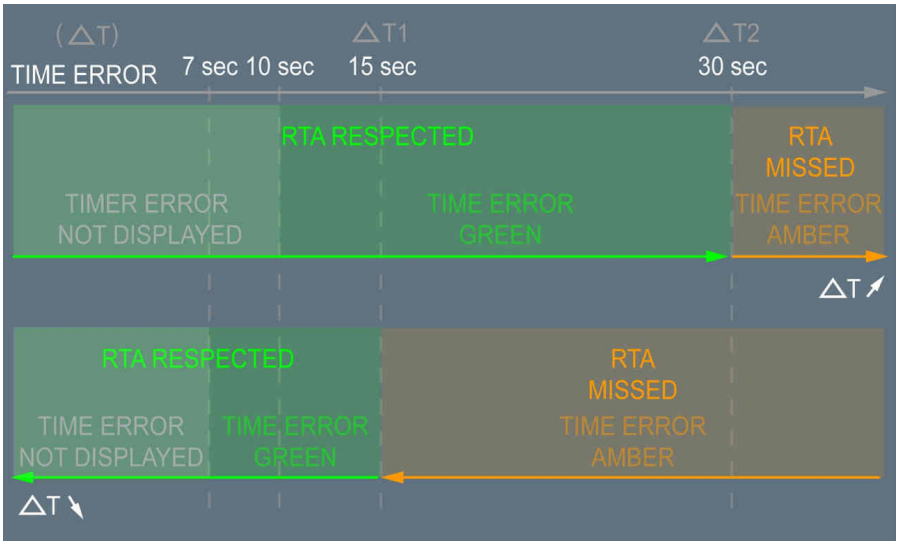
TIME ERROR

Indicates the time difference between the ETA and the RTA (Time error = ETA - RTA), and the type of time error, if applicable:

- LATE, if the time error is a positive value: the aircraft will arrive, at the revised waypoint, later than the requested AT or AT or BEFORE constraint
- EARLY, if the time error is a negative value: the aircraft will arrive, at the revised waypoint, earlier than the requested AT or AT or AFTER constraint.

L2 Following figure gives the display and color logic of the timer error:

Time Error Display



Note: *△T1 and △T2 are respectively 30 s and 15 s, if the distance between the aircraft and the waypoint with the time constraint is less than 2 000 nm.*
If the distance is more than 2 000 nm, △T1 and △T2 are linearly increased at a rate of 60 s per 1 000 nm.,

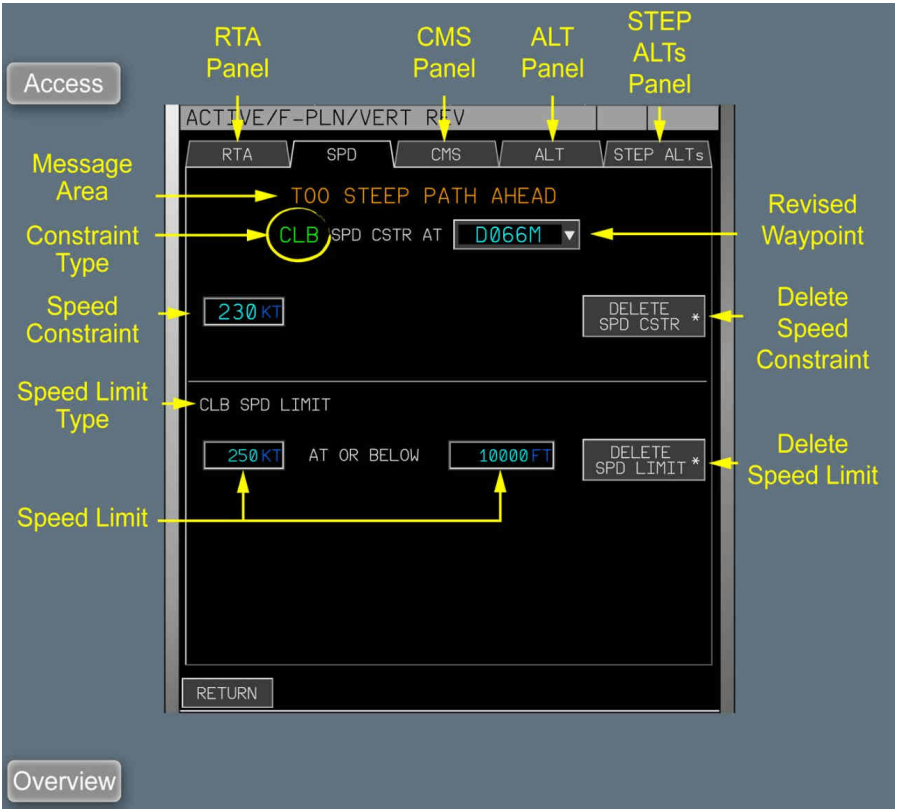
DELETE RTA BUTTON

When clicked, deletes the existing RTA and creates (or updates) the temporary flight plan.

L3 When clicked, and the flight phase is DESCENT or APPROACH and the aircraft current altitude is below FL 100 (or below the descent speed limit altitude if it is higher than FL 100), displays the F-PLN page.

SPD PANEL

SPD Panel



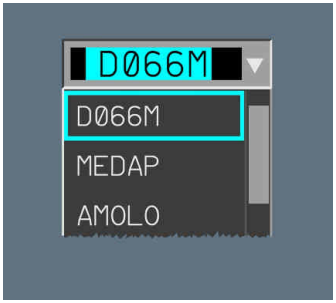
SPEED CONSTRAINT MESSAGE AREA

This area may display one of the following labels:

- SPD CSTR NOT ALLOWED AT XXXXXXX (XXXXXXX is the revised waypoint ident):
  Indicates that the flight crew cannot create a speed constraint on the revised waypoint.
- TOO STEEP PATH AHEAD:
  Indicates that the revised waypoint is part of a too steep path segment.

REVISED WAYPOINT LIST

Waypoint List



The flight crew selects the waypoint in the list, or enters it into the entry field using the keyboard.
The list displays all possible waypoints, on which a speed constraint can be defined.

L2 By default, the revised waypoint is selected.

L1 **ENTRY FORMAT**

Refer to WAYPOINT Entry Format

SPEED CONSTRAINT TYPE

Indicates whether the constraint is a climb (CLB) or descent (DES) speed constraint.
If the FMS cannot determine the type of constraint, the CLB/DES option is displayed. This option allows the flight crew to select the desired speed constraint type. (*Refer to CLB/DES Option*)

SPEED CONSTRAINT ENTRY FIELD

The flight crew enters the speed constraint in the entry field.
There may be a default speed constraint, stored in the navigation database with the revised waypoint. The flight crew can always overwrite the default value.

ENTRY FORMAT

Refer to SPD Entry Format

CLB/DES OPTION

With the CLB/DES option, the flight crew selects whether the constraint is a climb, or descent speed constraint.

CLB/DES Option

This option is only displayed if the FMS cannot determine the speed constraint type by itself.

DELETE SPEED CONSTRAINT BUTTON

When clicked, deletes the existing speed constraint and creates (or updates) the temporary flight plan.

SPEED LIMIT TYPE

Indicates whether the speed limit is a climb (CLB SPD LIMIT) or descent (DES SPD LIMIT) speed limit.

SPEED LIMIT ENTRY FIELDS

The flight crew enters the speed and altitude values of the speed limit in the entry fields.

The default speed limit may be (in the following order of priority):
- The navigation database value (the speed limits can be stored with the associated origin and destination airports)
- The FMS default value, that is 250 kt / 10 000 ft

The flight crew can always overwrite the default value.

ENTRY FORMAT

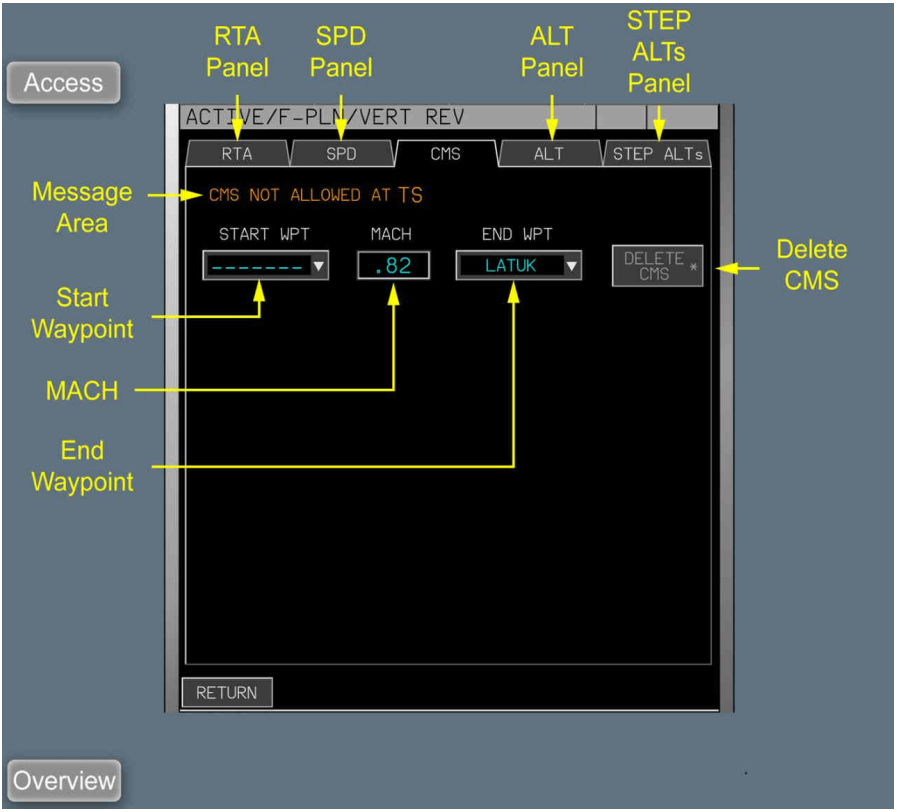
Refer to SPD Entry Format
Refer to ALT Entry Format

DELETE SPEED LIMIT BUTTON

When clicked, deletes the existing speed limit and creates (or updates) the temporary flight plan.

CMS PANEL

CMS Panel

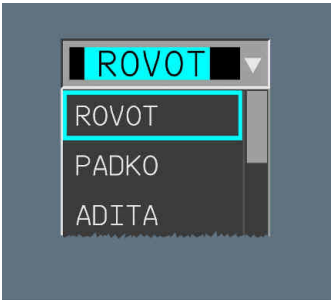


CMS MESSAGE AREA

The CMS NOT ALLOWED AT XXXXXXX (XXXXXXX is the revised waypoint ident) label, indicates that the flight crew cannot create a CMS on the revised waypoint.

START WAYPOINT LIST

Start Waypoint List



The flight crew selects the start waypoint in the list, or enters it into the entry field using the keyboard.
The start waypoint list displays all flight plan cruise waypoints down path the aircraft present position.

ENTRY FORMAT

Refer to WAYPOINT Entry Format

MACH ENTRY FIELD

The flight crew enters the Mach value in the entry field.

ENTRY FORMAT

Refer to MACH Entry Format

END WAYPOINT LIST

End Waypoint List

The flight crew selects the end waypoint in the list, or enters it into the entry field using the keyboard.
The end waypoint list displays all flight plan cruise waypoints down path the selected start waypoint.

ENTRY FORMAT

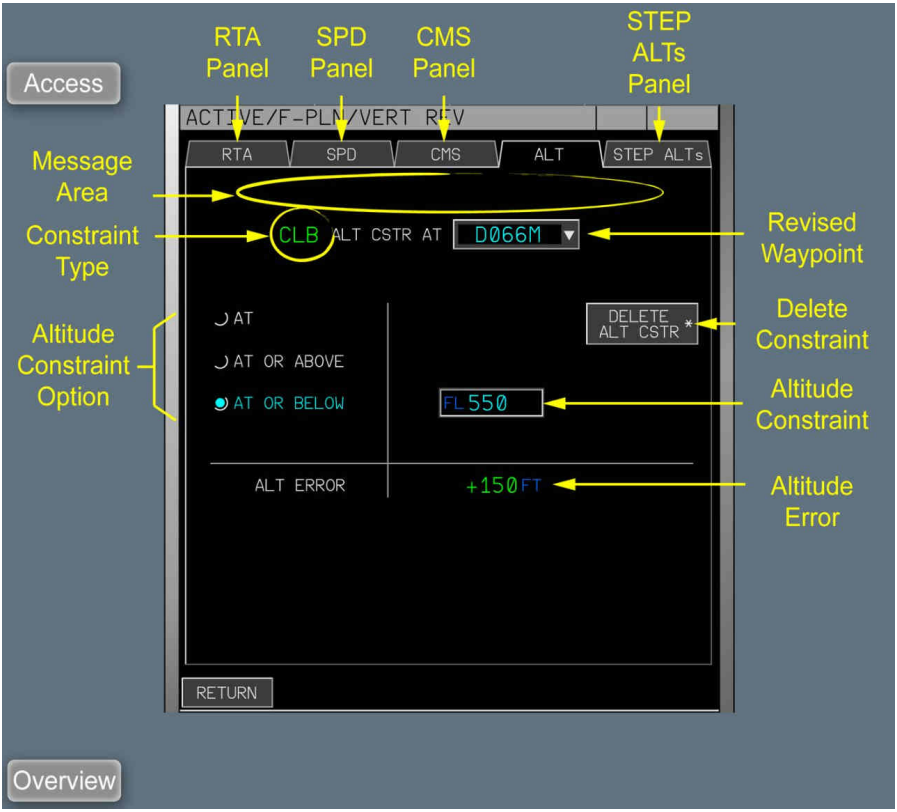
Refer to WAYPOINT Entry Format

DELETE CMS BUTTON

When clicked, deletes the existing CMS and creates (or updates) the temporary flight plan.

ALT PANEL

ALT Panel



ALTITUDE CONSTRAINT MESSAGE AREA

This area may display one of the following labels:

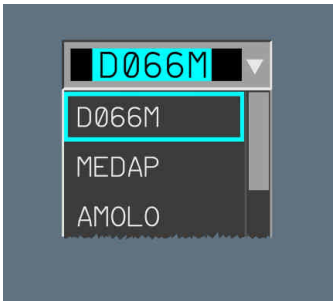
- ALT CSTR NOT ALLOWED AT XXXXXXX (XXXXXXX is the revised waypoint ident):
  Indicates that the flight crew cannot create an altitude constraint on the revised waypoint.
- TOO STEEP PATH AHEAD:
  Indicates that the revised waypoint is part of a too steep path segment.

ALTITUDE CONSTRAINT TYPE

Indicates whether the constraint is a climb (CLB) or descent (DES) altitude constraint.
If the FMS cannot determine the type of constraint, the CLB/DES option is displayed. This option allows the flight crew to select the desired altitude constraint type. (*Refer to CLB/DES Option*)

REVISED WAYPOINT LIST

Waypoint List



The flight crew selects the waypoint in the list, or enters it into the entry field using the keyboard.
The list displays all possible waypoints, on which an altitude constraint can be defined.

L2 By default, the revised waypoint is selected.

L1 **ENTRY FORMAT**

Refer to WAYPOINT Entry Format

ALTITUDE CONSTRAINT OPTION

The flight crew selects the type of altitude constraint:
- AT
- AT or ABOVE
- AT or BELOW

When one of these three options is selected, the associated entry field is displayed.
The navigation database may have a window altitude constraint associated with the revised waypoint. The flight crew cannot manually create a window altitude constraint.
If there is one, the window constraint is selected by default.

Note: After selecting an AT, AT OR ABOVE, or AT OR BELOW constraint, the flight crew cannot select the window constraint again.

Window Altitude Constraint

ALTITUDE CONSTRAINT ENTRY FIELD

The flight crew enters the altitude constraint in the entry field.

ENTRY FORMAT

Refer to ALT Entry Format

CLB/DES OPTION

With the CLB/DES option, the flight crew selects whether the constraint is a climb, or descent altitude constraint.

CLB/DES Option

This option is only displayed if the FMS cannot determine the altitude constraint type by itself.

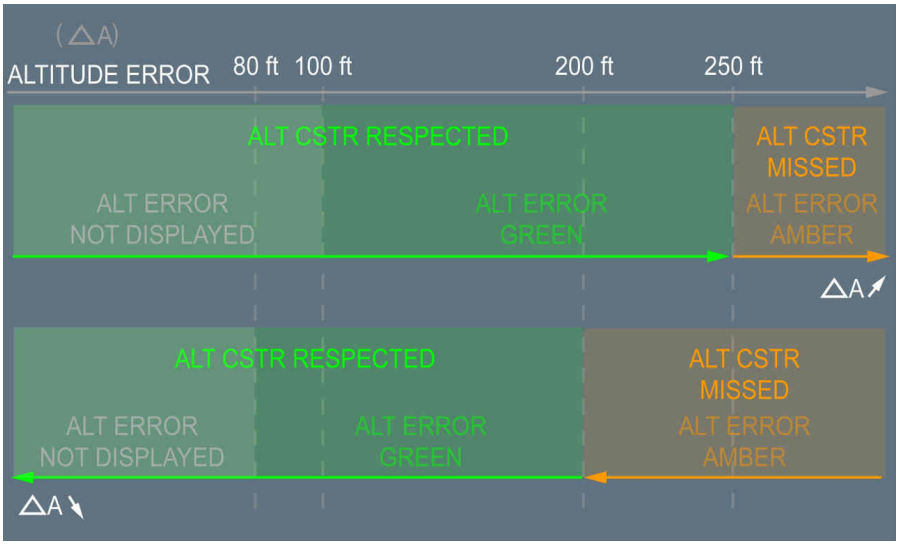
ALTITUDE ERROR

Indicates the altitude difference between the altitude constraint value and the predicted altitude value on the waypoint (ALT ERROR = Predicted Altitude - Altitude Constraint):

- If the altitude error is positive: the aircraft will be higher than the requested AT, AT or BELOW, or WINDOW constraint
- If the altitude error is negative: the aircraft will be lower than the requested AT, AT or ABOVE, or WINDOW constraint

L2 Following figure gives the display and color logic of the altitude error:

Altitude Error Display

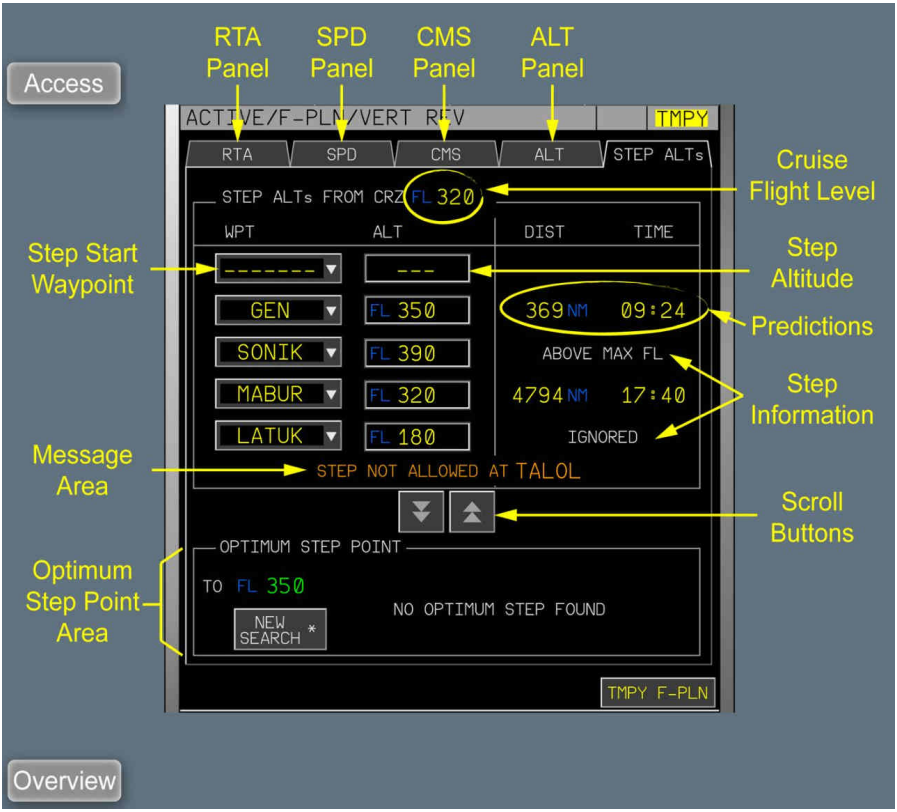


DELETE ALTITUDE CONSTRAINT BUTTON

When clicked, deletes the existing altitude constraint and creates (or updates) the temporary flight plan.

STEP ALT s PANEL

STEP ALTs Panel

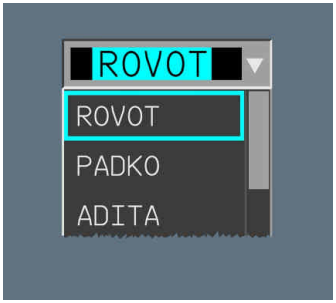


CRUISE FLIGHT LEVEL

Indicates the cruise flight level of the active flight plan.

STEP START WAYPOINT LIST

Start Waypoint



The flight crew selects the start waypoint in the list, or enters it into the entry field using the keyboard.
The start waypoint list displays all flight plan cruise waypoints down path the aircraft present position.
The default start waypoint for a new step is the revised waypoint.
When the flight crew has selected the optimum step point, the entry field displays OPT.

ENTRY FORMAT

Refer to WAYPOINT Entry Format
The flight crew can enter a place / distance, only when the flight crew has already entered a step altitude on the same line.
Refer to PLACE/DISTANCE Entry Format

ALTITUDE ENTRY FIELD

The flight crew enters the step altitude in the entry field.

ENTRY FORMAT

Refer to ALT Entry Format

STEP INFORMATION LABEL

Indicates that the step is ignored, or that the entered step is above the recommended maximum flight level.

L2 A step is ignored, when:
- The step end waypoint (the point of reaching the step altitude), is nearer than 50 nm to the T/D, or
- The step start point, or the step end waypoint, is located before the T/C or after the T/D.

Ignored steps are not deleted, but are ignored for the computation of predictions. An ignored step is not indicated in the flight plan on the MFD or the ND, but remains displayed on the STEP ALTs panel on the VERT REV page.
An ignored step may become a predicted step again, after a flight plan change.

DISTANCE AND TIME PREDICTIONS

Indicate:
- The distance to the step start waypoint, along the flight plan
- The estimated time of arrival (or flight time) at the step start waypoint.

SCROLL BUTTONS

The flight crew uses the scroll buttons to move, page by page, downwards (upwards) through the list of step altitudes.

STEP ALTS MESSAGE AREA

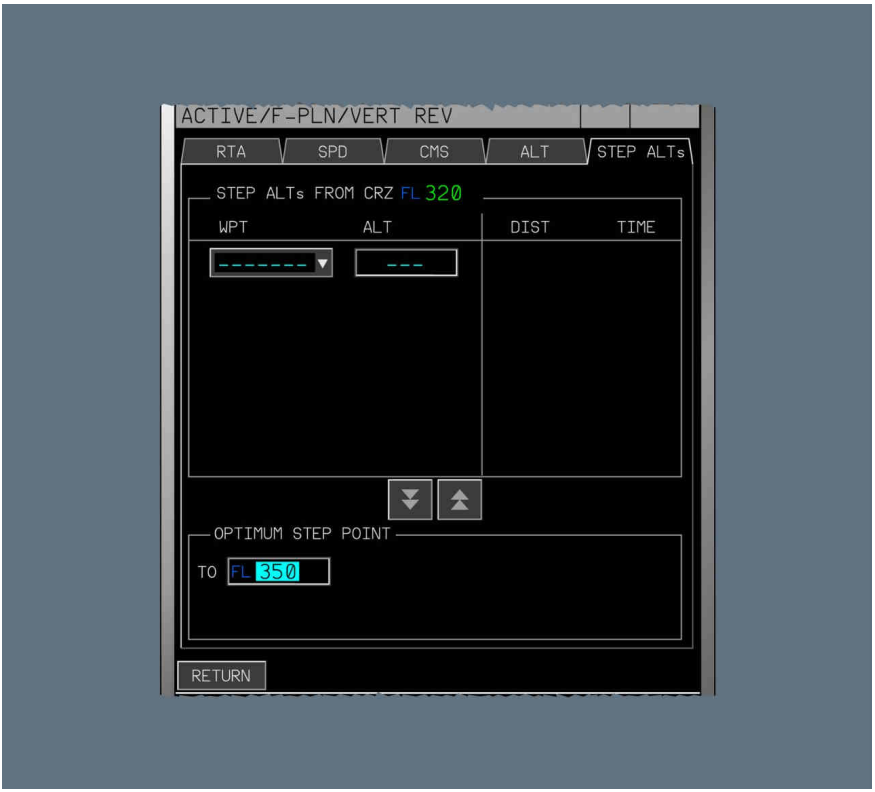
The STEP NOT ALLOWED AT XXXXXXX (XXXXXXX is the revised waypoint ident) label, indicates that the flight crew cannot create a step altitude on the revised waypoint.

OPTIMUM STEP POINT AREA

NO STEP IN THE FLIGHT PLAN

When no step exists in the flight plan, this area displays an altitude entry field:

Step Altitude Entry



The flight crew enters the step altitude for which he wants to compute the optimum step point. (*Refer to ALT Entry Format*)

Note: *The entered step altitude needs to be at least 100 ft above the current cruise flight level.*

When a valid step altitude is entered, the FMS computes the optimum step point and displays the predictions:

Note: *During the optimum step point computation, the optimum step point area displays NO OPTIMUM STEP POINT.*

Optimum Step Point

Distance and Time Predictions

Indicates the distance along the flight plan to the optimum step point, and the time of arrival (or flight time) at the optimum step point.

L2 These predictions are not displayed when the optimum step point is inserted in the active (or temporary flight plan).

L1 Fuel and Time Savings

Indicate the savings that would be made, if the step climb with optimum step point was inserted in the flight plan.
A minus sign means that there will be a fuel, or time saving.
A plus sign means that there will be an additional fuel, or time, cost.

Select / Update Button

When clicked if the button displays SELECT, inserts the optimum step point in the temporary flight plan, and displays the OPTIMUM SELECTED label.

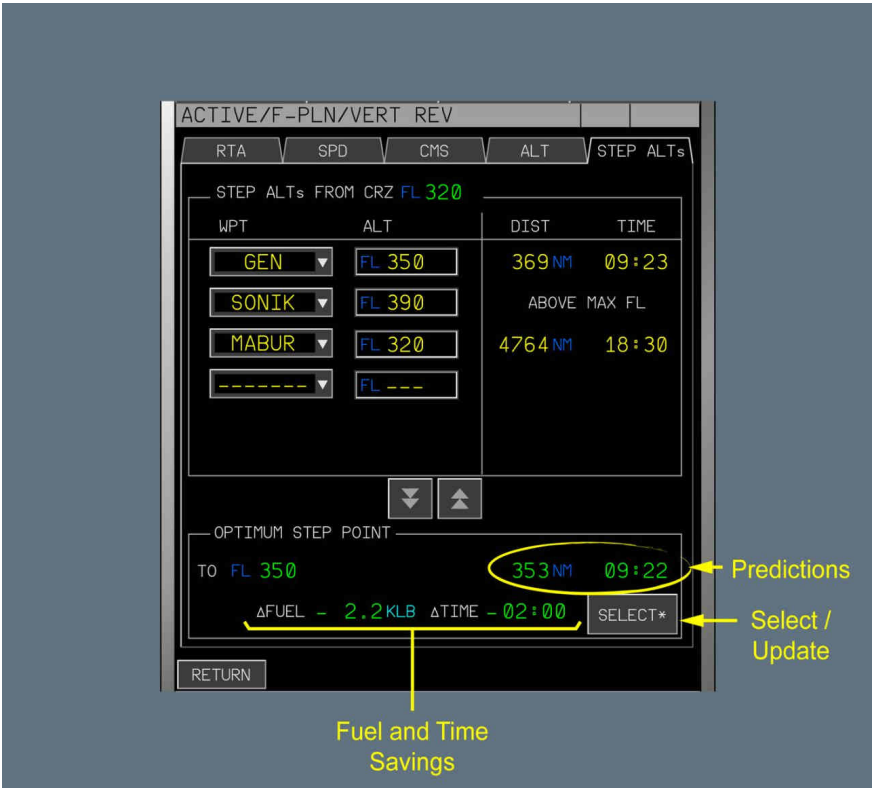
Optimum Selected

When clicked if the button displays UPDATE, the FMS will compute again the optimum step point. When the computation results in a new optimum step point, the flight crew has to click on the SELECT button to insert it in the temporary flight plan.

THE FLIGHT PLAN HAS AT LEAST ONE STEP

When the next down path step in the flight plan is a step climb, the FMS computes the optimum step point for this step, and displays the predictions:

Optimum Step Point



Step Altitude

Indicates the climb step altitude of the computed optimum step point.

Distance and Time Predictions

Indicates the distance along the flight plan to the optimum step point, and the time of arrival (or flight time) at the optimum step point.

L2 These predictions are not displayed when the optimum step point is inserted in the active (or temporary flight plan).

L1 Fuel and Time Savings

Indicate the savings that would be made, if the step climb was initiated at the optimum step, instead of at the start waypoint entered by the flight crew.

A minus sign means that there will be a fuel, or time saving.
A plus sign means that there will be an additional fuel, or time, cost.

Select / Update Button

When clicked if the button displays SELECT, inserts the optimum step point in the temporary flight plan, and displays the OPTIMUM SELECTED label.

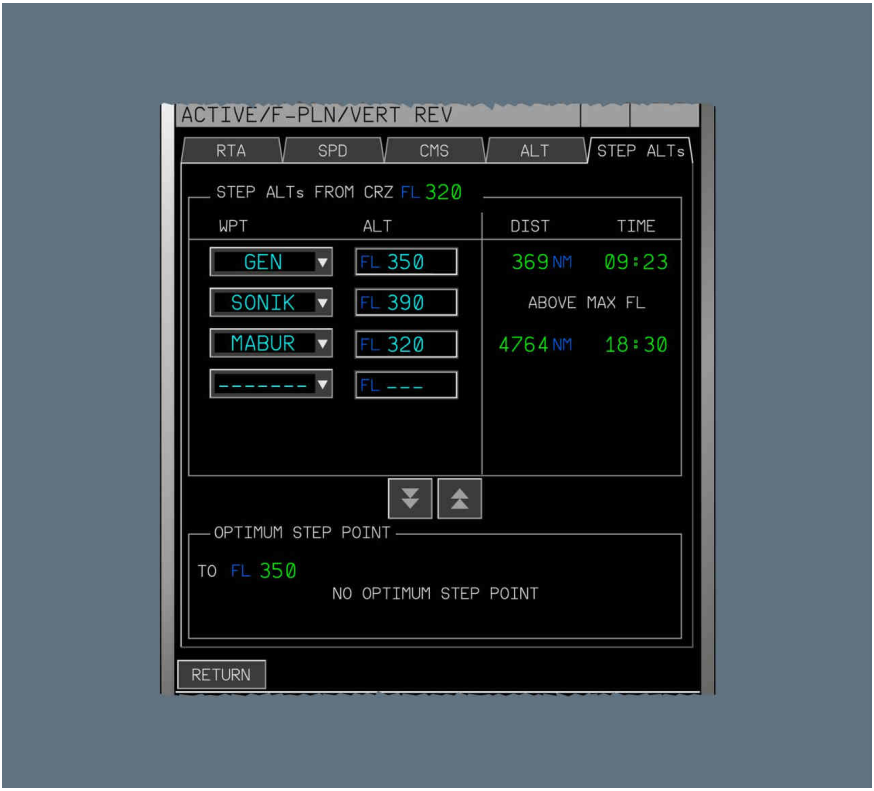
Optimum Selected

When clicked if the button displays UPDATE, the FMS will compute again the optimum step point. When the computation results in a new optimum step point, the flight crew has to click on the SELECT button to insert it in the temporary flight plan.

NO OPTIMUM STEP

If no optimum step point exists, or when the FMS is computing the optimum step point, the NO OPTIMUM STEP POINT label appears.

NO OPTIMUM STEP POINT



If a time constraint exists in the flight plan, the FMS cannot compute the optimum step point. In this case, the OPTIMUM NOT AVAIL: RTA EXISTING label appears.

RTA EXISTING

WIND PAGE

Applicable to: ALL

WIND Page — Overview

PURPOSE

On the WIND page, the flight crew can:

- Insert climb, cruise, and descent winds
- Insert cruise temperatures
- Insert the alternate trip wind
- Insert (or clear) the received company wind data.

The WIND page is available for the active and secondary flight plans.

LINKS

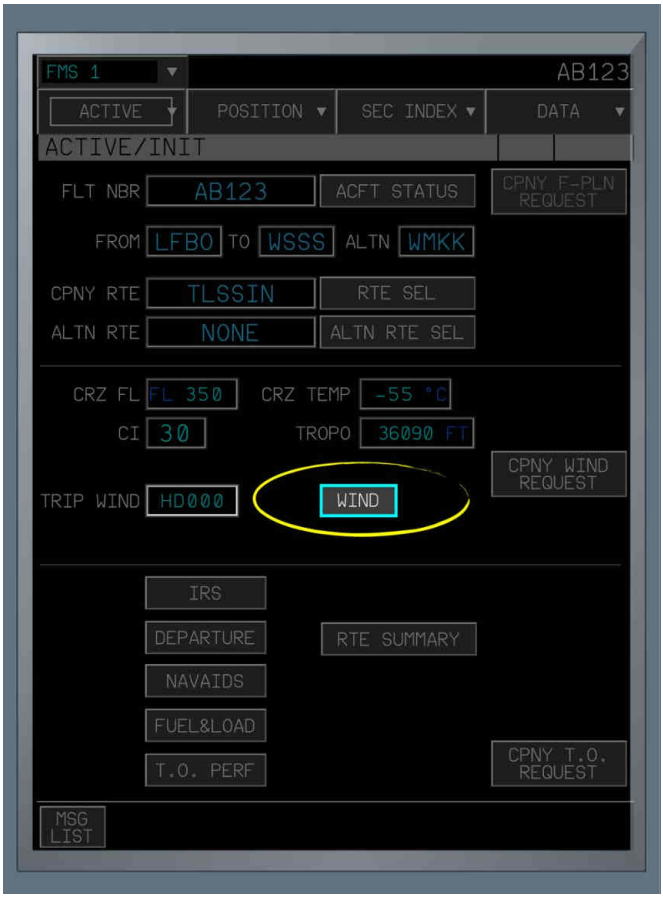
Refer to More Information on the WIND Revision

ACCESS

The flight crew can access the WIND page, via:

- The INIT page, by clicking on the Wind button

Wind Button on the INIT Page



- The F-PLN page, by:
  - Clicking directly on the wind prediction, associated to the waypoint

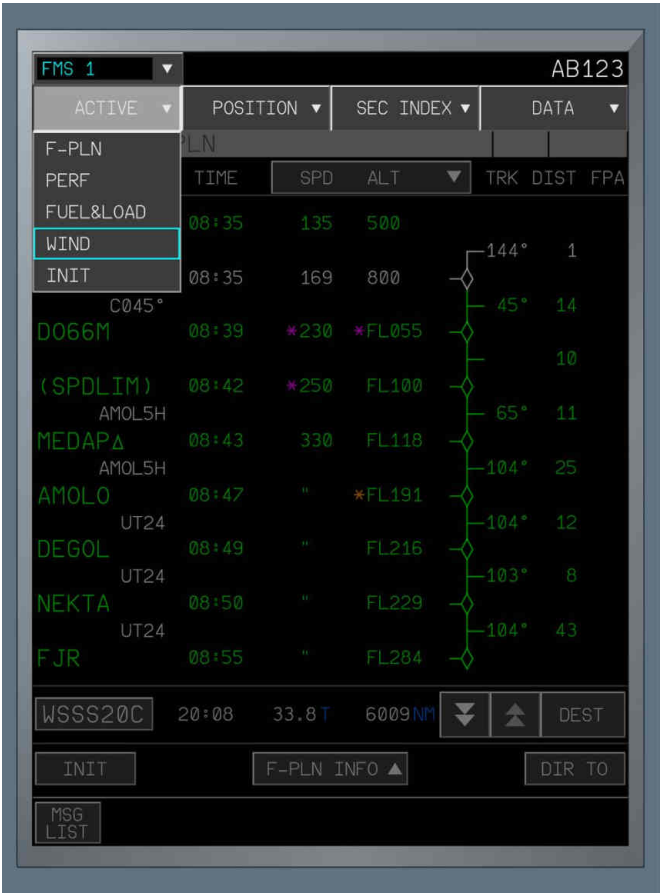
Wind Prediction on the F-PLN Page

- Selecting the WIND revision in the waypoint revisions menu on any waypoint.

Revisions Menu on the F-PLN Page

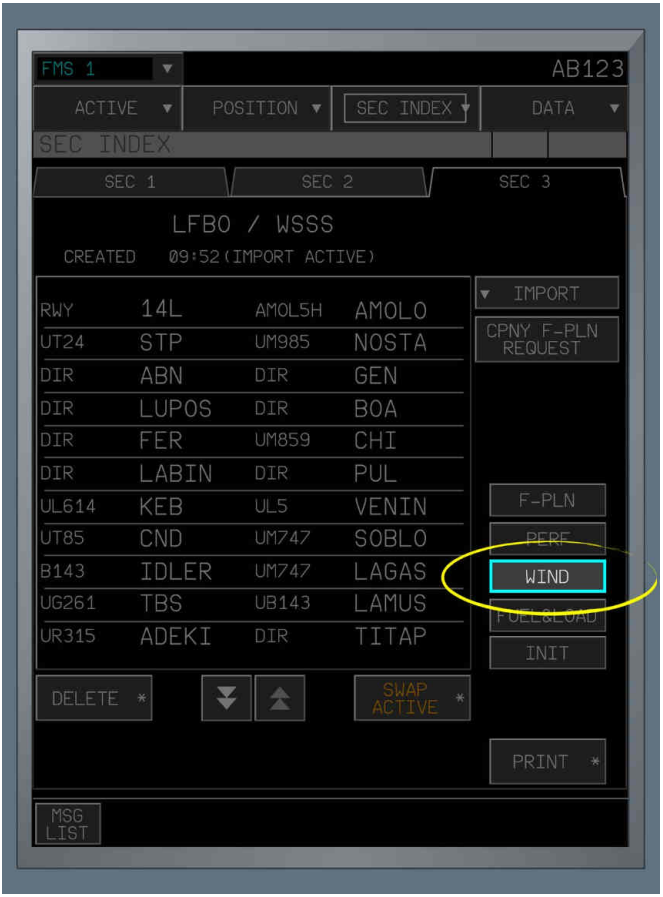
- The General Menu Bar, by selecting the WIND option from the ACTIVE menu.

General Menu Bar



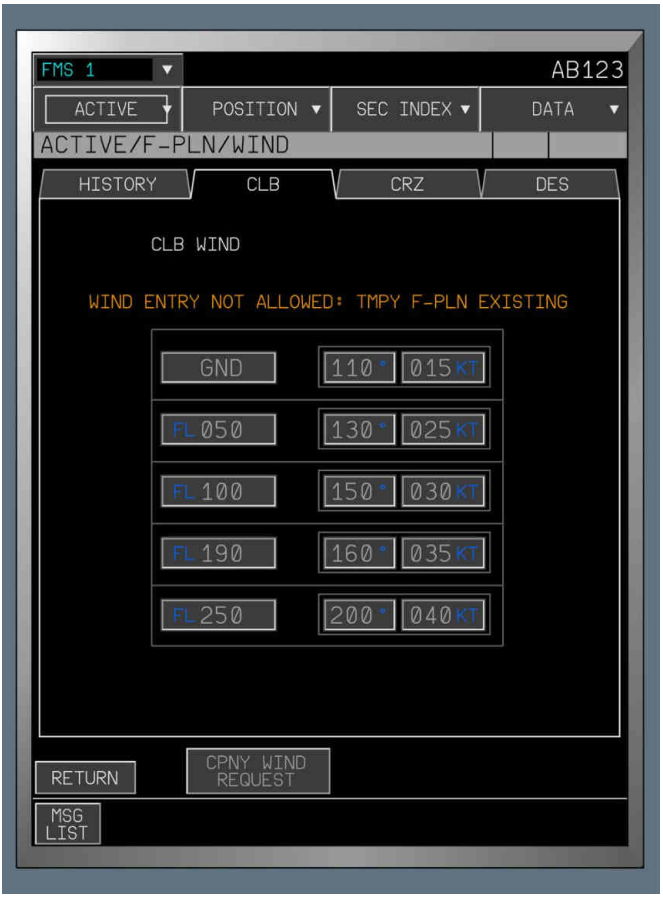
Note: *For the secondary flight plans, the flight crew can access the WIND page via the SEC / INIT or SEC / F-PLN page, or via the SEC INDEX page, by clicking on the WIND button.*

SEC INDEX Page



L2 When a temporary flight plan is pending, the flight crew cannot enter or change any wind data. In that case, the flight crew can still access the wind page. However, the entry fields cannot be selected and the WIND page displays WIND ENTRY NOT ALLOWED : TMPY F-PLN EXISTING.

WIND ENTRY NOT ALLOWED



RETURN BUTTON

When clicked, displays the page that was displayed before the WIND page.
The return button is not displayed, if the flight crew has accessed the WIND page via the General Menu Bar.

COMPANY WIND REQUEST BUTTON

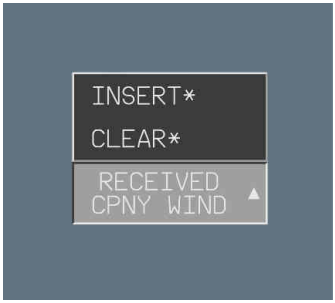
When clicked, sends via ACARS a company wind request to the company ground station.

If the Free Text AMI option is activated, clicking on the CPNY WIND REQUEST button will display the COMPANY WIND DATA REQUEST page. (*Refer to Page*)
On this page, the flight crew can enter any free text that will be sent with the wind request.
When an active wind request is pending, the button displays REQUEST PENDING ... . The button gives still access to the COMPANY WIND DATA REQUEST page.

REQUEST PENDING ...

When company wind data is received, the button displays RECEIVED CPNY WIND. When clicked, opens a menu that allows the flight crew to insert, or clear the received company wind.

RECEIVED CPNY WIND



INSERT WIND BUTTON

When clicked, inserts the draft climb, cruise, and descent winds and temperatures.
Insertion, change, or deletion of wind data, creates a set of draft winds. The draft winds are not considered for predictions computation before they are inserted.
The Draft Wind label indicates that a set of draft winds exists.

Note: When draft winds are pending and a temporary flight plan is created (by a flight plan revision, other than the WIND revision), the draft winds are inserted automatically in the active (and temporary) flight plan.

CANCEL WIND BUTTON

When clicked, cancels the draft climb, cruise, and descent winds and temperatures. After cancelling the draft winds, the WIND page displays the inserted winds that were considered before the wind update.
Insertion, change, or deletion of wind data, creates a set of draft winds. The draft winds are not considered for predictions computation before they are inserted.
The Draft Wind label indicates that a set of draft winds exists.

Note: When draft winds are pending and a temporary flight plan is created (by a flight plan revision, other than the WIND revision), the draft winds are inserted automatically in the active (and temporary) flight plan.

HISTORY WINDS

The history winds are the stored descent winds of the previous flight.
Winds are measured, and stored for the CRZ FL, FL 250 , FL 150 , and FL 050 .
The wind format is: Wind Direction (True North Reference) / Wind Velocity (knots).
In preflight, the flight crew can insert the history winds of the previous flight as the climb winds for the next flight, with the Insert History Wind button. (*Refer to Button*)
L2 The history winds are only available for the active flight plan.

INSERT HISTORY WIND BUTTON

When clicked, inserts the history winds as the climb winds of the active flight plan, and displays the CLB panel of the WIND page.

Note:
- *Insertion of the history winds does not create draft climb winds. The winds are directly inserted in the active flight plan.*
- *The flight crew cannot insert the history winds when draft winds, or a temporary flight plan are pending.*

CLIMB WIND ENTRY FIELDS

Indicate the wind direction and velocity, associated to (maximum) 5 altitudes or flight levels.
Inserted history winds are displayed in small font.
Inserted company wind uplinks, and wind data entered by the flight crew are displayed in big font.

L2 The climb winds can only be entered, or changed:
- In preflight, and
- When no temporary flight plan is pending.

L1 **WIND ALTITUDE**

Indicates a climb altitude:
- In feet, if the altitude is below the transition altitude
- In flight level, if the altitude is above the transition altitude.

The flight crew can enter a ground wind, by entering an altitude less than 400 ft , or by entering "GND" in the entry field.
Refer to WIND ALTITUDE ENTRY FORMAT

WIND DIRECTION AND VELOCITY

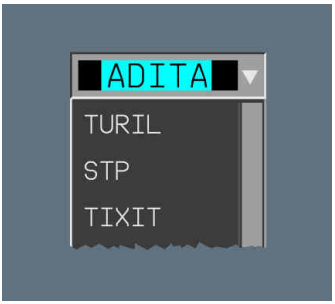
Indicates the wind direction (True North Reference), and the wind velocity (knots).
Refer to WIND DIRECTION ENTRY FORMAT
Refer to WIND VELOCITY ENTRY FORMAT

DRAFT WIND LABEL

Indicates (on the CLB, CRZ, and DES panel) that draft winds are pending.
Insertion, change, or deletion of wind data, creates a set of draft winds. The draft winds are not considered for predictions computation before they are inserted.

CRUISE WAYPOINT LIST

Cruise Waypoint List



Displays all cruise waypoints of the primary flight plan (between T/C and T/D).
The flight crew selects in the list the cruise waypoint for which he wants to display, and/or change the wind and temperature data.

WAYPOINT SCROLL BUTTONS

The flight crew uses the scroll down (or up) button to display the wind and temperature data of the next down path (or previous up path) cruise waypoint, without opening the cruise waypoint list.

Note: When the cursor is on the CRZ panel of the WIND page, the wheel of the KCCU has the same functionality as the scroll buttons: Scrolling down (or up) the wheel displays the next down path (or previous up path) cruise waypoint and its wind data.

CRUISE WIND ENTRY FIELDS

Indicate the wind direction and velocity, associated to a maximum of 4 flight levels.

L2 The cruise winds can only be entered if no temporary flight plan is pending.

L1 WIND ALTITUDE

Indicates a cruise flight level.
When the flight crew enters an altitude, the altitude is propagated to all (up-path and down-path) cruise waypoints. The flight crew can only change this altitude on the waypoint that it was defined on, and not on the waypoints where the altitude was propagated. If the waypoint is sequenced, the flight crew can change the altitude value on the next down-path waypoint.
Refer to WIND ALTITUDE Entry Format

WIND DIRECTION AND VELOCITY

Indicates the wind direction (True North Reference), and the wind velocity in knots.
When the flight crew enters a wind direction and velocity, they are propagated to the down-path cruise waypoints until the waypoint for which the flight crew has entered different wind data for the same flight level.
The flight crew can always change, but not clear, propagated wind data.
Propagated wind data is displayed in small font. Flight crew-entered wind data is displayed in big font.
Refer to WIND DIRECTION Entry Format
Refer to WIND VELOCITY Entry Format

EXAMPLE

STEP1: The flight crew enters a wind altitude, direction, and velocity at ADITA:
- The wind altitude (FL 320) is propagated to all waypoints, and this altitude can only be changed at ADITA
- The wind direction, and velocity (320 ° / 050 kt) are propagated to all down-path waypoints, and can be changed at all down-path waypoints

STEP 1

STEP 2: The flight crew changes the propagated wind at STP: The new wind direction, and velocity (315 ° / 055 kt) are propagated to all down-path waypoints, and can be changed at all down-path waypoints.

STEP 2

STEP 3: The flight crew enters a wind altitude, direction, and velocity at TURIL:

- The wind altitude (FL 290) is propagated to all waypoints, and this altitude can only be changed at TURIL
- The wind direction, and velocity (300 ° / 035 kt) are propagated to all down-path waypoints, and can be changed at all down-path waypoints

STEP 3

STEP 4: The aircraft sequences ADITA: The wind altitude (FL 320), that was entered at ADITA can now be changed at TURIL.

STEP 4

SAT ENTRY FIELDS

Indicates a flight level, and its associated Static Air Temperature (SAT).
The flight crew enters the altitude and SAT to define a temperature profile for predictions computation.

L2 The FMS defines an estimated temperature profile based on the difference between a reference temperature profile, and a measured or entered Static Air Temperature (SAT) at different altitudes.
The reference temperature profile is defined by the tropopause altitude that is entered on the INIT page. The default tropopause altitude is the ISA tropopause.
The flight crew defines the deviation from the reference temperature profile, for the cruise waypoints, by entering the SAT associated to an altitude.

L1 The temperature is propagated to the down path cruise waypoints in the same manner as the wind data.

ENTRY FORMAT

Refer to SAT ALTITUDE ENTRY FORMAT
Refer to SAT ENTRY FORMAT

DESCENT WIND ENTRY FIELDS

Indicate the wind direction and velocity, associated to (maximum 5) altitudes or flight levels.

L2 The descent winds can only be entered, or changed:
- Before the DESCENT flight phase, and
- When no temporary flight plan is pending.

L1 **WIND ALTITUDE**

Indicates the descent altitude:
- In feet, if the altitude is below the transition altitude
- In flight level, if the altitude is above the transition altitude.

The flight crew can enter a ground wind, by entering an altitude less than 400 ft , or by entering "GND" in the entry field.
Refer to WIND ALTITUDE ENTRY FORMAT

WIND DIRECTION AND VELOCITY

Indicates the wind direction (True North Reference), and the wind velocity (knots).
Refer to WIND DIRECTION ENTRY FORMAT
Refer to WIND VELOCITY ENTRY FORMAT

ALTERNATE CRUISE ALTITUDE

Indicates the alternate cruise flight level.
If the alternate flight plan distance is less than 200 nm, the alternate cruise flight level is FL 220. If the alternate flight plan distance is 200 nm or more, the alternate cruise flight level is FL 310.
The flight crew cannot change the alternate cruise flight level.

ALTERNATE TRIP WIND ENTRY FIELDS

Indicate the alternate trip wind direction (True North Reference) and velocity (knots).
L2 The alternate wind can only be entered if no temporary flight plan is pending.

L1 **ENTRY FORMAT**

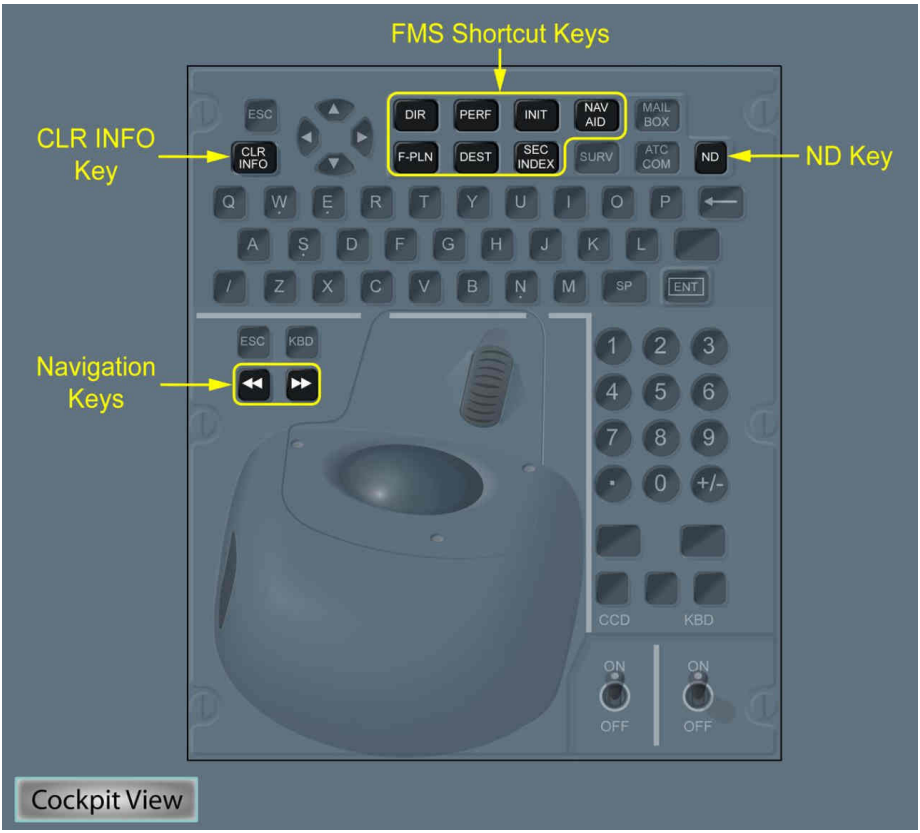
Refer to WIND DIRECTION Entry Format
Refer to WIND VELOCITY Entry Format

Intentionally left blank

FMS DEDICATED KCCU CONTROLS

Applicable to: ALL

FMS Dedicated KCCU Controls



There are two Keyboard and Cursor Control Units (KCCU s) on the center pedestal. There is one for the Captain and one for the First Officer.

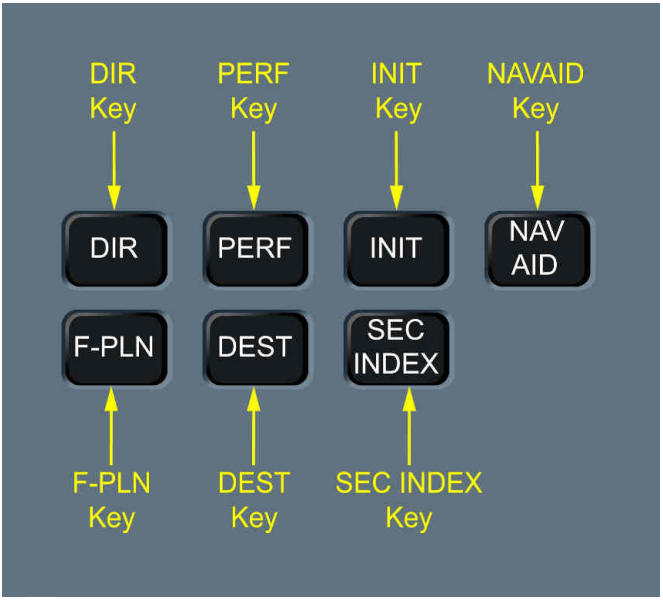
The flight crew uses the Keyboard and Cursor Control Unit (KCCU) to:

- Navigate through the FMS pages on the MFD
- Enter and modify data on the MFD FMS pages
- Perform some flight-plan revisions on the lateral ND .

The FMS dedicated KCCU controls are:
- The FMS shortcut keys
- The CLR INFO key
- The ND key
- The Navigation keys

For information on all KCCU controls, *Refer to Indicating/Recording - KCCU* .

FMS Shortcut Keys



DIR KEY

When pressed:
- Displays the FMS DIRECT TO page on the MFD (*Refer to FMS - DIRECT TO page*)
- Moves the cursor back to the MFD if it was on an other display before.

PERF KEY

When pressed:

- Displays the FMS ACTIVE / PERF page (on the panel that corresponds to the active flight phase) on the MFD (*Refer to FMS - PERF page*)
- Moves the cursor back to the MFD if it was on an other display before.

INIT KEY

When pressed:

- Displays the FMS ACTIVE / INIT page on the MFD (*Refer to FMS - INIT page*)
- Moves the cursor back to the MFD if it was on an other display before.

NAVAID KEY

When pressed:

- Displays the FMS POSITION / NAVAIDS page on the MFD (*Refer to POSITION / NAVAIDS page*)
- Moves back the cursor to the MFD if it was on an other display before.

F-PLN KEY

When pressed:

- Displays the top of the flight plan on the FMS ACTIVE / F-PLN page on the MFD , (*Refer to FMS - F-PLN page*)
- Moves the cursor back to the MFD if it was on an other display (ND , or ATC Mailbox) before.

DEST KEY

When pressed:

- Displays the bottom of the primary flight plan on the FMS ACTIVE / F-PLN page on the MFD (*Refer to FMS - F-PLN page*)
- Moves the cursor back to the MFD if it was on an other display before.

SEC INDEX KEY

When pressed:

- Displays the FMS SEC / INDEX page on the MFD (*Refer to FMS - SEC / INDEX page*)
- Moves the cursor back to the MFD if it was on an other display before.

CLR INFO KEY

When pressed, clears the message that is currently displayed in the FMS Message Area. (*Refer to Message Area)*

Note: This key is also used to clear the ATC COM , and SURV messages.

ND KEY

When pressed, moves the cursor to the ND.

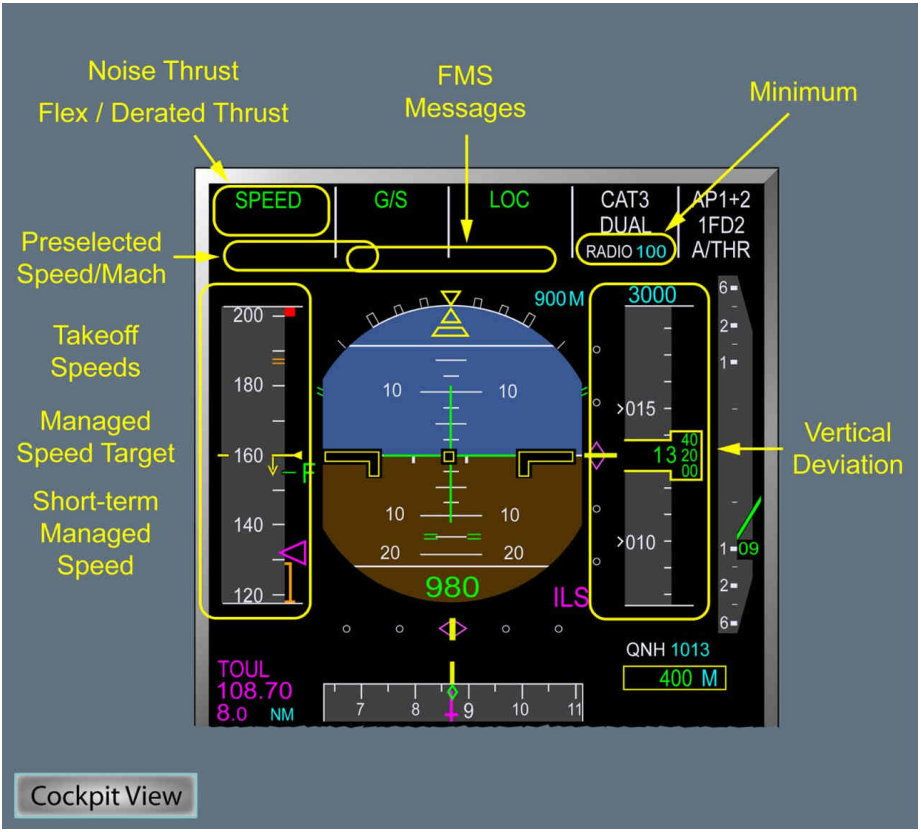
NAVIGATION KEYS

Moves the cursor to the display unit that is to the right, or to the left, of the one that is currently selected (if applicable).

FMS DATA ON PFD

Applicable to: ALL

FMS Data on PFD



FMS MESSAGES

Applicable to: ALL

FMS MESSAGES

The third line of the Flight Mode Annunciator (FMA) may display the following FMS messages:

- *Refer to CHECK APPR SEL*
- *Refer to CHECK EO SPD SETTING*

- *Refer to EXTEND SPD BRK*
- *Refer to RETRACT SPD BRK*
- *Refer to SET HOLD SPD*
- *Refer to T/D REACHED* .

MINIMUM

Applicable to: ALL

MINIMUM

Minimum

Indicates the approach minimum value, as entered on the APPR panel of the PERF page. (*Refer to Page*)
If the flight crew has not defined a minimum, the FMA displays NO DH.

L2 Appears when the aircraft is in:
- CRZ $_{phase}$, and less than 250 nm from the destination
- DES $_{phase}$
- APPR $_{phase}$
- GA $_{phase}$.

PRESELECTED SPEED/MACH

Applicable to: ALL

PRESELECTED SPEED/MACH

Preselected Speed/Mach

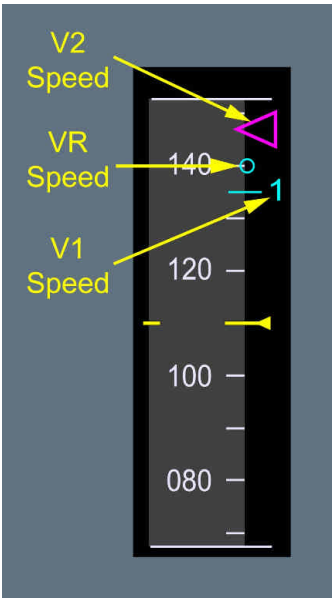
The FMA displays the preselected speed (or Mach), as entered on the CLB, or CRZ panel of the PERF page. (*Refer to PERF page*)

TAKEOFF SPEEDS

Applicable to: ALL

TAKEOFF SPEEDS

Takeoff Speeds on PFD



The airspeed scale displays V1, VR, and V2, as entered on the T.O panel of the PERF page.
For more information, *Refer to Airspeed indications during takeoff* .

MANAGED SPEED TARGET

Applicable to: ALL

MANAGED SPEED TARGET

The FMS computes the managed speed target, and displays it as a magenta triangle on the PFD airspeed scale.

For more information on the FMS managed speed profile, *Refer to Speed Profile* .

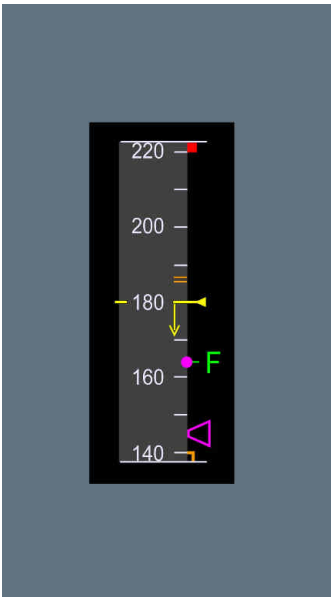
Fore more information on the managed speed/Mach behavior, *Refer to Flight Guidance - Managed Speed/MachTarget* .

SHORT-TERM MANAGED SPEED

Applicable to: ALL

SHORT-TERM MANAGED SPEED

Short-Term Managed Speed

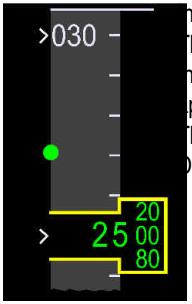


The FMS computes the short-term managed speed, and displays it as a magenta dot on the PFD airspeed scale.
For more information, *Refer to Short-term managed speed* .

VERTICAL DEVIATION

Applicable to: ALL

VERTICAL DEVIATION



ndicates the vertical deviation.
The FMS computes the difference between the current aircraft altitude, and he altitude where the aircraft would be, if it was on the theoretical descent or pproach path.
The flight crew can consult the numeric value of the vertical deviation on the ES and APPR panel of the ACTIVE / PERF page. (*Refer to PERF page*)

L2 The PFD displays the vertical deviation, when:
- The aircraft reaches the Top of Descent (T/D), or
- The FMS flight phase is DESCENT, or APPROACH.

Note: *When the aircraft is in a holding pattern (with manual exit), the vertical deviation is the difference between the altitude of the aircraft, and the altitude of the holding exit: Refer to DSC-22-FMS-10-40-50-22FMS4030G HOLD - Purpose .*

NOISE THRUST

Applicable to: ALL

NOISE THRUST

Noise Thrust

While flying a noise abatement departure procedure, and if the noise thrust is applied, the Flight Mode Annunciator (FMA) displays the percentage of N1.

The flight crew enters the noise thrust on the T.O, or CLB panel, of the PERF page. (*Refer to PERF page*)

FLEX/DERATED

Applicable to: ALL

FLEX / DERATED

Flex / Derated

Indicates when the engines apply a flex or derated thrust. When the engines apply a flex thrust, the FMA also displays the flex temperature.
The flight crew sets a flex, or derated thrust on the T.O panel of the PERF page. (*Refer to Page*)

Intentionally left blank

ND

Applicable to: ALL

For more information:

- On the FMS data on the ND, *Refer to DSC-31-20-30-80-GFMSD FMS Data Overview* ,
- On the interactive ND, *Refer to DSC-31-20-30-90 Interactive ND Overview* .

Intentionally left blank

VD

Applicable to: ALL

For more information on the VD , *Refer to DSC-31-20-40-10-GVERT Overview*

Intentionally left blank

EFIS CP

Applicable to: ALL

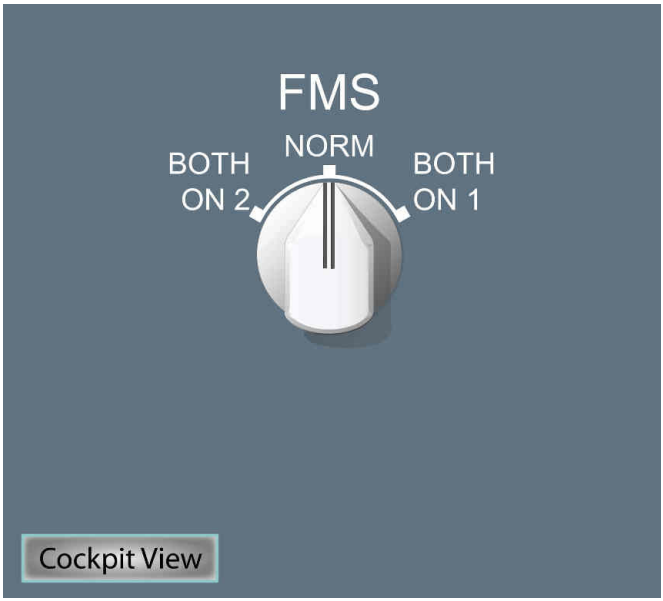
For more information on the EFIS CP, *Refer to DSC-31-20-50-GEFIS EFIS Control Panel*

Intentionally left blank

FMS SELECTOR

Applicable to: ALL

FMS selector



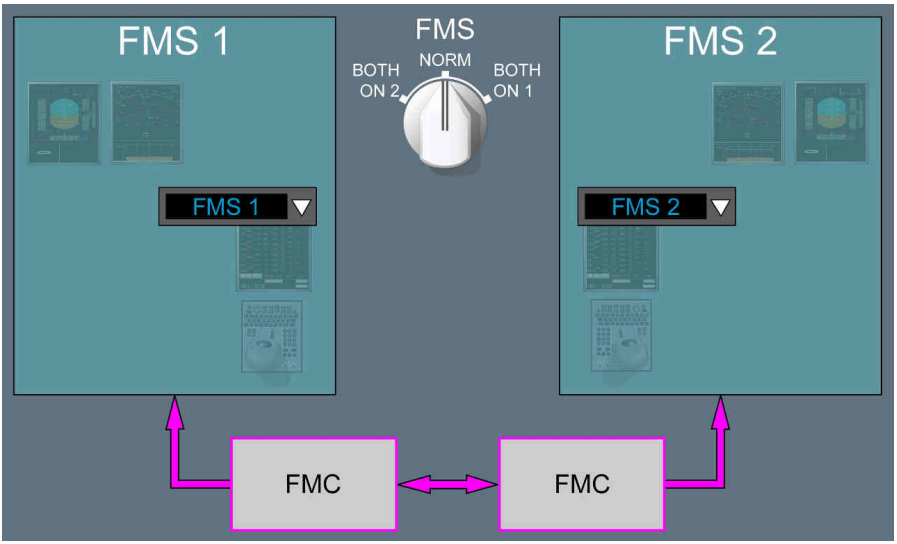
The FMS selector enables the flight crew to provide the flight management interfaces of both sides with data of the FMC on the Captain's side (when selecting BOTH ON 1), or with data of the FMC on the First Officer's side (when selecting BOTH ON 2).
The selector is used when FMS 1, or FMS 2 is failed.
Refer to Two FMC s FAULT (SINGLE Mode)

Note: The use of the selector has no influence on the weather and terrain data display.

NORM

When the FMS selector is set to NORM, each active FMC provides data to the onside flight management interfaces.

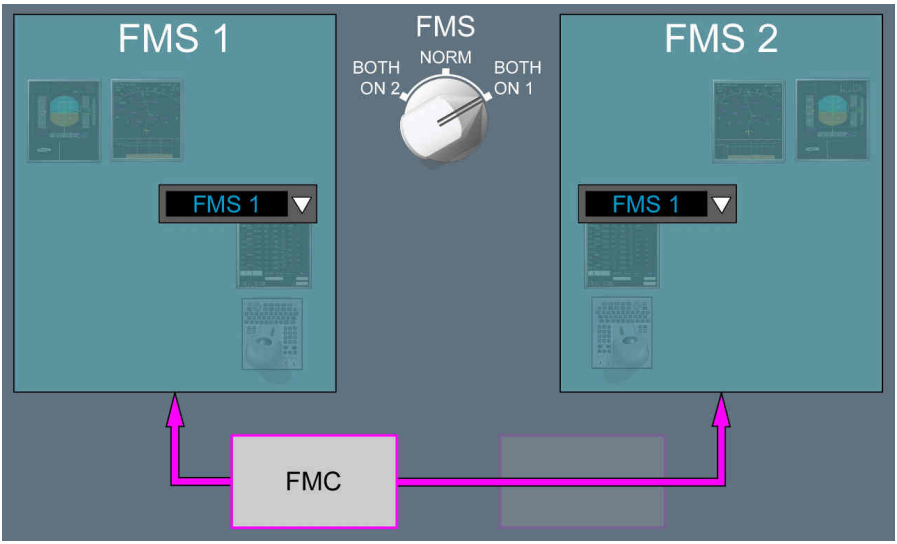
FMS selector set to NORM



BOTH ON 1

When the flight crew sets the FMS selector to BOTH ON 1, the active FMC on the Captain's side provides data to the flight management interfaces of both sides.

FMS selector set to BOTH ON 1



- The First Officer's MFD displays the ACTIVE / F-PLN page.
  The MFD System Menu displays the same label as on the Captain's MFD. This indicates that both sides display data, provided by the same FMC.
- The First Officer's ND displays the OFFSIDE FM CONTROL label: This message indicates that the active FMC on the Captain's side provides the FMS data for the First Officer's side.
- On the First Officer's EFIS CP, the flight crew can no longer select:
  - The FMS display options: CSTR, WPT, VORD, NDB, and ARPT
  - The ND mode (except the ROSE-VOR, and ROSE-LS modes)
  - The ND range (except the ZOOM position).

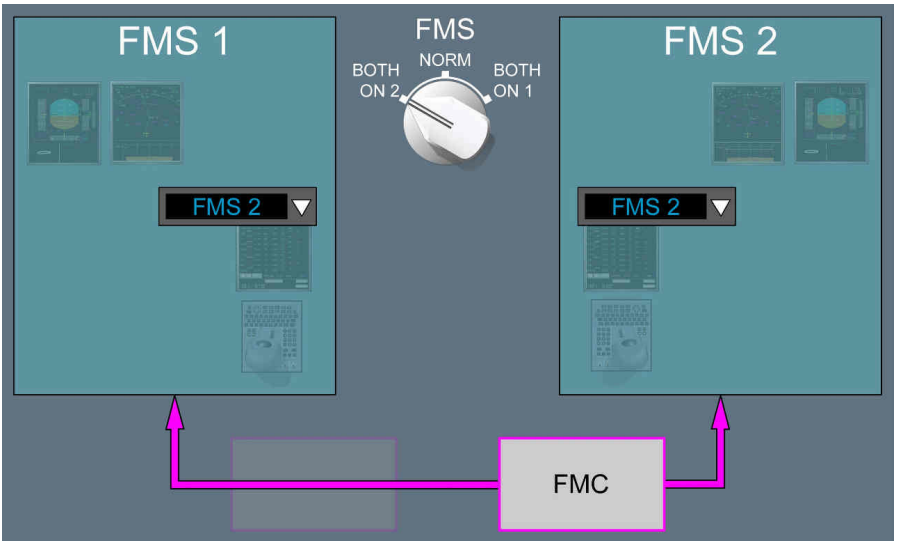
  From now on, these display options are driven by the Captain's EFIS CP.
- The First Officer's ND displays the weather (terrain) data, if the WXR (TERR) option is selected on the First Officer's EFIS CP, and:
  - The First Officer's or Captain's ND is in ROSE-VOR, or ROSE-LS mode, or
  - The Captain's ND is in ROSE-NAV mode, and the range is 80 nm.

  In all other cases, the First Officer's ND displays the WXR RNG (TERR RNG) message.
- The First Officer's VD displays the terrain (weather, if the WXR option is selected on the First Officer's EFIS CP) data, if the Captain's ND is in ROSE-NAV mode, and the range is 80 nm.
  If not, the First Officer's VD displays the TERR INOP (WXR INOP) message.

BOTH ON 2

When the flight crew sets the FMS selector to BOTH ON 2, the active FMC on the First Officer's side provides data for the flight management interfaces of both sides.

FMS selector set to BOTH ON 2



- The Captain's MFD displays the ACTIVE / F-PLN page.
  The MFD System Menu displays the same label as on the First Officer's MFD. This indicates that both sides display data, provided by the same FMC.
- The Captain's ND displays the OFFSIDE FM CONTROL label: This message indicates that the active FMC on the First Officer's side provides the FMS data for the Captain's side.
- On the Captain's EFIS CP, the flight crew can no longer select:
  - The FMS display options: CSTR, WPT, VORD, NDB, and ARPT
  - The ND mode (except the ROSE-VOR, and ROSE-LS modes)
  - The ND range (except the ZOOM position).

  From now on, these display options are driven by the First Officer's EFIS CP.

- The Captain's ND displays the weather (terrain) data, if the WXR (TERR) option is selected on the Captain's EFIS CP, and:
  - The Captain's or First Officer's ND is in ROSE-VOR, or ROSE-LS mode, or
  - The First Officer's ND is in ROSE-NAV mode, and the range is 80 nm.

  In all other cases, the Captain's ND displays the WXR RNG (TERR RNG) message.
- The Captain's VD displays the terrain (weather, if the WXR option is selected on the Captain's EFIS CP) data, if the First Officer's ND is in ROSE-NAV mode, and the range is 80 nm.
  If not, the Captain's VD displays the TERR INOP (WXR INOP) message.

Intentionally left blank

DATA ENTRY FORMATS

Applicable to: ALL

This chapter lists all data that the flight crew may enter on the MFD and interactive ND.

For each data, the table displays:
- The format

  Note: *Unless otherwise specified, leading and trailing zeros can be omitted.*

- The units
- The range
- The resolution

  Note: *When the flight crew scrolls the data with the cursor control wheel, the resolution is the scroll increment/decrement.*

- The page(s) where the flight crew enters the data.

The following characters are used to indicate the format:
- A: Letters
- T: True reference
- N: Numeric (Numbers)
- X: Alphanumeric (Letters and Numbers).

ACCEL ALT

Applicable to: ALL

Format	NNNNN
Units	FEET MSL (FT) If the flight crew enters 3 characters or less, the FMS considers the entry as a flight level. In this case, the unit of the entry field reverts to FL .
Range	*Min* : Takeoff (or Go Around) runway elevation + 400 ft *Max* : Maximum Certified Altitude (Performance Database)
Resolution	1

GENERAL

Applicable to: ALL

GENERAL

There are two types of FMS messages displayed in the FMS Message Area:
- Type I messages: These messages are a direct result of a flight crew action.
- Type II messages: These messages are displayed automatically to inform the flight crew on a given situation, or to call for a flight crew action.

Note: Some type II messages are also displayed on the ND, or PFD.

Type I messages always have priority over type II messages.

MESSAGE COLOR

The messages appears in black over :
- a white background for messages that are result from a flight crew entry, and for less important messages
- an amber background for messages which concern navigation, for messages that request for a data entry, and for more important messages.

AUTOMATIC CLEARING OF MESSAGES

Type I messages are cleared automatically, when:
- The flight crew makes a valid entry or selection for the data, that resulted in the display of the message
- The flight crew presses the DIR TO, F-PLN, INIT, NAVAIDS, PERF, or SEC key on the KCCU

Type II messages are cleared automatically when the display conditions of the message no longer apply.

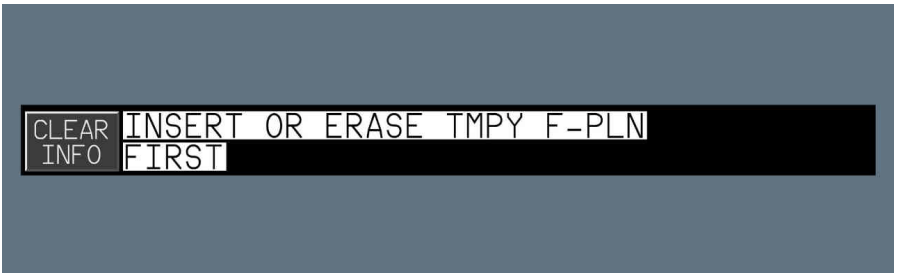
MESSAGES HISTORY LIST

Type II messages are stored in a first-in / first-out message list (5 messages maximum).
The first message of the message list is displayed in the FMS Message Area (if no type I message is currently displayed).
A message is automatically removed from the list as soon as the display conditions of the message no longer apply.
When the flight crew clears a type II message, it is not removed from the message history list, as long as the display conditions apply. The FMS Message Area then displays the next message of the message history list, if the flight crew has not cleared this message before.

The message history list is displayed on the MESSAGES LIST page. The flight crew can access this page via the MSG LIST button of the FMS Message Area. This button is only displayed when no messages are displayed.

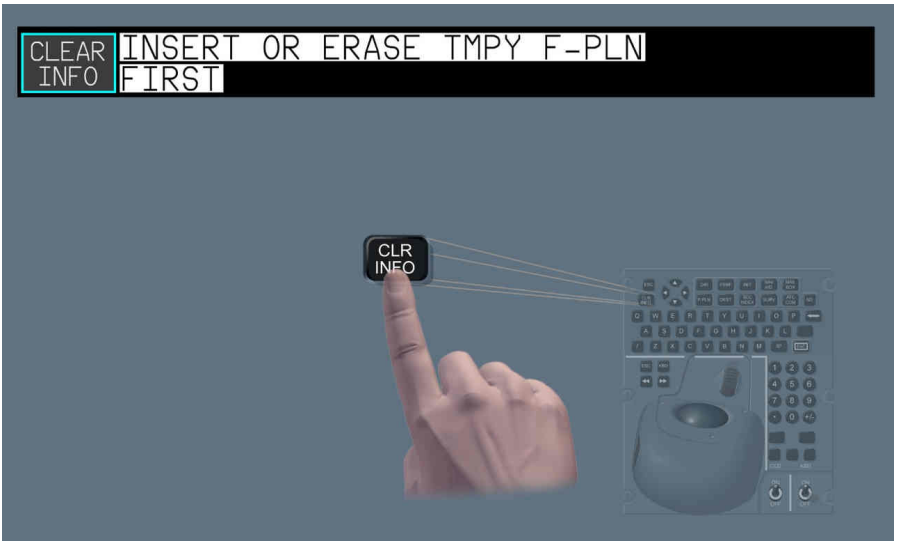
FMS MESSAGE AREA

FMS Message Area



The FMS displays the messages on two lines of 33 characters.
The flight crew can clear the displayed message by clicking on the CLEAR INFO button, or by pressing the CLR INFO key on the KCCU .

Clear Info



When no message are displayed, the flight crew can access the MESSAGE LIST page, by clicking on the MSG LIST button.

Message List

The MESSAGE LIST page displays the five latest type II messages. (*Refer to Page)*

ACFT POSITION NOT VALID

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The aircraft position has become invalid (while the HOLD, DIRECT TO, or CLOSEST AIRPORTs page is displayed).

ADJUST DESIRED TRK OR HDG

Applicable to: ALL

Type	II
Interface	MFD
Conditions	A direct to with interception of an inbound/outbound radial is inserted. This message informs the flight crew that it is possible to adjust the aircraft heading/track, to allow the computation of the INTCPT, or to change its position (if it was already computed before).

ADJUSTING SPD DUE TO RTA

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The FMS is computing a new managed target speed in order to respect the time constraint. This message is automatically cleared after 15 s.

AIRWAY / WPT DISAGREE

Applicable to: ALL

Type	I
Interface	MFD
Conditions	- The entered end waypoint of the airway segment does not belong to the defined airway, or - The entered airway does not contain the end waypoint of the preceding airway segment, or - The waypoint that has DCT, in its preceding VIA entry field, and an airway in the following VIA entry field, is not part of the airway.

AIRWAYS INSERTION IN PROGRESS: F-PLN REVISION NOT ALLOWED

Applicable to: ALL

Type	II
Interface	MFD
Conditions	An airways revision is in progress on one MFD, and the flight crew tries to access an other revision on the opposite side MFD.

ALIGN IRS

Applicable to: ALL

Type	II
Interface	MFD
Conditions	At least one IRS is waiting for an alignment position. In normal operation, the IRS automatically aligns on the GPS position. When this is not possible, the flight crew needs to initiate the alignment from the POSITION / IRS page. (*Refer to Page*)

AREA RNP IS XX.XX

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The flight crew has entered an RNP value that is greater than the default RNP value of the current flight phase, and there is no RNP value defined in the navigation database for the active leg or route.

ARPT REF / GPS POSITION DISAGREE

Applicable to: ALL

Type	I
Interface	MFD
Conditions	The IRS alignment failed. There is a disagreement between the alignment position, entered by the flight crew on the POSITION / IRS page, and the GPS position. *Refer to Page*

ARPT REF / LAST IRS POSITION DISAGREE

Applicable to: ALL

Type	I
Interface	MFD
Conditions	The IRS alignment failed. There is a disagreement between the alignment position, entered by the flight crew on the POSITION / IRS page, and the last stored IRS position. *Refer to Page*

ATC F-PLN INSERTED IN SEC 3

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The received ATC F-PLN is properly loaded in the secondary flight plan SEC3.

ATC F-PLN INSERTED IN SEC 3 REJECTED INFO SEE SEC /INDEX

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The received ATC F-PLN is partially loaded in the secondary flight plan SEC3 due to not valid data sent by the ATC center. The flight crew can review the rejected data on the REJECTED ATC INFO page, *Refer to REJECTED ATC INFO page.*

CABIN RATE EXCEEDED

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The aircraft is in CRUISE $_{phase}$, closer than 200 nm to the destination, and the cabin rate associated to the theoretical descent profile is higher than the maximum cabin rate. The flight can check and/or change the maximum cabin rate on the DES panel of the PERF page, *Refer to Page* .

CHECK ALTN WIND

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The company up linked alternate cruise flight level differs from the default alternate cruise flight level.

CHECK APPR SEL

Applicable to: ALL

L12

Type	II
Interface	MFD AND PFD
Conditions	The flight crew has manually tuned an ILS(GLS), on the POSITION/NAVAIDS page, that does not correspond with the approach selected in the flight plan. This message is only displayed, when the aircraft is: - In cruise, and less then 100 nm from the T/D, or - In descent, or - In approach, and the altitude is higher then 800 ft.

CHECK CPNY RTE

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The company route ident of the up linked flight plan differs from the company route ident of the flight plan request.

CHECK DATABASE CYCLE

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The current date does not match the effectivity of the active navigation database. This message is triggered when the flight crew enters a FROM/TO airport or company route.

CHECK DEST DATA

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The QNH, or OAT, or destination wind, that are displayed on the APPR panel of the PERF page, are completed by a company wind uplink. The flight crew should check the up linked values.

CHECK EO SPD SETTING

Applicable to: ALL

Type	II
Interface	MFD AND PFD
Conditions	In CLIMB, or CRUISE (and the guidance mode is not ALT* or ALT): the engine-out (EO) mode is active, and the selected speed target is not within the range (GREENDOT - 10 kt, GREENDOT + 10 kt).

CHECK IRS / ARPT POSITION

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The difference between at least one IRS position (IRS1, IRS2, or IRS3) and the airport position is 5 nmor more.

CHECK FLT NUMBER

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The company up linked flight number differs from the flight number of the flight plan request.

CHECK IRS 1(2)(3) / FMS POSITION

Applicable to: ALL

Type	II
Interface	MFD
Conditions	IRS1(2)(3) has drifted abnormally: The difference between the IRS1(2)(3) position and the FMS position is greater than a specified threshold. The threshold is function of time.

CHECK MIN FUEL AT DEST

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The entered MIN FUEL AT DEST is below ALTN + FINAL fuel. *Refer to Minimum Fuel At Destination*

CHECK NORTH REF

Applicable to: ALL

Type	II
Interface	MFD AND ND
Conditions	The position of the TRUE/MAG pb differs from the airport bearing reference. The airport bearing reference is stored in the navigation database. This message may be triggered for the origin airport (in preflight) or for the destination airport (in arrival and approach).

CHECK ONSIDE FMS P/N

Applicable to: ALL

Type	II
Interface	MFD
Conditions	There is a part number incompatibility between the different FMCs. The MFD displays automatically the FMS P/N pannel of the STATUS page.

CHECK SPD MODE

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The **selected** speed control is active, and: - The flight phase changes from CLIMB to CRUISE, or - The flight phase changes from CLIMB (or CRUISE) to DESCENT, or - The aircraft sequences the start waypoint of a constant mach segment (CMS).

CHECK T.O DATA

Applicable to: ALL

L12

Type	II
Interface	MFD
Conditions	The takeoff data has already been entered, and the flight crew: - Changes the takeoff runway, takeoff shift, flaps setting, packs setting, or anti-ice setting, or - Activates a secondary flight plan (in PREFLIGHT, or DONE phase) This message is also displayed when among the received company takeoff data, the TOW differs more than 2 200 lb from the FMS estimated TOW, or when the received TOCG differs more than 0.5 % from the FMS estimated TOCG. In that case, the flight crew cannot insert the received company takeoff data.

CHECK ZFW

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The flight crew has swapped a secondary flight plan with the active flight plan, and the two flight plans have a different ZFW, or ZFWCG. Note: *This may only happen before engine start.* *Before engine start, and when a swap is performed, the FQMS will use the new ZFW / ZFWCG values to initialize.* *After engine start, the active ZFW / ZFWCG values do not change after a swap. The FQMS does not initialize again.*

COMPANY F-PLN & LOAD DATA RECEIVED WAITING FOR INSERTION

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The FMS has received a flight plan and performance and load data uplink. The flight crew should insert, or clear, the uplink, via the RECEIVED CPNY F-PLN button on the INIT, or SEC INDEX page. *Refer to INIT page* *Refer to SEC INDEX page*

COMPANY F-PLN RECEIVED WAITING FOR INSERTION

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The FMS has received a flight plan data uplink. The flight crew should insert, or clear, the uplink, via the RECEIVED CPNY F-PLN button on the INIT, or SEC INDEX page. *Refer to INIT page* *Refer to SEC INDEX page*

COMPANY LOAD DATA RECEIVED WAITING FOR INSERTION

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The FMS has received a performance and load data uplink. The flight crew should insert, or clear, the uplink, via the RECEIVED CPNY LOAD button on the INIT, or SEC INDEX page. *Refer to INIT page* *Refer to SEC INDEX page*

COMPANY MSG INSERTION IN PROGRESS

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The insertion of the received company takeoff data is in progress.

COMPANY T.O DATA RECEIVED WAITING FOR INSERTION

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The FMS has received takeoff data. The flight can display, insert, or clear, the uplink, on the RECEIVED CPNY T.O DATA page. *Refer to RECEIVED CPNY T.O DATA page*

COMPANY WIND DATA RECEIVED WAITING FOR INSERTION IN ACTIVE

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The FMS has received wind data for the active flight plan. The flight crew should insert, or clear, the uplink, via the RECEIVED CPNY WIND button on the ACTIVE / WIND page. *Refer to WIND page*

COMPANY WIND DATA RECEIVED WAITING FOR INSERTION IN SEC 1(2)(3)

Applicable to: ALL

Type:	II
Interface:	MFD
Conditions:	The FMS has received wind data for the secondary 1(2)(3) flight plan. The flight crew should insert, or clear, the uplink, via the RECEIVED CPNY WIND button on the SEC1(2)(3) / WIND page. *Refer to WIND page*

COMPANY WIND UPLINK PENDING

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The FMS has received company wind data, while a temporary flight plan exists, or while the DIRECT TO page is displayed. The flight crew needs to insert, or clear the temporary flight plan, or needs to finalize the DIRECT TO revision, before he can insert (or clear) the received wind data.

CONSTRAINTS ABOVE CRZ FL: DELETED

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The CRZ FL or step altitudes are changed, so that the following constraints are deleted: The climb and descent constraints, that are at or above the new CRZ FL, and the descent constraints, that are at or above any inserted step altitude.

CONSTRAINTS BEFORE XXXXXXX : DELETED

Applicable to: ALL

Type	II
Interface	MFD
Conditions	- The flight phase transitions from CRUISE, DESCENT, or APPROACH, to GO AROUND, so that all altitude, and speed constraints between the aircraft and the primary destination are deleted. XXXXXXX is the ident of the waypoint, following the last down path waypoint with a descent altitude or speed constraint. - The alternate flight plan is enabled, so that all altitude, and speed constraints between the aircraft and the former primary destination, and all altitude, and speed constraints on the alternate flight plan, that are below the current aircraft altitude are deleted. XXXXXXX is the ident of the waypoint, following the last down path waypoint with a speed constraint, below the current aircraft altitude.

COST INDEX-NNN IN USE

Applicable to: ALL

Type	I
Interface	MFD
Conditions	The FMS has set a default value for the cost index. The default value is the last cost index of the previous flight, stored in the DONE phase (or 0, if there is no cost index, after a power up for example). The flight crew can always change the default value.

CRZ FL ABOVE MAX FL

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The flight crew has entered a flight level, that is higher than the recommended maximum flight level. *Refer to Recommended Maximum Flight Level*

DEST / ALTN CPNY RTE DISAGREE

Applicable to: ALL

Type	I
Interface	MFD
Conditions	The flight crew tried to enter an alternate company route, and the origin airport of the alternate company route does not match the destination airport of the primary flight plan.

DEST EFOB BELOW MIN

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The EFOB at destination is lower than the specified minimum fuel at destination.

DRAFT WIND INSERTED

Applicable to: ALL

Type	I
Interface	MFD
Conditions	When draft winds are pending and the flight crew creates a temporary flight plan, the draft wind are automatically inserted in the active (and temporary) flight plan.

ENTER DEST DATA

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The flight crew did not enter one or more of the destination data (QNH, OAT, or WIND), and the flight phase is CRUISE (and the aircraft is closer than 180 nmto the destination), DESCENT, or APPROACH.

ENTRY NOT IN LIST

Applicable to: ALL

Type	I
Interface	MFD
Conditions	The flight crew tried to make a manual entry, and the entry is not in the list associated to the entry field.

ENTRY OUT OF RANGE

Applicable to: ALL

Type	I
Interface	MFD
Conditions	The flight crew has entered a value that is out of the accepted range of the data, or the entered value leads to the computation of a parameter that is out of range. When applicable, the expected range and units are displayed on the second line of the FMS Message Area in the following format: “RNG: *(Lower Range Limit)* TO *(Upper Range Limit) (Unit)*”. Example: RNG: 23.0 TO 28.0 %

EXPECT TURN AREA EXCEEDANCE

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The aircraft will fly (or is flying) a procedure turn, and the FMS predicts that the aircraft will exceed the excursion distance (based on the predicted CAS, converted to a ground speed). The excursion distance is part of the navigation database, associated with the procedure turn.

EXTEND SPD BRK

Applicable to: ALL

Type	II
Interface	MFD AND PFD
Conditions	The DES mode is active, the thrust is IDLE, the flaps setting is not 3 or FULL, and the aircraft needs to decelerate to recover the vertical path, or to respect an altitude or speed constraint, or speed limit.

F-G/S BASED ON ISA

Applicable to: ALL

L12

Type	II
Interface	MFD
Conditions	The F-G/S deviation is computed, considering the ISA temperature at destination. The flight crew did not enter the temperature at destination (OAT) on the APPR panel of the PERF page. This message is displayed when the flight crew has pressed the LS pb on the EFIS CP, and the DES or APPROACH flight phase becomes active.

FLT NUMBER RECEIVED

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The FMS has received the flight number, as part of the up linked flight plan data, without previous request from the flight crew.

FMCS ACFT STATUS DISAGREE

Applicable to: ALL

L13

Type	II
Interface	MFD
Conditions	At power-up, the critical aircraft status data is not identical between one active FMC and the standby FMC. The critical aircraft status data are: - Navigation database - Performance database - Magnetic Variation database - OPC, and AMI file - FM Operational Program - Aircraft and engine type, and engine manufacturer program pins.

FMCS ACFT STATUS DISAGREE INDEPENDENT OPERATION

Applicable to: ALL

L13

Type	II
Interface	MFD
Conditions	At power-up, the status data is not identical for the two active FMC's. FMS 1 and FMS 2 operate independently. The status data are: - Navigation database - Performance database - Magnetic Variation database - OPC, and AMI file - FM Operational Program - Aircraft and engine type, and engine manufacturer program pins.

FMCS PIN PROG TYPE DISAGREE

Applicable to: ALL

Type	II
Interface	MFD
Conditions	At power-up, critical program pins (not aircraft or engine type related) are not identical between one active FMC and the standby FMC.

FMCS PIN PROG TYPE DISAGREE INDEPENDENT OPERATION

Applicable to: ALL

Type	II
Interface	MFD
Conditions	At power-up, critical program pins (not aircraft or engine type related) are not identical for the two active FMC's. FMS 1 and FMS 2 operate independently.

FMS DATALINK NOT AVAIL

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The data communication between the FMS and the Avionics Communication Router (ACR) is not available.

FMS1 / FMS2 GW DISAGREE

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The FMS 1 and FMS 2 gross weight differ by 4 400 lb or more. This message is cleared automatically when the difference becomes less than 3 300 lb.

FMS1 / FMS2 POSITION DISAGREE

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The FMS 1 and FMS 2 aircraft position differ by 0.5 nm or more. This message is cleared automatically when the difference becomes less than 0.3 nm.

FMS1 / FMS2 SPD TARGET DISAGREE

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The FMS 1 and FMS 2 target speed differ by 5 kt or more. This message is cleared automatically when the difference becomes less than 2.5 kt.

FORMAT ERROR

Applicable to: ALL

Type	I
Interface	MFD
Conditions	The flight crew has entered a value that has not the right format. When applicable, the expected format and units are displayed on the second line of the FMS Message Area in the following format: "FORMAT: *(Format) (Unit)*". The FMS uses the following characters to indicate the format: - A: Letters - X: Letters and Numbers - HHMMSS: Hours, Minutes, and Seconds - N/S: North, South - E/W: Est, West - F/B: Frontbeam, Backbeam - L/R: Left, Right - UP/DN: Up, Down Example: FORMAT: NN.N %

FORMAT ERROR ENTER ALT BEFORE PLACE/DIST

Applicable to: ALL

Type	I
Interface	MFD
Conditions	The flight crew needs to enter the step altitude first, before he can enter a place/distance start waypoint.

F-PLN ELEMENT RETAINED

Applicable to: ALL

Type	I
Interface	MFD
Conditions	The pilot stored elements are deleted, except the ones that are still used by the FMS. This message informs the flight crew that those elements are retained.

F-PLN FULL

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The flight plan data memory is exceeded.

GPS DESELECTED

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The flight crew has deselected manually the GPS, and the aircraft is at 80 nm from the T/D or the APPROACH phase became active.

GPS PRIMARY

Applicable to: ALL

Type	II
Interface	MFD AND ND
Conditions	The GPS becomes again the primary means for the computation of the FMS position (where GPS PRIMARY was LOST before). For more information, *Refer to Navigation Accuracy*

GPS PRIMARY LOST

Applicable to: ALL

Type	II
Interface	MFD AND ND
Conditions	The GPS is no longer the primary means for the computation of the FMS position. For more information, *Refer to Navigation Accuracy*

GLIDE DESELECTED

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The flight crew has deselected the glide slope data on the POSITION / NAVAIDS page, and one of the following modes is active: LOC armed, LOC*, LOC, LAND armed, or LAND.

INDEPENDENT OPERATION

Applicable to: ALL

Type	II
Interface	MFD
Conditions	A communication failure occurred between the two active FMC's: FMS 1 and FMS 2 operate independently.

INITIALIZE ZFW / ZFWCG

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The flight crew has started at least on engine, and the ZFW and ZFWCG are still undefined.

INSERT OR ERASE TMPY F-PLN FIRST

Applicable to: ALL

Type	I
Interface	MFD
Conditions	A temporary flight plan (that is not created by a direct to) is pending, and the flight crew tries to access the direct to revision via the KCCU.

LATERAL DISCONTINUITY AHEAD

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The aircraft is at 30 sor less from flying a flight plan discontinuity.

MACH SEGMENT DELETED

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The Constant Mach Segment is automatically deleted in the active flight plan, due to a flight phase transition from CRUISE to another flight phase.

NAV ACCUR DOWNGRADED

Applicable to: ALL

Type	II
Interface	MFD AND ND
Conditions	The navigation accuracy changed from HIGH to LOW. For more information, *Refer to Navigation Accuracy*

NAV ACCUR UPGRADED

Applicable to: ALL

Type	II
Interface	MFD AND ND
Conditions	The navigation accuracy changed from LOW to HIGH. For more information, *Refer to Navigation Accuracy*

NEW ACCEL ALT: HHHHH

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The flight crew has entered on a climb waypoint an AT, or AT OR BELOW altitude constraint, that induces a level-off below the acceleration altitude. The constraint altitude became the new acceleration altitude. HHHHH is the altitude constraint altitude.

NEW CRZ ALT: HHHHH

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The cruise flight level (on the INIT and PERF page) has been automatically updated with the AFS CP selected altitude.

NEW THR RED ALT : HHHHH

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The flight crew has entered on a climb waypoint an AT, or AT OR BELOW altitude constraint, that induces a level-off below the thrust reduction altitude. The constraint altitude became the new thrust reduction altitude. HHHHH is the altitude constraint altitude. (*Refer to Message*)

NO COMPANY REPLY

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The FMS did not receive any response from the company ground station within 4 minafter the company request.

NO FLS FOR THIS APPR

Applicable to: ALL

L13

Type	II
Interface	MFD
Conditions	The FMS does not compute an FLS beam for the selected non-precision approach. The FLS approach function is not available. The FMS does not compute the FLS beam: - For IGS with G/S out, SDF and LDA approaches, or - If the angle between the course of the final approach leg and the runway course is more than 50 °C.

NO INTERSECTION FOUND

Applicable to: ALL

Type	I
Interface	MFD
Conditions	The system cannot find a common waypoint nor intersection (for the definition of an airway segment, LAT/LONG crossing waypoint, or Place-Bearing / Place-Bearing waypoint).

NO NAV INTERCEPTION

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The selected HDG/TRACK does not intercept the flight plan before the TO waypoint. No interception path is displayed on the ND.

NOT ALLOWED

Applicable to: ALL

Type	I
Interface	MFD
Conditions	The data entry or selection is not allowed.

NOT ALLOWED DATABASE ARPTS ONLY

Applicable to: ALL

Type	I
Interface	MFD
Conditions	In the DATABASE RTEs panel of the DATA / ROUTE page, the flight crew has entered an airport that is a pilot created airport.

NOT IN DATABASE

Applicable to: ALL

Type	I
Interface	MFD
Conditions	In the DATABASE RTEs panel of the DATA / ROUTE page, the flight crew has entered an airport or a route that is not a navigation database, nor a pilot created element.

NOT TRANSMITTED TO ACR

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The flight crew tried to sent a company request or report, and a communication failure occurred between the FMS and the Avionics Communication Router (ACR).

PILOT RTES LIST FULL

Applicable to: ALL

Type	I
Interface	MFD
Conditions	The pilot stored routes database is full. This message informs the flight crew that the new route creation is rejected.

PLACE / DIST IN TRANS

Applicable to: ALL

Type	I
Interface	MFD
Conditions	The flight crew has tried to define a PLACE / DISTANCE (PD) waypoint within a planned fixed-turn-radius transition between two flight plan legs.

PLACE / WPT DISAGREE

Applicable to: ALL

Type	I
Interface	MFD
Conditions	To define a PLACE/DISTANCE (PD) waypoint, the flight crew has entered a PLACE that is different from the revised waypoint.

PLEASE WAIT

Applicable to: ALL

Type	I
Interface	MFD
Conditions	The FMS is processing.

PLEASE WAIT FOR COMPANY F-PLN UPLINK

Applicable to: ALL

Type	I
Interface	MFD
Conditions	The flight crew has made a change on the INIT, PERF, or FUEL&LOAD page, or has made a flight plan revision, while a flight plan request is pending. The flight crew should make the flight plan changes after reception and insertion of the flight plan uplink, to avoid data to be overwritten.

PLEASE WAIT FOR FMS RESYNCH

Applicable to: ALL

Type	I
Interface	MFD
Conditions	An FMC resynchronization is in progress.

PRINTER NOT AVAIL

Applicable to: ALL

Type	II
Interface	MFD
Conditions	A printer communication error has occurred while printing a report.

PROC RNP IS XX.XX

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The flight crew has entered an RNP value that is greater than the RNP value that is defined in the navigation database for the active leg or route.

RECEIVED ATC MSG NOT VALID

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The received ATC F-PLN is totally rejected by the FMS due to not valid data sent by the ATC center. The flight crew can review the rejected data on the REJECTED ATC INFO page, *Refer to REJECTED ATC INFO page.*

RECEIVED COMPANY F-PLN NOT VALID

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The flight plan, up linked from the company ground station, is not valid.

RECEIVED COMPANY LOAD DATA NOT VALID

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The performance data, up linked from the company ground station, is not valid.

RECEIVED COMPANY WIND DATA NOT VALID

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The wind data, up linked from the company ground station, is not valid.

RECEIVED COMPANY T.O DATA NOT VALID

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The takeoff data, up linked from the company ground station, is not valid.

RECEIVED FLT NUMBER NOT VALID

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The received flight number, that is part of the up linked flight plan data, is not valid.

REENTER ZFW / ZFWCG

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The FMS has detected a difference of more than 220 lb / 0.1 % between the ZFW / ZFWCG , entered by the flight crew, and the ZFW / ZFWCG , received from the FQMS . Both values need to be entered again. Note: *The FMS also displays this message in the case of the FQMS 1+2 FAULT alert. In this case, the flight crew should disregard the message. Refer to Alert*

RETRACT SPD BRK

Applicable to: ALL

Type	II
Interface	MFD AND PFD
Conditions	The DES mode is active, the speed brakes are extended, and: - The ALT* or ALT mode engages, or - The aircraft is below the vertical path and needs to recover it, or - The flaps setting becomes 3 or FULL.

RTA ALREADY EXISTING

Applicable to: ALL

Type	I
Interface	MFD
Conditions	In preflight, when an RTA exists, the flight crew tries to delete the FMS computed ETT.

RTA DELETED

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The RTA is automatically deleted in the active flight plan. This happens when one of the following events occur: - The Engine Out (EO) mode becomes active - The aircraft clock data is no longer valid - The aircraft is in a manual hold, or in the deceleration zone of a manual hold - The flight phase transitions from DESCENT, or APPROACH, to CLIMB, or CRUISE - The flight phase becomes GO AROUND

RTA NOT CONSIDERED FOR FUEL PLANNING

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The flight crew initiates the fuel planning function on the FUEL&LOAD page, and an RTA exists in the flight plan.

RTE IDENT ALREADY USED

Applicable to: ALL

Type	I
Interface	MFD
Conditions	This message informs the flight crew that the new route ident already exists in the navigation database, or in the pilot stored routes database.

RUNWAY / LS DISAGREE

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The flight crew has manually tuned a landing system on the POSITION / NAVAIDS page, that does not match the runway selected in the flight plan.

SELECT HDG OR TRK FIRST

Applicable to: ALL

Type	I
Interface	MFD
Conditions	The aircraft is in NAV, and the flight crew tries to insert a temporary flight plan, or activate a secondary flight plan, while the first leg of the temporary or secondary flight plan is not identical to the active leg of the active flight plan.

SELECT TRUE NORTH REF

Applicable to: ALL

Type	II
Interface	MFD AND ND
Conditions	At least one IRS reached an extreme latitude (> N82°) and the TRUE/MAG pb is still in the MAG position.

SET HOLD SPD

Applicable to: ALL

Type	II
Interface	MFD and PFD
Conditions	- The selected speed control is active - The aircraft is between the deceleration point and the Hold Entry Fix - The selected speed differs from the hold speed by more than 5 kt.

SOME REVISIONS NOT STORED

Applicable to: ALL

L12

Type	II
Interface	MFD
Conditions	The flight crew has stored a route and some flight plan elements are removed from the stored flight plan. When a route is stored, the following flight plan elements are removed: - Holding pattern(s), entered by the flight crew - Offset(s) - Changes to terminal area procedures - Constraints, entered by the flight crew - Waypoint, created by the FMS (example: Latitude/Longitude Crossing points) - Optimum Step - CMS, defined by the flight crew - When a route is stored, only the first 30 flight plan elements are stored. All other elements are removed.

SPD ERROR AT XXXXXXX

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The speed constraint will be missed at waypoint XXXXXXX. The speed error is more than 10 kt.

SPD LIMIT EXCEEDED

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The speed limit is actually exceeded: the aircraft's altitude is below the speed limit altitude, and the aircraft's speed is more than 10 kt over the speed limit.

SPECIF NDB NOT AVAIL

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The NDB (defined for an NDB approach) is not available or deselected.

SPECIF VOR-D NOT AVAIL

Applicable to: ALL

Type	II
Interface	MFD AND ND
Conditions	The VOR or VOR/DME (defined for an RNAV or VOR approach) is not available or deselected.

STEP ABOVE MAX FL

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The entered step altitude is above the recommended maximum flight level. *Refer to Recommended Maximum Flight Level*

STEP AHEAD

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The aircraft is closer than 20 nm from the start waypoint of a step climb or step descent.

STEP DELETED

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The step is automatically deleted in the active or temporary flight plan. For the active flight plan, the STEP DELETED message appears when one of the following events occurs : - The step start waypoint is sequenced and the flight crew did not initiate the step climb or step descent - The Engine Out (EO) mode becomes active - After a cruise altitude change in PREFLIGHT, TAKEOFF, or CLIMB, a step climb becomes a step descent, or vice versa - The FCU altitude is increased to 100 ft or more above the aircraft altitude, in CRUISE, all step descents, and all step climbs with a step altitude less than the new FCU altitude, are deleted - The FCU altitude is decreased to 100 ft or more below the aircraft altitude, in CRUISE, all step climbs, and all step descents with a step altitude greater than the new FCU altitude, are deleted. For the temporary flight plan, the STEP DELETED message appears when the step start waypoint is deleted.

T/D REACHED

Applicable to: ALL

Type	II
Interface	MFD AND PFD
Conditions	The managed speed control is active, and the aircraft reaches the top of descent (T/D).

TIME ERROR AT XXXXXXX

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The time constraint will be missed at waypoint XXXXXXX. The time error is more than 30 s.

TIME MARKER REACHED

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The time marker is reached.

TIME TO EXIT

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The aircraft must leave the holding pattern immediately to meet the fuel reserve requirements. The fuel requirements consider an extra fuel = 0 at landing at the primary destination.

TOO STEEP PATH AHEAD

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The FMS has detected a too steep path in the vertical descent profile. *Note: This message is displayed only once per destination.*

T.O SPEED TOO LOW - CHECK TOW & T.O DATA

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The inserted V1, VR, V2 speeds do not satisfy the existing regulatory conditions regarding VMC and VS1G speeds.

T.O TIME REACHED

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The aircraft clock time reaches the ETT.

TRUE NORTH REFERENCED ENTRY EXPECTED

Applicable to: ALL

Type	I
Interface	MFD
Conditions	The flight crew tried to make a course entry with magnetic reference, while the aircraft is flying at extreme latitudes.

TUNE BBB FFF.FF

Applicable to: ALL

Type	II
Interface	MFD
Conditions	The FMS cannot tune the desired NAVAID because of a manual NAVAID selection. BBB is the NAVAID ident. FFF.FF is the associated frequency.

V1/VR/V2 DISAGREE

Applicable to: ALL

Type	II
Interface	MFD
Conditions	V1, VR and V2 speeds do not satisfy the condition V1 ≤ VR ≤ V2.

XXXX IS DESELECTED

Applicable to: ALL

Type	I
Interface	MFD
Conditions	The flight crew tried to manually tune a deselected NAVAID, or tried to deselect a NAVAID that was already deselected. XXXX is the ident of the NAVAID.

10 RWYS MAX : ALL IN USE

Applicable to: ALL

Type	I
Interface	MFD
Conditions	The pilot stored runways database is full, and the flight crew tries to store a new runway. This message informs the flight crew that the storage of the new runway is rejected.

50 WPTS MAX : ALL IN USE

Applicable to: ALL

Type	I
Interface	MFD
Conditions	The pilot stored database is full, and the flight crew tries to store a new waypoint. This message informs the flight crew that the storage of the new waypoint is rejected.

20 NAVAIDS MAX : ALL IN USE

Applicable to: ALL

Type	I
Interface	MFD
Conditions	The pilot stored database is full, and the flight crew tries to store a new navaid. This message informs the flight crew that the storage of the new navaid is rejected.

MEMO

Applicable to: ALL

FMS SWTG	The FMS selector is in the BOTH ON 1, or BOTH ON 2 position.

Intentionally left blank

OVERVIEW

Applicable to: ALL

NORMAL OPERATION

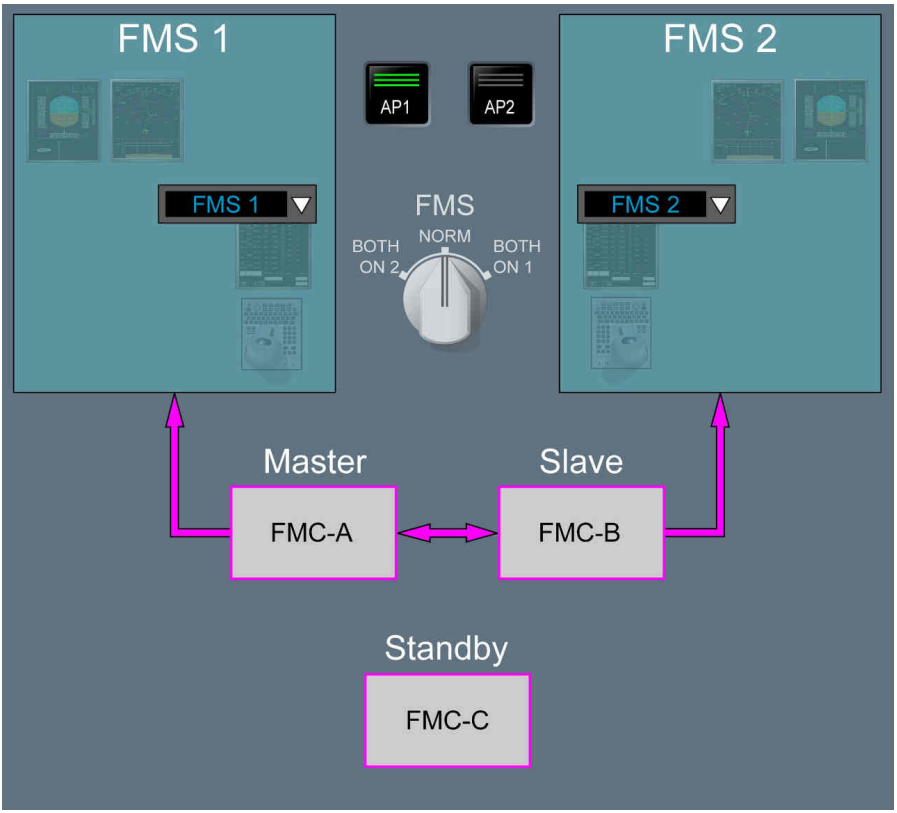
In normal operation:
- FMC -A provides data to FMS 1
- FMC -B provides data to FMS 2
- FMC -C is the standby computer
- The FMS selector is set to NORM.

L2 FMC -A, FMC -B, and FMC -C are three identical computers, each able to perform all FMS tasks. However, FMC -A and FMC -B are assigned to their specific FMS side (FMC -A to FMS 1, and FMC -B to FMS 2), or to the standby position.

Note: FMC -A cannot be assigned to FMS 2, and FMC -B cannot be assigned to FMS 1.

In case of an FMC -A, or FMC -B failure, the FMC s will automatically reconfigure to set FMC -C on FMS 1 or FMS 2.

Normal Operation



L1 **DUAL MODE**

In normal operation, FMS 1 and FMS 2 are in DUAL mode: The two active FMC s independently calculate data, and then share, compare, and synchronize this data.

MASTER AND SLAVE FMCS

Of the two active FMC s, one FMC is referred to as the “master”, the other as the “slave”. Flight guidance uses only the master FMC long-term guidance data.

L2 The master FMC provides some important FMS data to be used by the slave FMC , such as:

- The FMS flight phase
- The FCU clearance altitude

- Landing system frequency and course
- etc ...

L1 The selection of the master FMC is based on which Autopilot (AP) is active, and on the position of the FMS selector . The switch has priority over the Autopilot.

Master FMS side	Position of the FMS selector		
	BOTH ON 2	NORM	BOTH ON 1
AP 1 engaged	FMS 2	FMS 1	FMS 1
AP 2 engaged	FMS 2	FMS 2	FMS 1

Refer to More Information on the FMS selector

When no Autopilot is active, and the FMS selector is in the NORM position, the FMC of FMS 1 is the master FMC .

STANDBY COMPUTER

The standby FMC has no data and does not perform any calculation.
In normal operation, FMC -C is the standby computer. If FMC -A, or FMC -B fails, FMC -C is able to take over and to provide data for FMS 1 (or FMS 2).

ABNORMAL OPERATION

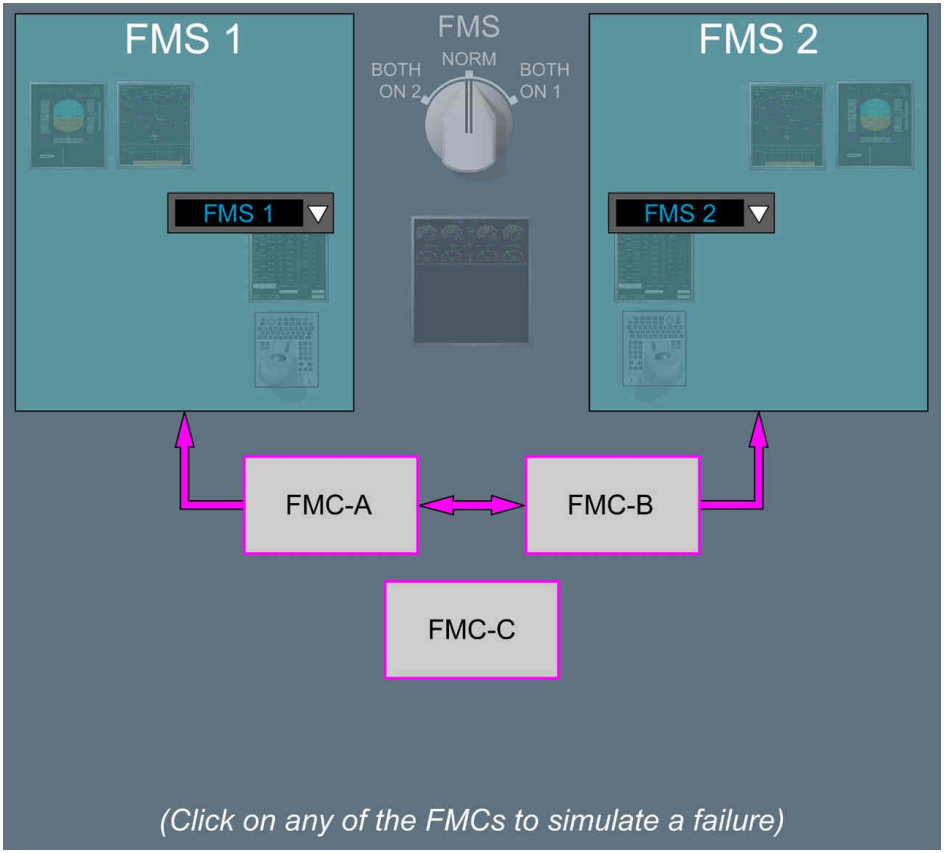
In abnormal operation, one (or more) of the following may occur:

- FMS 1 and FMS 2 no longer share data (*Refer to INDEPENDENT mode*)
- FMC failure(s)

  One or more FMC s fail:

  On the illustration below, click on any of the FMCs to simulate its failure.

Abnormal Operation

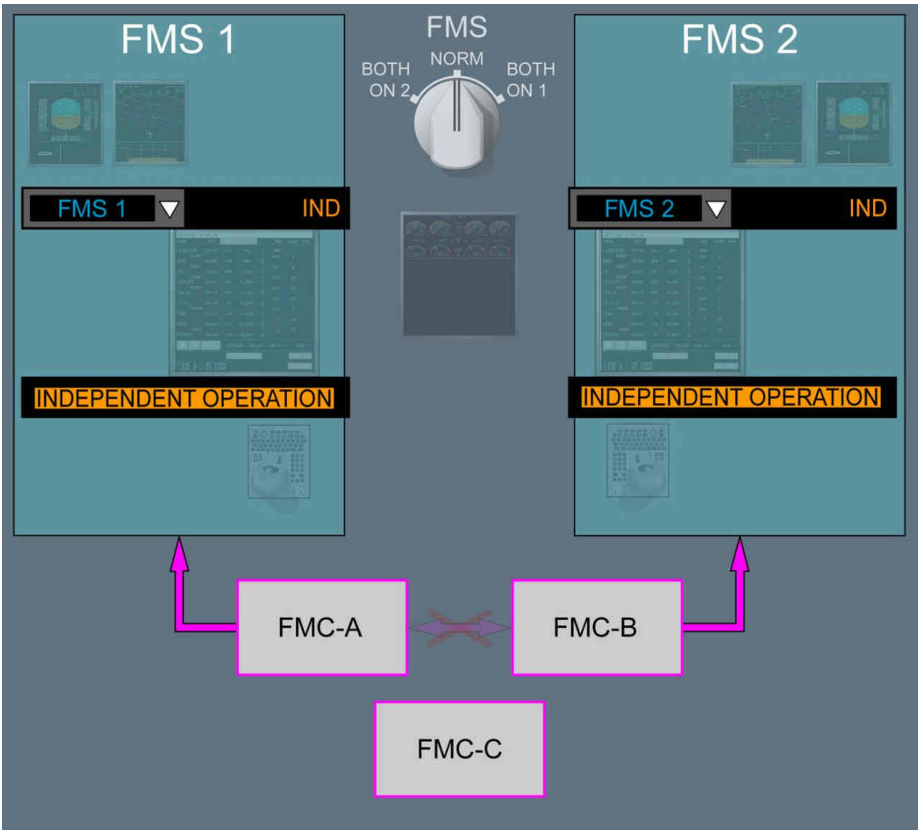


INDEPENDENT MODE

Applicable to: ALL

In normal operation, FMS 1 and FMS 2 are in DUAL mode: The two active FMC s independently calculate data, and then share, compare, and synchronize this data.
The FMS s change from DUAL to INDEPENDENT mode, if there is a communication failure (avionics network problem) between the active FMC s .
When the FMS s are in the INDEPENDENT mode, the FMC s no longer share information. They operate independently.

Independent Operation



L3 At FMC power-up, the active FMC s crosscheck data that needs to be identical for a normal DUAL operation. If one of these data is not identical, the active FMC s will change to INDEPENDENT mode.

The crosschecked data is:
- Navigation, Performance, and Magnetic Variation databases
- OPC and AMI files
- Aircraft and engine type
- FM Operational Program
- Engine manufacturer program pins.

L1 **CONTROLS AND INDICATORS**

ON THE MFD

Both MFD s display:
- IND in the system message area, and
- The INDEPENDENT OPERATION message in the FMS message area.

L3 At FMC power-up, when the active FMC s change to INDEPENDENT mode, due to not identical data, the type of the not identical data is added to the INDEPENDENT OPERATION message.
Refer to FMCs ACFT STATUS DISAGREE INDEPENDENT OPERATION
Refer to FMCs PIN PROG TYPE DISAGREE INDEPENDENT OPERATION

INDEPENDENT OPERATION

L2 The POSITION pages do not display the position data, that is computed by the offside FMC .

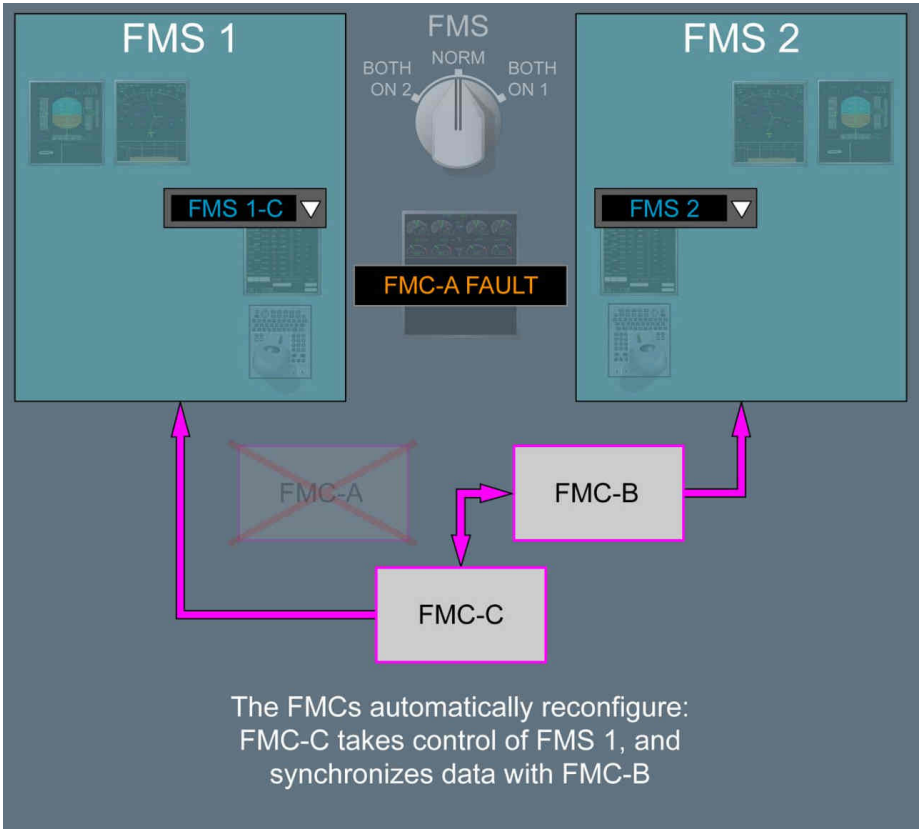
ONE FMC FAULT

Applicable to: ALL

If one of the active FMC s fails, the standby FMC takes over, and synchronizes with the not affected active FMC . FMS 1, and FMS 2 are still operative. However, redundancy is lost, because there is no longer a standby FMC .
If the standby FMC fails, redundancy is lost.

Note: *When the autopilot is engaged, and the onside active FMC fails, the autopilot does not disconnect. However, the flight guidance modes revert to HDG / TRACK and V/S / FPA. The flight crew can engage the managed guidance modes again as soon as the standby FMC has taken control of the failed FMS side.*

Example: FMC A FAULT



CONTROLS AND INDICATORS

ECAM ALERTS

Refer to AUTO FLT FMC -A(B)(C) FAULT

ON THE MFD , AND ND

If the standby FMC fails, the MFD will not indicate the FMC failure.

If one of the active FMC s fails:
- The onside ND displays MAP NOT AVAIL
- The onside VD displays the altitude and distance scales in red

  Note: *If the VD displays the FMS dialog area, the dialog area disappears and the VD displays FMS PAGE NOT AVAIL.*

- If the onside MFD displays an FMS page, the page disappears and the MFD displays FMS PAGE NOT AVAIL.

  As soon as the standby FMC takes over, the MFD displays:
  - FMS 1–C (or FMS 2–C) in the MFD system menu, to indicate that FMC -C will provide data to FMS 1 (or FMS 2)
  - The STATUS page (before engine start), or the ACTIVE / F-PLN page (after engine start)
  - The PLEASE WAIT FOR FMS RESYNCH message in the FMS message area

When the standby FMC becomes operative, the PLEASE WAIT FOR FMS RESYNCH message disappears from the FMS message area.

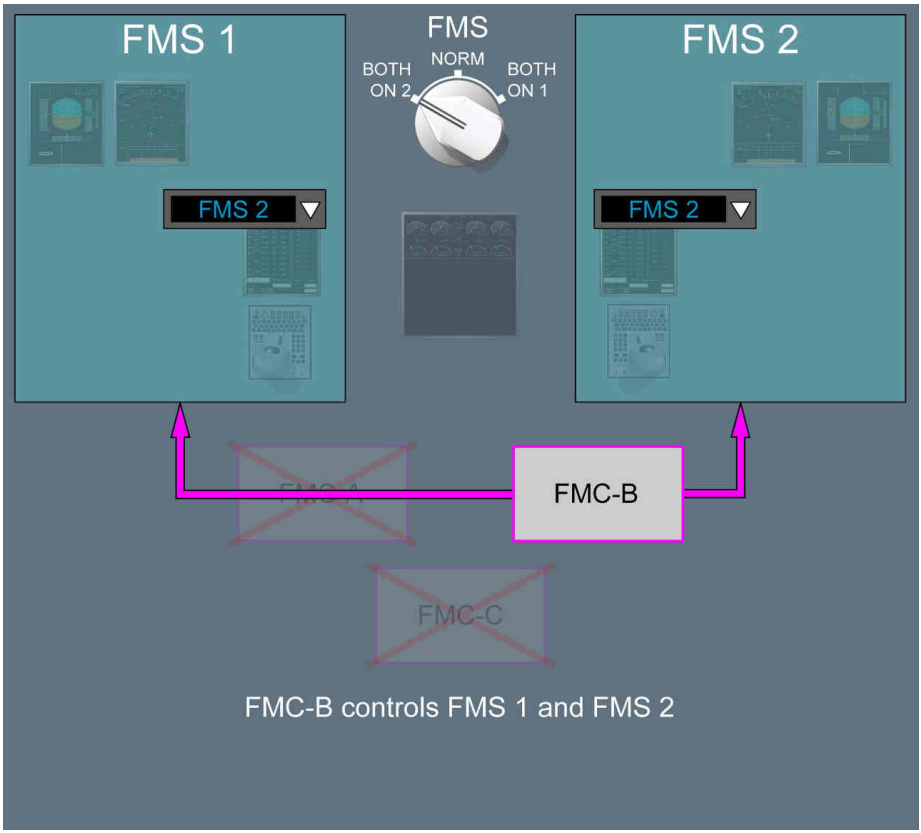
TWO FMC S FAULT (SINGLE MODE)

Applicable to: ALL

If two FMC s fail, one entire FMS side (FMS 1, or FMS 2) is lost: The remaining FMS is in SINGLE mode.
In this case, the flight crew uses the FMS selector to display the data from the not affected FMS side on both sides.

Note: *When the autopilot is engaged, and the onside FMS fails, the autopilot does not disconnect. However, the flight guidance modes revert to HDG / TRACK and V/S / FPA.*
The flight crew can engage the managed guidance modes again as soon as he sets the FMS selector to the right position.

Example: FMC A+C FAULT



L2 If the two active FMC s fail, and the time between the two failures was too short for the standby FMC to synchronize the data, all FMS data is lost: The flight crew then must initialize the FMS again.

L1 **CONTROLS AND INDICATORS**

ECAM ALERTS

Refer to AUTO FLT FMS 1(2) FAULT

ON THE MFD , AND ND / VD

If one FMS side fails:

- The onside ND displays MAP NOT AVAIL: The onside ND no longer displays flight plan, and weather (terrain) data.
- The onside VD displays the altitude and range scales in red color: The onside VD no longer displays flight plan, and weather (terrain) data.

  Note: *If the VD displays an FMS dialog area, the dialog area disappears and the VD displays FMS PAGE NOT AVAIL instead.*

- If the onside MFD displays an FMS page, the page disappears and the MFD displays FMS PAGE NOT AVAIL.

After setting the FMS selector :

- The onside MFD displays the ACTIVE / F-PLN page.
  The MFD System Menu displays the same label as on the offside MFD . This indicates that both sides display data, provided by the same FMC .
- The onside ND displays the OFFSIDE FM CONTROL label: This message indicates that the offside FMC provides all FMS data.
- On the onside EFIS CP , the flight crew can no longer select:
  - The FMS display options: CSTR, WPT, VORD, NDB, and ARPT
  - The ND mode (except the ROSE-VOR, and ROSE-LS modes)
  - The ND range (except the ZOOM position).

  From now on, these display options are driven by the offside EFIS CP .
- The onside ND displays the weather (terrain) data, if the WXR (TERR) option is selected on the onside EFIS CP , and:
  - The onside or offside ND is in ROSE-VOR, or ROSE-LS mode, or
  - The offside ND is in ROSE-NAV mode, and the range is 80 nm .

  In all other cases, the onside ND displays the WXR RNG (TERR RNG) message.
- The onside VD displays the terrain (weather, if the WXR option is selected on the onside EFIS CP) data, if the offside ND is in ROSE-NAV mode, and the range is 80 nm .
  If not, the onside VD displays the TERR INOP (WXR INOP) message.

ALL FMCS FAULT (BACKUP NAVIGATION)

Applicable to: ALL

If all FMC s fail, all FMS data and functions are lost on both sides (FMS 1 and FMS 2).
The flight crew must tune the NAVAIDS via the RMP . (*Refer to For more information on the Standby Radnav*)
The flight crew can create a basic flight plan via the ISIS . (*Refer to For more information on the ISIS*)

All FMC s Fault

CONTROLS AND INDICATORS

ECAM ALERTS

Refer to AUTO FLT FMS 1+2 FAULT

ON THE MFD , AND ND

If all FMC s fail:
- Both ND s display MAP NOT AVAIL
- Both VD s display the altitude and distance scales in red color

Note: If the VD displays an FMS dialog area, the dialog area disappears and the VD displays FMS PAGE NOT AVAIL.

- If the MFD displays an FMS page, the page disappears and the MFD displays FMS PAGE NOT AVAIL.

FMC RESET AND RESYNCHRONIZATION

Applicable to: ALL

AUTOMATIC FMC RESET

When the FMC software cannot work properly or receives instructions to perform impossible operations, it automatically resets.

MINOR RESET

In case of a simple **minor** reset, the FMC recovers all FMS data.
After the data recovery, the FMC resynchronizes with the other active FMC to restore the DUAL mode of operation.

MAJOR RESET

When three resets occur at short intervals, the FMC looses all FMS data. This is called a **major** reset. To recover the FMS data, the FMC will resynchronize with the healthy FMC, if any.

LATCH

When four resets occur at short intervals, the FMC is latched and the FMC A(B)(C) FAULT message is triggered. The standby FMC, if available, will take over.

Note: In the case of an FMC latch, the flight crew applies the ECAM procedure.

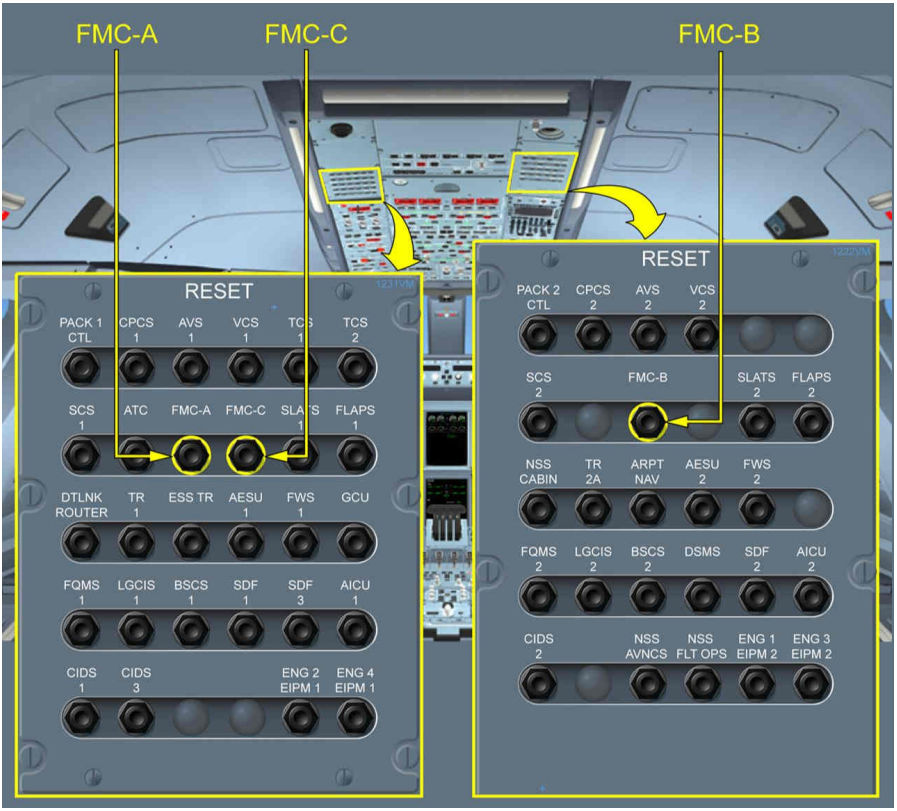
AUTOMATIC FMC RESYNCHRONIZATION

After a reset, the FMC resynchronizes with the healthy FMC to recover all FMS data and/or to restore the DUAL mode of operation.
If several resynchronizations occur and fail at short intervals, the active FMCs will start working in the INDEPENDENT mode.

MANUAL FMC RESET

On rare occasions, the FMC may require manual resetting.
The flight crew should reset one FMC at a time.
The flight crew uses the three FMC reset buttons on the overhead panel.

Reset Buttons



FMC MALFUNCTION

When the flight crew detects an FMC malfunction (with or without the associated FMC-A(B)(C) FAULT alert on the ECAM), the flight crew may try to restore the FMS functions by resetting the FMC. To reset the FMC, the flight crew pulls and pushes the reset button.

FMC IN ABNORMAL CONFIGURATION

Before engine start, if all FMCs are operative, the three FMCs ensure automatically the normal operation configuration:

- FMC-A on FMS 1
- FMC-B on FMS 2
- FMC-C in standby.

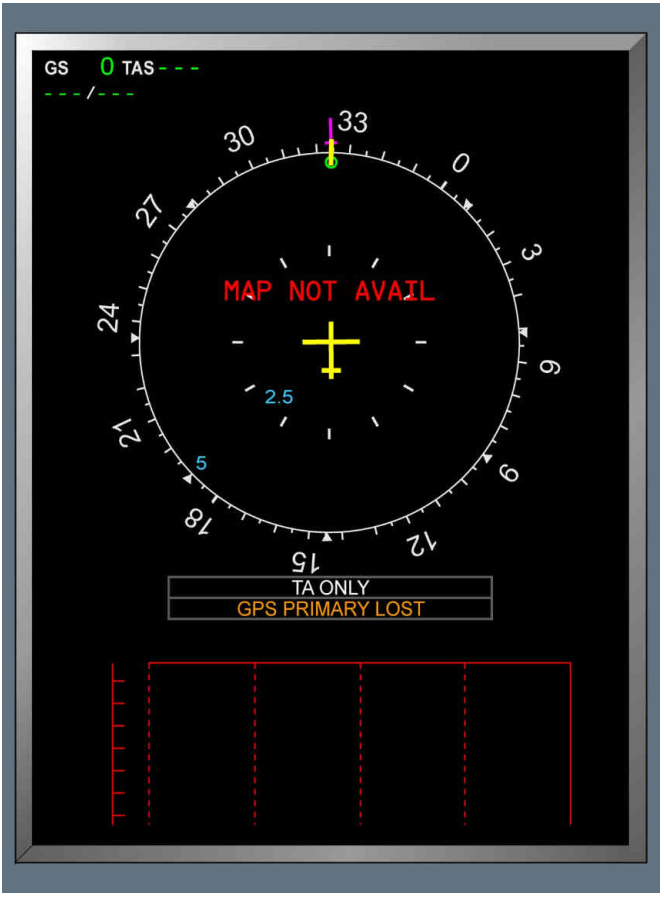
After engine start, the flight crew may detect that the three FMCs are operative, but in an abnormal configuration (for example: FMC-C on FMS 1, and FMC-A in standby). The flight crew can restore the normal operation configuration by resetting one of the FMCs, that is not in the right configuration. To perform this manual re-configuration, the flight crew pulls the reset button more than 10 s, and then pushes the reset button.
Example: FMC-C is on FMS 1, FMC-B on FMS 2, and FMC-A in standby, and all three FMCs are healthy. When the flight crew resets FMC-A, FMC-A will take over control of FMS side 1, and FMC-C will return to standby.

FMS STATUS DURING FMC RESET AND RESYNCHRONIZATION

During an FMC reset and resynchronization:

- The ND displays the MAP NOT AVAIL message, and the VD displays the altitude and distance scales in red.

The ND/VD During Reset



- The MFD temporarily displays FMS PAGE NOT AVAIL.

During the resynchronization, the MFD displays:

- The STATUS page

- The PLEASE WAIT FOR FMS RESYNCH message in the FMS message area.

MFD During Reset and Resynchronization

After FMC resynchronization, the MFD displays:

- The STATUS page before engine start, or
- The ACTIVE / F-PLN page after engine start.

- The auto-tuning of the NAVAIDS is lost on the failed FMS side.
  After FMC resynchronization, the auto-tuning is recovered.
- The managed modes may be lost: In this case, the AP/FD modes revert to HDG/TRACK and V/S / FPA.
  After FMC resynchronization, the flight crew should push the HDG/TRK knob and the ALT knob to engage the managed modes again.

ECAM ALERTS

Applicable to: ALL

AUTO FLT FMC-A(B)(C) FAULT (*Refer to procedure*)

AUTO FLT FMS 1(2) FAULT (*Refer to procedure*)

AUTO FLT FMS 1+2 FAULT (*Refer to procedure*)

T.O SPEEDS NOT INSERTED (*Refer to procedure*).

Intentionally left blank

PERFORMANCE DATA NOT CLEARED AT F-PLN RE-INITIALIZATION

Applicable to: ALL

DESCRIPTION

When a flight plan exists, and the flight crew enters the city-pair again, the flight plan re-initializes. The FMS deletes the existing flight plan data. However, the FMS does not delete the associated performance data.
Refer to TDU

ERRONEOUS FUEL PREDICTIONS IN THE CASE OF DESCENT WITH TWO ALTITUDE CONSTRAINTS

Applicable to: ALL

DESCRIPTION

If the flight plan has two altitude constraints for the descent, the flight crew may notice erroneous FMS fuel predictions.

EXPLANATION

If the flight plan has two altitude constraints for the descent, the FMS may define a geometric segment between both altitude constraints. If there is a deceleration required within the geometric segment, the FMS may consider that the geometric segment is too steep to fly without speedbrakes. In this case, the FMS tags the entire geometric segment as a speedbrake segment: The FMS assumes that during the entire segment half of the speedbrakes are extended, even for the parts where no deceleration is planned. As a consequence, the FMS will predict an increased thrust for the entire geometric segment. This may lead to erroneous fuel predictions. (e.g. a geometric segment of 160 nm may lead to an error of1.3 t for the fuel prediction at destination).

Note: When flying the geometric segment, the predictions become better as the aircraft approaches the end of the geometric segment, and turn back to normal when the aircraft has sequenced the second altitude constraint.

PROCEDURE

If the flight crew suspects this behavior in preflight, or during the flight, they can delete and enter again one altitude constraint in descent and compare the fuel predictions of the flight plan with and without the geometric segment. This allows the flight crew to evaluate the impact of the geometric segment on the fuel predictions.
It is not recommended to permanently delete altitude constraints that are stored in the navigation database.

REF IDENT ENTRY NOT ALLOWED ON EQUI-TIME POINT PAGE

Applicable to: ALL

DESCRIPTION

When the flight crew tries to enter a reference ident in REF 1(2) field on the EQUI-TIME POINT page, the FMS may erroneously reject the entered ident and display the NOT ALLOWED message in the FMS Message Area.
Refer to TDU .

EXPLANATION

Due to a misbehavior of the FMS , the reference ident may be still kept in the FMS memory after an automatic clear of REF 1(2) field (e.g. following the activation of a secondary flight plan).
The consequence is that in some cases, the FMS may consider that the reference ident is already selected in the other reference entry field and therefore reject the entered reference ident and display the NOT ALLOWED message.

PROCEDURE

If such behavior is suspected, the flight crew can:
- Enter the desired reference ident on the other MFD . When both MFD s synchronize, the flight crew will get the EQUI-TIME POINT computation results on both MFD s, or
- Temporarily enter and validate two other valid reference idents in REF 1 and REF 2 fields on the affected MFD . This will properly “erase” the reference ident from the FMS memory. Then, the flight crew will be able to enter again the desired reference idents in REF 1 and REF 2 fields.

REVERSION FROM MANAGED TO SELECTED SPEED TARGET AFTER MAP SEQUENCING IN NPA

Applicable to: ALL

DESCRIPTION

In non precision approaches, the managed speed mode will revert to the selected speed mode 5 s after sequencing the MAP (Missed Approach Point), if the Vapp is the one computed by the FMS .
This misbehavior does not occur if, before sequencing the MAP (e.g during descent preparation), the flight crew manually enters the Vapp on the APPR panel of the FMS PERF page.

EXPLANATION & OPERATIONAL CONSEQUENCES

Due to a misbehavior of the FMS L2 standard, the Vapp is no longer computed 5 s after sequencing the MAP (Missed Approach Point).
This misbehavior has no consequence on precision approaches.

L2 There is no effect on precision approaches, because:
- The Vapp is memorized by the PRIM below 700 ft RA until approach modes are disengaged/disarmed, and
- The MAP is at the runway threshold.

L1 On non precision approaches, 5 s after sequencing the MAP :

- The managed speed target reverts to selected speed target.
- The selected speed is the current aircraft speed.

L2 The selected speed target is limited in lower value by VLS . Before the reversion from managed speed to selected speed, the managed speed target was limited in lower value by VLS + 5 kt .

L1 - The ground speed mini function is lost.
For more information on the ground speed mini function, *Refer to 00009382 **Not found** .*

This misbehavior has no consequence on GO-AROUND guidance.

L2 In the case of a GO-AROUND after the MAP , the PRIM will behave as usual:
- SRS GA and GA TRK engage
- There is a reversion from selected speed target to managed speed target
- The managed speed target is the memorized aircraft speed at SRS GA engagement
- But the lower speed limit will not be the usual one. The speed target for GO AROUND SRS will be limited in lower value by VLS + 5 kt instead of being limited by Vapp.

L1 This misbehavior is cancelled by the next FMS L3 standard.

INTRODUCTION

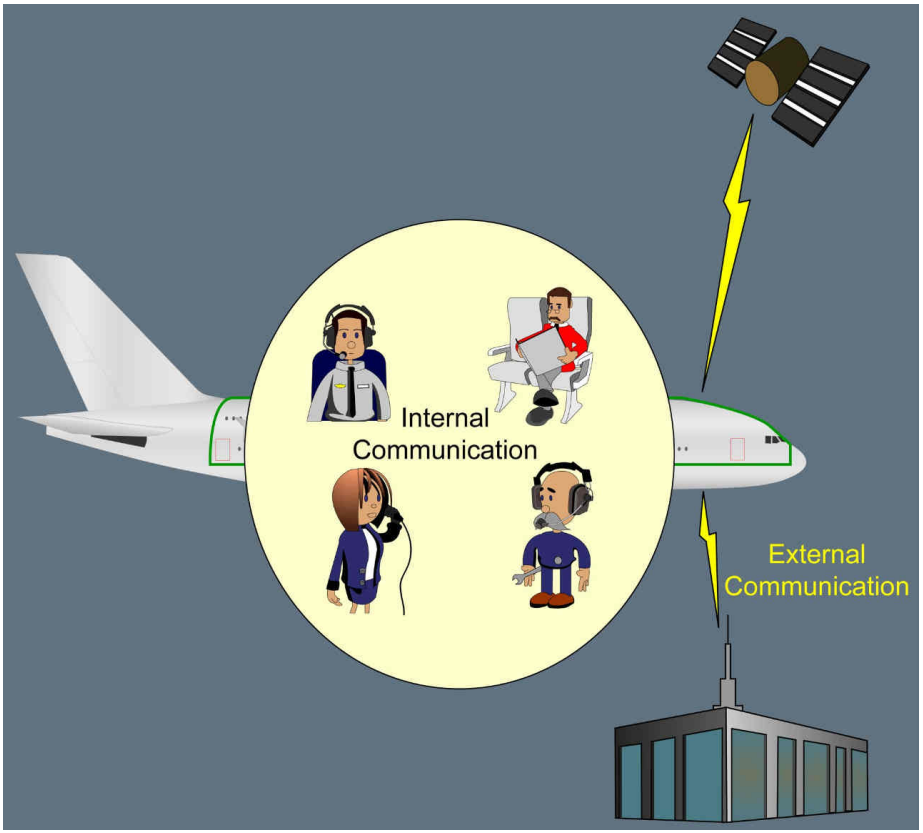
Applicable to: ALL

The communication system enables:

- Internal communication between the:
  - Captain
  - First Officer
  - Third and fourth occupants
  - Cabin crew
  - Ground crew
  - Passengers (i.e. for flight or cabin crew announcements)

  Internal communication is possible via the flight, cabin, and service interphones, and via the Passenger Address (PA).
- External communication in voice and data modes, via the VHF , HF , and Satellite Communication (SATCOM) systems.

Communication System Overview

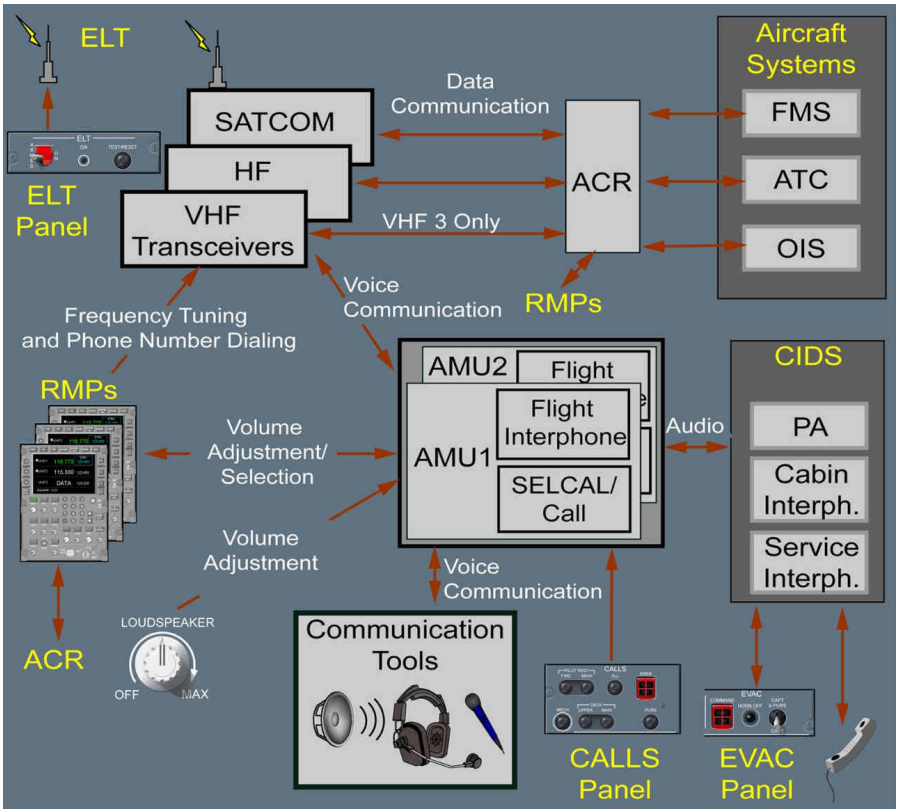


COMMUNICATION SYSTEM ARCHITECTURE

Applicable to: ALL

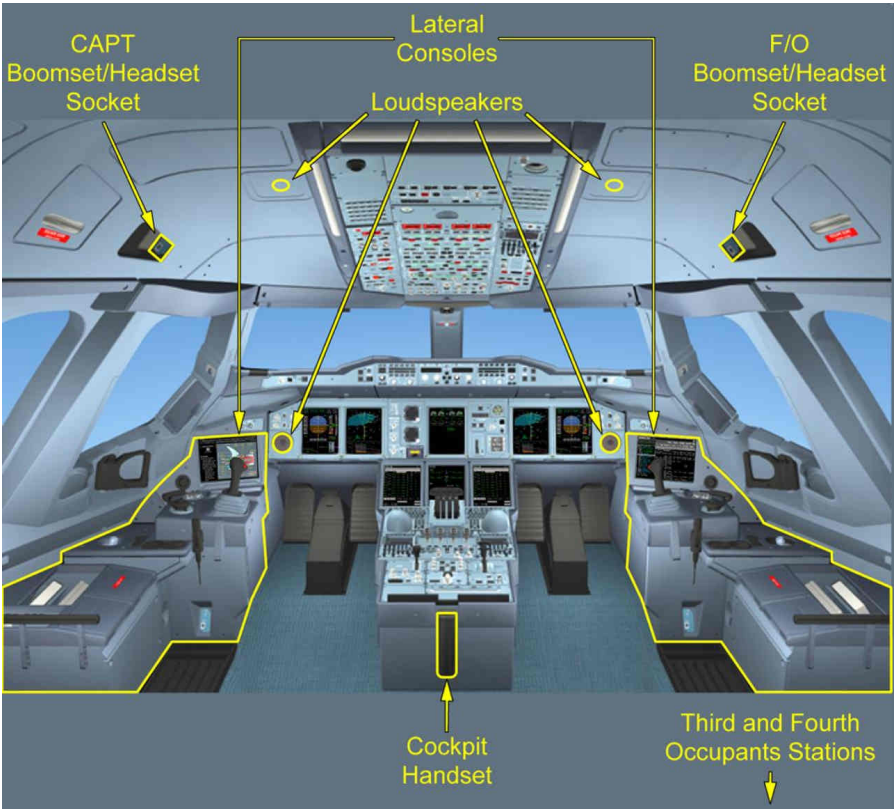
COMMUNICATION SYSTEM ARCHITECTURE

Communication System Architecture



COMMUNICATION EQUIPMENT

Communication Equipment Cockpit View



The cockpit has the following equipment:

- Four loudspeakers

L2 The two loudspeakers on the left are for communication broadcasts that the Captain selects on the RMP.

The two loudspeakers on the right are for communication broadcasts that the First Officer selects on the RMP.

L1 - One Push-To-Talk switch (PTT sw) on each one of the two sidesticks
- Three boomsets
- Four headsets

- Three hand microphones, each with a PTT sw

L3 Communication via the hand microphone takes priority over communication via the boomset or via the oxygen mask microphone.

L1 - One microphone on the oxygen mask of the Captain (CAPT), First Officer (FO) and third occupant
- One cockpit handset.

RADIO MANAGEMENT PANEL (RMP)

There are three Radio Management Panels (RMP s) in the cockpit. The flight crew uses these RMPs to control the communication system.

On each RMP , the flight crew can:
- Select the communication mean(s) in transmission and/or reception mode(s)
- Tune HF and VHF frequencies
- Dial SATCOM Telephone (TEL) numbers
- Select voice or data mode
- Monitor and change data mode parameters
- Enter the Squawk (SQWK) code
- Select Standby Radio Navigation (STBY RAD NAV) and tune the NAVAID s (only via RMP 1 and RMP 2).
  For information on radio navigation tuning, *Refer to DSC-22-FMS-10-30-20-22FMS3020A Radio Navigation Tuning - Introduction* .
  For information on standby radio navigation, *Refer to DSC-22-FMS-30 All FMCs FAULT (Backup Navigation)* .
- Adjust the volume for voice communication and for NAVAID identification.

In addition to the RMP s, the flight crew uses:
- The CALLS panel to generate visual, and aural call indications (in the cabin and/or on the steering nose gear panel) via the flight and cabin interphones
- The Evacuation (EVAC) panel, to initiate evacuation of the aircraft
- The Emergency Locator Transmitter (ELT) panel, to control the ELT.

For more information on the RMP s, *Refer to DSC-23-10-10-20 RMP Architecture* .

L2 AUDIO MANAGEMENT UNIT (AMU)

There are two Audio Management Units (AMUs) in the aircraft. The AMUs are located in the main backward avionic bays.

The AMUs manage:
- communication transmission / reception of all the radio communication and radio navigation facilities,
- Interphone communication between crew members.

L3 The AMUs distribute, and adjust the volume of audio signals (analog) between the communication equipment and the:
- HF/VHF transceivers
- SATCOM system
- SELCAL
- NAVAID receivers (for NAVAID identification in STBY RAD NAV)
- Flight interphone
- Cabin Intercommunication Data System (CIDS) that includes:
  - The cabin interphone
  - The service interphone
  - The Passenger Address (PA).

L2 *Note: The cockpit handset is directly connected to the CIDS.*

L3 AVIONICS COMMUNICATION ROUTER (ACR)

The RMPs also transmit flight crew selections to the Avionics Communication Router (ACR). The ACR controls datalink communications for Air Traffic Control (ATC) and Airline Operational Communications (AOC) applications, and is hosted in CPIOM D.

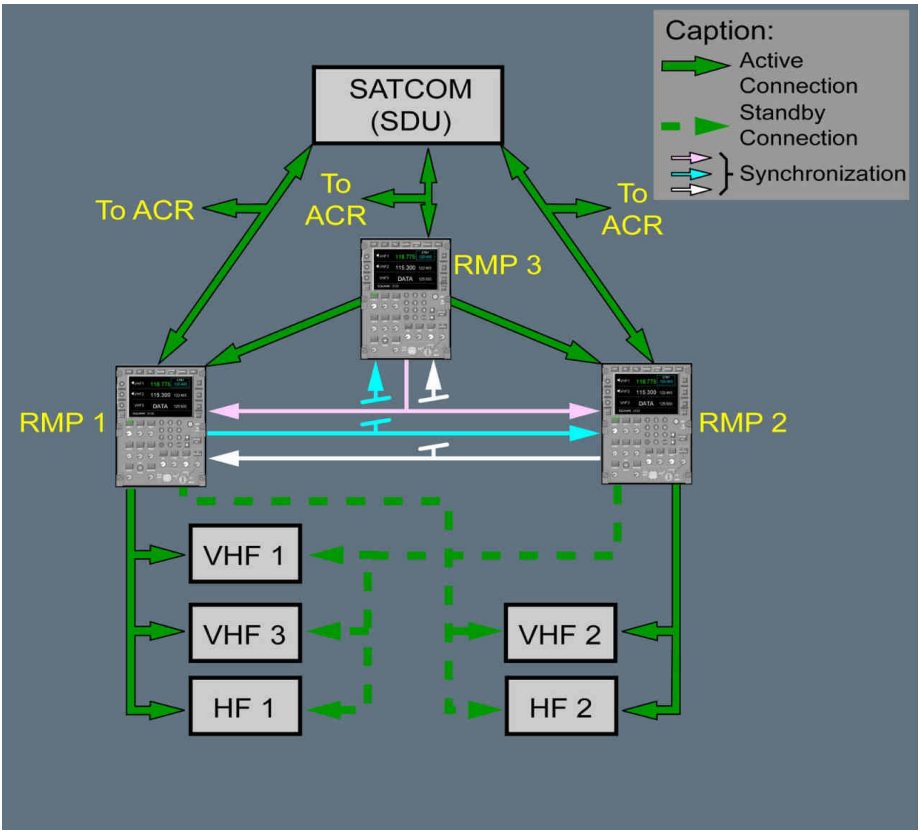
Note: The ACR interfaces with:

- *The Flight Management System (FMS)*
- *The ATC datalink system*
- *The Onboard Information System (OIS).*

RMP ARCHITECTURE

Applicable to: ALL

RMP Architecture



RMP SYNCHRONIZATION

The RMPs share selections and inputs to enable the flight crew to control all radio communication via any RMP.

L2 The RMPs share mainly the following data:
- Active and standby frequencies
- SATCOM channels and their status (e.g. logged on/off, cabin calls enabled/disabled, connected)
- Active function displays (e.g. Amplitude Modulation (AM))

L1 However, it is possible to display a different page on each RMP.

ACTIVE COMMUNICATION

In normal operation:

- The Captain controls communication via RMP 1
- The First Officer controls communication via RMP 2
- The third and the fourth occupants control communication via RMP 3.

RMPs 1 and 2 are directly connected to the VHF and HF transceivers.
L2 RMP 1 transmits all commands to VHF 1, VHF 3 and HF 1.
RMP 2 transmits all commands to VHF 2 and HF 2.
L1 RMP 3 transmits commands to RMP 1 or RMP 2, via the appropriate control connection. RMP 1 and/or RMP 2 then send these commands to the appropriate transceivers.
All three RMPs are directly connected to the SATCOM system.

STANDBY CONTROL

If a connection or an RMP fails, the communication system can automatically reconfigure to ensure continued communication control.
L3 Standby connections are activated instead of the failed connections.
L1 RMP 3 can be used, as a backup, instead of the failed RMP (not for STBY RAD NAV control).
For information on reconfiguration with RMP failures or with connection failures, refer to the abnormal operation chapter.
If the FMS can no longer control the radio NAVAIDS (e.g. FMS failure), RMPs 1 and 2 can also be used, as a backup, to tune the NAVAIDS.

Flight Interphone

FLIGHT INTERPHONE

Applicable to: ALL

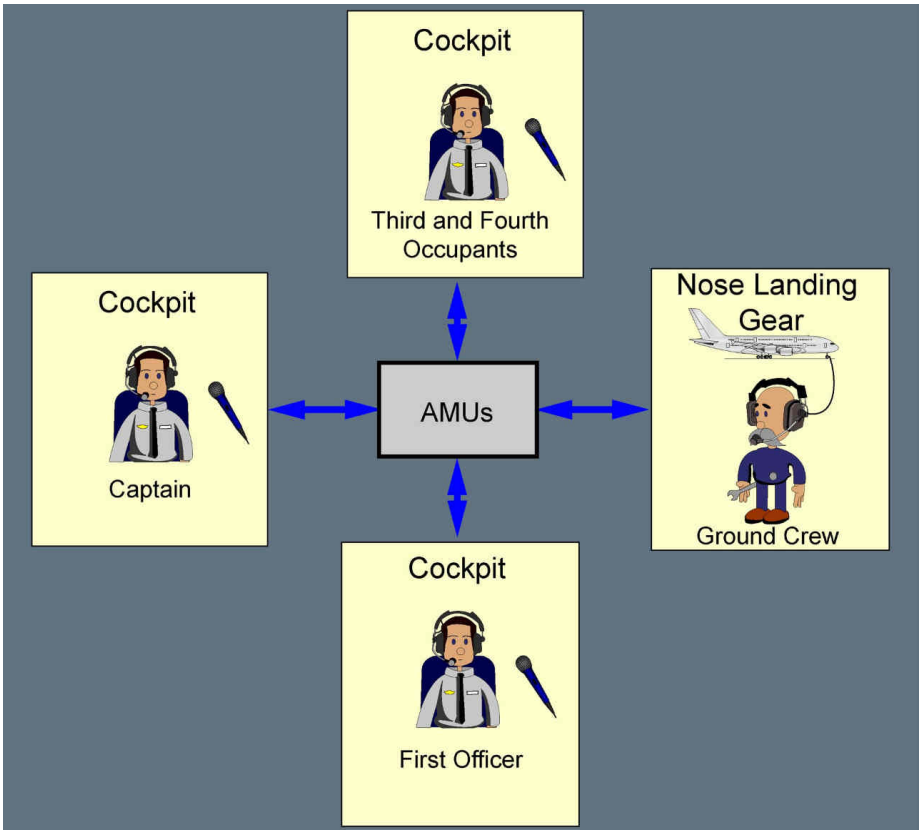
L3 The Audio Management Units (AMUs) host the flight interphone.

L1 The flight crewmembers use the flight interphone to communicate with each other, and with the ground crew via the:

- Boomsets/headsets
- Hand microphones
- Microphones on the oxygen masks.

The ground crew can communicate with the flight crew via the FLT INT jack on the maintenance nose landing gear panel.

Flight Interphone



Before transmitting via the flight interphone, the flight crewmember must:
- Press and release the INT reception knob to the out position
- Press the INT transmission key
- Press a PTT sw or set the INT/RAD sw to RAD to transmit.

For permanent transmission (i.e. conference mode):
- Press and release the INT reception knob to the out position
- Set the INT/RAD sw to INT.

Cabin Interphone

CABIN INTERPHONE

Applicable to: ALL

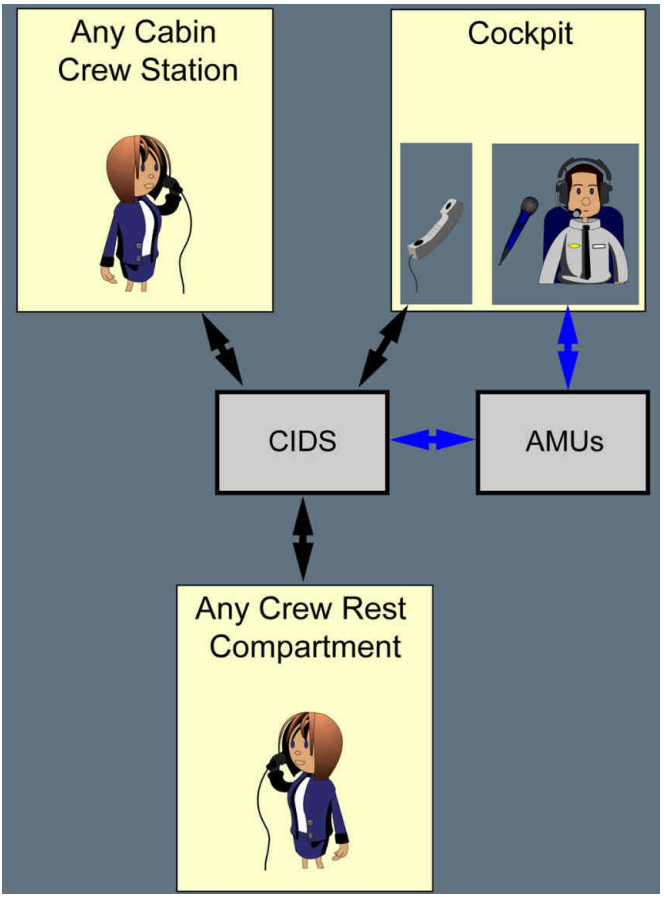
L3 The Cabin Intercommunication Data System (CIDS) hosts the cabin interphone.

L1 The flight crew can use the cabin interphone to communicate with the cabin crew at any cabin crew station, and with a crewmember in a crew rest compartment via the:

- Boomsets/headsets
- Hand microphones
- Microphones on the oxygen masks
- Cockpit handset. For more information *Refer to DSC-23-10-20-20-10 Cockpit Handset* .

Note: *Cabin crewmembers can also use the cabin interphone to communicate with other cabin crewmembers that are at different attendant stations or in the crew rest compartment.*

Cabin Interphone



Before transmitting via any other appropriate equipment, the flight crewmember should:
- Press and release the CAB reception knob in the out position
- Press the CAB transmission key
- Press a PTT sw or set the INT/RAD sw to RAD to transmit.

COCKPIT HANDSET DESCRIPTION

Applicable to: ALL

Impacted DU: 00016492 Cockpit Handset

COCKPIT HANDSET DESCRIPTION

The flight crew can use the cockpit handset:
- For public address
- For internal communication to each handset (i.e Cabin or CCRC handset)

Note: The flight crew must use the PILOT REST pb on the overhead CALL panel to call the Flight Crew Rest Compartment (FCRC).

- For communication with ground crew to each service area.

L3 The company can customize the Cabin Intercommunication Data System (CIDS) through the Cabin Assignment Module (CAM). In accordance with the CIDS customisation, the crew could have access to optional functions.

L1 For more information on handset description and utilization, *Refer to DSC-23-10-20-20-10 Cockpit handset layout*

Impacted by TDU: 00023043 Cockpit Handset

COCKPIT HANDSET DESCRIPTION

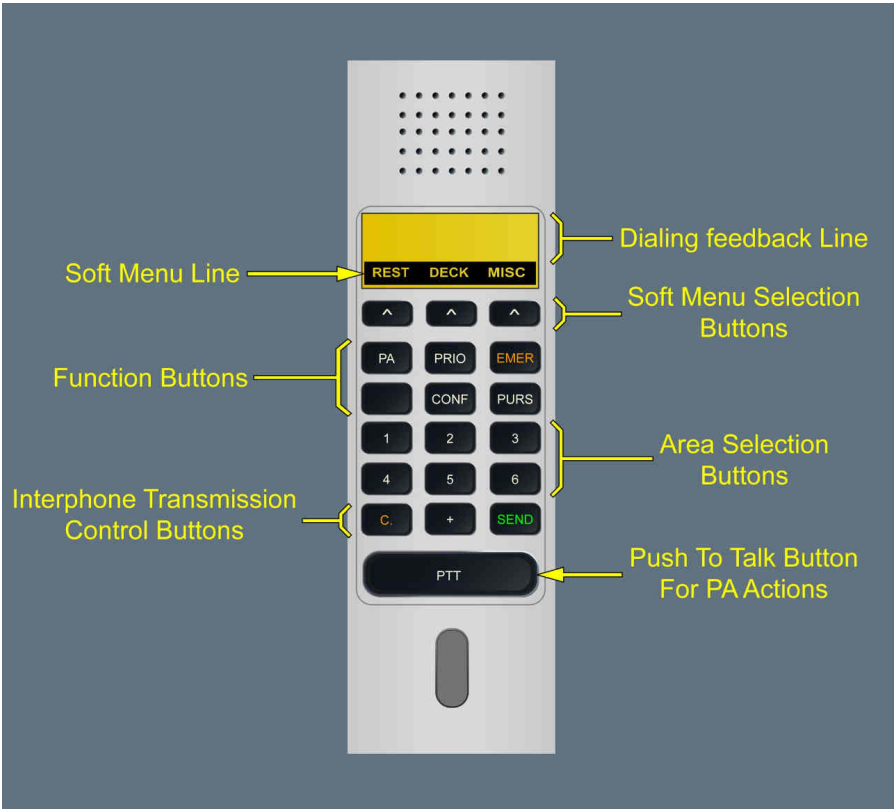
The flight crew can use the cockpit handset:
- For public address
- For internal communication to each handset (i.e. cabin, FCRC or CCRC handset)
- For communication with ground crew to each service area.

L3 The company can customize the Cabin Intercommunication Data System (CIDS) through the Cabin Assignment Module (CAM). In accordance with the CIDS customisation, the crew could have access to optional functions.

L1 For more information on handset description and utilization, *Refer to DSC-23-10-20-20-10 Cockpit handset layout*

COCKPIT HANDSET LAYOUT

Cockpit Handset Layout



SOFT MENU LINE

Displays the various function that can be selected using the soft menu selection button. After activation of a call function, this line give the transmission state of the call.

DIALING FEED-BACK LINE

Displays data system state.

SOFT MENU SELECTION BUTTONS

Push any of the soft menu selection buttons to access the relevant menu or function.

FUNCTION BUTTONS

PUBLIC ADDRESS (PA) BUTTON

Push the PA button access the public address function.

Following the access to the PA function, the flight crew can choose a specific zone for public address using:
- area selection button, or
- sof menu selection button

To transmit voice message, the flight crew will push and keep pushed the PTT button .

PRIO BUTTON

Push to give priority to the call.

L2 *Note: For the handset operation, the following order of priority is defined (level 1 is the highest priority) :*
- *Level 1: Emergency call (EMER)*
- *Level 2: Calls from cockpit*
- *Level 3: Priority calls (PRIO)*
- *Level 4: Purser calls (PURS)*
- *Level 5: Conference calls (CONF)*
- *Level 6: Normal calls*

For public address operation, the following order of priority is defined (not combine with interphone) :
- *Level 1: PA from AMU (cockpit)*
- *Level 2: Direct public address (Direct PA)*
- *Level 3: Priority public address (PRIO PA)*
- *Level 4: Normal public address (PA)*

L1 CONF BUTTON

Push the conference interphone function connects several cabin crew or ground crew stations for communication.
The flight crew chooses the desired zone for conference interphone calls by using the soft menu selection button and pushes the SEND button to activate the selected conference call.

PURS BUTTON

Push to call the purser. The flight crew will push the SEND button after PURS button to activate the purser call.

EMER BUTTON

Press to initiate an emergency call to all the handsets in the cabin.
For activation of the emergency call the flight crew must press the EMER button at least 5 s
L2 This button also requires higher pressure than the others.
L1 The emergency call has priority over any other function or call.

AREA SELECTION BUTTONS

Press the correspondent key, to access the desired zone for interphone function or per Public Address.

INTERPHONE TRANSMISSION BUTTONS

SEND BUTTON

Press to call the selected interphone addressees.

C. BUTTON

Press to undo or delete the last selection menu or stop the conversation.

PUSH TO TALK BUTTON

Press to directly access the Public Address (PA) function for the entire aircraft.
L2 This mode overrides all other active announcements.
L1 When specific areas are selected before the PTT button is pressed, announcements will be made on these areas only.

Passenger Address (PA)

PASSENGER ADDRESS (PA)

Applicable to: ALL

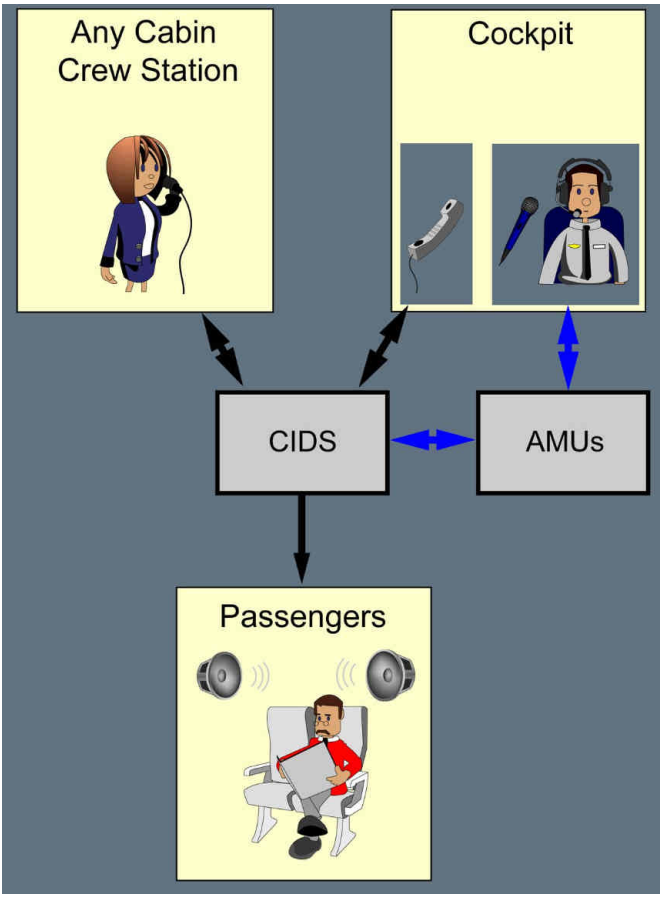
L3 The Cabin Intercommunication Data System (CIDS) hosts the PA .

L1 The flight crew, and the cabin crew can use the PA to make announcements to the passengers via the:

- Boomsets/headsets
- Hand microphones
- Microphones on the oxygen masks
- Cockpit handset. For more information *Refer to DSC-23-10-20-20-10 Cockpit Handset* .

For more information on the PA, *Refer to CCOM/05-20-10 General Information about the PA System* .

PA



Before making an announcement via any other appropriate equipment, the flight crewmember should:

- Press and release the PA reception knob to the out position
- Press and hold the PA transmission key on the RMP to make the announcement.

Note: *It is not necessary to use a PTT sw .*

Cabin Intercommunication Data System

SERVICE INTERPHONE

Applicable to: ALL

L3 The Cabin Intercommunication Data System (CIDS) hosts the service interphone.

L1 The flight crew can use the service interphone to communicate with the cabin crew at any cabin crew station, and with the ground crew via the:

- Boomsets/headsets
- Hand microphones
- Microphones on the oxygen masks
- Cockpit handset. For more information *Refer to DSC-23-10-20-20-10 Cockpit Handset* .

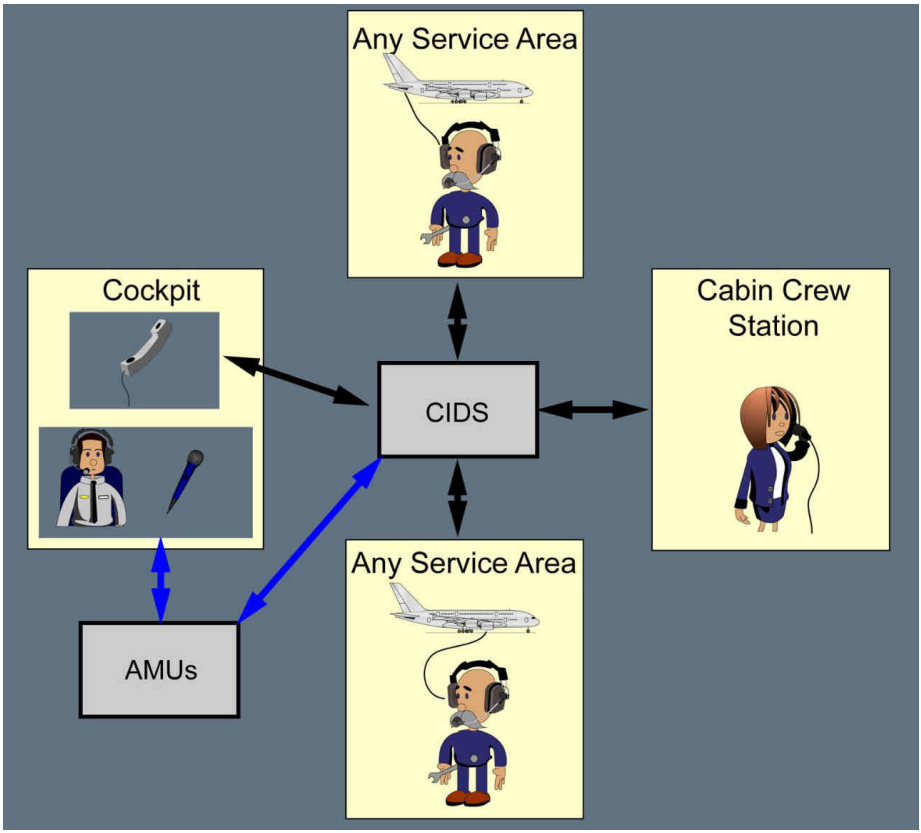
The ground crew can communicate with the flight crew via any SVCE INT jack at any service area.

L2 There is a SVCE INT jack:

- At the nose landing gear maintenance panel
- In the APU bay
- In the main avionics bay
- On the external surface of each engine air intake
- At several locations on the fuselage.

L1 *Note:* *Ground crewmembers can also use the service interphone to communicate with other ground crewmembers that are at different service areas.*

Service Interphone



Before transmitting via any other appropriate equipment, the flight crewmember should:

- Press and release the CAB reception knob to the out position
- Press the CAB transmission key
- Press a PTT sw or set the INT/RAD sw to RAD to transmit.

Radiocommunication

VHF

Applicable to: ALL

The communication system has three VHF transceivers, and each transceiver has its own antenna.
L2 *Refer to Antenna locations*
L3 Each VHF transceiver operates within a frequency band that ranges from 118.000 MHz to 136.975 MHz, by increments of 8.33 kHz.
L1 VHF 1 and VHF 2 are for short-range communication in voice mode only.
VHF 3 is mainly for short-range communication in data mode. VHF 3 can be a backup for communication in voice mode.

L3 Data communication is automatically transferred to the SATCOM , or to the available HF transceiver, if:
- VHF 3 is in voice mode, or
- The aircraft is outside the range of a VHF station.

The Operator can customize the configuration software that defines the policy for Avionics Communication Router (ACR) transfers.
L1 For information on how to tune the RMP , *Refer to DSC-23-40 How to Tune a Radio Frequency* .
For information on how to switch to DATA mode, *Refer to DSC-23-40 How to Switch to DATA Mode* .
For information on how to modify the VHF datalink provider, *Refer to DSC-23-40 How to Modify the VHF Datalink Provider* .

HF

Applicable to: ALL
Impacted DU: 00002316 HF

The communication system has two HF transceivers that operate either in Amplitude Modulation (AM) or Single Side Band (SSB) mode.
L2 The flight crew can select the AM or SSB mode via the HF page on any RMP .
L1 HF 1 and HF 2 are for long-range communication in voice or data mode.

Note: *If the flight crew wants to use the HF in data mode, the flight crew should preferably use the HF 1 in data mode.*

L3 Each HF transceiver operates within a frequency band that ranges from 2.800 MHz to 23.999 MHz, by increments of 1 kHz.
L1 The two transceivers use the same antenna, and cannot transmit information simultaneously.
L2 *Refer to Antenna locations*

L1 If the flight crew tries to transmit voice messages simultaneously via HF 1 and HF 2, an aural alert is generated via the headsets and the loudspeakers.
L2 In case of simultaneous voice and data transmission, voice communication takes priority over data communication .
However, simultaneous reception is possible, when no HF is transmitting.
L3 On ground, HF communication in data mode is automatically inhibited. For maintenance purposes, the ground crew can override this inhibition using the GND HF DATALINK pb-sw on the overhead maintenance panel.
L1 For information on how to tune the RMP , *Refer to DSC-23-40 How to Tune a Radio Frequency* .
For information on how to switch to DATA mode, *Refer to DSC-23-40 How to Switch to DATA Mode* .

HF

Applicable to: ALL
Impacted by TDU: 00023570 HF

The communication system has two HF transceivers that operate either in Amplitude Modulation (AM) or Single Side Band (SSB) mode.
L2 The flight crew can select the AM or SSB mode via the HF page on any RMP .
L1 HF 1 and HF 2 are for long-range communication in voice or data mode.
L3 Each HF transceiver operates within a frequency band that ranges from 2.800 MHz to 23.999 MHz, by increments of 1 kHz.
L1 The two transceivers use the same antenna, and cannot transmit information simultaneously.
L2 *Refer to Antenna locations*
L1 If the flight crew tries to transmit voice messages simultaneously via HF 1 and HF 2, an aural alert is generated via the headsets and the loudspeakers.
L2 In case of simultaneous voice and data transmission, voice communication takes priority over data communication .
However, simultaneous reception is possible, when no HF is transmitting.
L3 On ground, HF communication in data mode is automatically inhibited. For maintenance purposes, the ground crew can override this inhibition using the GND HF DATALINK pb-sw on the overhead maintenance panel.
L1 For information on how to tune the RMP , *Refer to DSC-23-40 How to Tune a Radio Frequency* .
For information on how to switch to DATA mode, *Refer to DSC-23-40 How to Switch to DATA Mode* .

SATCOM

SATCOM

Applicable to: ALL

The flight crew, the cabin crew, and the passengers use the SATCOM to communicate with ground, in voice and data modes.
There are six voice channels and one data channel. The voice channels are for cockpit and cabin telephone (TEL) communication.
L2 However, on two voice channels, cockpit communication has priority over cabin communication, provided that the telephone number is assigned a higher priority than “PUBLIC”.
For information on priority levels, *Refer to priority levels* .
L1 For information on how to dial a telephone number, *Refer to DSC-23-40 How to Dial a Telephone Number* .
For information on how to disable telephone calls from the cabin, *Refer to DSC-23-40 How to Disable Telephone Calls from the Cabin*

The SATCOM has:
- An antenna to exchange signals with Ground Earth Stations (GES), via geostationary satellites
L2 *Refer to Antenna locations*
L3 - A Satellite Data Unit (SDU), that encodes/decodes the voice and data signals that are exchanged between the GES and the aircraft systems
The SDU interfaces with the RMP s, the AMU s, and the ACR .
Voice communication is exchanged via the AMU s, and data communication via the ACR .
The SDU also receives aircraft position and aircraft attitude data from the Air Data and Inertial Reference Units (ADIRU s), in order to send an appropriate steering command to the BSU .
- A High Power Amplifier (HPA), that amplifies SDU signals
- A Beam Steering Unit (BSU), that electronically steers the antenna to track the selected satellite.

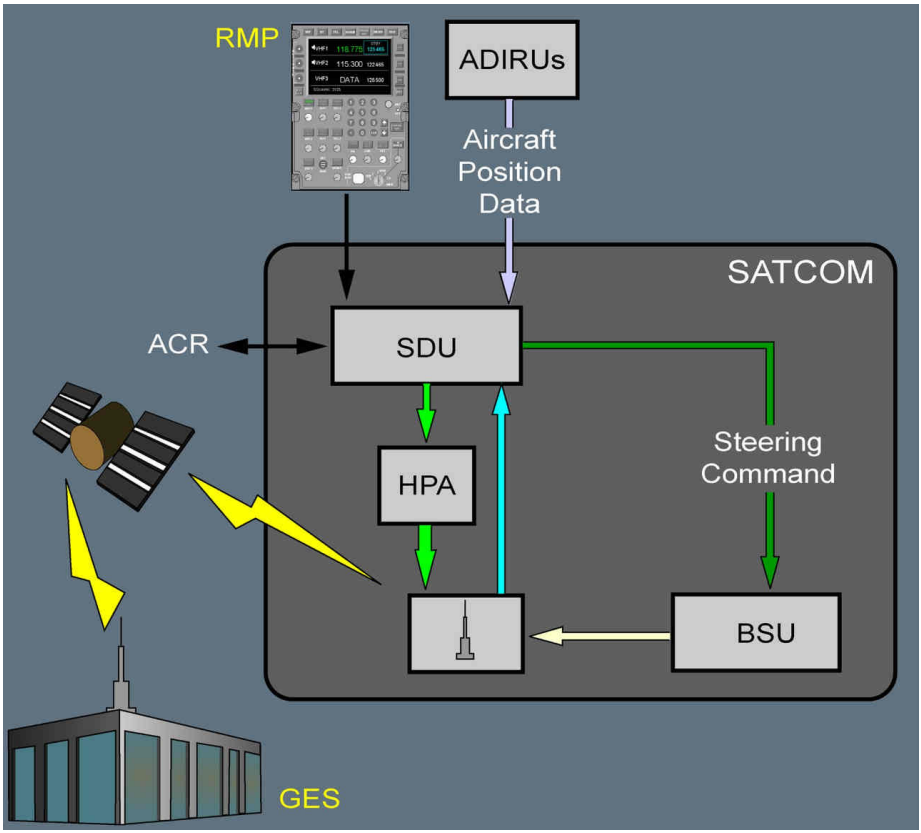
The SATCOM system is not available, when the position of the aircraft exceeds a latitude of 80 degrees North or 80 degrees South.

L1 The flight crew can select either one of the following functions for SATCOM connection to a GES :
- The AUTO LOG ON function
The SATCOM automatically selects the satellite and the GES .
- The MANUAL LOG ON function
The flight crew manually selects the satellite and the GES .

For information on how to automatically log on the SATCOM , *Refer to DSC-23-40 How to LOG ON to the SATCOM Automatically* .
(For information on how to manually log on the SATCOM , *Refer to DSC-23-40 How to LOG ON to the SATCOM Manually* .

The flight crew uses the LOG OFF function to disconnect the SATCOM .

SATCOM



SELCAL

SELCAL

Applicable to: ALL

The Selective Calling (SELCAL) identifies incoming VHF or HF calls that have the aircraft-specific SELCAL code. SELCAL then triggers visual and aural alerts:

- On the RMP, the CALL light of the corresponding VHF or HF transmission key flashes in amber
- A buzzer sounds in the cockpit
- On the RMP, the Reset (RST) key on the RMP goes on in amber.

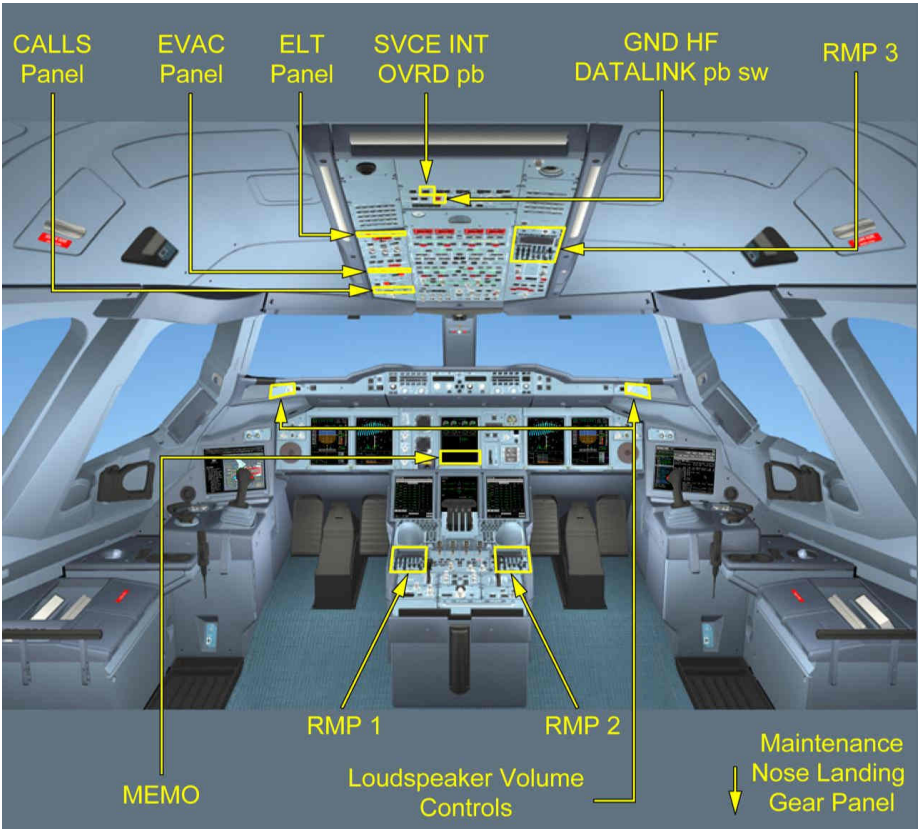
Note: The buzzer sounds when an incoming call is identified, regardless of the setting of the loudspeaker volume, but is inhibited during takeoff and landing.

Intentionally left blank

COCKPIT VIEW

Applicable to: ALL

Cockpit View

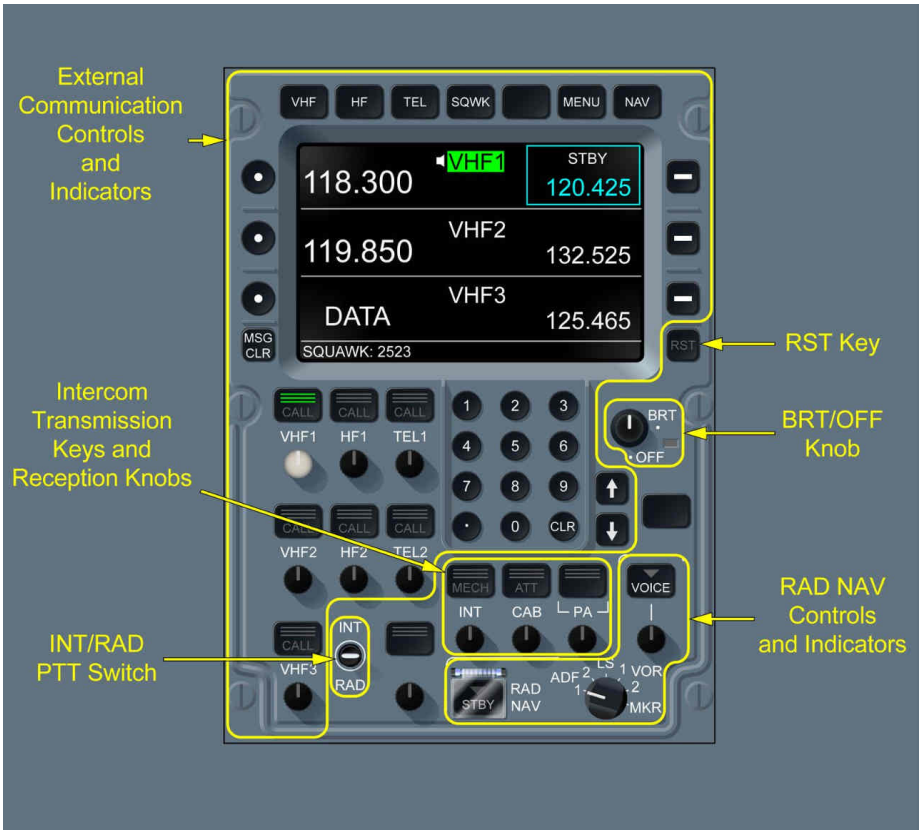


For information on the communication equipment, *Refer to DSC-23-10-10-10 Communication Equipment* .

RMP OVERVIEW

Applicable to: ALL

RMP Overview



INT/RAD SWITCH

The flight crew uses the INT/RAD sw to activate the boomset, or the oxygen mask microphones.

The switch on:
- RMP 1 controls the microphones for the Captain
- RMP 2 controls the microphones for the First Officer
- RMP 3 controls the microphones for the third occupant.

The Interphone/Radio Push-To-Talk switch (INT/RAD sw) is in the off position.

- When set to RAD, the INT/RAD sw activates the boomset or the oxygen mask microphone. However, the appropriate transmission key should be selected first, in order to transmit the message.
- When released, the INT/RAD sw returns to the off position.

- When set to INT, the INT/RAD sw activates the boomset or the oxygen mask microphone.
- When released, the INT/RAD sw remains in the INT position, until the flight crew selects another.

BRT/OFF knob

The flight crew uses the BRT/OFF knob to turn the RMP on or off, and to adjust the brightness of the RMP screen.
The status indicator changes color to indicate the status of the RMP.

The RMP is OFF and is on standby.

The RMP is OFF, and is failed.

The RMP is on.

The RMP is on, but is failed.

RESET (RST) KEY

The Reset (RST) key is not active.

The RST light goes on in amber, when the buzzer sound associated to an incoming SELCAL, or telephone call is generated.
When the RST key is pressed, the buzzer sound is cancelled, and the RST light goes off.

Note: The RST key cancels also the CALL light, on the transmission keys, when the associated communication mean is already in transmission mode.

RAD NAV CONTROLS AND INDICATORS

For more information *Refer to DSC-34-10-60-10 Overview* for description.

Impacted DU: 00002883 Internal Communication Transmission Keys and Reception Knobs

INT(CAB)(PA) TRANSMISSION KEY AND Reception knob

INT(CAB)(PA) Transmission KEY

The associated interphone (i.e. INT, CAB, or PA) is not in transmission mode.
When pressed, the transmission key turns on the transmission mode.

Note: Only one communication type at a time (internal and external communication) can be in transmission mode on each RMP.

The associated interphone (i.e. INT, CAB, or PA) is in transmission mode.
When pressed, the transmission key turns off the transmission mode.

Note: To make an announcement on the PA, the flight crew must press and maintain the PA transmission key during the announcement. In this case, it is not necessary to use any PTT sw.

L13

The amber light (i.e. MECH or ATT) flashes to indicate an incoming call:
- From the ground crew (MECH light), or
- From the cabin crew (ATT light).

The light flashes for 60 s at the most, or until the flight crew answers the call.

Associated to the light:
- When the ground crew calls the cockpit, a buzzer continuously sounds, as long as the ground crew maintains down the COCKPIT CALL sw
- When the cabin crew makes a normal call, a buzzer sounds one time
- When the cabin crew makes a priority call to Captain, a buzzer sounds one time

  Note: If the flight crew wants to differentiate a priority call to Captain from a normal call, the flight crew must watch the dialing feedback line of the handset:
  - *In the case of a priority call to Captain, PRIO CAPTAIN appears*
  - *In the case of a normal call, CAPTAIN appears.*

- When the cabin crew makes an emergency call:
  - A buzzer sounds three times
  - The CALL light of the EMER pb-sw on the CALLS panel flashes for 60 s at the most, or until the flight crew answers the call.

INT(CAB)(PA) Reception knob

The associated interphone (i.e. INT, CAB, or PA) is not in reception mode. When pressed and released in the out position, the reception knob turns on the reception mode.

The associated interphone (i.e. INT, CAB, or PA) is in reception mode. When pressed and released in the in position, the reception knob turns off the reception mode.
When turned, the reception knob adjusts the volume of the headset.

Impacted by TDU: 00023122 Internal Communication Transmission Keys and Reception Knobs

INT(CAB)(PA) TRANSMISSION KEY AND Reception knob

INT(CAB)(PA) Transmission KEY

The associated interphone (i.e. INT, CAB, or PA) is not in transmission mode. When pressed, the transmission key turns on the transmission mode.

Note: Only one communication type at a time (internal and external communication) can be in transmission mode on each RMP.

The associated interphone (i.e. INT, CAB, or PA) is in transmission mode. When pressed, the transmission key turns off the transmission mode.

Note: To make an announcement on the PA, the flight crew must press and maintain the PA transmission key during the announcement. In this case, it is not necessary to use any PTT sw.

The amber light (i.e. MECH or ATT) flashes to indicate an incoming call:
- From the ground crew (MECH light), or
- From the cabin crew (ATT light).

The amber light flashes for 60 s at the most, or until the flight crew answers the call.

Associated to the light:
- When the ground crew calls the cockpit, a buzzer continuously sounds, as long as the ground crew maintains down the COCKPIT CALL sw
- When the cabin crew makes a normal call, a buzzer sounds one time
- When the cabin crew makes a priority call to Captain, a buzzer sounds three times
- When the cabin crew makes an emergency call:
  - A buzzer sounds three times
  - The CALL light of the EMER pb-sw on the CALLS panel flashes for 60 s at the most, or until the flight crew answers the call.

INT(CAB)(PA) Reception knob

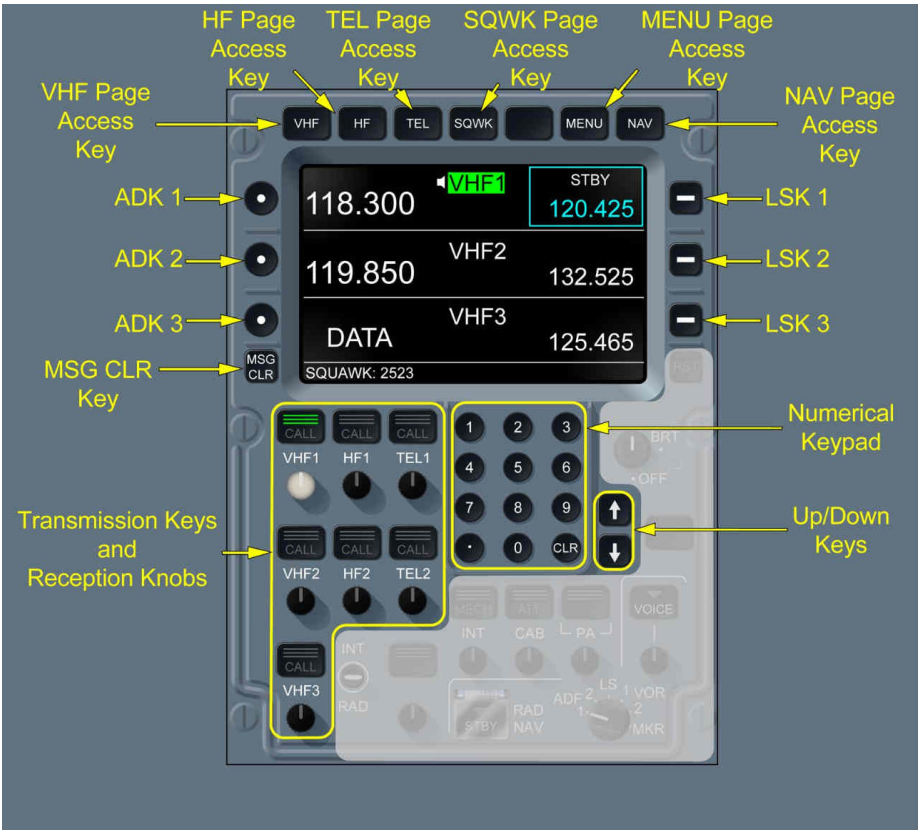
The associated interphone (i.e. INT, CAB, or PA) is not in reception mode. When pressed and released in the out position, the reception knob turns on the reception mode.

The associated interphone (i.e. INT, CAB, or PA) is in reception mode. When pressed and released in the in position, the reception knob turns off the reception mode.
When turned, the reception knob adjusts the volume of the headset.

RMP EXTERNAL COMMUNICATION

Applicable to: ALL

RMP External Communication



Line Selection KEYS : LSK 1(2)(3)

When pressed, select, validate, or activate the corresponding displays (e.g. frequencies, functions, page titles).

Activation/Dialing KEYS : ADK 1(2)(3)

When pressed, dial, select, validate, activate the corresponding displays (e.g. frequencies, functions).

MESSAGE CLEAR (MSG CLR) KEY

When pressed, clears any displayed RMP message.

Note: Does not clear the squawk code that appears on the VHF, HF and TEL pages.

NUMERICAL KEYPAD

NUMBER KEYS

When pressed, inserts the corresponding number at the cursor position, in the field selected for modification.

DECIMAL KEY

Not active. The decimal is automatically-entered where necessary.

CLR KEY

- When pressed and released, clears the last digit
- When pressed and maintained, clears the field selected for modification, and displays the last validated entry.

SCROLL KEYS

UP KEY

When pressed and released, scrolls up a list of items provided that an up arrow is displayed in the field that is selected for modification.
When pressed and maintained, displays the first item of the list.

DOWN KEY

When pressed and released, scrolls down a list of items provided that a down arrow is displayed in the field that is selected for modification.
When pressed and maintained, displays the last item of the list.

VHF 1(2)(3)/HF 1(2)/TEL 1(2) TRANSMISSION KEYS AND Reception knobS

VHF 1(2)(3)/HF 1(2)/TEL 1(2) Transmission KEYS

The associated communication mean (i.e. VHF 1(2)(3), HF 1(2) or TEL 1(2)) is not in transmission mode. When pressed, the transmission key turns on the transmission mode.

Note: Only one communication mean at a time (internal and external communication) can be in transmission mode on each RMP.

The associated communication mean (i.e. VHF 1(2)(3), HF 1(2) or TEL 1(2)) is in transmission mode. When pressed, the transmission key turns off the transmission mode.
The TEL 1(2) transmission key flashes to indicate that an outgoing telephone call is connected, and TEL 1(2) is not in transmission mode. When pressed, the TEL 1(2) transmission key activates the transmission mode and enables the telephone communication.

Flashes to indicate an incoming:
- Telephone call, or
- SELCAL.

When a telephone call, or a SELCAL is received, a buzzer sounds in the cockpit until it is reset, via the RST key, or the flight crew answers the call.

VHF 1(2)(3)/HF 1(2)/TEL 1(2) Reception knobS

The associated communication mean (i.e. VHF 1(2)(3), HF 1(2) or TEL 1(2)) is not in reception mode. When pressed and released in the out position, the reception knob turns on the reception mode.

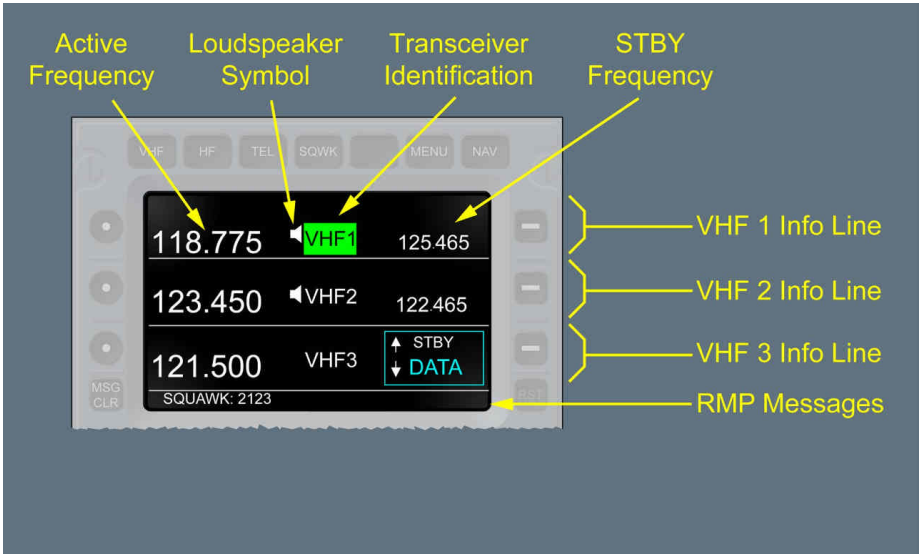
The associated communication mean (i.e. VHF 1(2)(3), HF 1(2) or TEL 1(2)) is in reception mode. When pressed and released in the in position, the reception knob turns off the reception mode.
When turned, the reception knob adjusts the volume of the headset.

VHF PAGE

Applicable to: ALL

L2 After an RMP power-up or reset, or after deactivation of the RAD NAV STBY mode, the RMP display defaults to the VHF page.

VHF Page



L1 In the illustration above:

- VHF 1 is in transmission and reception mode, 118.775 MHz is the active frequency, and 125.465 MHz is the standby frequency
- VHF 2 is in reception mode only
- VHF 3 is neither in transmission nor reception mode
- The VHF 3 standby frequency is boxed to indicate that it is selected for modification
- The current squawk code is 2123.

LOUDSPEAKER SYMBOL

No display: Reception mode is off.

The active frequency is in reception mode.

L13

The active frequency is in transmission mode, but not in reception mode. When the flight crew turns on the transmission mode only, the symbol flashes for 2 s, and then remains steady.

TRANSCEIVER IDENTIFICATION

VHF 1(2)(3) is not in transmission mode.

VHF 1(2)(3) is in transmission mode.

ACTIVE FREQUENCY

The VHF transceiver is tuned on the displayed frequency.

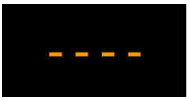
The VHF transceiver is in voice mode, and is either failed or not available.

For information on possible failures:
- *Refer to DSC-23-30-20 RMP Synchronization Failure*
- *Refer to DSC-23-30-20 RMP - VHF/HF Transceiver Connection Failure* .

FOR VHF 3 ONLY

Data mode is active.

Data mode is disconnecting.



The VHF transceiver is in data mode, and is either failed or not available.

For information on possible failures:
- *Refer to DSC-23-30-20 RMP Synchronization Failure*
- *Refer to DSC-23-30-20 RMP - VHF/HF Transceiver Connection Failure* .

STANDBY (STBY) FREQUENCY

The standby frequency cannot be modified.

The VHF transceiver is in voice mode and is either failed, or not available. For an example of failure, *Refer to DSC-23-30-20 RMP Synchronization Failure* .

The modified standby frequency is not a standard VHF voice frequency. The flight crew can clear the erroneous digits, via the CLR key, until the standby frequency displays in blue again.
The VHF 1(2) FREQ NOT VALID RMP message is displayed also. For more information on this message, *Refer to DSC-23-20-100 VHF 1(2) (3)/HF 1(2) FREQ NOT VALID* .

FOR VHF 1 AND VHF 2 ONLY

When boxed, the standby frequency can be modified.

The standby frequency appears in :
- Big characters until it is validated by the flight crew, via the appropriate LSK
- Small characters after validation by the flight crew.

When entering a frequency, the flight crew may start with the second digit provided it is different from “1”.

Note: After a flight crewmember modifies a standby frequency, he should validate it, in order to prevent inadvertent modification of the frequency.

FOR VHF 3 ONLY

L12

When boxed, the standby frequency can be modified.

The standby frequency (except DATA) appears in :
- Big characters until it is validated by the flight crew, via the appropriate LSK
- Small characters after validation by the flight crew.

Note: After a flight crewmember modifies a standby frequency, he should validate it, in order to Prevent inadvertent modification of the frequency.

When entering a frequency, the flight crew may start with the second digit provided it is different from “1”.
The up-arrow and the down-arrow indicate that the flight crew can use the up and down keys to scroll through the list of frequencies.

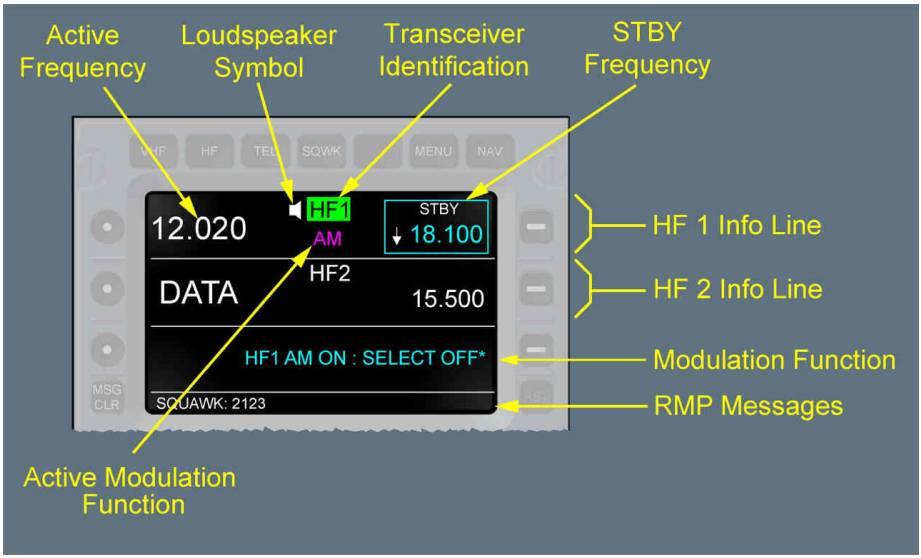
The list contains the following frequencies :
- DATA
- 121.500 MHz
- the modifiable frequency.

When the flight crew enters a frequency, via the numerical keypad, the modifiable frequency appears automatically whatever the current display.

HF PAGE

Applicable to: ALL

HF Page



In the illustration above :

- HF 1 is in transmission (AM mode) and reception mode, and 12.020 MHz is the active frequency. The standby frequency is boxed to indicate that it is selected for modification.
- HF 2 is in data mode.

LOUDSPEAKER SYMBOL

No display: Reception mode is off.

The active frequency is in reception mode.

L13

The active frequency is in transmission mode, but not in reception mode. When the flight crew turns on the transmission mode only, the symbol flashes for 2 s, and then remains steady.

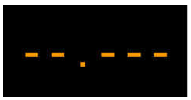
TRANSCEIVER IDENTIFICATION

HF 1(2) is not in transmission mode.

HF 1(2) is in transmission mode.

ACTIVE FREQUENCY

The HF transceiver is tuned on the displayed frequency.



The HF transceiver is in voice mode, and is either failed or not available.

For information on possible failures:
- *Refer to DSC-23-30-20 RMP Synchronization Failure*
- *Refer to DSC-23-30-20 RMP - VHF/HF Transceiver Connection Failure* .

The HF transceiver is in data mode.

The HF transceiver is in data mode, and is either failed or not available.

For more information on possible failures:
- *Refer to DSC-23-30-20 RMP Synchronization Failure*
- *Refer to DSC-23-30-20 RMP - VHF/HF Transceiver Connection Failure*

STANDBY (STBY) FREQUENCY

The standby frequency is displayed and cannot be changed.

The HF transceiver is in voice mode and is either failed, or not available. For an example of failure, *Refer to DSC-23-30-20 RMP Synchronization Failure* .

L12

When boxed, the standby frequency can be modified.

A voice standby frequency displays:
- In large characters until it is inserted, via the appropriate LSK
- In small characters after insertion.

Note: *After a flight crewmember modifies the standby frequency, he should insert it, in order to prevent inadvertent modification of the frequency.*

The up-arrow and the down-arrow indicate that the list of frequencies can be scrolled up, or down.

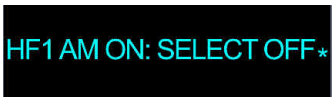
The list contains the following frequencies:
- DATA
- 8.364 MHz
- The modifiable frequency.

When the flight crew enters a frequency, via the numerical keypad, the modifiable frequency appears automatically whatever the current display.

The standby frequency is not a standard HF voice frequency. The flight crew can clear the erroneous digits, via the CLR key, until the standby frequency displays in blue again.
The HF 1(2) FREQ NOT VALID RMP message is displayed also. For more information on this message, *Refer to DSC-23-20-100 VHF 1(2) (3)/HF 1(2) FREQ NOT VALID* .

MODULATION FUNCTION

HF 1(2) is in Single Side Band (SSB) mode. When the flight crew presses the associated LSK, the Amplitude Modulation (AM) mode activates.
The modulation function display changes from HF 1 to HF 2 when the blue box is moved from HF 1 to HF 2 standby frequency.



HF 1(2) is in Amplitude Modulation (AM) mode. When the flight crew presses the associated LSK, the Single Side Band (SSB) mode activates.

ACTIVE MODULATION FUNCTION

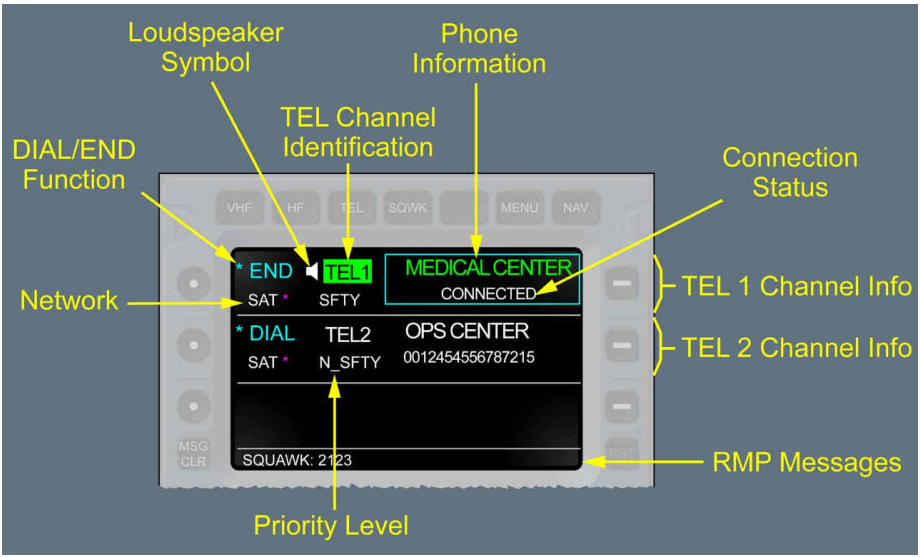
No display — Single Side Band (SSB) mode is active.

AM — Amplitude Modulation (AM) mode is active.

TEL PAGE

Applicable to: ALL

TEL Page



LOUDSPEAKER SYMBOL

No display: Reception mode is off.

The active frequency is in reception mode.

L13

The active frequency is in transmission mode, but not in reception mode. When the flight crew turns on the transmission mode only, the symbol flashes for 2 s, and then remains steady.

DIAL/END FUNCTION

L12

When selected, the telephone number is dialed, and connected. After the telephone number is connected, the transmission and reception modes should be activated via the appropriate TEL transmission key and reception knob.
The DIAL function appears, when the associated telephone number is not yet connected.

L12

When selected, the telephone number is disconnected.
The END function appears, when the associated telephone number is connected.

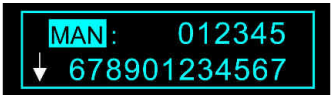
TELEPHONE (TEL) CHANNEL IDENTIFICATION

TEL 1(2) is not in transmission mode.

TEL 1(2) is in transmission mode.

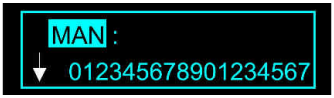
TELEPHONE INFORMATION

L12



- When boxed, indicates that the flight crew can modify the telephone information field
- MAN indicates that the flight crew has manually dialed the telephone number
- The down arrow indicates that the flight crew can scroll down the list
- The manually-dialed telephone number is displayed in big characters to indicate that it is not validated
- The telephone information appears on two lines, until the connection is established, and CONNECTING is displayed.

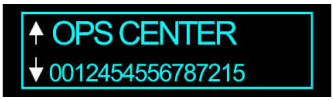
Note: *The flight crew can dial a telephone number manually even if the MAN line is not already displayed. Dialing the telephone number via the keypad will automatically display the MAN line.*



The flight crew has manually-dialed and validated the telephone number.

The manually-dialed telephone call is connected.

L12



- When boxed, indicates that the flight crew can modify the telephone information field
- The up arrow and down arrow indicate that the flight crew can scroll up or down the list
- The telephone number is selected from the list of pre-dialed telephone numbers
- The telephone information appears on two lines, until the connection is established, and CONNECTING is displayed.

The pre-dialed telephone number, selected by the flight crew from the scroll list, is connected.

An external call is received. In this case, the status of the connection can be INCOMING CALL, CONNECTED, or CALL ENDED.

The SATCOM is either failed, or not logged on.

TELEPHONE CONNECTION STATUS

No display — No telephone call connection.

L13

Connection of the telephone call is in progress.
Appears for outgoing telephone calls only.

Telephone call connection is established.

L12

CALL ENDED

Disconnection of the telephone call is in progress.

Appears temporarily, when:
- The flight crew ends the call, or
- The ground station ends the call, or
- The flight crew rejects an incoming external call, or
- The telephone connection is failed.

INCOMING CALL

The flight crew is receiving a telephone call from a ground station.

PRIORITY LEVEL

Each telephone number is assigned a priority level.

L3 The airline can assign and customize the priority levels.

L1

EMER

Top priority.

SFTY

High priority.

N_SFTY

Medium priority.

PUBLIC

Low priority.

- - - - -

The SATCOM is either failed, or not available.

NETWORK

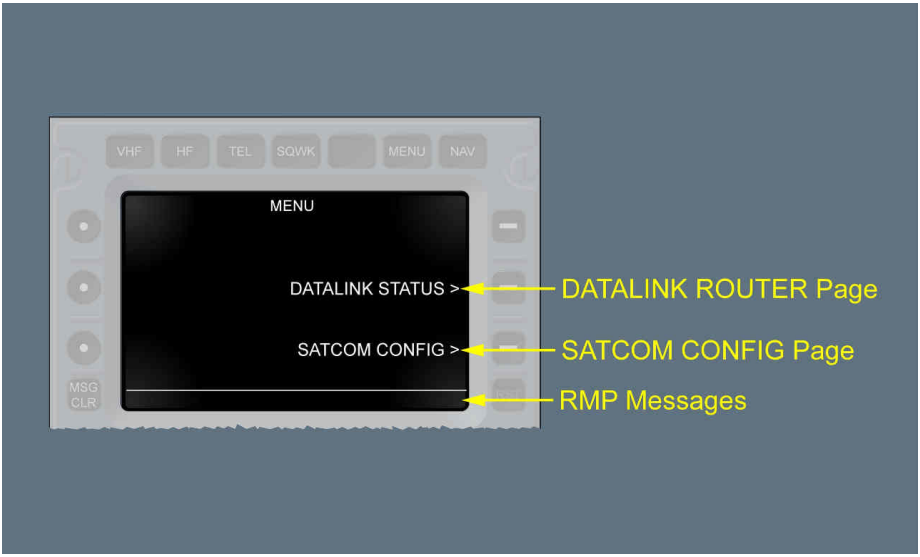
SAT

The SATCOM is available.

MENU PAGE

Applicable to: ALL

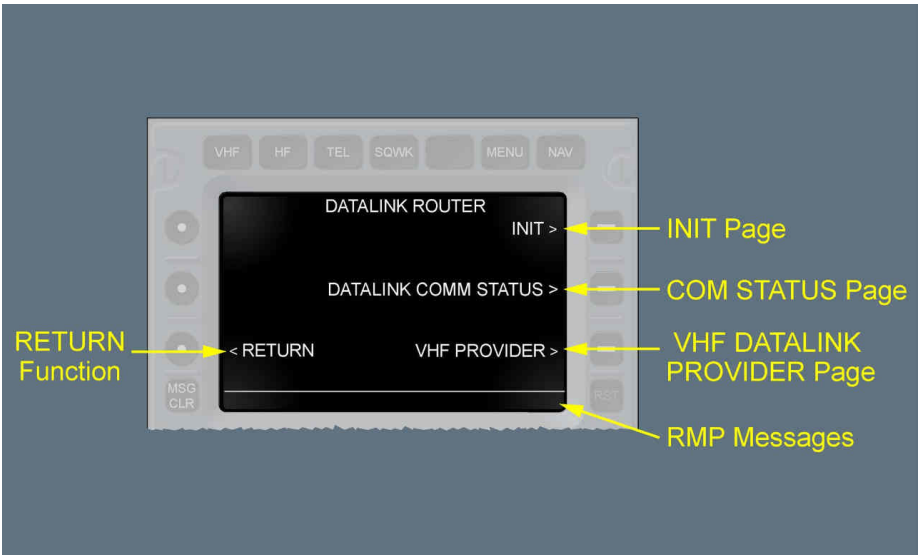
MENU Page



DATALINK ROUTER PAGE

Applicable to: ALL

DATALINK ROUTER Page



The DATALINK ROUTER, also referred to as the Avionics Communication Router (ACR), manages data communication.
On the DATALINK ROUTER page, the flight crew can access sub-pages to display some data communication parameters, and to change the VHF datalink provider.

RETURN FUNCTION

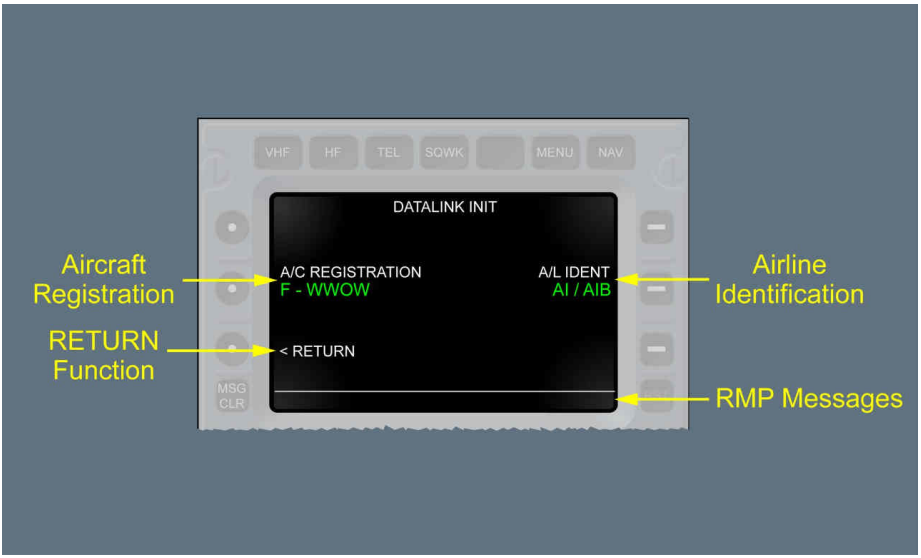
< RETURN

When selected, the previous page (MENU) appears.

DATALINK INIT PAGE

Applicable to: ALL

DATALINK INIT Page



The DATALINK INIT page displays the information that identifies the aircraft in datalink messages.

AIRLINE IDENTIFICATION

The ACR hosts datalink configuration data, and sends the airline identification information to the RMPs.
The flight crew cannot modify this information.

AIRCRAFT REGISTRATION

The ACR hosts datalink configuration data, and sends the aircraft registration information to the RMPs.
The flight crew cannot modify this information.

RETURN FUNCTION

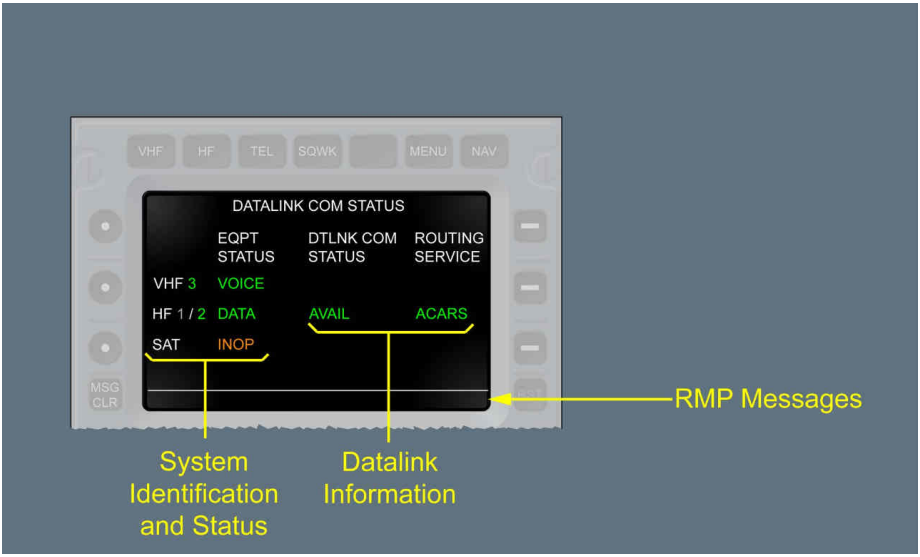
< RETURN

When selected, the previous page (DATALINK ROUTER) appears.

DATALINK COM STATUS PAGE

Applicable to: ALL

DATALINK COM STATUS Page



The DATALINK COM STATUS page indicates which communication means are available for data communication.

SYSTEM IDENTIFICATION AND STATUS

VHF 3 VOICE

VHF 3 is available in voice mode.

HF 1 is available in voice mode, and HF 2 is available in data mode.

HF 1 is not available, and HF 2 is available in voice mode.

The SATCOM is inoperative.

DATALINK INFORMATION

No Display

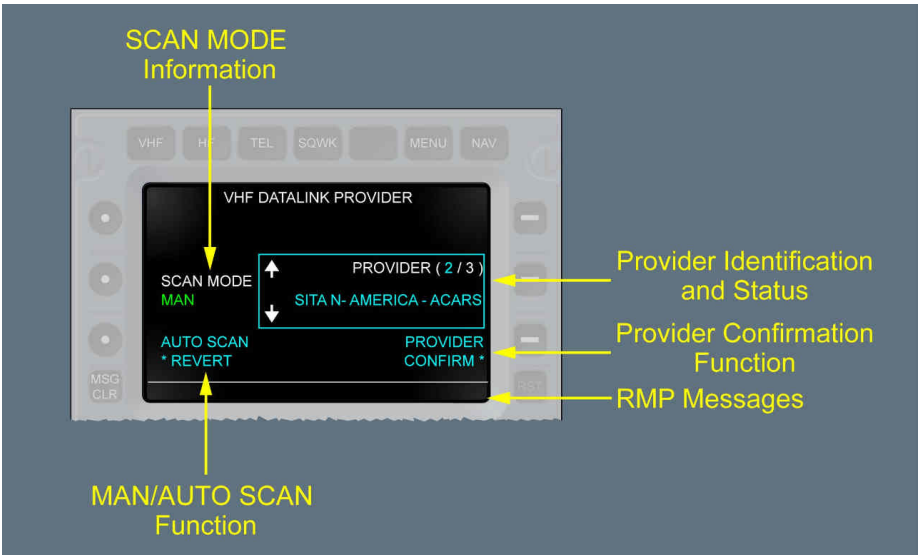
The associated communication mean is either in voice mode, or not available.

The associated communication mean available for data communication via ACARS.

VHF DATALINK PROVIDER PAGE

Applicable to: ALL

VHF DATALINK PROVIDER Page



The VHF DATALINK PROVIDER displays the selected ground network for VHF data communication. Also, the flight crew can activate either the automatic, or manual, scan mode for the selection of the ground network.

SCAN MODE INFORMATION

SCAN MODE
AUTO

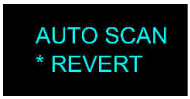
The automatic VHF datalink provider scan mode is active.

SCAN MODE
MAN

The manual VHF datalink provider scan mode is active.

MAN/AUTO SCAN FUNCTION

The flight crew can activate the MAN SCAN function by pressing the associated Activation/Dialing Key (lADK).
When the MAN SCAN function is active, the flight crew can manually select the VHF datalink provider.



The flight crew can activate the AUTO SCAN function by pressing the associated ADK.
When the AUTO SCAN function is active, the system automatically selects the most appropriate VHF datalink provider.

PROVIDER IDENTIFICATION AND STATUS

The VHF datalink provider was automatically selected, and is connected.

L12

The MAN SCAN function is active.
The flight crew can use the UP and DOWN keys on the RMP, to manually select a provider in the list.
When scrolling: if a provider is already connected , the PROVIDER header changes to ACTIVE PROVIDER, and the RMP displays “CONNECTED” as the status.

PROVIDER CONFIRMATION FUNCTION

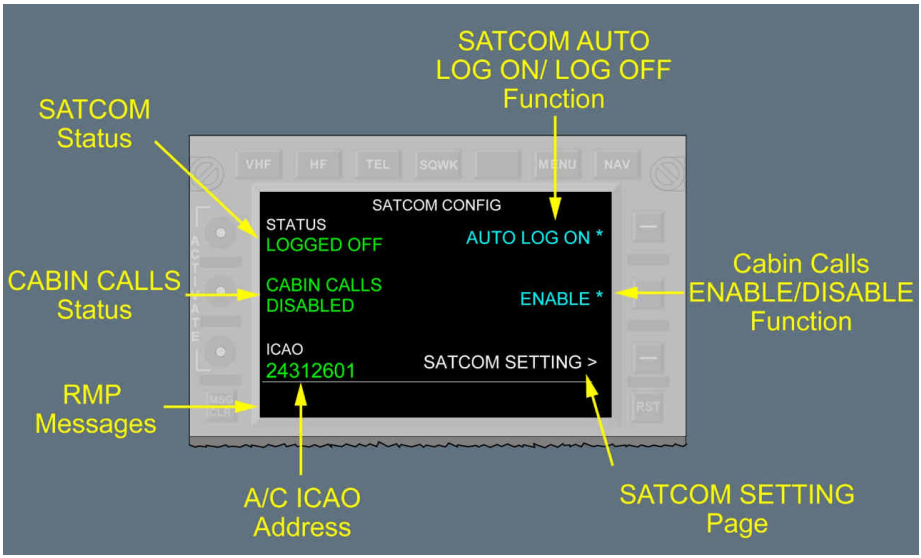
No Display : The AUTO SCAN function is active.

The MAN SCAN function is active, and the flight crew has manually selected a provider. To connect the provider, the flight crew should confirm the selection by pressing the associated Activation/Dialing Key (ADK).

SATCOM CONFIG PAGE

Applicable to: ALL

SATCOM CONFIG Page



SATCOM STATUS

LOGGED ON AUTO	The SATCOM is on and connected. The satellite and the GES are automatically-selected.
LOGGED ON MANUAL	The SATCOM is on and connected. The satellite and the GES are manually-selected.
LOGGING ON AUTO	The SATCOM is attempting to connect. The satellite and the GES are automatically-selected.
LOGGING ON MANUAL	The SATCOM is attempting to connect. The satellite and the GES are manually-selected.

The SATCOM is logging off.

The SATCOM is disconnected.
The satellite and the GES are not connected.

SATCOM AUTO LOG ON/OFF FUNCTION

L13

The AUTO LOG ON function is available, and can be activated by pressing the associated Line Selection Key (LSK).
When this function is active, the satellite and the GES are automatically-selected.
Appears, only when SATCOM is logged off.

L13

The LOG OFF function is available, and can be activated by pressing the associated LSK.
Appears, only when SATCOM is logged on or logging on.

CABIN CALLS STATUS

It is possible to make telephone calls in the cabin.

It is not possible to make telephone calls in the cabin.

CABIN CALLS ENABLE/DISABLE FUNCTION

The cabin telephone calls ENABLE function is available. When this function is selected, it is possible to make telephone calls from the cabin via the SATCOM.

The cabin telephone calls DISABLE function is available. When this function is selected, it is not possible to make telephone calls from the cabin via the SATCOM.

AIRCRAFT ICAO ADDRESS

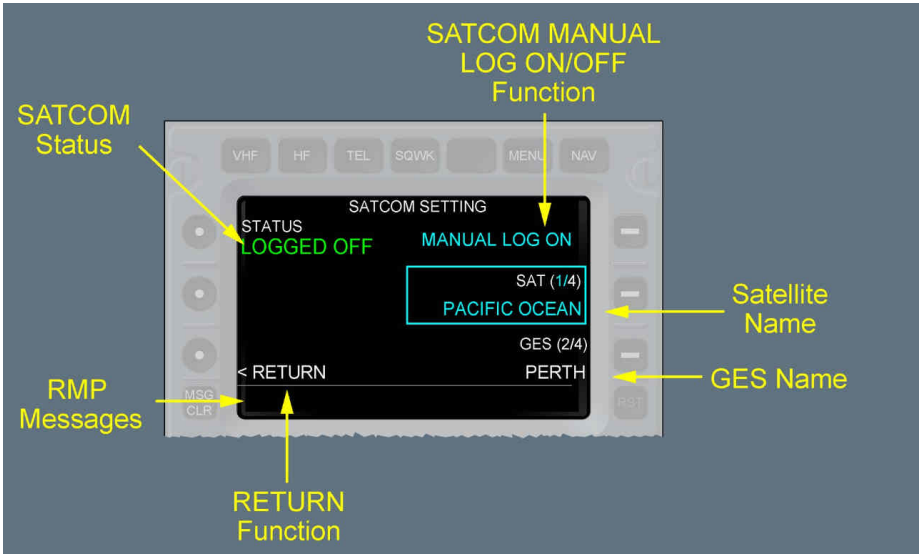
The aircraft ICAO address identifies the aircraft during all SATCOM voice or data communication.
The flight crew cannot change the address.

L3 The aircraft ICAO address is entered in the Satellite Data Unit (SDU) by pin programming.

SATCOM SETTING PAGE

Applicable to: ALL

SATCOM SETTING Page



SATCOM MANUAL LOG ON/OFF FUNCTION

L13

MANUAL LOG ON *

The MANUAL LOG ON function is available, and can be activated by pressing the associated Line Selection Key (LSK).
When this function is active, the satellite and the GES are manually-selected.
Appears, only when SATCOM is logged off.

L13

The LOG OFF function is available, and can be activated by pressing the associated LSK.
Appears, when SATCOM is logged on, or logging on.

SATCOM STATUS

The SATCOM is on and connected.
The satellite and the GES are automatically-selected.

The SATCOM is on and connected.
The satellite and the GES are manually-selected.

The SATCOM is attempting to connect.
The satellite and the GES are automatically-selected.

The SATCOM is attempting to connect.
The satellite and the GES are manually-selected.

The SATCOM is logging off.

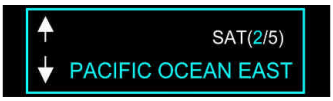
The SATCOM is disconnected.
The satellite and the GES are not connected.

SATELLITE NAME

The SATCOM is not connected, and the flight crew cannot change the satellite name.

The SATCOM is connected, and the flight crew cannot change the satellite name.

L12



The SATCOM is not connected, and the flight crew can change the satellite name, because it is boxed.
SAT(2/5) indicates that PACIFIC OCEAN EAST is second in the list of satellites, and there are 5 satellites currently available.
The up and down arrows indicate that the flight crew can scroll through the list of currently available satellites.

GROUND EARTH STATION (GES) NAME

The SATCOM is not connected, and the flight crew cannot change the GES.

The SATCOM is connected, and the flight crew cannot change the GES.

L12

The SATCOM is not connected. The GES is boxed, and can be changed.
GES(7/15) indicates that NILES CANYON is seventh in the list of GES, and there are 15 GES currently available.
The up and down arrows indicate that the flight crew can scroll through the list of currently available GES.

RETURN FUNCTION

When selected, the previous page (SATCOM CONFIG) appears.

NAV PAGE

Applicable to: ALL

The flight crew uses the NAV page to tune the NAVAID frequencies/channel when FMS 1 and FMS 2 are failed.
This page is available on RMP 1 and RMP 2 only. The flight crew must press the RAD NAV STBY key to enable the NAV page access key. For more information on how to tune the navaid in standby mode, *Refer to DSC-34-10-60-30 How to Tune Navaids in Standby RadNav* .

SQWK PAGE

Applicable to: ALL

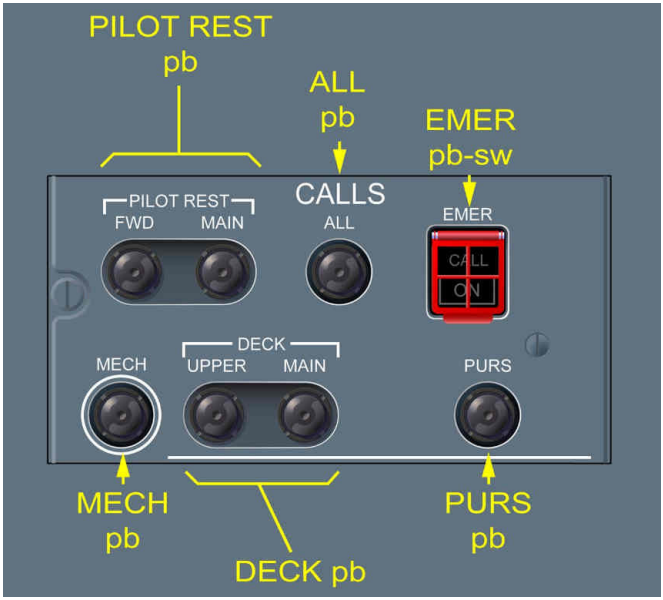
The flight crew uses the SQWK page to:

- set the squawk,
- activate the IDENT function. *Refer to DSC-34-20-50-20-10 RMP*

CALLS PANEL

Applicable to: ALL

CALLS Panel



PURS pb

When pressed:
- A pink light, on the Purser Area Call Panel (ACP), comes on
- The CAPTAIN CALL message appears on the Purser Attendant Indication Panel (AIP)
- A high/low chime sounds through the associated cabin loudspeakers.

PILOT REST pb

When pressed, a high/low chime sounds in the forward(aft) crew rest.

DECK pb

When pressed:
- A pink light, on the upper(lower) deck Area Call Panels (ACP), comes on
- The CAPTAIN CALL message appears on the upper(lower) deck Attendant Indication Panels (AIP)
- A high/low chime sounds through the upper(lower) deck cabin loudspeakers.

ALL pb

When pressed:
- A pink light, on all the ACPs in the cabin, comes on. For information on the ACPs, *Refer to CCOM/04-20-20-B Area Call Panel (ACP)*
- The CALL ALL CAPT message appears on all AIPs in the cabin. For information on the AIPs, *Refer to CCOM/04-20-20-A Attendant Indication Panel (AIP)*
- A high/low chime sounds through the cabin loudspeakers.

MECH pb

When pressed:
- The COCKPIT CALL light on the maintenance nose gear panel comes on
- An external horn sounds as long as the ground crew maintains the MECH pb pressed.

EMER pb-sw

Neither the flight crew nor the cabin crew has made an EMER call.

The cabin crew has made an EMER call. The CALL light flashes, and a buzzer sounds three times through the cockpit loudspeakers.

-
EMER Call

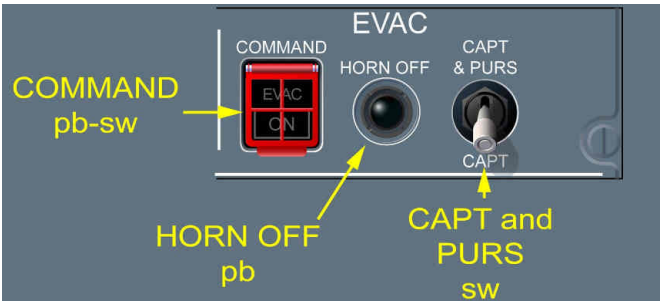
The ATT transmission key flashes on all RMPs.

When pressed:
- The ON and the CALL lights come on
- A pink light, on all the area call panels in the cabin, comes on
- The CALL PRIO CAPT message appears on all AIPs in the cabin
- Three successive high/low chimes sound through the cabin loudspeakers.

EVAC PANEL

Applicable to: ALL

EVAC Panel



COMMAND pb-sw

Normal Operation. Neither the Captain nor the Chief Purser order an evacuation.

The Chief Purser requests or orders an evacuation.

If the CAPT and PURS sw is set to CAPT position, when the Chief Purser requests an evacuation:
- The EVAC light comes on
- A horn sounds in the cockpit during 3 s.

Evac Horn

If the CAPT and PURS sw is set to CAPT & PURS position, when the Chief Purser orders an evacuation:
- The EVAC light flashes
- Message EVAC ACTIVE is displayed on the ECAM
- A horn sounds in the cockpit

Evac Horn
- The EVACUATION ALERT message appears on all Attendant Indication Panels (AIP) in the cabin
- EVAC CMD pb on FAPs, MINI FAPs and AAPs will be lit in the cabin
- The evacuation horn sounds in the cabin.

The Flight Crew orders an evacuation, regardless of the CAPT and PURS sw position (CAPT or CAPT & PURS).

When pressed:
- The ON light and the EVAC light flashes
- Message EVAC ACTIVE is displayed on the ECAM
- The EVACUATION ALERT message appears on all Attendant Indication Panels (AIP) in the cabin
- EVAC CMD pb on FAPs, MINI FAPs and AAPs will be lit in the cabin
- The evacuation horn sounds in the cabin.

HORN OFF pb

When pressed, the horn goes off in the cockpit.

CAPT AND PURS SWITCH

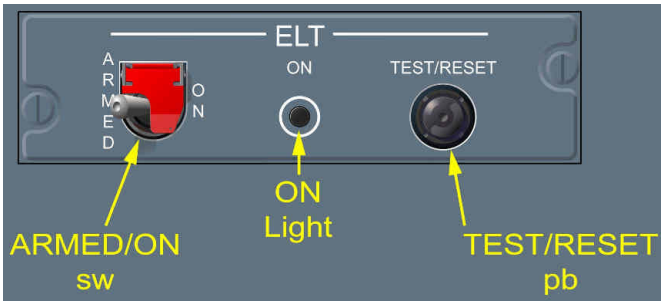
Only the Captain can order the evacuation.

The Captain or the Chief Purser can order the evacuation.

ELT PANEL

Applicable to: ALL

ELT Panel



ARMED/ON sw

The Emergency Locator Transmitter (ELT) is armed, and automatically transmits the emergency radio signal, when the aircraft sustains an abnormal load factor.

The ELT is on, and transmits the emergency radio signal.

ON light

The ELT is not transmitting.

L12

The ELT is either transmitting, or running a self-test.

Note: If the ELT is transmitting when the aircraft is on the ground, the external horn sounds.

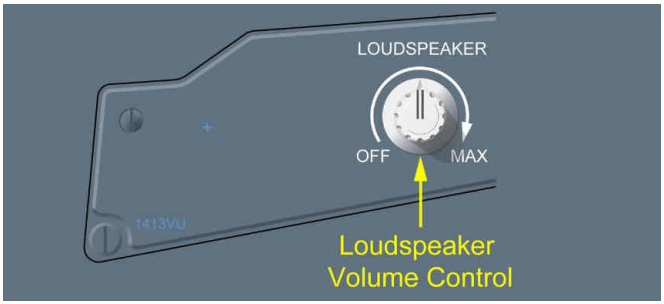
TEST/RESET pb

When pressed:
- An ELT self-test starts, or
- The ELT stops transmitting.

LOUDSPEAKER VOLUME CONTROL PANEL

Applicable to: ALL

Loudspeaker volume control panel



Loudspeaker Volume Control knob

The two onside loudspeakers are OFF.

The two onside loudspeakers are on. The volume is adjusted by turning the knob.

Note: *The volume control knobs of the loudspeakers adjust the volume of voice communication messages, but cannot adjust the volume of Flight Warning System (FWS) and Aircraft Environment Surveillance System (SURV) audio messages.*

GND HF DATALINK pb-sw

Applicable to: ALL

L2 **GND HF DATALINK pb-sw**

HF data communication is automatically inhibited on ground.

For maintenance purposes, the ground crew can press the GND HF DATALINK pb-sw to activate HF data communication on ground.

SVCE INT OVRD pb

Applicable to: ALL

L2 SVCE INT OVRD pb

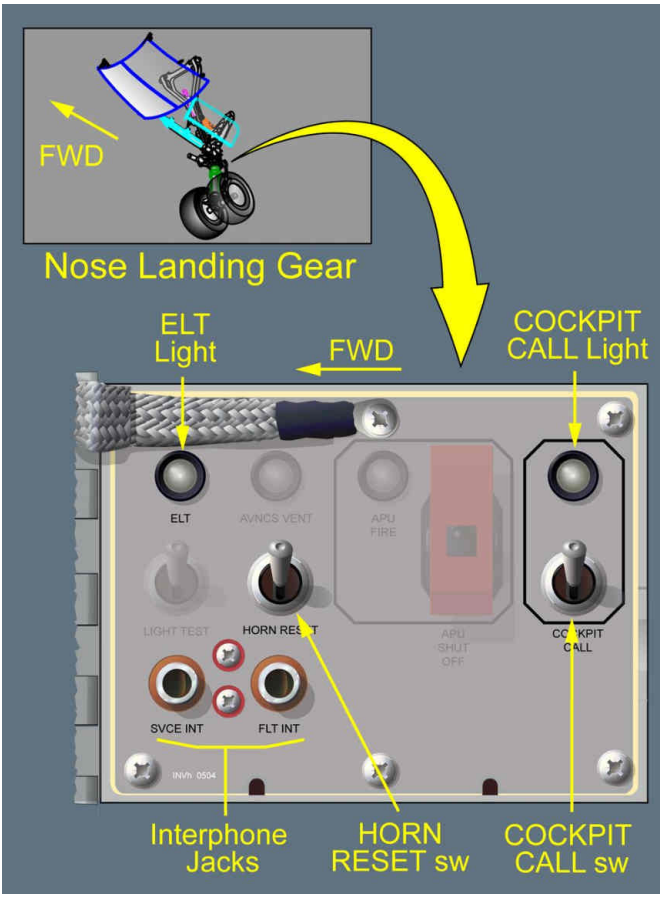
The service interphone is automatically inhibited in flight.

If the service interphone remains abnormally inhibited on ground, the ground crew can manually activate it, by pressing the SVCE INT OVRD pb .

MAINTENANCE NOSE GEAR PANEL

Applicable to: ALL

Nose Landing Gear Panel



L2 **ELT light**

The ELT is not transmitting.

The ELT is transmitting.

Note: If the ELT is transmitting when the aircraft is on the ground, the external horn sounds.

L2 COCKPIT CALL light

The flight crew does not initiate a call from the cockpit.

The flight crew initiates a call from the cockpit. This light flashes and the external horn sounds.

L2 COCKPIT CALL sw

L23

When pushed down and maintained:

- The buzzer sounds through the loudspeakers in the cockpit
  The buzzer in the cockpit goes off when the ground crew releases the COCKPIT CALL sw.
- The MECH light on the MECH key flashes in amber on the cockpit RMP.

  The flashed MECH light on the MECH key goes off when:
  - The flight crew pushes the MECH key in order to answer the call, or
  - The flight crew pushes the RST key without answering to the call, or
  - Automatically after 60 s if the flight crew does not answer.

L2 HORN RESET sw

L23

When pressed, the COCKPIT CALL light goes off.
When the flight crew releases the MECH pb on the overhead CALLS panel, the external horn stops but the COCKPIT CALL light remains on.

RMP MESSAGES

Applicable to: ALL

RMP MESSAGES

The RMP displays messages to inform the flight crew, when:
- A selection is not appropriate, or not complete, or
- A connection is failed, or
- Voice or data mode is not available.

Note: The current squawk is displayed by default in the scratchpads of the VHF, HF and TEL pages.

L3 An RMP message can be displayed on all RMPs simultaneously (global display), or on one RMP only (local display). However, some local messages can be displayed on more than one RMP, provided that the same page is displayed.
If several messages are displayed one after the other without being cleared, the active messages are stored in a queue, in their order of appearance (the RMP displays the most recent message). The flight crew must check, and clear the active messages, one by one, in order to cancel the queue.

L1 The various RMP communication messages are listed below:

L12 DATA FIELD NOT MODIFIABLE : The flight crew tries to modify a field that cannot be modified.

L12 VHF 3 / HF 1(2) DATA MODE NOT AVAILABLE : The flight crew tries to activate VHF 3 / HF 1(2) in data mode, but the data mode is not available.

L12 VHF 1(2)(3) / HF 1(2) FREQ NOT COMPLETED : The flight crew tries to validate a frequency that is not complete.

L12 VHF 1(2)(3) / HF 1(2) FREQ NOT VALID : The flight crew enters a frequency that is not a standard VHF / HF voice communication frequency.

L12 VHF 1(2)(3) / HF 1(2) / TEL 1(2) RECEPTION NOT SELECTED : The flight crew selects VHF 1(2)(3) / HF 1(2) / TEL 1(2) in transmission mode, but the reception mode is not active.

L12

VHF 1(2)(3) / HF 1(2) STBY REVERTED TO PREV ENTRY : The flight crew tries to validate a frequency that is not a standard VHF / HF voice frequency, and the VHF 1(2)(3) / HF 1(2) FREQ NOT VALID message is already displayed. The last validated STBY frequency appears instead of the invalid entry.

L12

HF 1(2) VOICE MODE NOT AVAILABLE : The flight crew tries to activate HF 1(2) in voice mode, but the voice mode is not available.

L12

LOG OFF TO MODIFY SATCOM SETTINGS: The flight crew tries to modify the SATCOM settings, but the SATCOM is logged on.

L12

MAN DIALING NOT ALLOWED : The flight crew tries to manually dial a telephone number, but the SATCOM configuration software does not allow it.

L12

NO MORE LIST ITEMS : The flight crew tries to scroll through a list and the first (last) element of the list is displayed.

L12

NO NUMBER DIALED : The flight crew tries to make a telephone call by pressing an ADK, but has not dialed a telephone number.

L12

SATCOM CONFIG PAGE NOT AVAIL : The flight crew presses the SATCOM CONFIG page access key, but the SATCOM or the connections between the RMPs and the SATCOM are failed.

L12

SATCOM LOG ON: FAIL : The flight crew to log on the SATCOM, but the log on fails.

L12

SATCOM SETTING PAGE NOT AVAIL : The flight crew presses the SATCOM SETTING page access key, but the SATCOM, or the connections between the RMPs and the SATCOM are failed.

L12

TEL 1(2) CONNECTION: FAIL : The flight crew tries to make a telephone call, but it cannot be established or it is interrupted due to a failure.

L12

TEL 1(2) NOT CONNECTED : The flight crew selects TEL 1(2) in transmission mode, but no connection is established.

L12

TEL 1(2) REVERTED TO PREV ENTRY : The flight crew dials a telephone number, then clears it by using the MSG CLR key.

L12

TEL 1(2) STILL CONNECTED : The flight crew tries to end a telephone call that is still connected.

L12

USE MAN SCAN TO MODIFY PROVIDER : The flight crew tries to modify the VHF datalink provider on the VHF DATALINK PROVIDER page, and the AUTO SCAN function is active.

MEMO

Applicable to: ALL

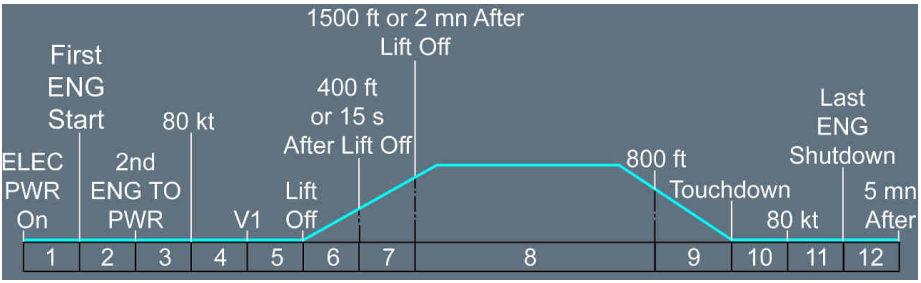
L12

CAPT(F/O) ON RMP 3 : Only RMP 1(2) is OFF, and indicates that the CAPT(F/O) must use RMP 3.

CAPT+F/O ON RMP 3 RMPs 2 and 3 are OFF. Both the CAPT and the F/O must use RMP 3.

L2 Flight Phase Inhibition:

Flight Phase Inhibition



CABIN READY	Indicates to the flight crew that the cabin is ready for take-off and/or for landing.

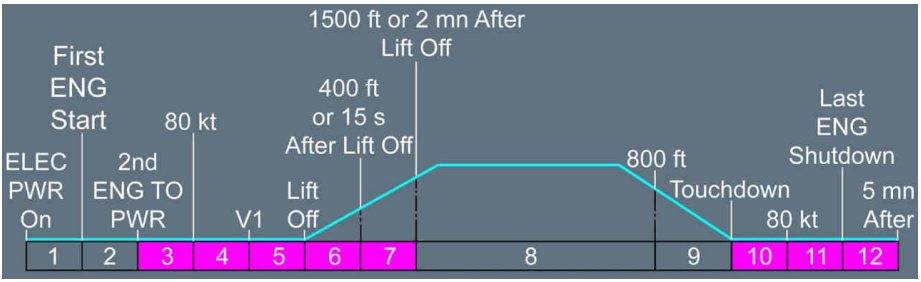
L2 The CABIN READY information can be optionally displayed:

- In the T/O memo and LDG memo
- In the BEFORE TAKEOFF checklist and the LANDING checklist.

Note: In this case, the CABIN READY memo will never appear on the right hand side of the EWD.

Flight Phase Inhibition:

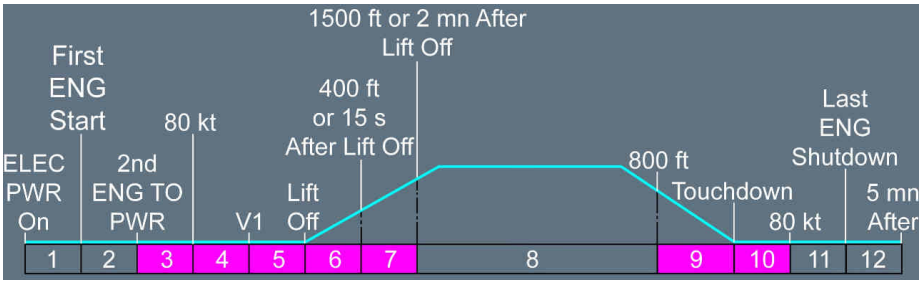
Flight Phase Inhibition



DATALINK STBY	Data mode is available, via at least one VHF/HF/SATCOM, but the datalink is temporarily lost.

L2 Flight Phase Inhibition:

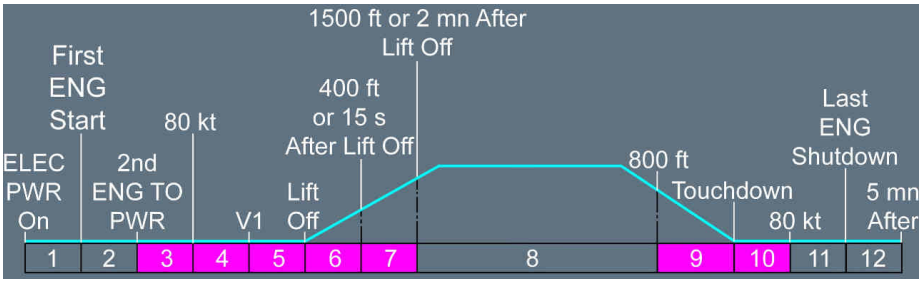
Flight Phase Inhibition



GND HF DATALINK OVRD	The GND HF DATALINK pb-sw is in the override position, and HF communication is not inhibited on ground. For more information on the GND HF DATALINK pb-sw , *Refer to DSC-23-20 GND HF DATALINK pb-sw* .

L2 Flight Phase Inhibition:

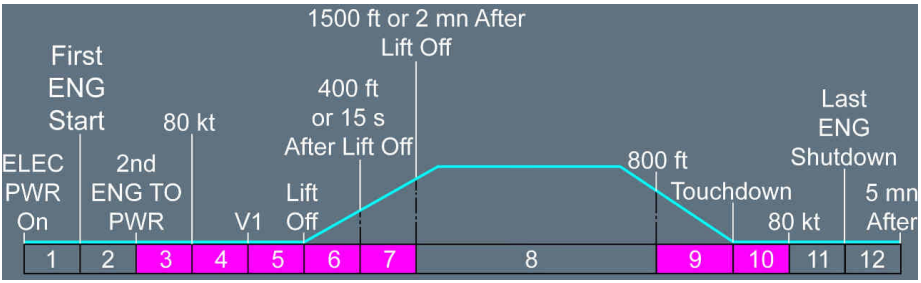
Flight Phase Inhibition



HF VOICE	HF data mode is: - Not selected, or - Interrupted, or - Failed.

L2 Flight Phase Inhibition:

Flight Phase Inhibition



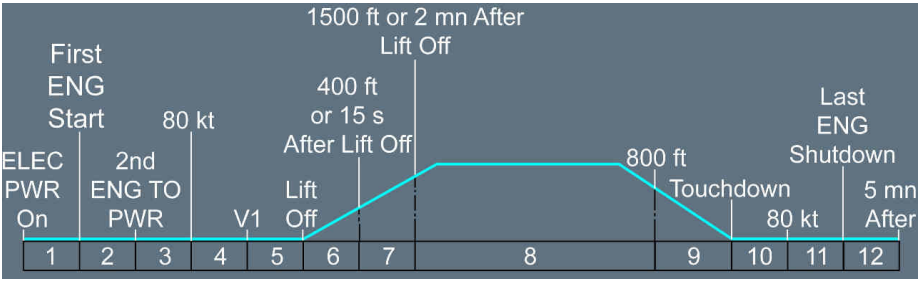
L12

PA IN USE : The flight crew presses and maintains the PA transmission key, in order to make an announcement in the cabin.

RMP 1+2+3 OFF RMPs 1, 2 and 3 are OFF.

L2 Flight Phase Inhibition:

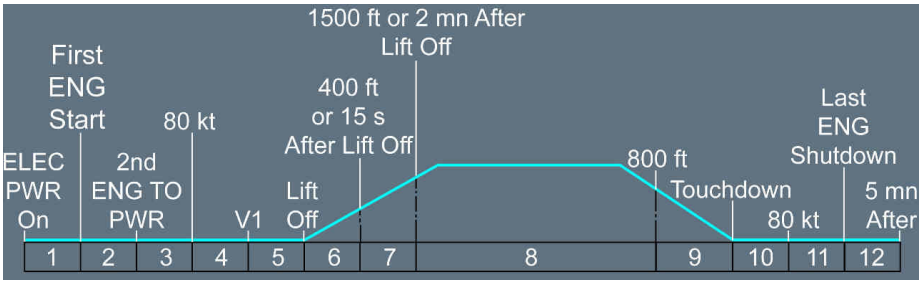
Flight Phase Inhibition



RMP 1+3(2+3) OFF RMPs 1 and 3(2 and 3) are OFF.

L2 Flight Phase Inhibition:

Flight Phase Inhibition

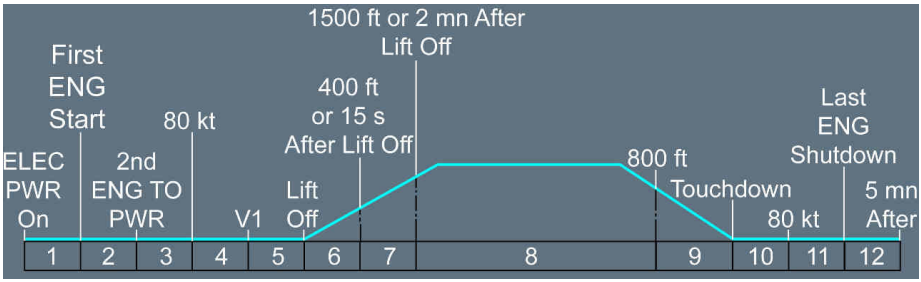


RMP 3 OFF

Only RMP 3 is OFF.

L2 Flight Phase Inhibition:

Flight Phase Inhibition

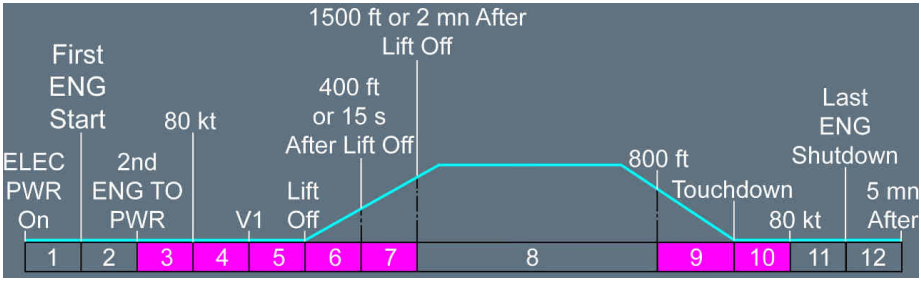


SATCOM ALERT

The flight crew has received a high priority telephone call, via the SATCOM (*Refer to DSC-23-20-30 Priority Level*).

L2 Flight Phase Inhibition:

Flight Phase Inhibition

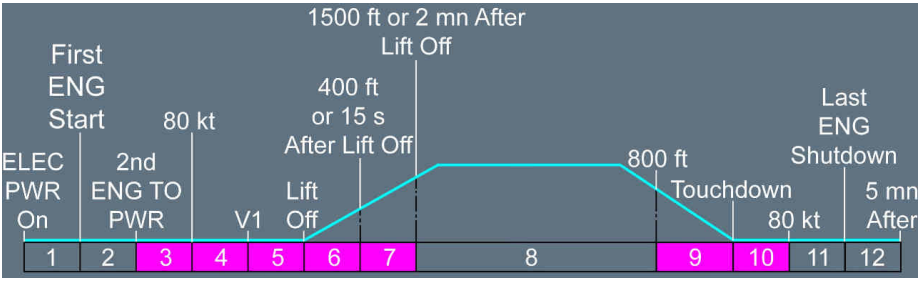


VHF DTLNK MAN SCAN

The flight crew has manually selected the datalink provider, via the DATALINK ROUTER page on the RMP . For more information on the DATALINK ROUTER page, *Refer to DSC-23-20-35 DATALINK ROUTER Page* .

L2 Flight Phase Inhibition:

Flight Phase Inhibition

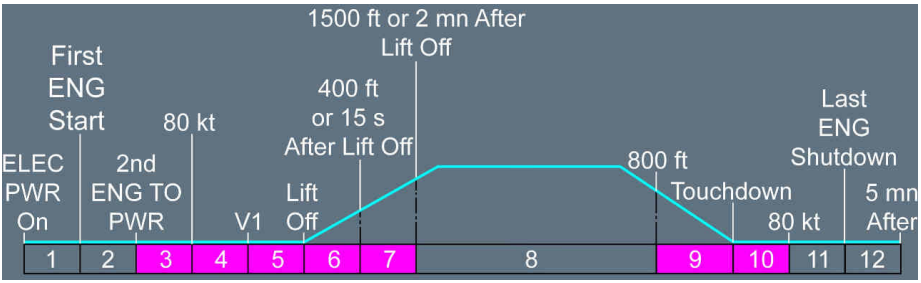


VHF VOICE

VHF data mode is:
- Not selected, or
- Interrupted, or
- Failed.

L2 Flight Phase Inhibition:

Flight Phase Inhibition

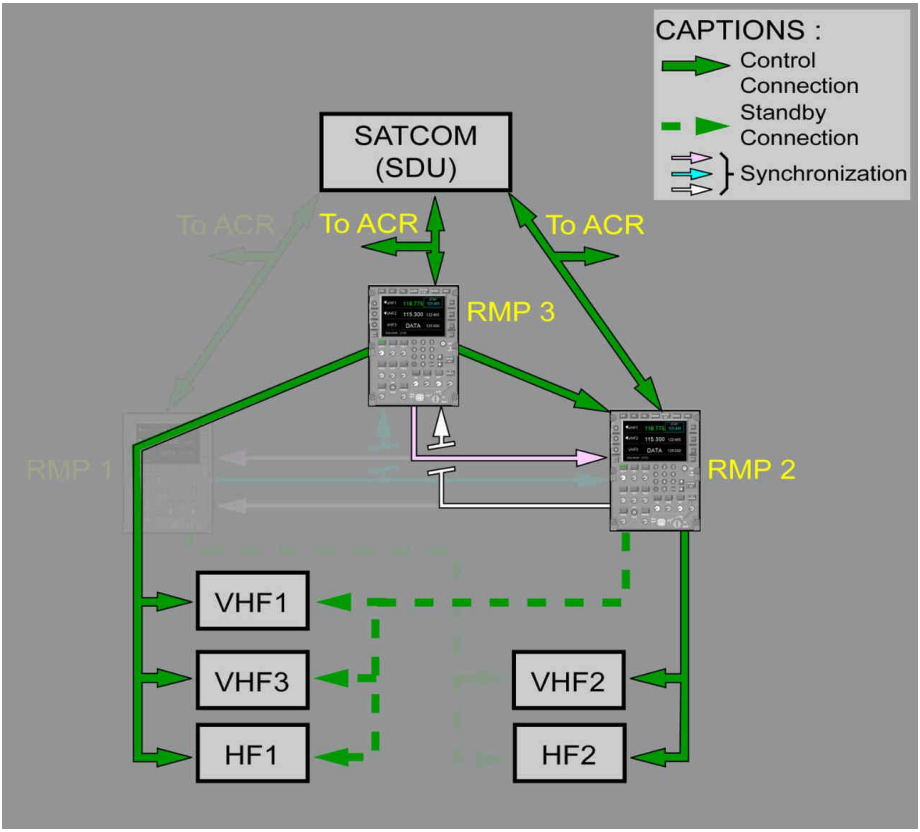


Intentionally left blank

SINGLE RMP FAILURE

Applicable to: ALL

Single RMP Failure



If RMP 1 or RMP 2 fails, the Captain or the First Officer can use RMP 3 to recover control of the communication system.

When the failed RMP is turned off:
- RMP 3 connects directly to the VHF and HF transceivers
- The affected flight crewmember can control his communication equipment, via RMP 3.

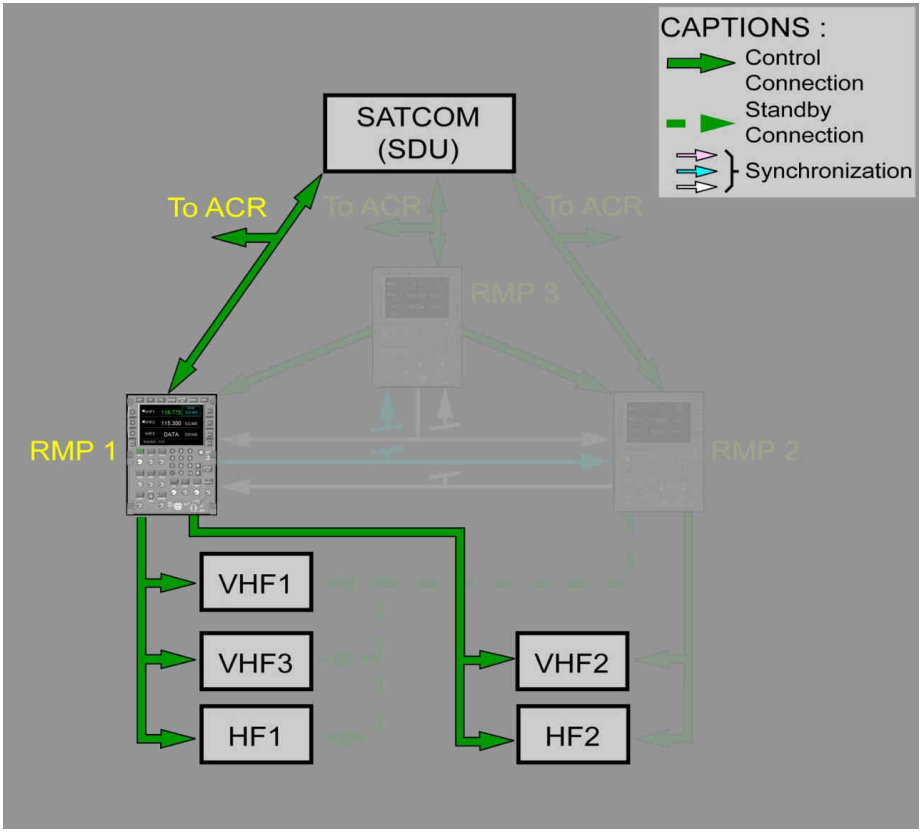
L3 If RMP 1 fails, RMP 3 controls VHF 1, VHF 3 and HF 1.
If RMP 2 fails, RMP 3 controls VHF 2 and HF 2.

L1 Standby radio navigation control is available via the operative RMP (RMP 1 and 2 only).

DUAL RMP FAILURE

Applicable to: ALL

Dual RMP Failure



If two RMPs fail, the Captain and the First Officer can use the remaining RMP to control the communication system.

When the failed RMPs are turned off, the operative RMP connects to, and controls all the radio communication means.

L3 Control of all radio communication is enabled by activation of standby connections.

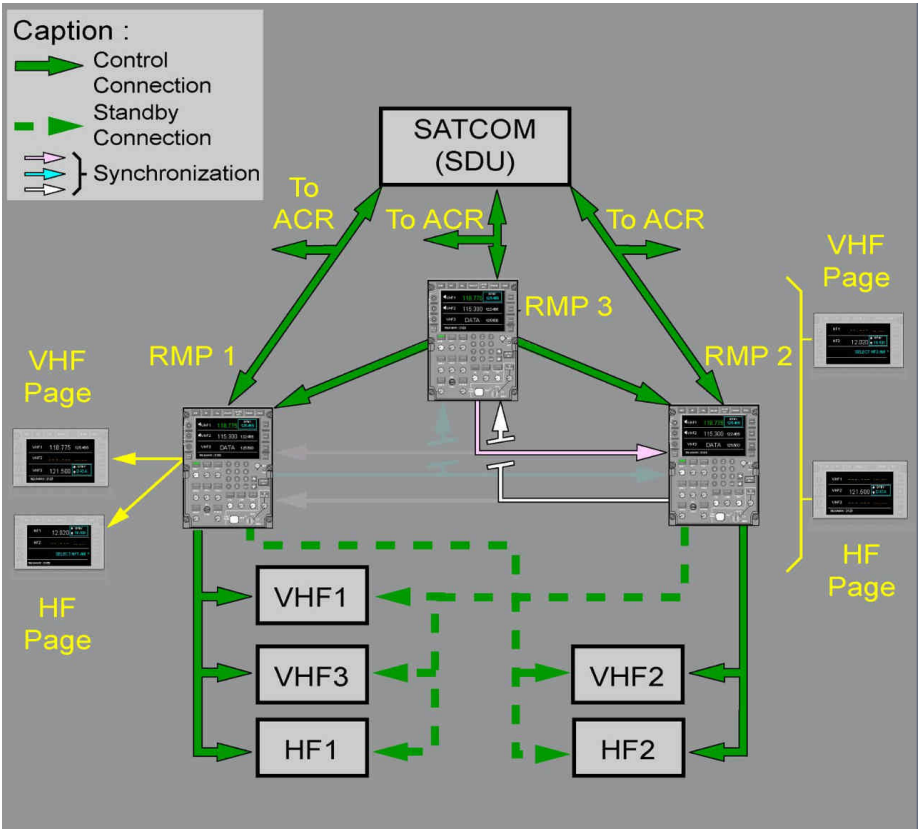
L1 If RMP 1 and RMP 2 fail, standby radio navigation control is no longer available.

Intentionally left blank

RMP SYNCHRONIZATION FAILURE

Applicable to: ALL

RMP Synchronization Failure



A synchronization failure results in a partial display of the VHF, HF, and NAV pages on each RMP.

L3 In the above illustration of connection failure, RMP 1 does not share information related to VHF 1, VHF 3 and HF 1 with the two other RMPs. Therefore, RMP 1 synchronization is interrupted. Only RMP 2 and RMP 3 are synchronized.

L1 The displays on the TEL, SATCOM and DATALINK ROUTER pages are normal.

RMP - VHF/HF TRANSCEIVER CONNECTION FAILURE

Applicable to: ALL

In the case of a control connection failure between an RMP and a VHF/HF transceiver in voice mode, the RMPs continue to operate normally. However, the affected transceiver cannot be controlled and remains tuned to the pre-failure active frequency.

The flight crew detects the discrepancy only when a frequency change is attempted and feedback from Air Traffic Control (ATC) is not consistent.

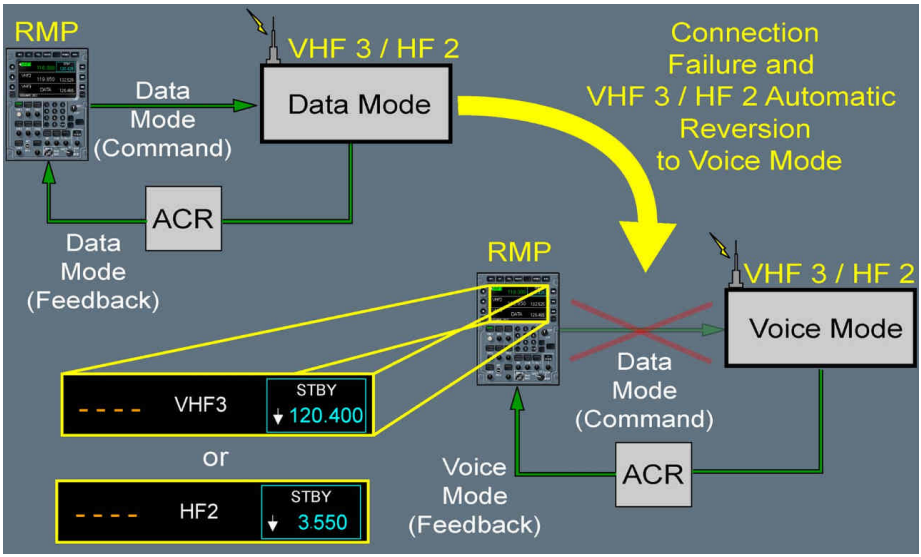
If such failure occurs when VHF 3 /HF 1(2) is in data mode, the transceiver automatically returns to the tune pre-failure standby frequency. Amber dashes replace DATA because the transceiver is in a mode (voice mode) that is not consistent with the mode commanded by the RMP (data mode).

L3 The ACR sends the VHF 3/HF 1(2) active mode information (voice or data) to the RMPs.

The illustration below shows an example of what happens when the connection, between an RMP and VHF 3/HF 2 fail.

In normal operation, a standby connection failure has no effect on the control of the VHF/HF transceivers.

RMP-VHF/HF Connection Failure



HOW TO TUNE A RADIO FREQUENCY

Applicable to: ALL

The procedure how to tune VHF or HF frequency is identical.

HOW TO SWITCH TO DATA MODE

Applicable to: ALL

The procedure how to switch to data mode for VHF or HF frequency is identical.

Switch HF2 to DATA Mode

Press LSK2 to select HF2 STBY frequency for modification.

HOW TO LOG ON TO THE SATCOM AUTOMATICALLY

Applicable to: ALL

SATCOM log on with the AUTO LOG ON function

Press LSK3 to select the SATCOM CONFIG page.

HOW TO LOG ON THE SATCOM MANUALLY

Applicable to: ALL

HOW TO DIAL A TELEPHONE NUMBER

Applicable to: ALL

How to manually-dial a telephone number is described. How to dial a telephone number from the scroll list is identical.

Manually Dial a Telephone Number via TEL 1

Press LSK1 to select the TEL1 phone number for modification.

HOW TO DISABLE TELEPHONE CALLS FROM THE CABIN

Applicable to: ALL

HOW TO TUNE NAVAIDS

Applicable to: ALL

The flight crew can tune navaids manually through:

- The FMS interface (*Refer to DSC-22-FMS-10-30-20-22FMS3020A Radio Navigation Tuning - Introduction*)
- The standby radio navigation interface (*Refer to DSC-34-10-60-30 How to Tune Navaids in Standby RadNav*)

HOW TO MODIFY THE VHF DATALINK PROVIDER

Applicable to: ALL

Modify the VHF datalink provider

Press LSK2 to select the DATALINK ROUTER page.

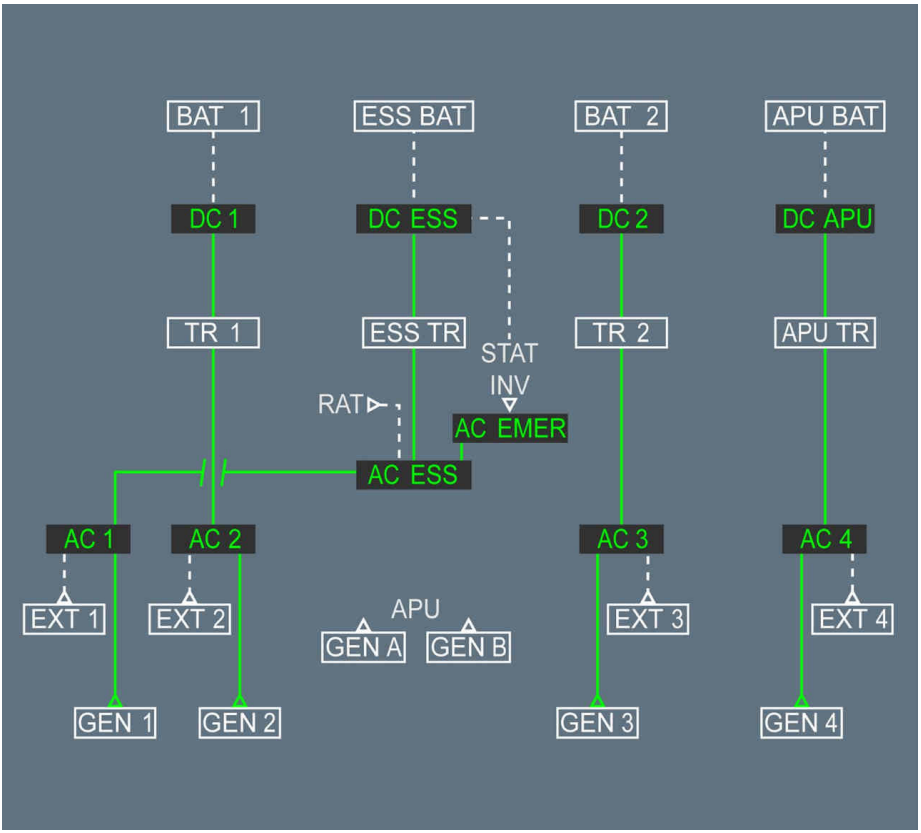
ECAM Alerts....A

OVERVIEW

Applicable to: ALL

The electrical power system generates and distributes electrical power to all applicable aircraft systems.

General



AC POWER

115 V Alternating Current (AC) power can be provided by three types of power sources:

- Four engine generators (GEN 1, GEN 2, GEN 3, and GEN 4)
- Two APU generators (APU GEN A and APU GEN B)
- Four external power units (EXT 1, EXT 2, EXT 3, and EXT 4).

Refer to AC Generation

In emergency configuration, the RAT or the DC static inverter can also provide some AC power.

Refer to Emergency Generation

DC POWER

28 V Direct Current (DC) power is provided from AC power by four Transformer Rectifiers (TR 1, ESS TR , TR 2, and APU TR).

In the event that AC power is not available, four batteries can also provide DC power.

Refer to DC Generation

ELECTRICAL NETWORKS AND POWER DISTRIBUTION

Electrical power is distributed to:

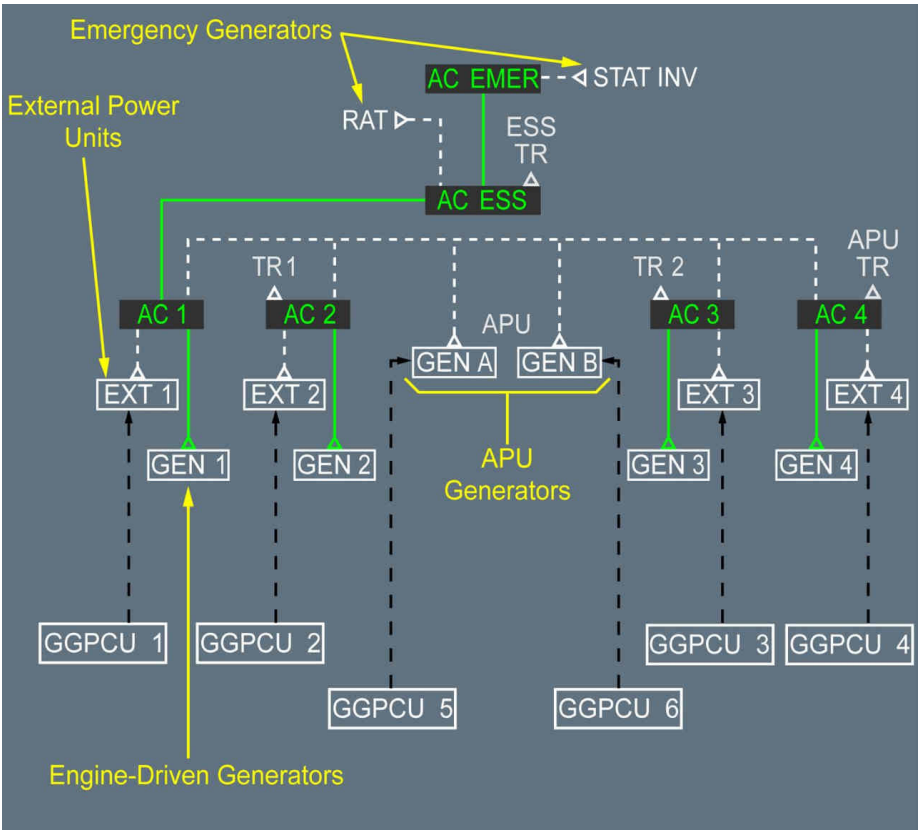
- The normal AC and DC networks via:
  - Four AC busbars (AC 1, AC 2, AC 3, and AC 4)
  - Two DC busbars (DC 1 and DC 2)
  - One DC APU busbar (DC APU busbar).
- The emergency AC and DC networks via:
  - One AC essential busbar (AC ESS)
  - One AC emergency busbar (AC EMER)
  - One DC essential busbar (DC ESS).

Refer to Electrical Networks and Power Distribution

AC GENERATION

Applicable to: ALL

AC Generation



ENGINE-DRIVEN GENERATORS

Each engine has one generator. These engine-driven generators are the main source of electrical power. When an engine is running, its generator provides 115 V AC power at variable frequency.

L3 This frequency ranges from 360 Hz to 800 Hz , depending on the N2 rotation speed of the engine. An oil system lubricates, and cools the engine generators. The ECAM monitors the oil level.

L1 Each engine generator supplies AC power to its assigned AC busbar (e.g. GEN 1 supplies AC 1).

If one or more generators fail, their assigned busbars are automatically supplied by the remaining generators. At least two engine generators (or APU generators) are necessary to supply the entire network. (*Refer to DSC-24-40 Reconfigurations Overview*).

L2 Each engine generator can supply up to 150 KVA .

There is one Generator and Ground Power Control Unit (GGPCU) per engine generator. Each GGPCU controls one engine generator and its corresponding external power unit.

The GGPCU :

- Monitors the frequency of the generator
- Controls the voltage of the generator
- Detects the generator overloads.

APU GENERATORS

The APU can drive two APU generators (APU GEN A and APU GEN B). When the APU is running, it drives both generators at the same time. These generators provide 115 V AC power at a constant frequency of 400 Hz .

An APU generator can replace the function of any generator, on ground and in flight, in the operational envelope of the APU .

For more precisions on the operational envelope of the APU : *Refer to LIM-49-20 Operational Envelope* .

- On ground, the two APU generators are able to supply the entire aircraft network.
- In flight, only one APU generator is available.

L2 In flight, when the APU is running, it drives the APU GEN A. If the APU GEN A is inoperative, in this case the APU drives the APU GEN B.

L3 The In-Flight or On-Ground information comes from the ADR 1 and ADR 3.

If the ADR 1 or the ADR 3 fails in flight, the APU GEN B will not be reconnected on ground.

L1 For more information on the electrical configuration with the APU only: *Refer to DSC-24-30 On Ground APU* .

L2 Each APU generator can supply up to 120 KVA .

There is one GGPCU per APU generator.

The GGPCU :

- Controls the frequency and voltage of the APU generator, and
- Detects the APU generator overloads.

EXTERNAL POWER UNITS

On ground, it is possible to connect as many as four external power units (EXT 1, EXT 2, EXT 3 and EXT 4).

Two external power units are sufficient to supply the entire aircraft network (*Refer to DSC-24-40 Reconfigurations Overview*).

L2 The external power units supply the aircraft by providing 115 V AC power at a constant frequency of 400 Hz . Each external power unit can supply up to 90 KVA .
There is one GGPCU per external power unit. Each external power unit controls its external power unit and its corresponding engine generator.

The GGPCU :

- Controls the frequency and voltage from the external power unit

L3 If the external power unit supplies more than 90 KVA , the GGPCU automatically limits the power supply of the external power unit to 90 KVA .

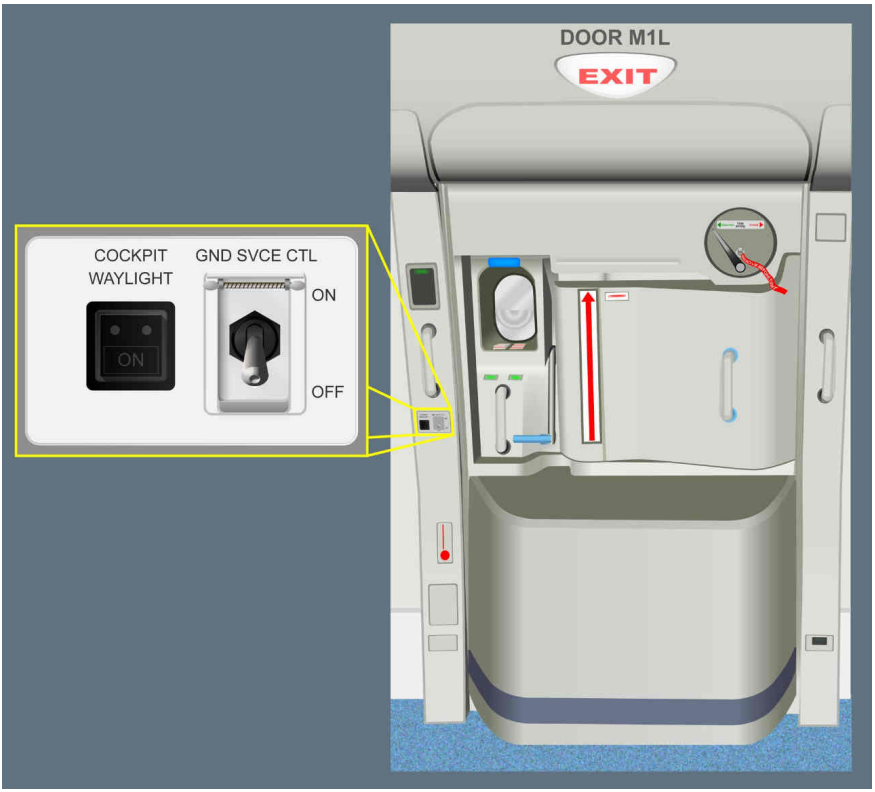
L2 - Detects the external power unit overloads.

GROUND SERVICING

The ground servicing electrical network is supplied, when:

- EXT 1 is connected to the aircraft.
- Maintenance and ground service personnel set the GND SVCE CTL sw to on.

GND SVCE CTL sw Location



In this configuration, the normal and emergency electrical networks are not supplied.

L3 EXT 1 supplies only the following loads:

- Cabin and cockpit lighting
- Hydraulic compartment lighting
- Cargo compartment lighting and power outlets
- Landing gear compartment lighting and servicing power outlets
- Equipment compartment lighting and servicing power outlets
- Vacuum cleaner power outlets
- Cockpit servicing power outlets
- Fuel quantity indicators
- Navigation lights

- Parking brake
- Cargo door hydraulic electric pumps.

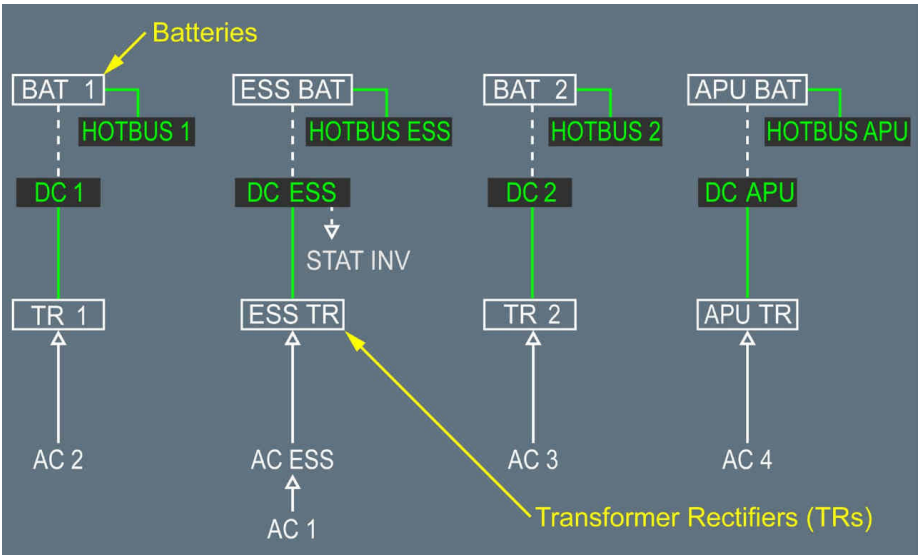
L2 Note: *Ground servicing loads are also supplied, when at least two generators supply the electrical network.*

Intentionally left blank

DC GENERATION

Applicable to: ALL

DC Generation



BATTERIES

The aircraft has four batteries:

- BAT 1

L3 BAT 1 is permanently connected to its assigned HOT BUS 1.

L1 - BAT 2

L3 BAT 2 is permanently connected to its assigned HOT BUS 2.

L1 - ESS BAT

L3 ESS BAT is permanently connected to its assigned HOT BUS ESS.

L1 - APU BAT

L3 APU BAT is permanently connected to its assigned APU HOT BUS.

The systems connected to the battery HOT BUS remain supplied by the associated battery even if the BAT pushbutton is set to OFF.

L1 In normal operation, and provided the BAT pushbutton is set to AUTO, BAT 1, BAT 2, ESS BAT, and APU BAT connect to the DC 1, DC 2, DC ESS, and APU BAT busbars, respectively.
The APU BAT is assigned to APU start.

In addition, BAT 1 and ESS BAT can supply the DC ESS busbar:
- On ground, when no other power source is available
- In emergency configuration:
  - During RAT extension, or
  - After landing, for evacuation procedures.

L3 Each battery has a capacity of 50 Ah.

TRANSFORMER RECTIFIERS

The Transformer Rectifiers (TRs) supply the DC network with a 28 V DC power from the 115 V AC power.

There are 4 TRs:
- TR 1

L2 Transforms power from the AC 2 busbar, to supply the DC 1 busbar.

L3 TR 1 also monitors BAT 1 charging.

L1 - ESS TR

L2 Transforms power from the AC ESS busbar, to supply the DC ESS busbar.

L3 ESS TR also monitors BAT ESS charging.

L1 - TR 2

L2 Transforms power from the AC 3 busbar, to supply the DC 2 busbar.

L3 TR 2 also monitors BAT 2 charging.

L1 - APU TR

L2
- Transforms power from the AC 4 busbar, to supply the DC APU busbar
- Connects the APU BAT to the DC APU busbar for APU starting, when no other power source is available.

L1 The TRs also control:

- Their associated battery charging
- The connection of their associated batteries to the DC busbars, in order to prevent a power interruption during source transfer.
  In normal operation, all the batteries, except the APU battery, are permanently connected to their associated busbar.

EMERGENCY GENERATION

Applicable to: ALL

RAM AIR TURBINE (RAT) GENERATOR

In the event that the AC 1, AC 2, AC 3, and AC 4 busbars are lost in flight, the RAT will automatically extend, and mechanically drive the emergency generator. This emergency generator supplies the AC ESS busbar with AC power at a variable frequency.

L3 This frequency ranges from 360 Hz to 800 Hz , depending on the rotation speed of the RAT .

L1 The emergency generator can supply all the electrical loads that are necessary for the remainder of the flight and for landing (for more information on the emergency configuration of the electrical system, *Refer to DSC-24-40 Emergency Electrical Configuration*).

L2 The RAT is under the LH wing, and supplies power, when the aircraft speed is greater, or equal to 140 kt .

The emergency Generator Control Unit (GCU) monitors and controls the RAT .

L3 The GCU :

- Monitors the frequency of the RAT generator,
- Controls the extension of the RAT , and
- Controls the output voltage of the RAT generator.

L1 STATIC INVERTER

During RAT extension, and after landing (speed less than 140 kt), the static inverter powers the AC EMER busbar.

L2 The static inverter transforms DC power from BAT 1, and from ESS BAT , into 115 V AC power at a constant frequency of 400 Hz .

Intentionally left blank

ELECTRICAL NETWORKS

Applicable to: ALL

NORMAL NETWORK

Each generator connects to the electrical networks via its assigned contactor.

The normal AC and DC network is supplied via:
- Four AC busbars: AC 1, AC 2, AC 3, and AC 4
- Two DC busbars: DC 1 and DC 2
- One DC APU busbar: DC APU .

The BUS TIE Contactors (BTC s) automatically open or close to reconfigure the electrical network.
For more information on the electrical network reconfigurations, *Refer to DSC-24-40 Reconfigurations Overview* .

L3 There are 8 BUS TIE contactors.

L1 When the flight crew sets the BUS TIE pb-sw to OFF , some BUS TIE contactors open to segregate:
- The AC 1 and AC 2 busbars from the AC 3 and AC 4 busbars, and
- The DC 1 busbar from the DC 2 busbar.

L2 The EHA AC busbar is supplied via the AC 3 busbar. The EHA DC busbar is supplied via the DC 2 busbar.

The EHA AC and the EHA DC busbars supply:
- Several EHA / EBHA actuators on the rudder,
- The PRIM 2, and
- The SEC 2.

In emergency configuration, and when both hydraulic systems are lost:
- The EHA AC busbar is supplied via the AC ESS busbar
- The EHA DC busbar is supplied via the DC ESS busbar.

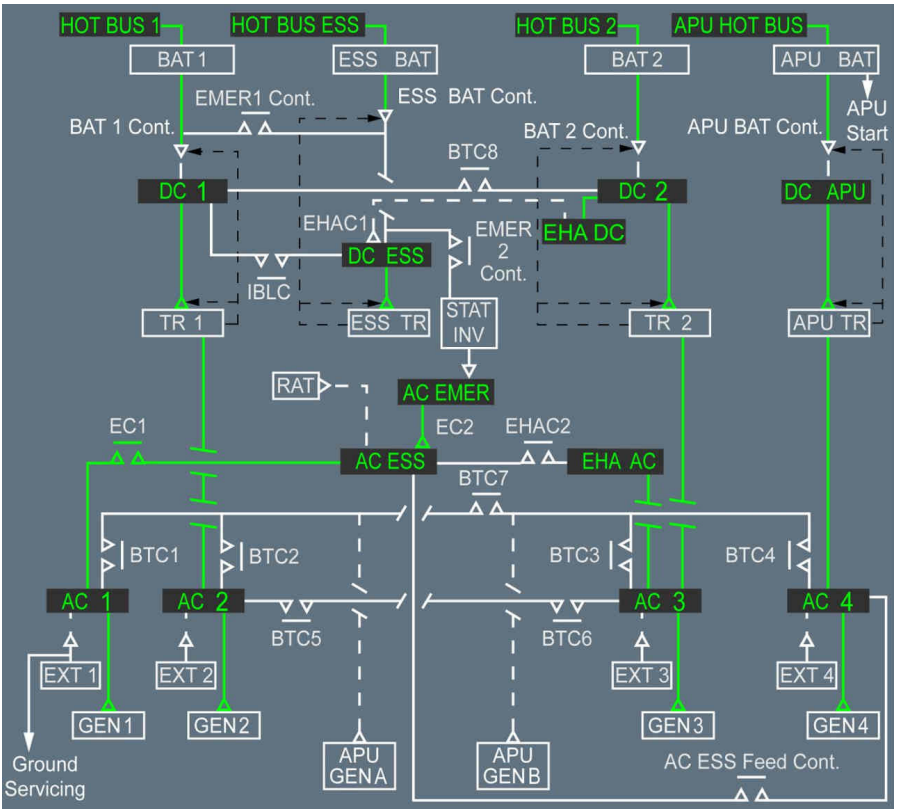
EMERGENCY NETWORK

The emergency network is supplied:

- Via the AC 1 busbar, or
- Via the AC 4 busbar if:
  - The AC 1 busbar is lost, or
  - AC ESS Feed pb-sw is set to ALTN.
- Directly from the RAT, in the event that the AC 1, AC 2, AC 3, and AC 4 busbars are lost.

ELECTRICAL NETWORKS

Electrical Networks



L3 Electricity is distributed to the electrical networks via supply centers (*Refer to DSC-24-10-50 Supply Centers*).

CONTACTORS

BTC 1, BTC 2, BTC 3, BTC 4, BTC 5, BTC 6, BTC 7	:	Enable any reconfiguration of the AC busbars. BTC 5, BTC 6, and BTC 7 are forced open when the BUS TIE pb-sw is set to OFF .
BTC 8 and the Inter Bus Line Contactor (IBLC)	:	Enable any reconfiguration of the DC busbars power supply. BTC 8 is forced open when the BUS TIE pb-sw is set to OFF .
EC 1	:	Closed to supply the AC ESS busbar via the AC 1 busbar (normal position). Opens, when - The AC ESS Feed pb-sw is set to ALTN , or - The static inverter supplies the AC EMER busbar.
AC ESS Feed contactor	:	Closes when: - The AC 1 busbar is lost, or - AC ESS FEED pb-sw is set to ALTN .
EC 2	:	Closed to supply AC EMER via AC ESS (normal position). Opens, when the static inverter supplies the AC EMER busbar.
EMER 1 and EMER 2 contactors	:	Close when: - The AC 1, AC 2, AC 3, and AC 4 busbars are lost, and - The RAT is not available. *Note: BAT ESS contactor also closes, when the EMER 1 and 2 contactors close.*
Battery contactors	:	Open: - When the associated battery is set to OFF . - If the associated battery fails.
EHA C1 and EHA C2	:	Close, in emergency configuration, when both hydraulic systems are lost.

SUPPLY CENTERS

Applicable to: ALL

The aircraft systems are supplied via the busbars. The busbars are grouped in several supply centers:

- The primary supply center: To distribute electricity to high loads (greater than 15 A) of the normal network.
- Two secondary supply centers: To distribute electricity to low loads (less than, or equal to, 15 A) of the normal network.
  The secondary supply center is ventilated by the avionics ventilation system, and by an assigned ventilation system.

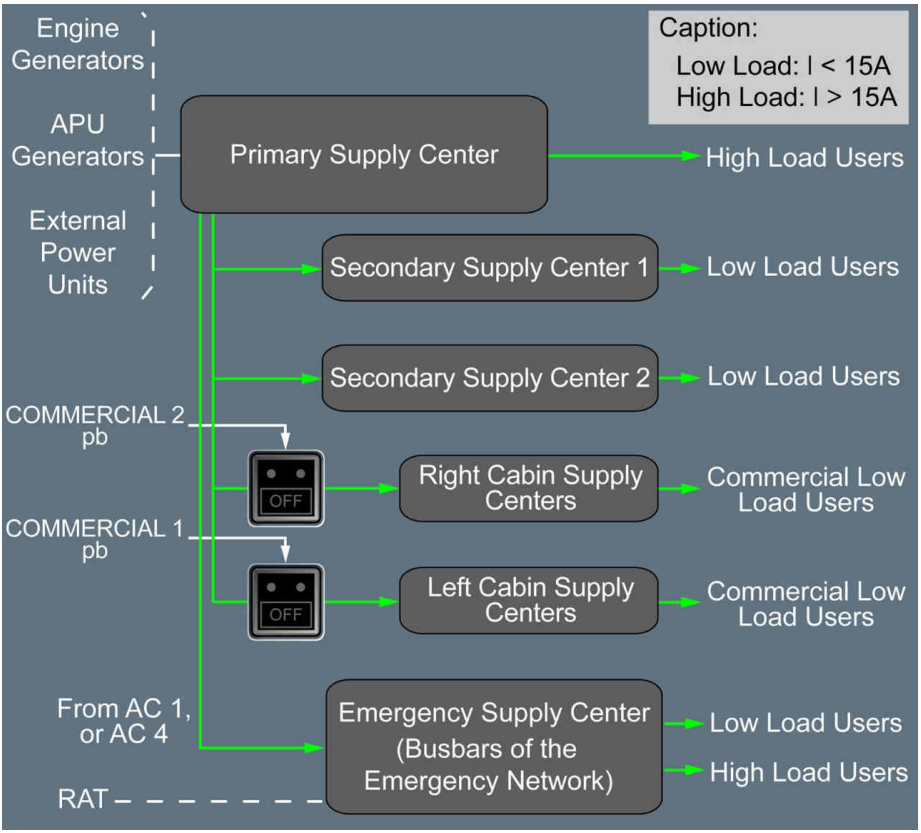
L2 There is one assigned blowing fan for each secondary supply center.

L1 - The left and right cabin supply centers: To distribute electricity to Commercial low loads.
Each cabin supply center has two overheat detectors, to detect any overheat in the commercial and cabin loads.

L3 There are four left cabin supply centers, and four right cabin supply centers.

L1 - The emergency supply center: To distribute electricity to emergency loads.

The Electrical Supply Centers



Intentionally left blank

ELECTRICAL NETWORK MANAGEMENT AND LOAD SHEDDING

Applicable to: ALL

The Electrical Network Management Units (ENMU 1 and ENMU 2) control the electrical networks by:

- Connecting AC and DC power sources.

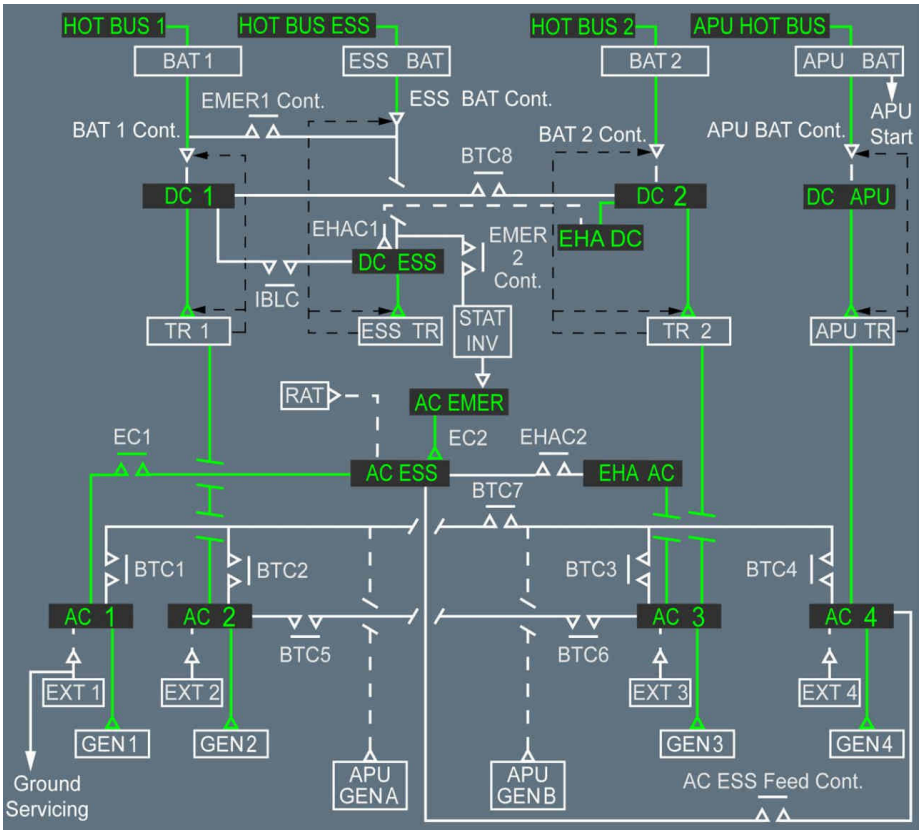
L2 E.g. the ENMU s will connect a power source to the network, by closing the appropriate power source contactor, when no power source malfunction is detected by the applicable GGPCU .

L1 - Reconfiguring the electrical network, depending on the availability of the busbars (for more information on the electrical reconfigurations, *Refer to DSC-24-40 Reconfigurations Overview*).

- Sending applicable information to the ECAM , for display on the EWD and the SD .
- Activating ground servicing to supply loads for aircraft cleaning, cargo loading/unloading, etc.

L2 (for more information on the ground servicing, *Refer to DSC-24-10-20-10 External Power Units*).

Control of the Electrical Networks



L3 ENMU 1 controls:

- Engine generator 1 and 2 contactors
- BUS TIE Contactors (BTC 1, BTC 2,and BTC 5)
- APU generator contactor 1
- Inter Bus Line Contactor (IBLC)
- EMER 1 and 2 contactors
- Static inverter contactor
- The Emergency Contactor 1 (EC)

ENMU 2 controls:
- Engine generators 3 and 4 contactors
- BUS TIE Contactors (BTC 3, BTC 4, BTC 6 and BTC 7, and BTC 8)
- APU generator contactor 2

L1 **LOAD SHEDDING**

In the event of a generator overload, some commercial AC loads will be automatically shed.

L2 These commercial loads are:
- All galleys
- The In-flight Entertainment (IFE) system
- The cargo loading system
- Water and waste ice protection
- Lavatory and cabin lights
- The water heater
- Supplemental cooling
- Door heaters.

L1 The load shedding function is performed by the ELMU .

L2 An overload may occur when there is a high demand, and only one or two generators are supplying the electrical network.

L1 When sufficient power is recovered, connections resume automatically.

L3 The applicable GGPCU determines the overloaded power source, and the overload value. The ELMU then sheds the appropriate loads.
Any commercial high or low AC load can be shed.
The ELMU uses the consumption priority criteria to identify which loads to reconnect.

L1 If the ELMU is not available, load shedding will be available only on high AC loads.

L3 The ENMU s will then perform this function, on high commercial AC loads greater than 15 A (e.g. galley).

CIRCUIT BREAKER (C/B) MONITORING

Applicable to: ALL

Two types of Circuit Breakers (C/Bs) protect the electrical networks:
- Conventional C/Bs on the normal and emergency networks.

L2 Conventional C/Bs connect:
- High loads to the normal network.
- High and low loads to the emergency network.

L1 - Self-monitored contactors, also referred to as remote C/Bs, that act as C/Bs, on the normal network.

L2 Self-monitored contactors connect low loads to the normal network.

L3 The self-monitored contactors can be monitored for maintenance purposes only, via the remote C/B controller that is at the back of the cockpit.
Low loads are on the secondary supply center, or on the cabin supply centers.

L1 C/B MONITORING FUNCTION

The C/B monitoring function:
- Identifies the tripped C/Bs (conventional and remote C/Bs) that connect loads to the electrical network
- Displays these tripped C/Bs on the C/B page of the SD.

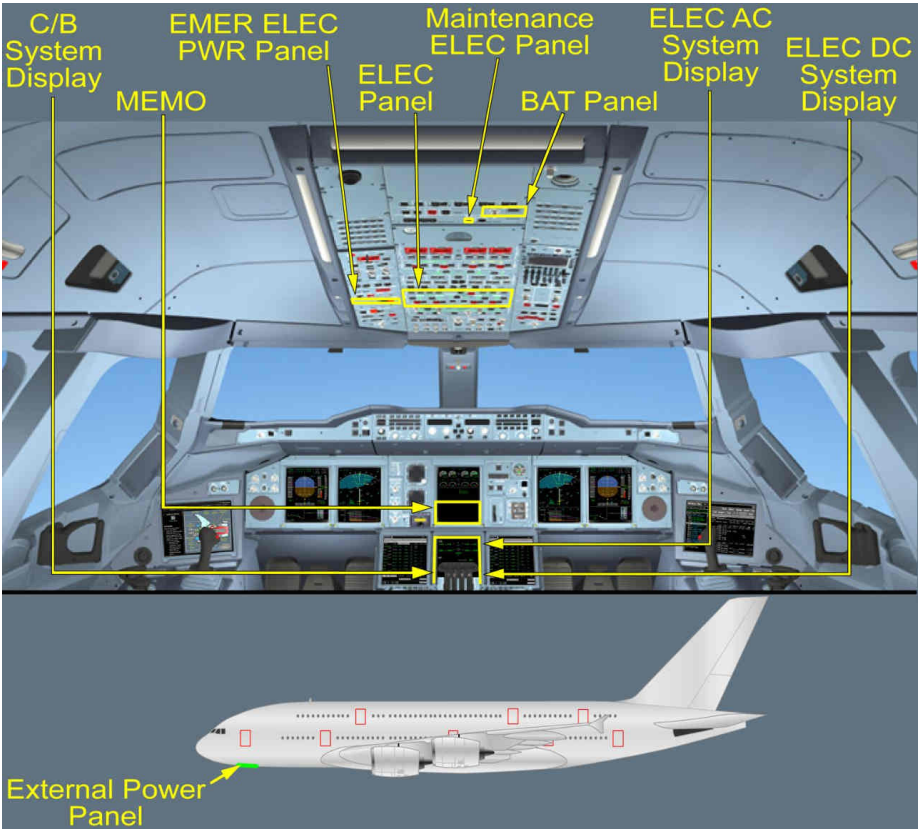
The emergency part of the C/B monitoring function:
- Identifies the tripped C/Bs that connect loads to the emergency network
- Displays these tripped C/Bs on the C/B page of the SD.

L3 The C/B monitoring function is hosted on the CPIOM E.

COCKPIT VIEW

Applicable to: ALL

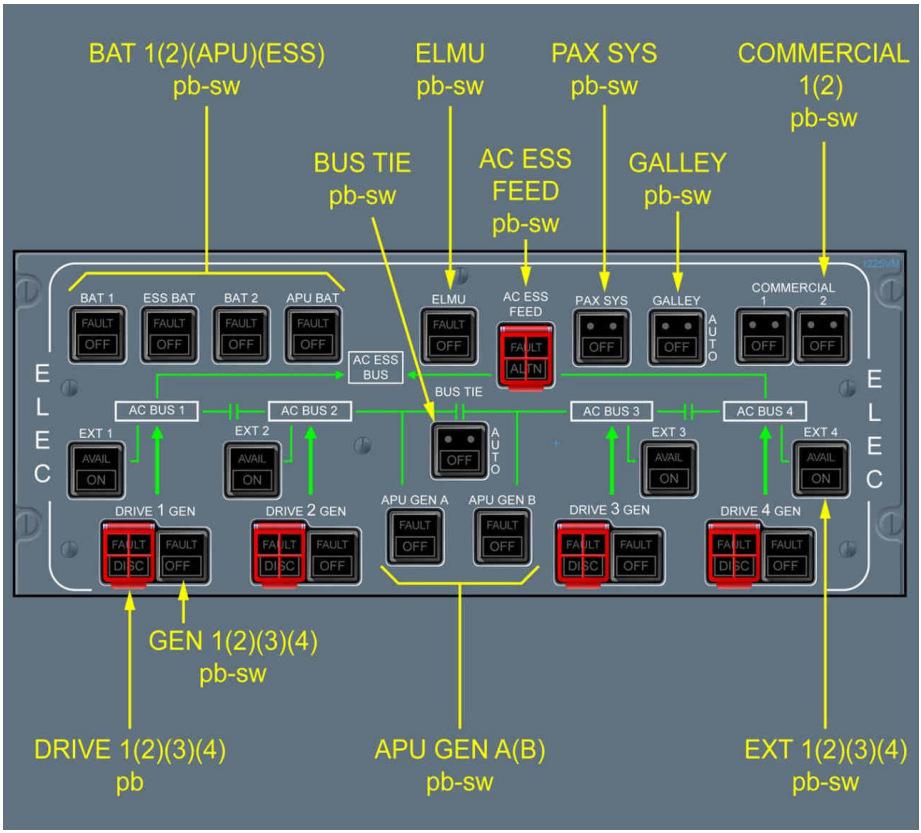
Cockpit View



ELEC PANEL

Applicable to: ALL

ELEC Panel



BAT1(2)(APU)(ESS) pb-sw

Normal position.
Battery charging is automatically-controlled by its associated TR .

The battery is disconnected from the network.

L12

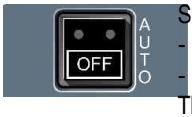
The charging or discharging current of the battery is abnormal.
The battery automatically disconnects from its associated DC busbar.

Associated with one of the following ECAM cautions:
- ELEC APU BAT FAULT (*Refer to procedure)*
- ELEC BAT 1 (2)(ESS) FAULT (*Refer to procedure).*

BUS TIE PB-SW

Normal position.
The BUS TIE contactors automatically open or close, to reconfigure the electrical network, as necessary.

L13



Some BUS TIE contactors open to segregate:
- The AC 1 and AC 2 busbars from the AC 3 and AC 4 busbars, and
- The DC 1 busbar from the DC 2 busbar.

The BUS TIE contactors BTC 5, BTC 6, BTC 7, and BTC 8 are forced open.
For more information, *Refer to Electrical Networks*

PAX SYS PB-SW

Normal Operation: The IFE center, and the passenger seats are electrically-supplied.

The IFE center, and the seat power supply are manually shed.

ELMU pb-sw

The automatic shedding function for high and low commercial loads is available.

L12

The ELMU is off: The automatic shedding function for low commercial loads is not available.
ENMU 1 and 2 can shed high loads, if necessary.

L12

The ELMU is failed: The automatic shedding function for low commercial loads is not available.
ENMU 1 and 2 can shed high loads, if necessary.

Associated with the following ECAM caution:
- ELEC LOAD MANAGT FAULT *Refer to procedure.*

AC ESS Feed pb-sw

Normal position:
- The AC 1 busbar supplies the AC ESS busbar.
- If the AC 1 busbar is lost, the AC 4 busbar will automatically supply the AC ESS busbar.

The AC ESS FEED pb-sw is manually set to ALTN .
The AC 4 busbar supplies the AC ESS busbar.

L12

The AC ESS busbar is not supplied.

Associated with the following ECAM caution:
- ELEC AC ESS BUS FAULT (*Refer to procedure).*

GALLEY pb-sw

The galleys are supplied. Some galleys may be automatically shed, if necessary.

All galleys are manually shed.

COMMERCIAL 1(2) PB-SW

All commercial loads of the upper left (right) cabin supply centers, are supplied. Some commercial loads may be automatically shed, if necessary.

L12

All commercial loads of the upper left (right) cabin supply centers, are manually shed.

The commercial loads are:
- All galleys
- The In-Flight Entertainment (IFE) system
- Ground servicing
- The cargo loading system
- Water and waste ice protection
- Lavatory and cabin lights
- The water heater
- The ice protection system for the slides.

EXT 1(2)(3)(4) pb

The external power unit is not connected to the aircraft.

The external power unit is connected to the aircraft, and is available to supply the electrical network.

The external power unit supplies the electrical network.

APU GEN A(B) pb-sw

The APU generator is available to supply the electrical network.

The APU GEN A(B) pb-sw is set to OFF with the APU running.

L12

The APU generator is disconnected from the electrical network.
The applicable GGPCU disconnects the APU generator from the electrical network.

L2 Associated with the following ECAM alert:
- ELEC APU GEN A(B) FAULT (*Refer to PRO-ABN-ECAM-10-24-80 ELEC APU GEN A(B) FAULT* procedure).

GEN 1(2)(3)(4) pb-sw

The engine generator is connected to the electrical network.

The GEN 1(2)(3)(4) pb-sw is set to OFF with the engine running.

L12

The engine generator is disconnected from the electrical network.
The applicable GGPCU disconnects the engine generator from the electrical network.

Associated with the following ECAM alerts:
- ELEC GEN 1(2)(3)(4) FAULT (*Refer to procedure).*

L2 *Note: If the DRIVE pb-sw is set to DISC , the engine is disconnected from the engine generator, and the ENG pb-sw automatically sets to FAULT .*

DRIVE 1(2)(3)(4) pb

L13

The engine generator is driven by the engine.

L12

The engine generator is disconnected from the engine.
It can only be reconnected by maintenance action on ground.
The reconnection requires the removal of the engine generator from the aircraft, and refurbishment of the engine generator in workshop.

The engine generator must be disconnected from the engine.

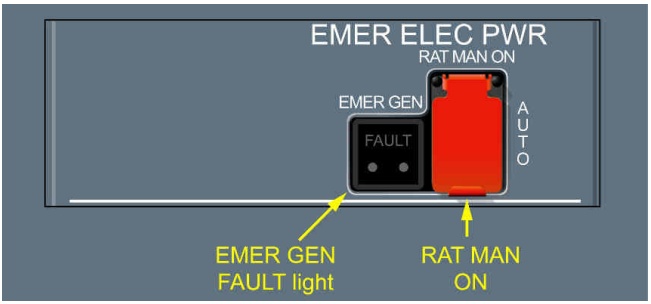
Associated with the following ECAM alerts:
- ELEC DRIVE 1(2)(3)(4) OIL OVHT (*Refer to PRO-ABN-ECAM-10-24-220 ELEC DRIVE 1(2)(3)(4) OIL OVHT*)
- ELEC DRIVE 1(2)(3)(4) OIL PRESS LO (*Refer to procedure)* .

EMER ELEC PWR PANEL

Applicable to: ALL

EMER ELEC PWR PANEL

EMER ELEC PWR Panel



RAT MAN ON pb

Normal position:

- The RAT is stowed, and the emergency generator does not supply the emergency network.
- In the event that all AC busbars are lost, the RAT automatically extends, and the emergency generator electrically-supplies the emergency network.

The guard is open.
When the pushbutton is pressed, the RAT extends, and the emergency generator connects to the emergency network.

EMER GEN FAULT LIGHT

The emergency generator is available, if necessary.

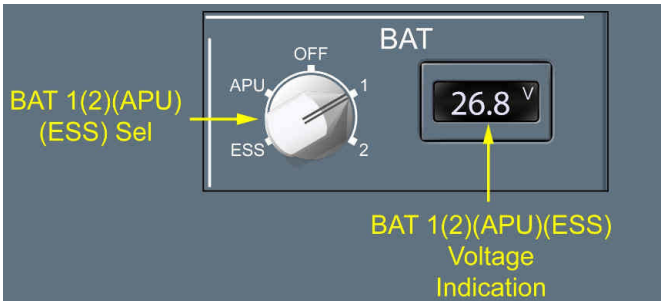
Comes on when:
- The RAT is extending, or
- The RAT is extended, and the emergency generator does not supply the emergency network.

BAT PANEL

Applicable to: ALL

BAT PANEL

BAT Panel



BAT 1 (2) (APU) (ESS) selector

Selects the battery, in order to display the associated voltage.

BAT 1 (2) (APU) (ESS) VOLTAGE INDICATION

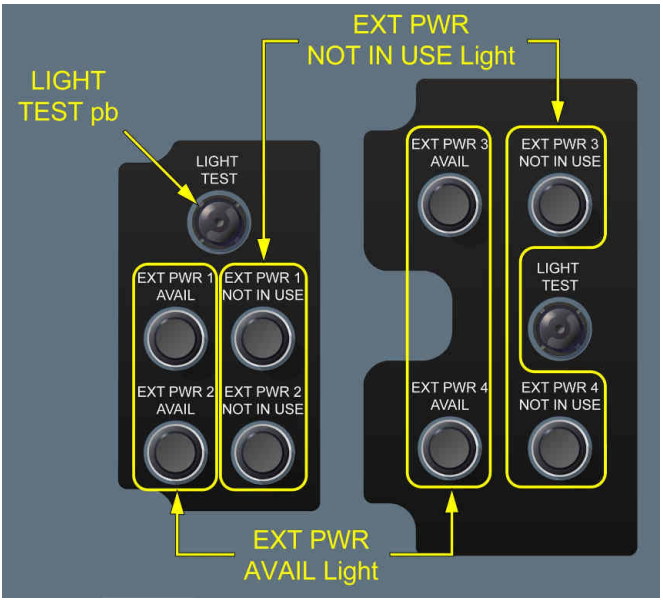
The voltage of the selected battery.

EXTERNAL POWER PANEL

Applicable to: ALL

EXTERNAL POWER PANELS

External Power Panels



EXT PWR 1 (2)(3)(4) NOT IN USE light

This white light comes on () to inform the ground mechanics that the applicable external power unit is not supplying the electrical network, and can be disconnected. The white light disappears, when the external power unit is supplying the electrical network.

EXT PWR 1(2)(3)(4) AVAIL light

This amber light comes on (), to inform the ground mechanics that the applicable external power unit is available, with an appropriate voltage.

LIGHT TEST pb

The LIGHT TEST pb is used to test the associated EXT PWR AVAIL light and EXT PWR NOT IN USE light.

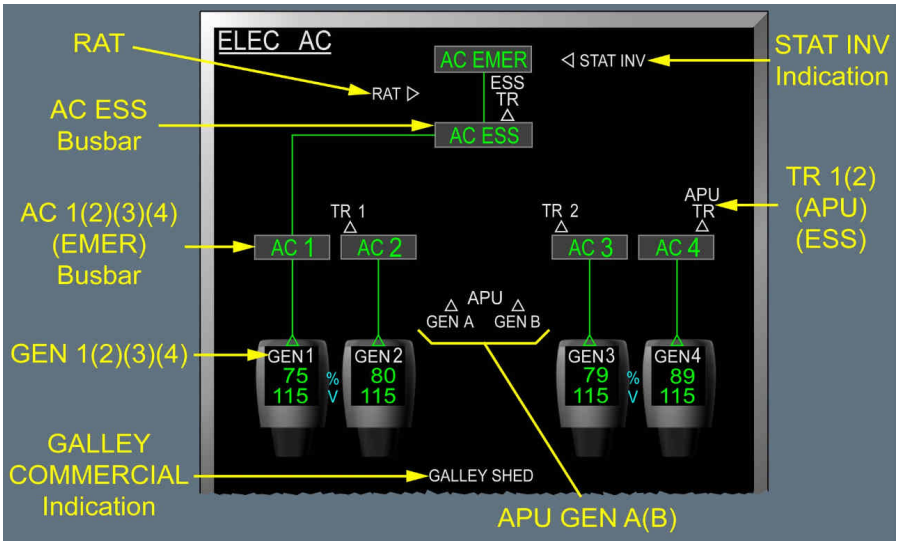
ELEC AC SYSTEM DISPLAY: IN-FLIGHT CONFIGURATION

Applicable to: ALL

For the ELEC AC system display on-ground configuration, *Refer to DSC-24-20-60 ELEC AC System Display: On-Ground Configuration* .

ELEC AC SYSTEM DISPLAY: IN-FLIGHT CONFIGURATION

ELEC AC System Display: In-Flight Configuration



STAT INV INDICATION

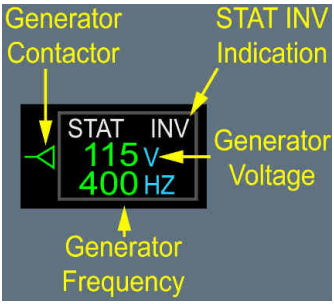
The static inverter indications on the SD differ, when the static inverter is:
- On standby, or
- In operation.

STATIC INVERTER ON STANDBY

The static inverter is on standby.

STATIC INVERTER IN OPERATION

Static Inverter In Operation



GENERATOR CONTACTOR

The static inverter is connected to the AC EMER busbar.

The static inverter contactor is failed: The static inverter is no longer connected to the AC EMER busbar.

STAT INV INDICATION

The static inverter operates normally.

The static inverter is failed.

GENERATOR VOLTAGE

L12

The static inverter voltage is normal.
The voltage is normal between 110 V and 120 V.

The static inverter voltage is abnormal.

GENERATOR FREQUENCY

L12

The static inverter frequency is normal.
The frequency is normal between 390 Hz and 410 Hz.

The static inverter frequency is abnormal.

AC ESS BUSBAR

The AC ESS busbar is powered.

The AC ESS busbar is not powered.

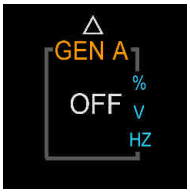
APU GEN A(B)

The APU generator indications on the SD differ, when the APU generator is:
- On standby, or
- Off, or
- In operation.

APU GENERATOR ON STANDBY

The APU generator is on standby: The APU is off.

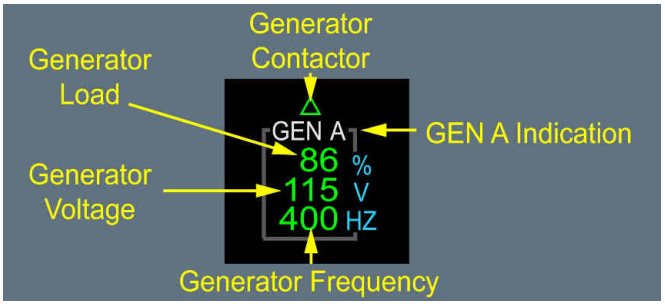
APU GENERATOR OFF



The APU generator is off: The APU is on, and the APU GEN A pb-sw is set to OFF.

APU GENERATOR IN OPERATION

GEN A In Operation



GENERATOR CONTACTOR

The APU generator is connected to the electrical network.

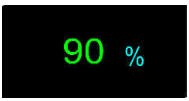
The APU generator is not connected to the electrical network.

GEN A INDICATION

GEN A — Normal operation.

GENERATOR LOAD

L12



The APU generator load is normal.
The load is normal, when it is less than 108 %.

L12

There is an overload on the APU generator.
The load is greater than 108 % for more than 10 s.

GENERATOR VOLTAGE

L12

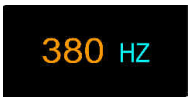
The APU generator voltage is normal.
The voltage is normal between 110 V and 120 V.

The APU generator voltage is abnormal.

GENERATOR FREQUENCY

L12

The APU generator frequency is normal.
The frequency is between 390 Hz and 410 Hz.



The APU generator frequency is abnormal.

GALLEY/COMMERCIAL INDICATION

COMMERCIAL OFF	All commercial loads are shed.
GALLEY SHED	All galley loads are shed.
COMMERCIAL PARTIALLY SHED	Some commercial loads are shed.
GALLEY PARTIALLY SHED	Some galley loads are shed.

GEN 1(2)(3)(4)

The engine generator indications on the SD differ, when the engine generator is:
- Off, or
- In operation.

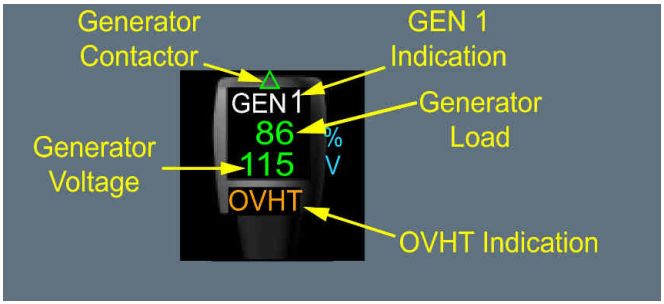
ENGINE GENERATOR OFF

The engine generator is off.

The engine generator is disconnected from the engine.

ENGINE GENERATOR IN OPERATION

GEN 1(2)(3)(4) In Operation



GENERATOR CONTACTOR

△ The engine generator is connected to the electrical network.
Does not appear, if the generator is disconnected from the electrical network.

GEN 1 INDICATION

Normal operation.

The engine generator is off, failed, or the assigned engine is not running.

No information from the engine generator is available.

GENERATOR LOAD

L12

The engine generator load is normal.
The load is normal, when it is less than 108 %.

L12

There is an overload on the engine generator.
The load is greater than 108 % for more than 10 s.

GENERATOR VOLTAGE

L12

The engine generator voltage is normal.
The voltage is normal between 110 V and 120 V.

The engine generator voltage is abnormal.

OVHT INDICATION

L13

The engine generator overheats.
The temperature is above 185 °C.

AC 1(2)(3)(4)(EMER)

The AC busbar is powered.

The AC busbar is not powered.

TR 1(2)(APU)(ESS)

The TR is powered.

The TR is failed, or is not powered.

RAT

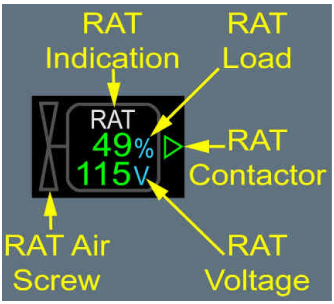
The RAT indications on the SD differ, when the RAT is:
- On standby, or
- In operation.

RAT ON STANDBY

The RAT is on standby.

RAT IN OPERATION

RAT In Operation



RAT INDICATION

Normal operation.

The RAT is failed.

RAT LOAD

L12

The RAT load is normal.
The load is normal, when it is less than 108 %.

L12

There is an overload on the RAT.
The load is greater than 108 % for more than 10 s.

RAT CONTACTOR

The RAT is connected to the emergency network.

The RAT contactor is failed.

RAT VOLTAGE

L12

The RAT voltage is normal.
The voltage is normal between 110 V and 120 V.

The RAT voltage is abnormal.

RAT AIR SCREW

The RAT is deployed.

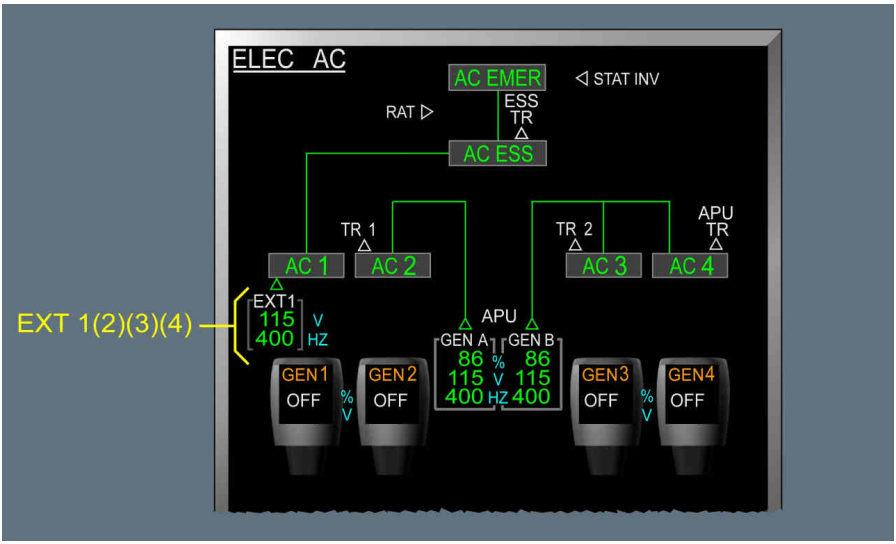
The RAT is still stowed, but should be deployed.

ELEC AC SYSTEM DISPLAY: ON-GROUND CONFIGURATION

Applicable to: ALL

ELEC AC SYSTEM DISPLAY: ON-GROUND CONFIGURATION

ELEC AC System Display: On-Ground Configuration



EXT 1(2)(3)(4) INDICATION

The external power unit indications on the SD differ, when the external power unit is:

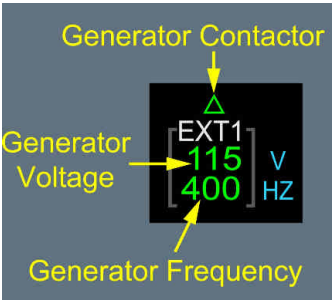
- Not available: Not connected to the aircraft, or
- Available on standby: Connected to the aircraft and does not supply the electrical network, or
- In operation: Supplies the electrical network.

EXTERNAL POWER UNIT NOT AVAILABLE

The aircraft is on ground and the external power is not connected to the aircraft.

EXTERNAL POWER UNIT AVAILABLE OR IN OPERATION

External Power Unit In Operation



GENERATOR CONTACTOR

The external power unit supplies the electrical network.

The external power unit is not supplying the electrical network.

GENERATOR VOLTAGE

L12

115 V — The external power unit voltage is normal.
The voltage is normal between 110 V and 120 V.

108 V — The external power unit voltage is abnormal.

GENERATOR FREQUENCY

L12

400 HZ — The external power unit frequency is normal.
The frequency is normal between 390 Hz and 410 Hz.

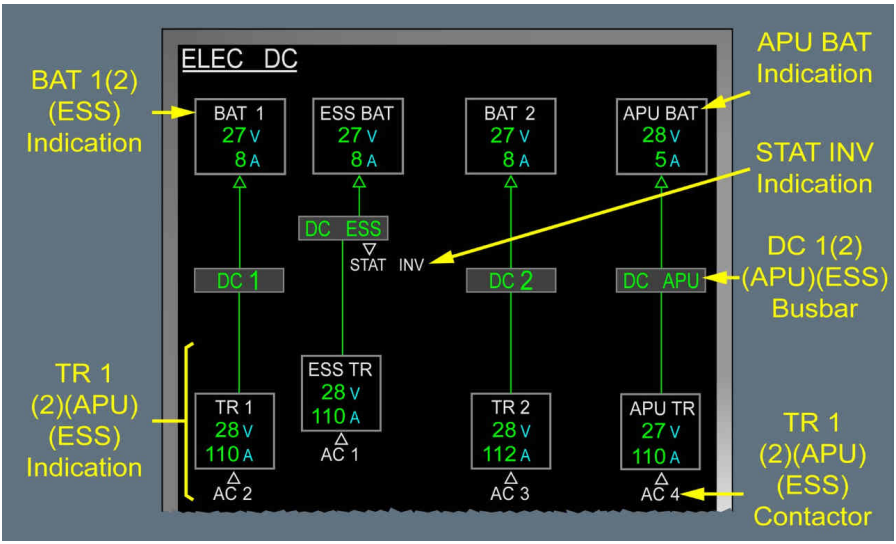
415 HZ — The external power unit frequency is abnormal.

ELEC DC SYSTEM DISPLAY

Applicable to: ALL

ELEC DC SYSTEM DISPLAY

ELEC DC System Display



STAT INV INDICATIONS

The static inverter is available.

The static inverter is failed.

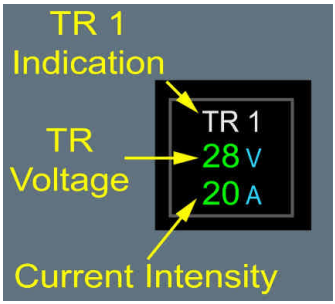
DC (1)(2)(APU)

The DC busbar is powered.

he DC busbar is not powered.

TR 1(2)(APU)(ESS) INDICATION

TR 1



TR 1 INDICATION

The TR is powered.

The TR is not powered, or failed.

TR VOLTAGE

L12

The TR voltage is normal.
The voltage is normal between 27 V and 32 V.

The TR voltage is abnormal.

CURRENT INTENSITY

L12

The intensity of the current is normal.
The intensity of the current is normal, when greater than, or equal to, 2 A.

The intensity of the current is abnormal.

TR 1(2)(APU)(ESS) CONTACTOR

The busbar supplies its assigned TR.

The busbar does not supply its assigned TR.

BAT1(2)(ESS) INDICATIONS

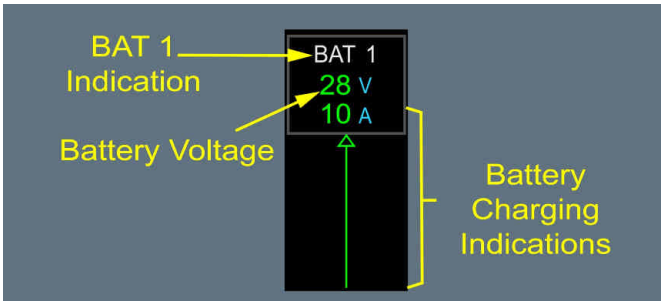
The battery indications on the SD differ, when the battery is:
- Off, or
- In operation.

BATTERY OFF

The battery is off.

BATTERY IN OPERATION

BAT 1 In Operation

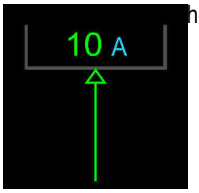


BAT 1 INDICATION

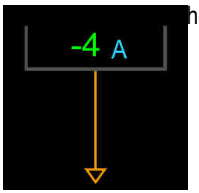
Normal operation.

The battery is off, or is failed.

BATTERY CHARGING INDICATIONS

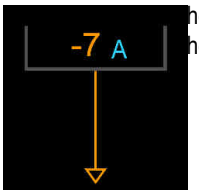


he battery is charging: The intensity of the current is normal.

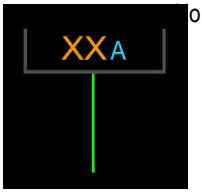


he battery is discharging: The intensity of the current is normal.

L12



he battery is discharging: The intensity of the current is abnormal.
he intensity of the current is abnormal, when it is less than –5 A.



o information from the battery charging is available.

BATTERY VOLTAGE

The battery voltage is normal.

L12

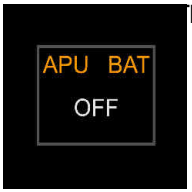
The battery voltage is abnormal.

The voltage is abnormal, if:
- It is less than, or equal to, 25 V, and current intensity is greater than 0 A, or
- It is less than 20 V.

APU BAT INDICATIONS

The APU battery indications on the SD differ, when the battery is:
- Off, or
- In Operation.

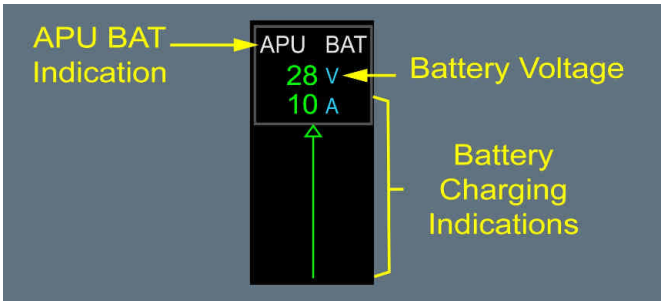
APU BAT OFF



The APU BAT pb-sw is set to OFF.

APU BAT IN OPERATION

APU Battery In Operation



APU BAT INDICATION

The APU battery operates normally.

The APU BAT pb-sw is set to OFF, or the APU battery is failed.

BATTERY VOLTAGE

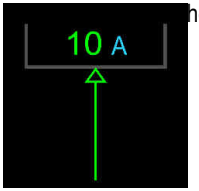
The APU battery voltage is normal.

L12

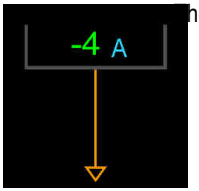
The APU battery voltage is abnormal.

The battery voltage is abnormal, if:
- It is less than, or equal to, 25 V and
- The APU is not in the starting sequence.

APU BATTERY CHARGING INDICATIONS

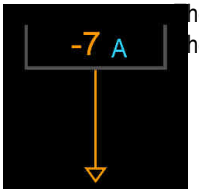


The APU battery is charging with a normal intensity of the current.

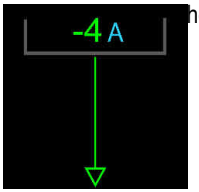


The APU battery is discharging with a normal intensity of the current.

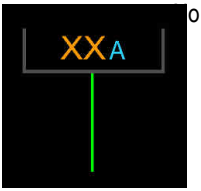
L12



The APU battery discharging with an abnormal intensity of the current.
The intensity of the current is abnormal when less than –5 A.



The APU battery is discharging to start the APU.



o information from the APU battery charging is available.

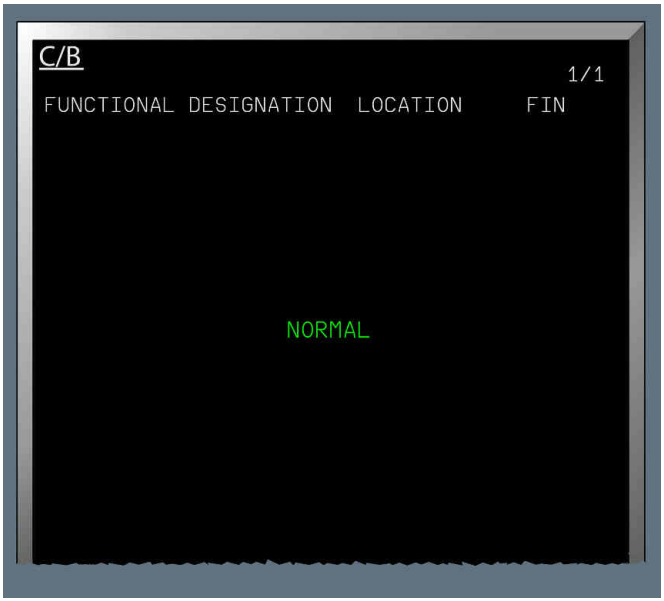
C/B ECAM PAGE

Applicable to: ALL

The indications on the C/B SD differ, when:
- No C/B is tripped, or
- At least one C/B is tripped.

NO C/B TRIPPED

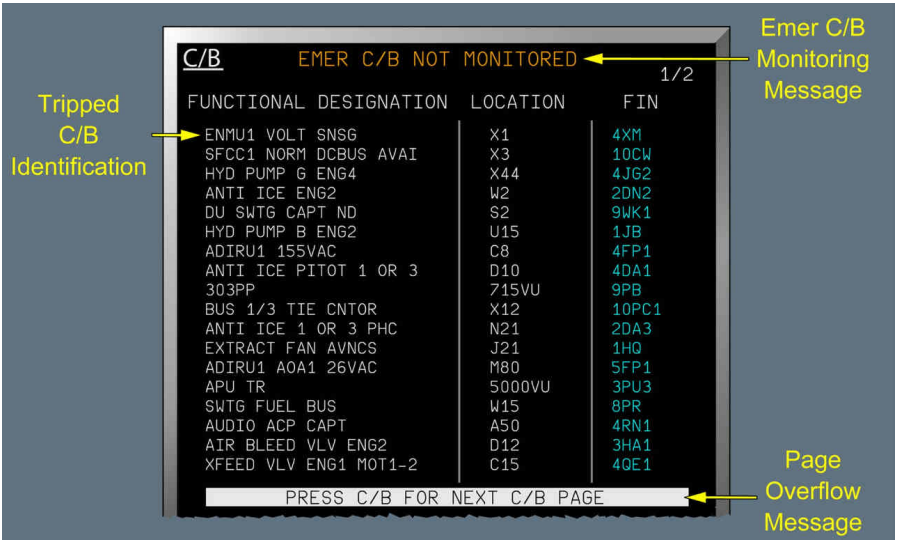
No C/B Tripped



The NORMAL indication is replaced by the NOT AVAIL indication, when the C/B monitoring function is lost.

AT LEAST ONE C/B TRIPPED

When at least one C/B is tripped



TRIPPED C/B IDENTIFICATION

The last tripped C/B is displayed at the top of the tripped C/B list.
The location and the Functional Identification Number (FIN) of the tripped C/B is for maintenance purposes only.

EMERGENCY C/B MONITORING MESSAGE

This message only appears, when the emergency C/B monitoring function is lost: The tripped C/B on the electrical emergency network can no longer be displayed on the C/B SD.

PAGE OVERFLOW MESSAGE

This message only appears, when there are more than 18 tripped C/Bs. The remaining tripped C/B appear, when the flight crew presses the C/B key on the ECAM control panel.

L3 A maximum of two pages is available.

MAINTENANCE ELEC PANEL

Applicable to: ALL

MAINTENANCE ELEC PANEL

Normal operation.

The remote C/B controller is ON, and can be displayed on the OIT. This controller is for maintenance purposes only.

MEMO

Applicable to: ALL

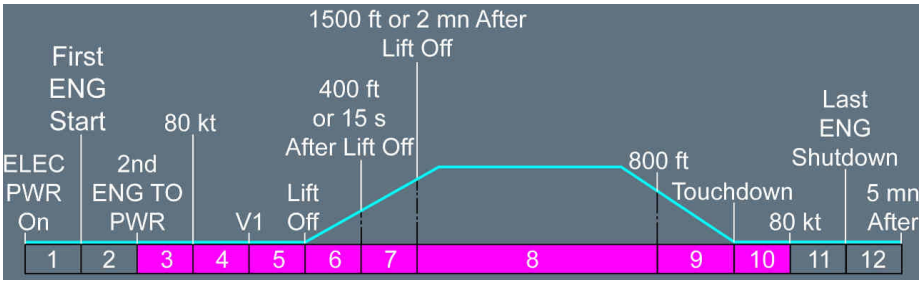
COMMERCIAL PART SHED

Commercial loads are partially shed. This MEMO is displayed in the following cases:

- Automatic load shedding by the ELMU (*Refer to DSC-24-10-60 Electrical Network Management and Load Shedding*).
- Manual load shedding by the COMMERCIAL 1(2) pb is set to OFF.

L2 Flight Phase Inhibition:

Flight Phase Inhibition

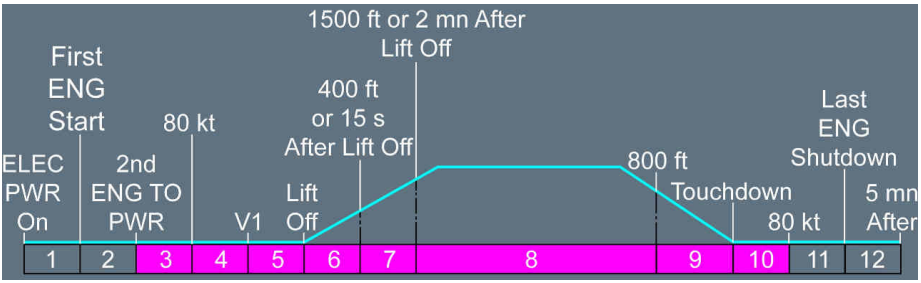


ELEC EXT PWR

At least one external power unit is connected to the electrical network, and two or more engines are running.

L2 Flight Phase Inhibition:

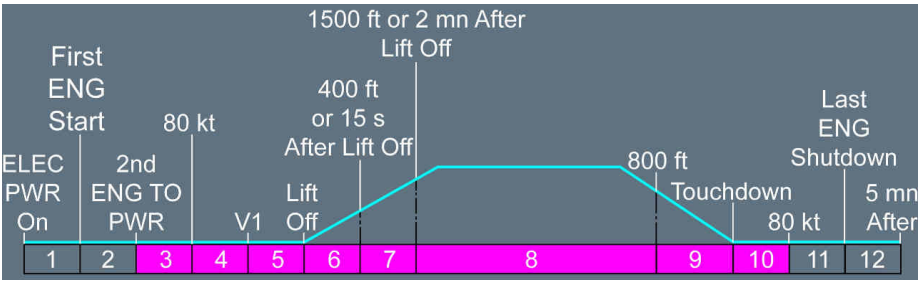
Flight Phase Inhibition



ELEC EXT PWR — At least one external power unit is connected to the electrical network, and one or no engine is running.

L2 Flight Phase Inhibition:

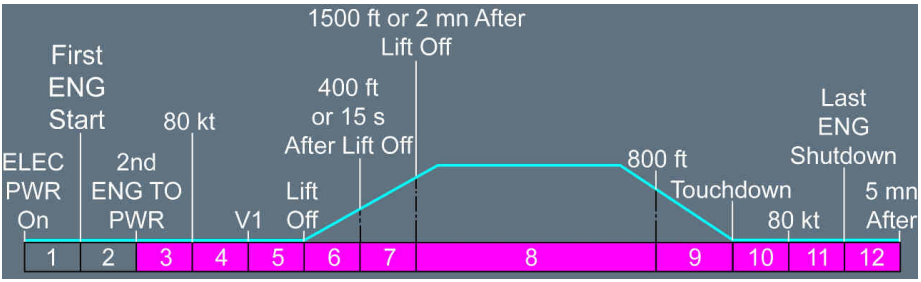
Flight Phase Inhibition



RAT OUT — The RAT is deployed, and the aircraft is on ground.

L2 Flight Phase Inhibition:

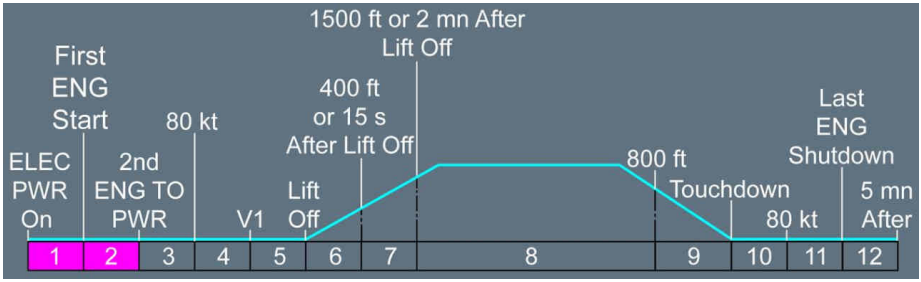
Flight Phase Inhibition



RAT OUT — The RAT is deployed, and the aircraft is in flight.

L2 Flight Phase Inhibition:

Flight Phase Inhibition

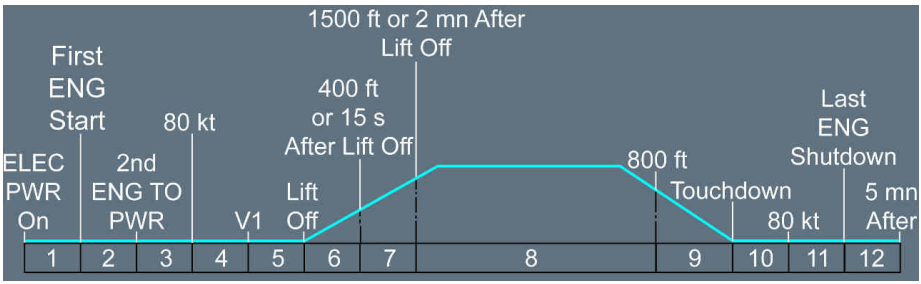


L13

REMOTE C/B CTL ON — The remote C/B controller is still ON . This controller is for maintenance purposes only.
Refer to DSC-24-10-60 Electrical Network Management and Load Shedding

L2 Flight Phase Inhibition:

Flight Phase Inhibition



OVERVIEW

Applicable to: ALL

In normal operation, and before all engines are started, the electrical network automatically reconfigures to supply as many busbars as possible.
This reconfiguration takes generator availability into account, and occurs according to priority rules.
Any two generators can supply the entire electrical network: Each generator can supply up to two AC busbars.

L2 Each AC busbar is supplied, in the following order of priority, by:

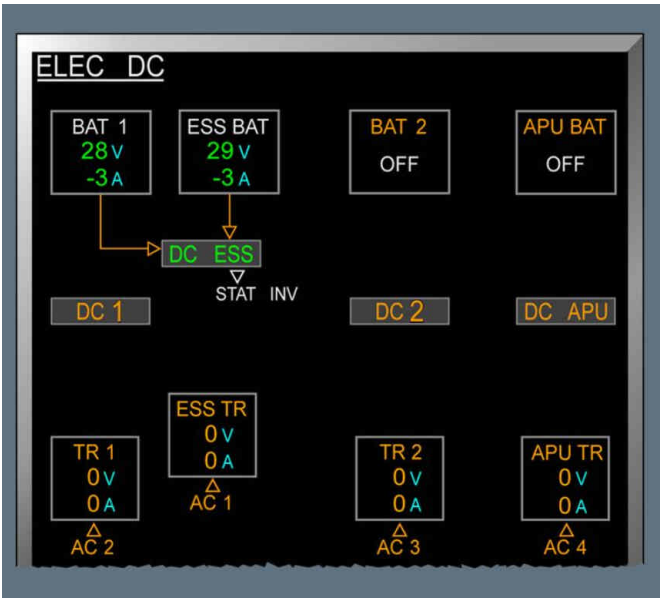
- Its assigned engine generator
- Its assigned external power unit
- The APU generator on the same side
- The APU generator on the other side
- The other engine generator on the same side
- The other external power unit on the same side
- Its symmetrical engine generator on the opposite side.
- Its symmetrical external power unit on the opposite side.

ON GROUND BATTERIES ONLY

Applicable to: ALL

Each DC ESS busbar is supplied by BAT ESS and BAT 1.

Batteries Only-ELEC DC



The DC ESS busbar powers the AC EMER busbar, via the static inverter.

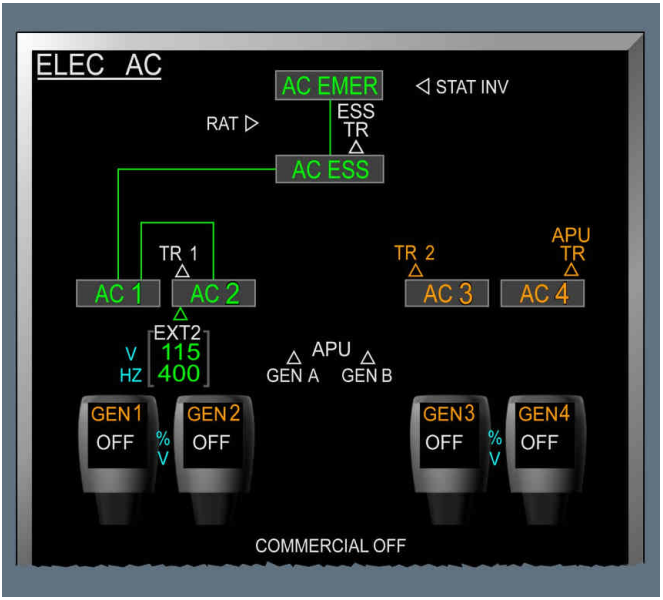
Batteries Only-ELEC AC

ON GROUND ONE EXTERNAL POWER UNIT

Applicable to: ALL

The external power unit (e.g. EXT 2) supplies its assigned busbar, and the other busbar on the same side.

EXT 2

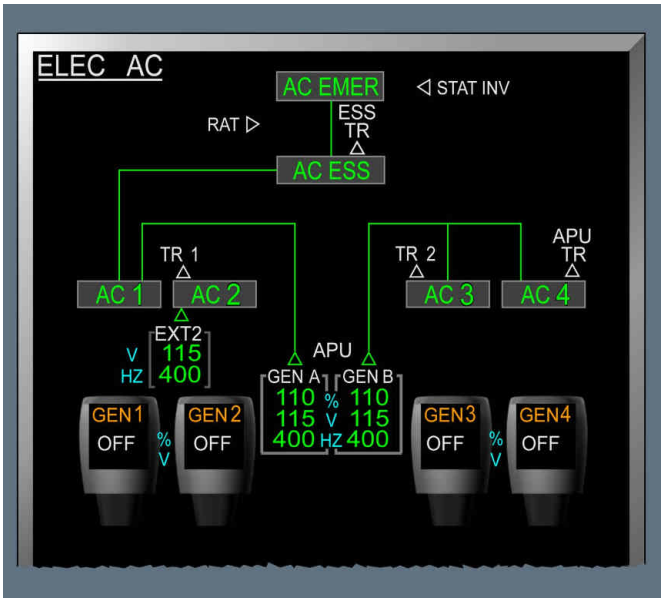


ON GROUND ONE EXTERNAL POWER UNIT, AND APU RUNNING

Applicable to: ALL

The external power unit supplies its assigned busbar.
The other AC busbars are supplied by the APU generator that is on their same side.

EXT 1 and APU

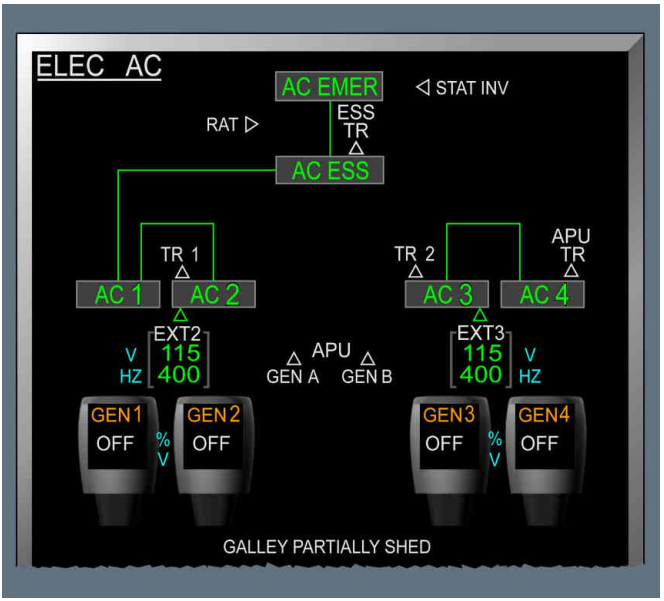


ON GROUND TWO EXTERNAL POWER UNITS

Applicable to: ALL

Each external power unit (e.g. EXT 2 and EXT 3) supplies the AC busbars on the same side.

EXT 2 and EXT 3

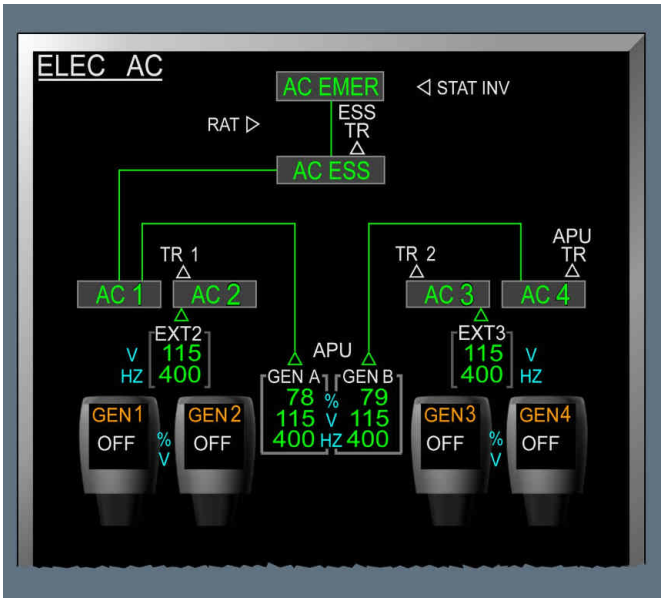


ON GROUND, TWO EXTERNAL POWER UNITS, AND APU RUNNING

Applicable to: ALL

The two external power units supply their assigned AC busbars.
The other two AC busbars are supplied by the APU generator that is on their same side.

EXT 2, EXT 3, and APU



Note: *APU GEN A (resp. APU GEN B) is available to supply the AC 2 (resp. AC 3) busbar. However, APU GEN A (resp. APU GEN B) is not connected to the AC 2 (resp. AC 3) busbar because EXT 2 and EXT 3 have priority on their assigned busbars.*

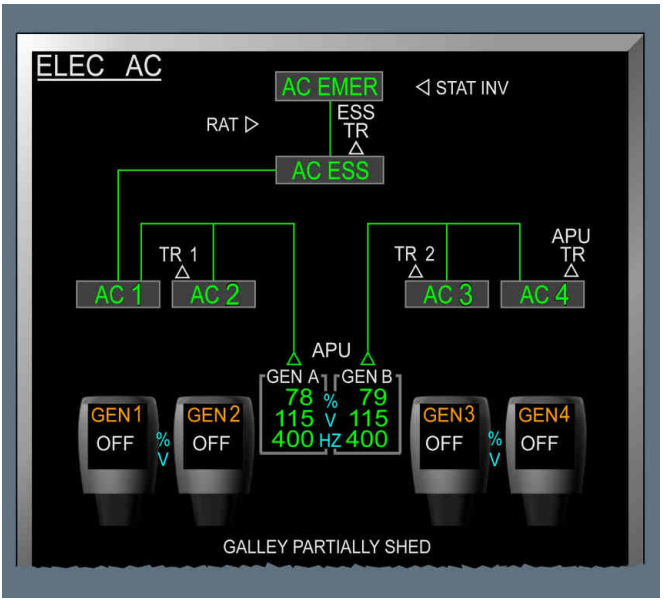
ON GROUND APU RUNNING

Applicable to: ALL

Each APU generator supplies the AC busbars on its same side:

- APU GEN A supplies the AC 1 and AC 2 busbars
- APU GEN B supplies the AC 3 and AC 4 busbars.

APU

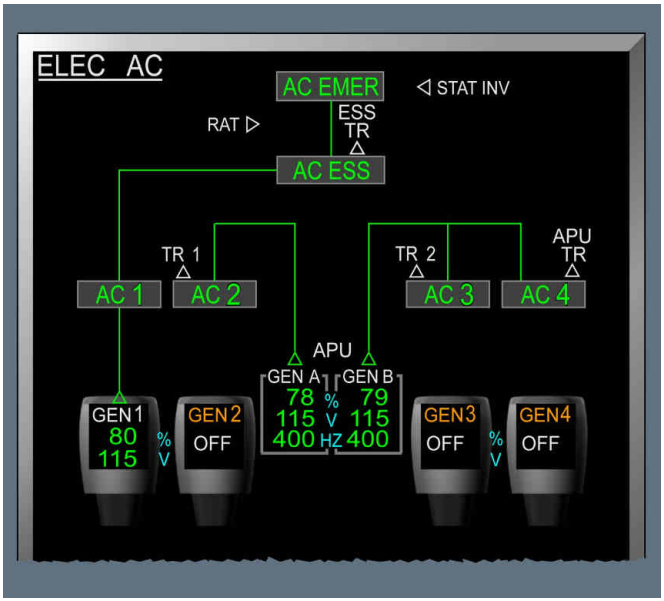


ON GROUND ONE ENGINE, AND APU RUNNING

Applicable to: ALL

The engine generator supplies its assigned AC busbar.
The APU generators supply the other three AC busbars.

APU and GEN 1

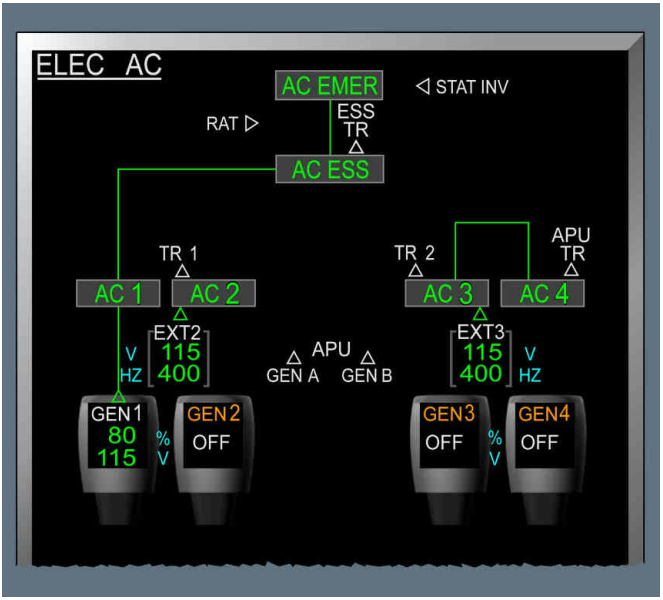


ON GROUND TWO EXTERNAL POWER UNITS, AND ONE ENGINE RUNNING

Applicable to: ALL

GEN 1 and EXT 2 supply their assigned AC busbar. EXT 3 supplies the two busbars on the same side.

EXT 2, EXT 3 and GEN 1



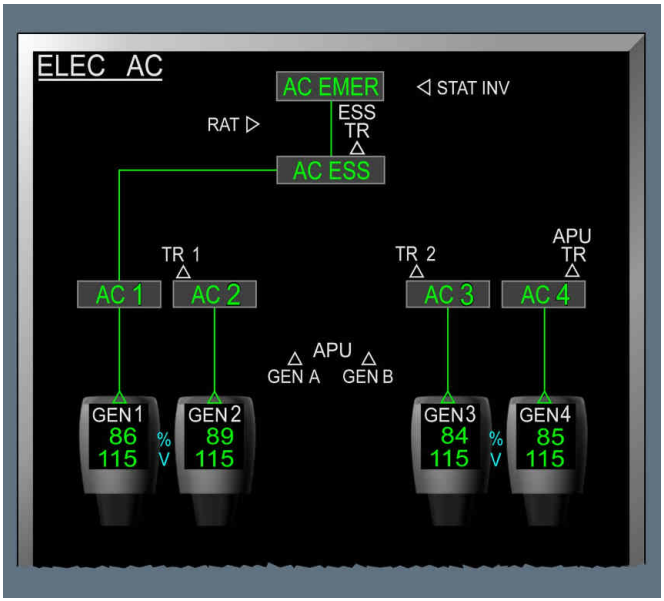
ALL ENGINES RUNNING

Applicable to: ALL

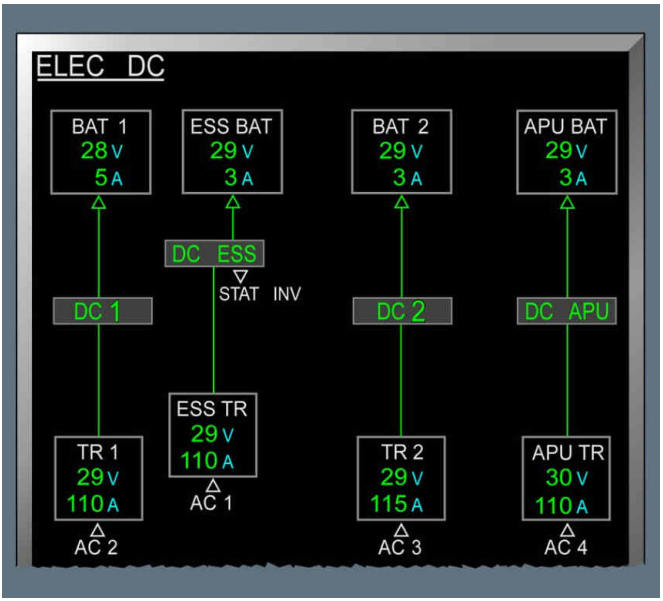
Each engine generator supplies its assigned AC busbar. The AC busbars then supply power, as follows:

- The AC 1 busbar supplies the AC ESS busbar.
  The AC ESS busbar supplies the AC EMER busbar and the ESS TR.
  ESS TR supplies the DC ESS busbar.
- The AC 2 busbar supplies TR 1.
  TR 1 supplies the DC 1 busbar.
- The AC 3 busbar supplies TR 2.
  TR 2 supplies the DC 2 busbar.
- The AC 4 busbar supplies APU TR.
  APU TR supplies the DC APU busbar.

In Flight-ELEC AC



In Flight-ELEC DC



RECONFIGURATIONS OVERVIEW

Applicable to: ALL

In any abnormal electrical configuration (e.g. failure of one or more engine generators, TR failure), the electrical network automatically reconfigures to ensure that the remaining power sources continue to supply as many busbars as possible.
Any two electrical generators can supply the entire electrical network: Each generator can supply up to two AC busbars.

FAILURE OF SOME ENGINE/APU GENERATORS

Each AC busbar will be supplied, in the following order of priority, by:

- The APU generators

L2 Priority is first given to the APU generator on the same side, then to the APU generator on the other side.

L1 - The other engine generators

L2 On ground, priority is first given to the engine generator on the same side, then to the engine generator that is symmetrically-opposite.

L1 *Note: All DC busbars continue to be supplied, provided that at least one generator is available.*

FAILURE OF ALL ENGINE/APU GENERATORS

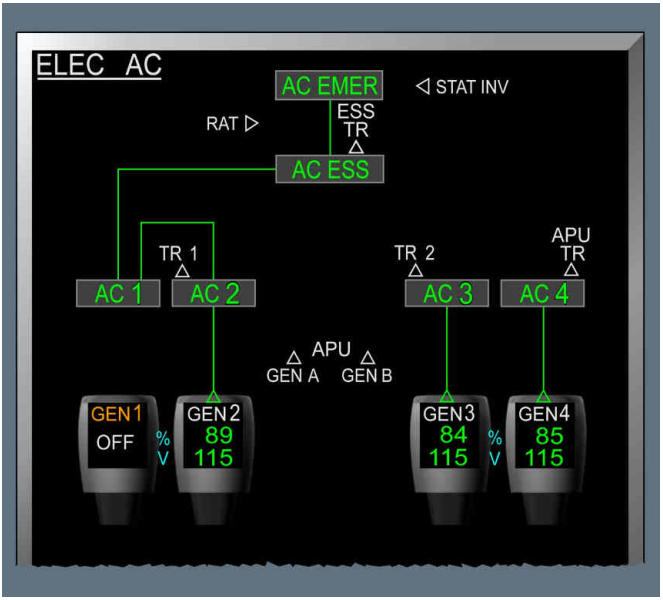
The RAT will supply the emergency network.

FAILURE OF ONE ENGINE GENERATOR, AND APU NOT RUNNING

Applicable to: ALL

If one engine generator fails, the other engine generator on the same side will take over.

GEN 1 Failure, with APU Not Running

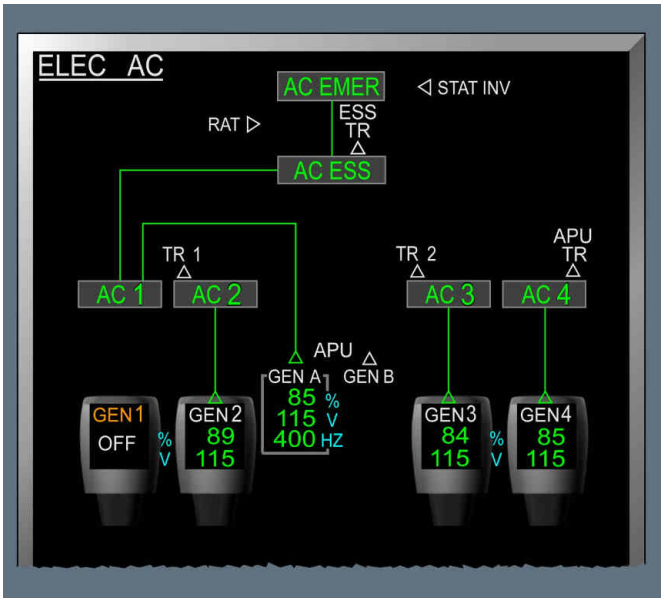


FAILURE OF ONE ENGINE GENERATOR, AND APU RUNNING

Applicable to: ALL

If one engine generator fails, the APU generator on the same side will take over.

Failure of GEN 1, and APU Running



FAILURE OF TWO ENGINE GENERATORS

Applicable to: ALL

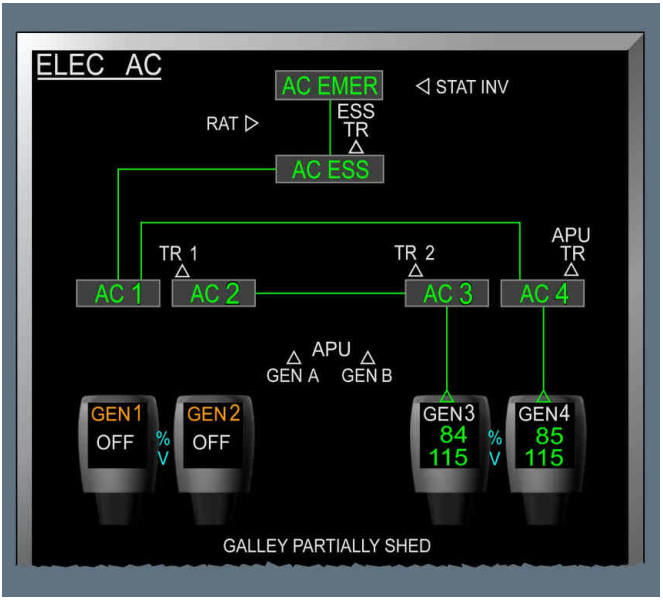
FAILURE OF TWO ENGINE GENERATORS ON THE SAME SIDE, AND APU NOT RUNNING

If two engine generators fail on one side:

- The outer-engine generator on the other side will supply both AC 1 and AC 4 busbars.
- The inner-engine generator on the other side will supply both AC 2 and AC 3 busbars.

In such a case, some of the commercial loads may be automatically shed, depending on the electrical demand.

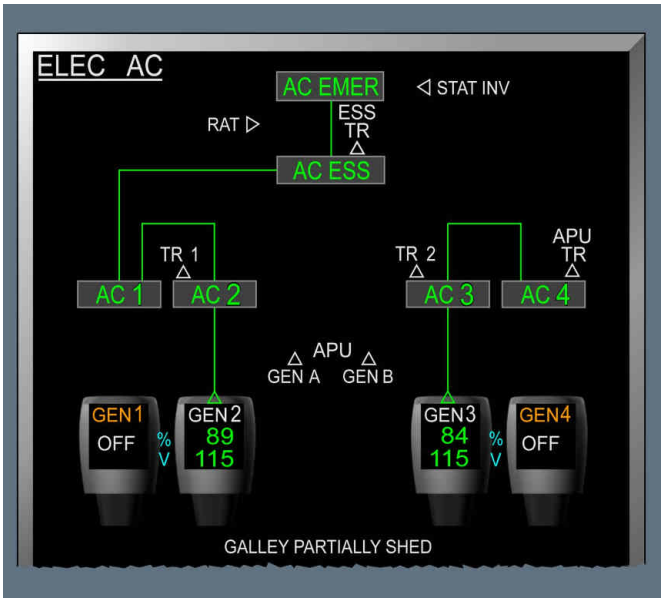
GEN 1 and GEN 2 Failure, and APU not Running



FAILURE OF ONE ENGINE GENERATOR ON EACH SIDE, AND APU NOT RUNNING

If one engine generator fails on each side, the other available generator on each side will take over, and supply both AC busbars on the corresponding side.
In this case, some of the commercial loads may be automatically shed, depending on the electrical demand.

Failure of GEN 1 and GEN 4, and APU not Running



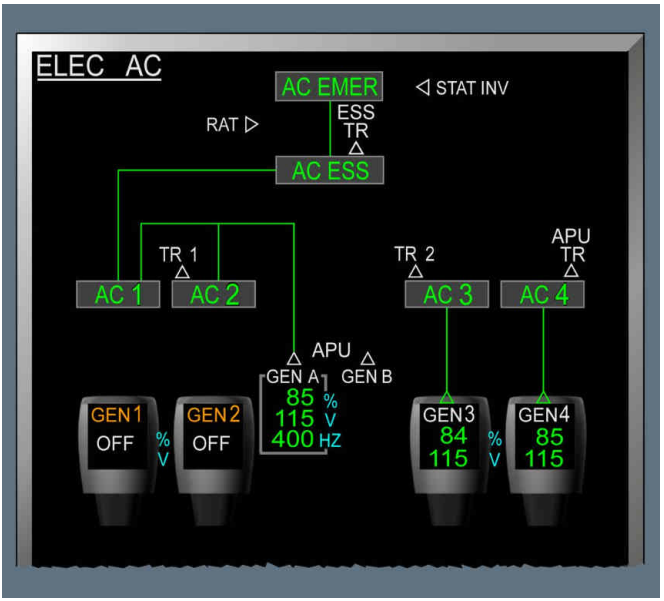
FAILURE OF TWO ENGINE GENERATORS, AND APU RUNNING

Applicable to: ALL

FAILURE OF TWO ENGINE GENERATORS ON THE SAME SIDE, AND APU RUNNING

If two engine generators fail on the same side, then the APU generator on the same side will supply the two affected busbars.

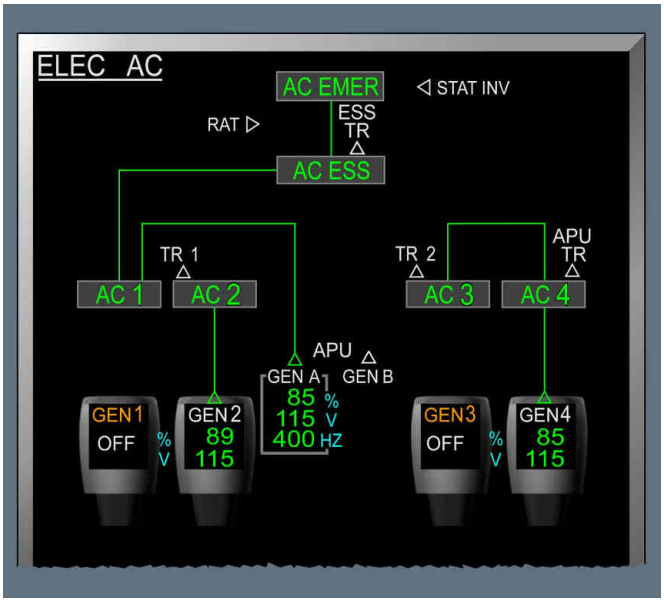
Failure of GEN 1 and GEN 2, and APU Running



FAILURE OF TWO ENGINE GENERATORS ON OPPOSITE SIDES, AND APU RUNNING

If one engine generator fails on each side, then the APU generator on each side will supply the affected busbar on its corresponding side.

Failure of GEN 1 and GEN 3, and APU Running



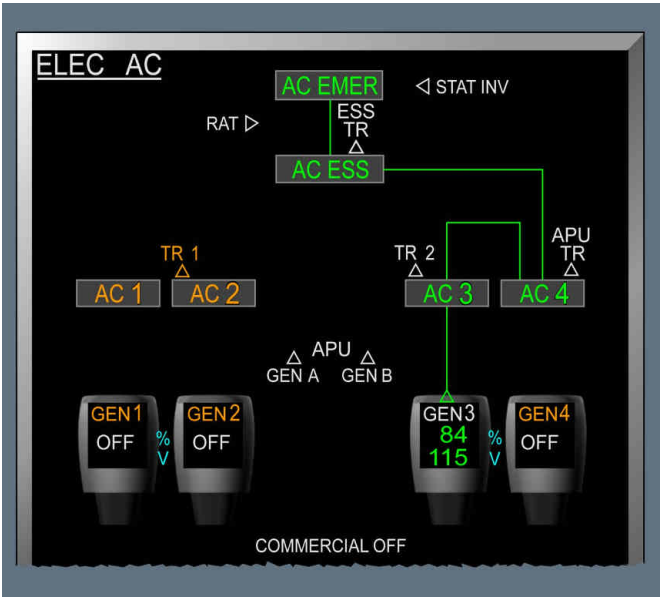
FAILURE OF THREE ENGINE GENERATORS, AND APU NOT RUNNING

Applicable to: ALL

If three engine generators fail, and the APU generators are not running, then the last available engine generator will supply only the two busbars on its same side.
In this case, some of the commercial loads may be automatically shed, depending on the electrical demand.

Note: *Emergency busbars are supplied, either via the AC 1 busbar, or via the AC 4 busbar, depending on which side is supplied.*

GEN 1, GEN 2 and GEN 3 Failure, APU not Running

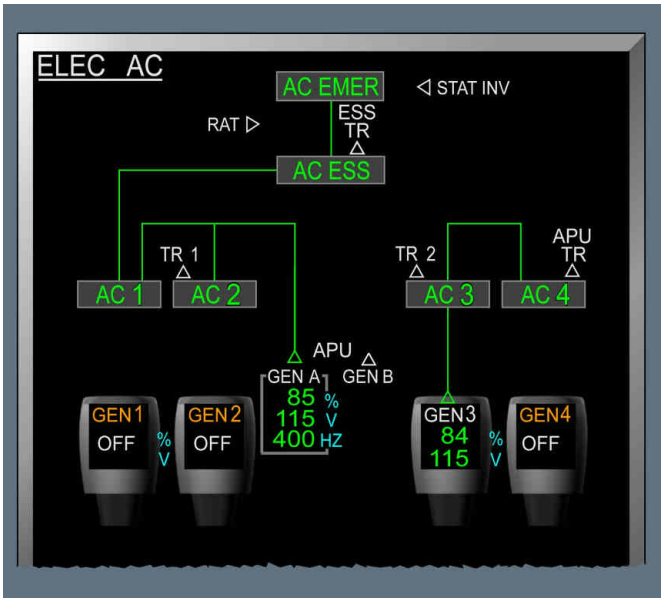


FAILURE OF THREE ENGINE GENERATORS, AND APU RUNNING

Applicable to: ALL

If three engine generators fail, the APU generators will automatically take over.

Failure of GEN 1, GEN 2 and GEN 4, and APU Running

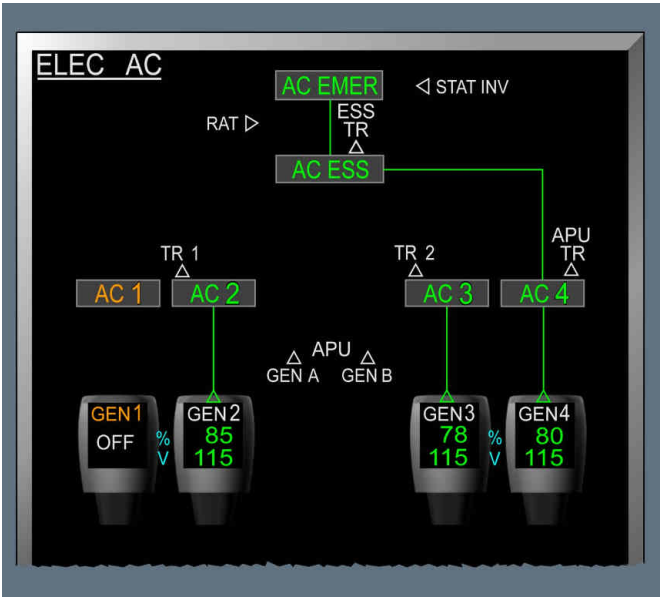


FAILURE OF THE AC 1 BUSBAR

Applicable to: ALL

If the AC 1 busbar is lost, it cannot be recovered.
In this case, the AC 4 busbar will supply the AC ESS and AC EMER busbars.

Failure of the AC 1 Busbar



FAILURE OF THE AC ESS BUSBAR

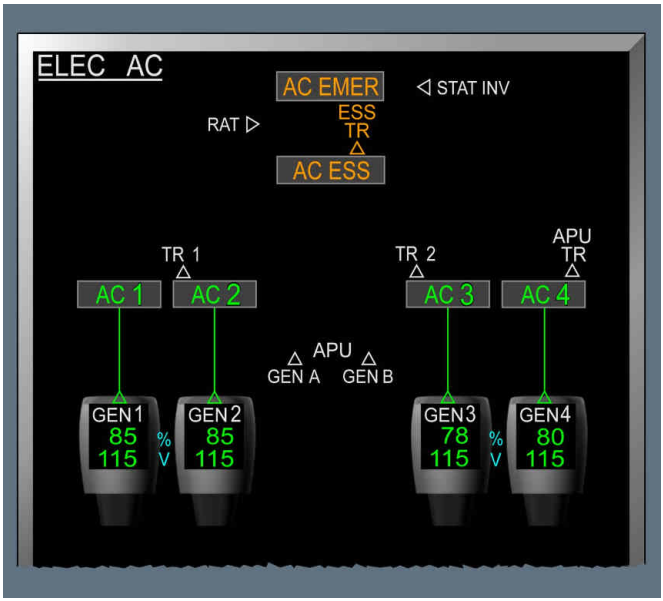
Applicable to: ALL

If the AC ESS busbar is lost, it cannot be recovered.

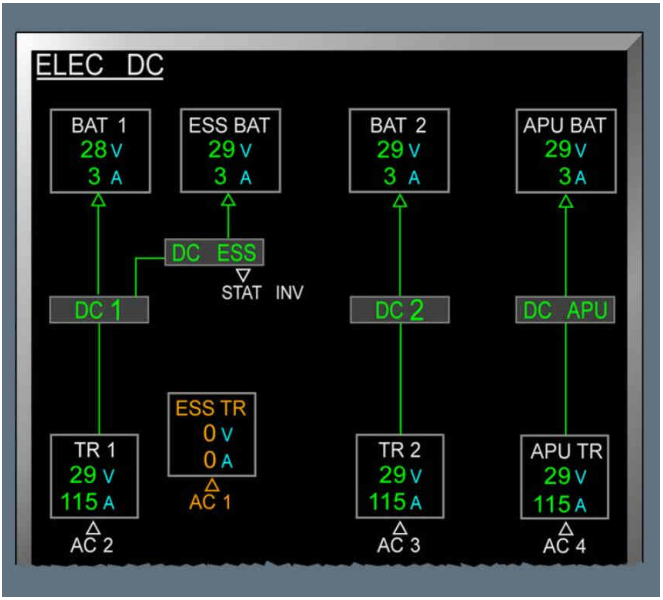
In this case:

- AC EMER and AC ESS will be lost.
- The DC 1 busbar will supply the DC ESS busbar.

ELEC AC Page-Failure of the AC ESS Busbar



ELEC DC Page-Failure of the AC ESS Busbar

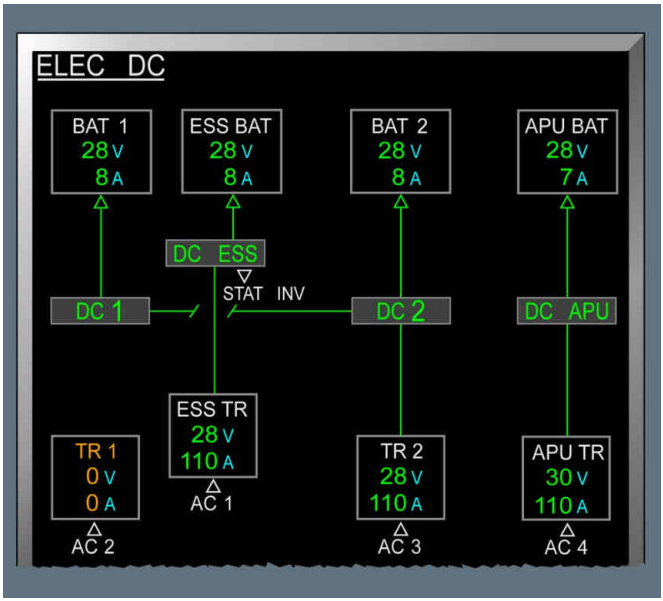


TR 1 FAILURE

Applicable to: ALL

If TR 1 fails, TR 2 will supply the DC 1 and DC 2 busbars.

TR 1 Failure

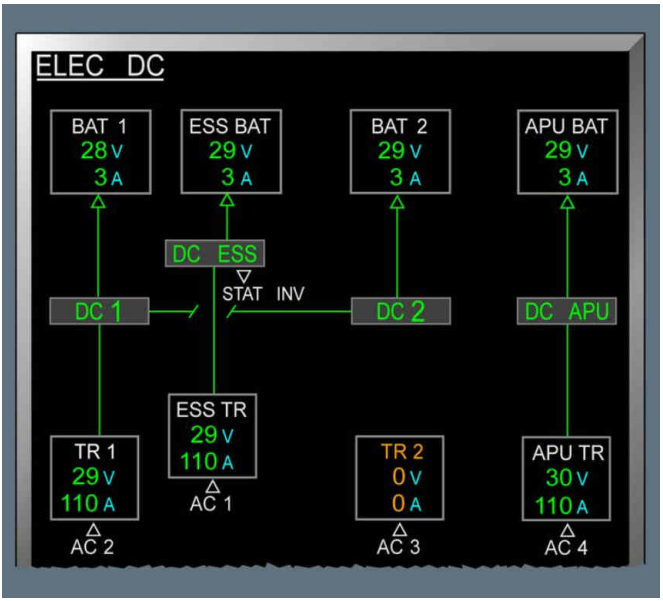


TR 2 FAILURE

Applicable to: ALL

If TR 2 fails, TR 1 will supply the DC 1 and DC 2 busbars.

TR 2A Failure

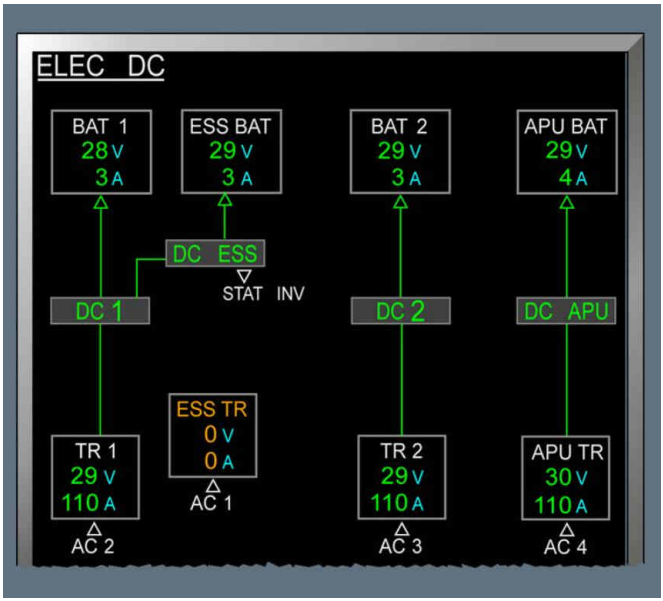


ESS TR FAILURE

Applicable to: ALL

If TR ESS fails, TR 1 will supply the DC 1 and DC ESS busbars.

ESS TR Failure

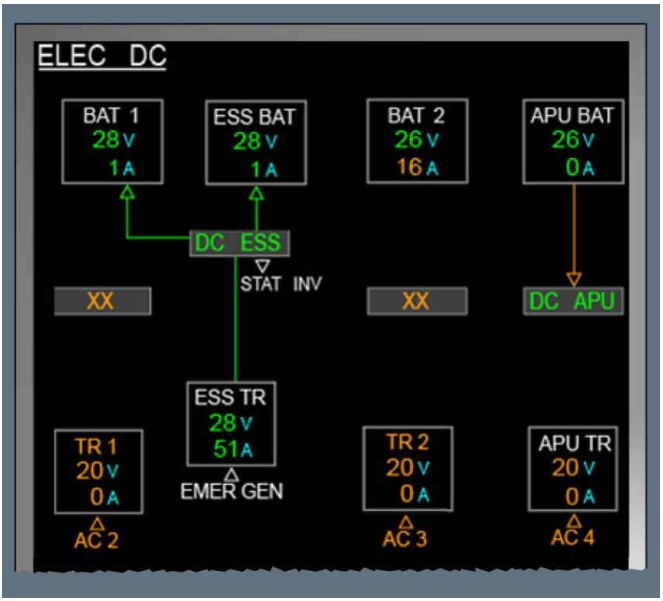


EMERGENCY ELECTRICAL CONFIGURATION

Applicable to: ALL

In the event that AC 1, AC 2, AC 3 and AC 4 busbars are lost, the RAT will automatically extend to power the AC ESS and AC EMER busbars, and the ESS TR . The ESS TR then supplies the DC ESS busbar.

Emergency Generation- ELEC DC



Emergency Generation- ELEC AC

OVERVIEW

Applicable to: ALL

The equipment in the cockpit ensures that both the Captain and the First Officer can monitor the instruments, and the systems necessary to operate the aircraft.

Most system controls are located on:
- The pedestal
- The front panels (main instrument panel and glareshield)
- The overhead panel.

There are three seats at the rear of the cockpit for three additional occupants.

INDICATIONS AND POSITIONS OF THE PUSHBUTTONS

Applicable to: ALL

The pushbutton switches have several positions and indications, that correspond to the configurations of the aircraft.
The pushbuttons have only one position (they do not remain pressed in), and their indications correspond to the configurations of the aircraft.

Indications have the following color code:

- For warnings:
  - Red: Indicates a failure that requires immediate action, e.g. 

.
- For cautions:
  - Amber: Indicates a configuration, or a failure that the flight crew should be aware of, but that does not require immediate action, e.g. 

.
    However, when time and situations permit, these cautions should be considered without delay, to prevent any further degradation of the affected system.
- For indications:
  - Green: Indicates that the corresponding system is in normal operation, e.g. 

.
  - Cyan: Indicates that the corresponding system is in normal operation, and used temporarily, e.g. 

.
  - White: Indicates that the pushbutton has an abnormal position, e.g. 

.

When the aircraft is in normal configuration, only green lights can be lit permanently , the cyan light can be lit temporarily.
The following table outlines the possible pushbutton switch positions:

Position	Pushbutton switch Indications
Pressed in	ON, AUTO, OVRD
Released out	OFF, MAN

Note: *Two dots on the pushbutton, indicates that this part of the pushbutton is not used to give indications (e.g.* 
).

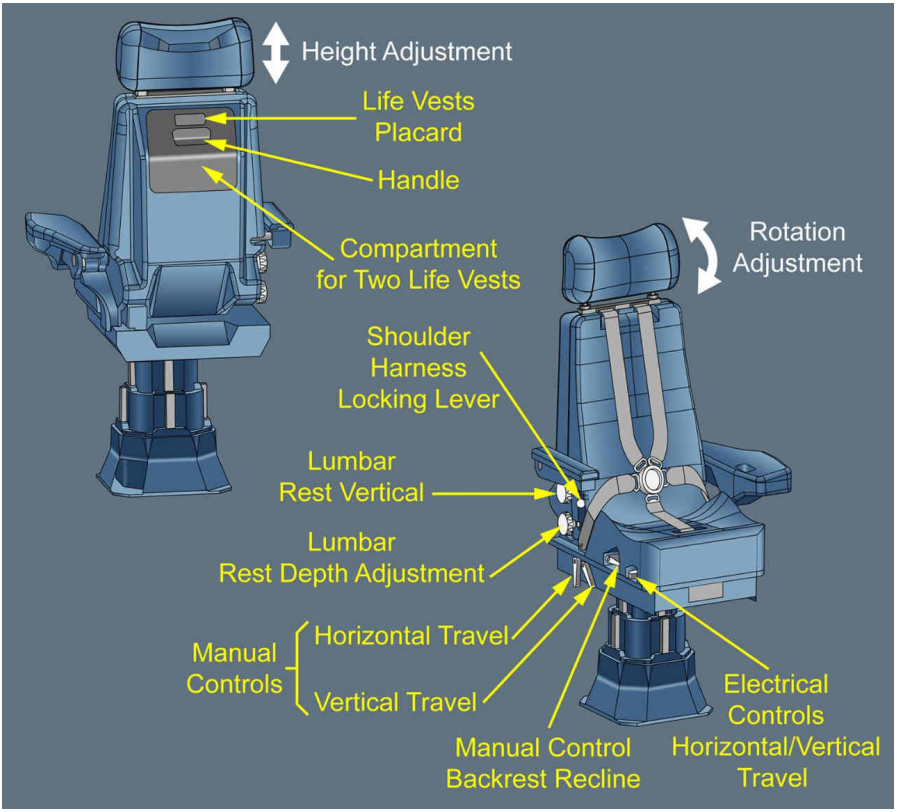
CAPT AND F/O SEATS

Flight Crew Seat



CAPT AND F/O SEAT ADJUSTMENT

The flight crew can adjust his seat electrically by pressing the horizontal or the vertical adjustment electrical switch in the desired direction. As a backup, the flight crew can also adjust its seat mechanically by lifting the horizontal or vertical mechanical control handle.

The flight crew can adjust the depth and the vertical position of the lumbar rest by:
- Pulling the appropriate lumbar rest controller,
- Turning it to adjust the lumbar rest to the desired position, and
- Pushing it to keep the desired position.

HEADREST ADJUSTMENT

The flight crew can:
- Adjust manually the inclination of the headrest
- Adjust manually the height of the headrest.

SHOULDER HARNESS LOCK / UNLOCK POSITION

The flight crew can lock the shoulder harness position, by setting the shoulder harness lever to LOCK.

SIDESTICK ARMREST ADJUSTMENT

The flight crew can adjust the position of the sidestick armrest:
- By turning the pitch knob to adjust the pitch of the sidestick armrest.
- By turning the height knob to adjust the height of the sidestick armrest.

Sidestick Armrest

FIRE AND SMOKE PROTECTION - GENERAL

Applicable to: ALL

The fire and smoke protection system includes:

- Fire and overheat detection for the following aircraft areas:
  - The engines (*Refer to DSC-26-20-10 Engine Fire Protection - General*)
  - The APU (*Refer to DSC-26-30-10 APU Fire Protection - General*)
  - The Main Landing Gear (MLG) bay (*Refer to DSC-26-40-10-10 MLG Fire Protection - Detection*).
- Smoke detection for the following aircraft areas:
  - The avionics bays (*Refer to DSC-26-50-10-10 Avionics Bays Smoke Detection*)
  - The cargo compartments (*Refer to DSC-26-60-10 Cargo Compartments Protection - General*)
  - The cabin areas (*Refer to DSC-26-70-10-10 Crew Rest Compartments Protection - General*).
- Fire extinguishing for the following aircraft areas:
  - The engines (*Refer to DSC-26-20-10 Engine Fire Protection - Extinguishing*)
  - The APU (*Refer to DSC-26-30-10 APU Fire Protection - Extinguishing*)
  - The cargo compartments (*Refer to DSC-26-60-10 Cargo Compartments Fire Extinguishing*)
  - The lower deck Cabin Crew Rest (CCR) compartment (*Refer to DSC-26-70-10-10 Crew Rest Compartments Fire Extinguishing*)
  - The lavatories (*Refer to DSC-26-70-20-10 Waste Bin Fire Extinguishing*).

In addition, the aircraft has portable fire extinguishers in the cockpit (*Refer to DSC-25-10-20 Left Rear Area*) and in the cabin areas (*Refer to CCOM/11-10-30-B Portable Fire Extinguisher General*).

SMOKE DETECTION FUNCTION

Applicable to: ALL

The Smoke Detection Function (SDF) is a part of the Cabin Intercommunication Data System (CIDS) and monitors smoke detection in:

- The avionics bays
- The cargo compartments
- The cabin areas.

It also manages fire extinguishing in the cargo compartments.

FIRE DETECTION UNIT

Applicable to: ALL

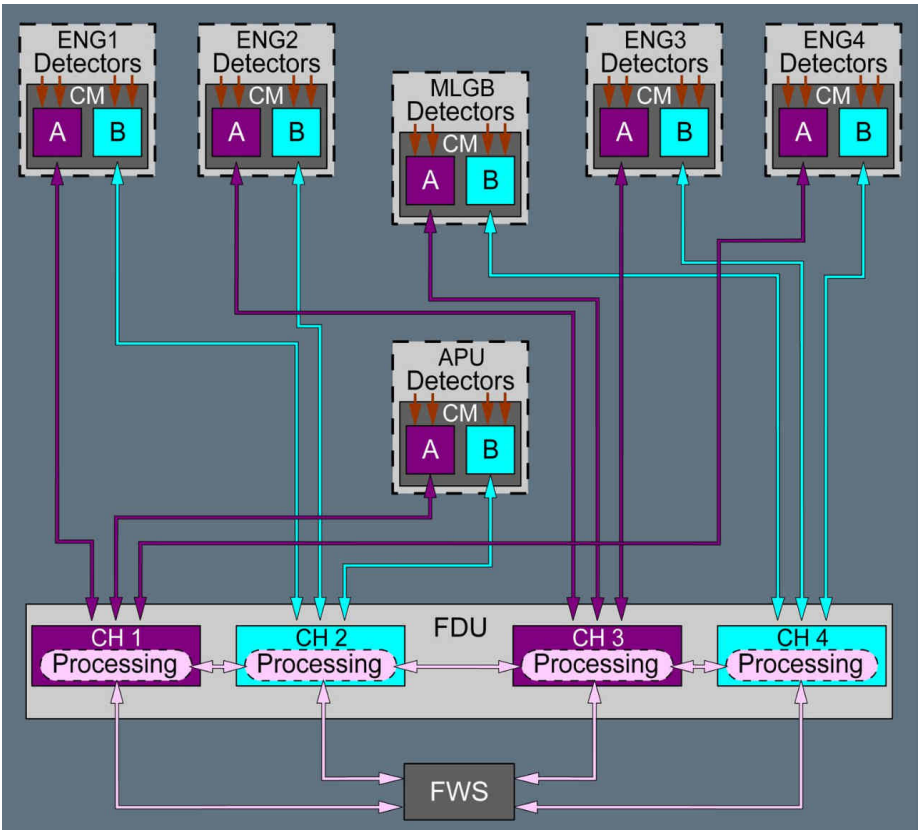
The Fire Detection Unit (FDU) monitors fire detection in:

- The engines
- The APU
- The MLG bay.

It also manages fire extinguishing in:

- The engines
- The APU.

Fire Detection Unit



Intentionally left blank

ECAM ALERTS

Applicable to: ALL

SMOKE DET FAULT (*Refer to Procedure*)

Intentionally left blank

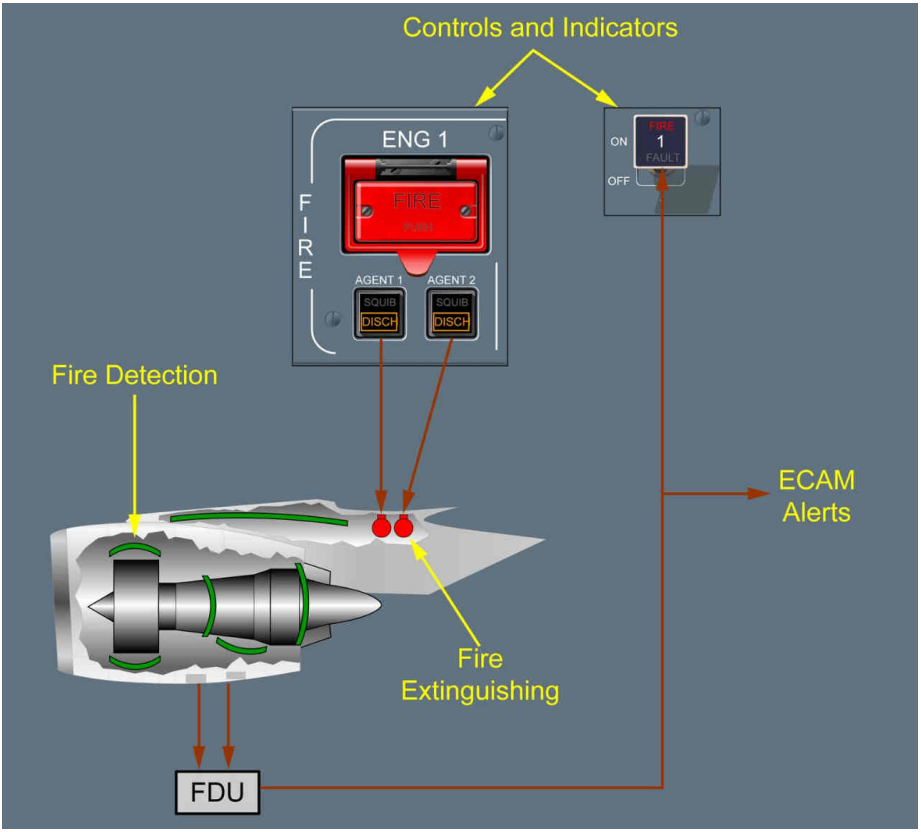
ENGINE FIRE PROTECTION - GENERAL

Applicable to: ALL

Each engine has a fire protection system, with:

- A fire detection system that monitors all sensitive zones
- Two extinguisher bottles that discharge extinguisher agent
- An ENG FIRE panel, with assigned pushbuttons
  These pushbuttons can be used to isolate the applicable engine(s) from the other aircraft systems, and to control fire extinguishing.
- Visual and aural alerts.

Engine Fire Protection



ENGINE FIRE PROTECTION - DETECTION

Applicable to: ALL

FIRE DETECTION

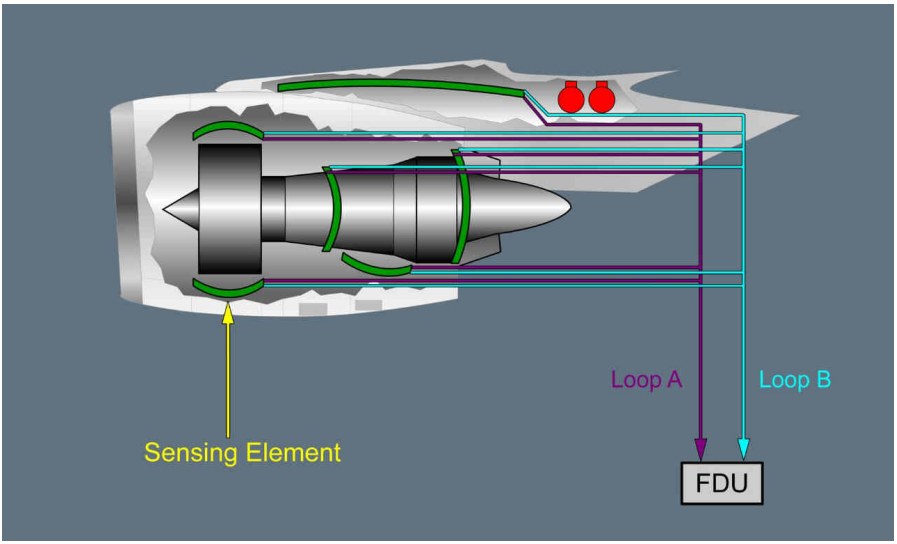
The fire detection system uses two identical loops (A and B) to monitor the sensitive zones.

L2 The sensitive zones of the engines are the:
- Fan compartment
- Intermediate compressor compartment
- Core compartment
- Pylon nacelle.

L3 The above zones are protected, because they are heat sensitive zones in which a fire could potentially start.

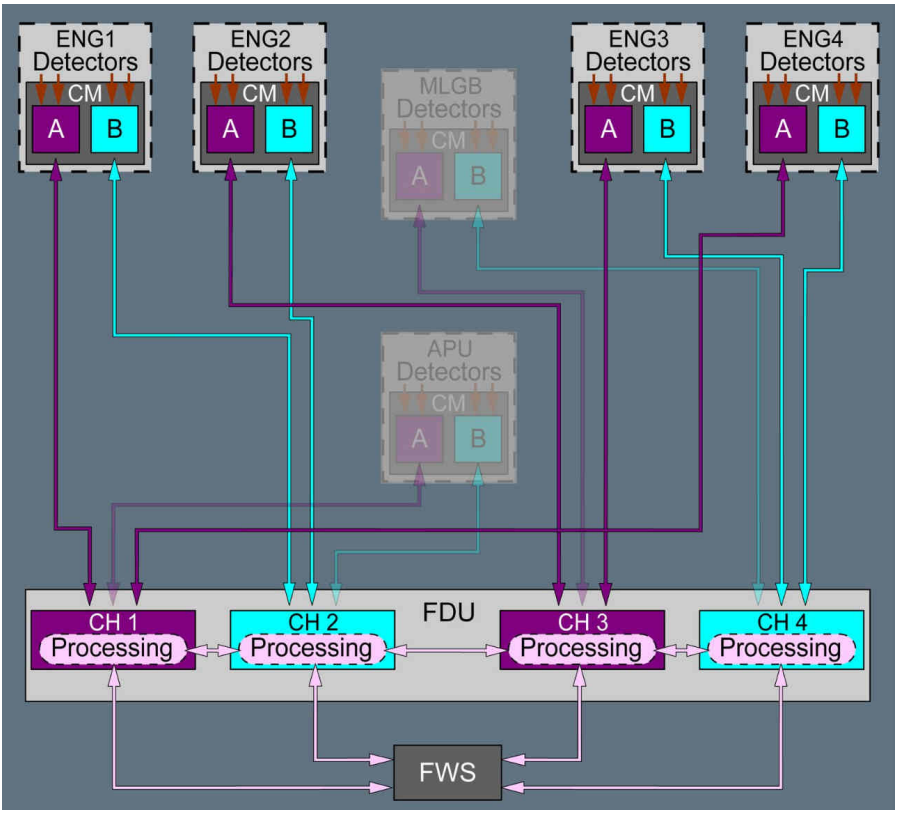
L1 Each loop has a fire detector for each sensitive zone.
The Fire Detection Unit (FDU) receives information from the two loops. The FDU provides information to the ECAM to generate applicable fire warnings or loop cautions.

Fire Detection Architecture



L3 The FDU has four independent channels.
For each engine, the FDU uses two different channels to compare the information that it receives from both loops.

Fire Detection Unit



L1 When fire is detected in an engine:
- The continuous repetitive chime sounds
- The MASTER WARN lights flash
- The associated ECAM ENG FIRE warning triggers
- The ECAM SD displays the ENG page
- On the ENG FIRE panel, the assigned FIRE light comes on
- On the ENG MASTER panel, the assigned FIRE light comes on.

L2 FIRE DETECTION AND LOOP FAULT LOGIC

The following alert(s) will trigger, when the loops detect either a fire, or a fault:

Detection on LOOP A		Detection on LOOP B		Alert
Fire	Fault	Fire	Fault	
Yes	No	Yes	No	ENG 1(2)(3)(4) FIRE
No	Yes	Yes	No	ENG 1(2)(3)(4) FIRE
Yes	No	No	Yes	ENG 1(2)(3)(4) FIRE
No	Yes	No	Yes	ENG 1(2)(3)(4) FIRE On the same engine: If one failure occurs after the other, within 5 s.
				ENG 1(2)(3)(4) FIRE DETECTN FAULT On the same engine: If one failure occurs after the other, at an interval greater than 5 s.
No	Yes	No	No	ENG 1(2)(3)(4) FIRE LOOP A FAULT (1)
Yes	No	No	No	ENG 1(2)(3)(4) FIRE LOOP A FAULT (1)
No	No	Yes	No	ENG 1(2)(3)(4) FIRE LOOP B FAULT (1)
No	No	No	Yes	ENG 1(2)(3)(4) FIRE LOOP B FAULT (1)

(1) *In case a failure is detected in one loop, the not affected loop continues to operate, and fire detection remains available.*

ENGINE FIRE PROTECTION - FIRE EXTINGUISHING

Applicable to: ALL

The flight crew can isolate and extinguish an engine fire from the ENG FIRE panel in the cockpit.

ENGINE ISOLATION

Each engine can be isolated by pressing its assigned ENG FIRE pb.

L2 When pressed, the system:
- Stops the aural fire warning
- Arms the squibs on the fire extinguishers
  The fire extinguisher bottles are ready to discharge.
- Closes the low-pressure fuel valve
- Closes the hydraulic fire shutoff valve
- Closes the engine bleed valve
- Closes the pack flow control valve
- Shuts off the FADEC power supply.

L1 FIRE EXTINGUISHING

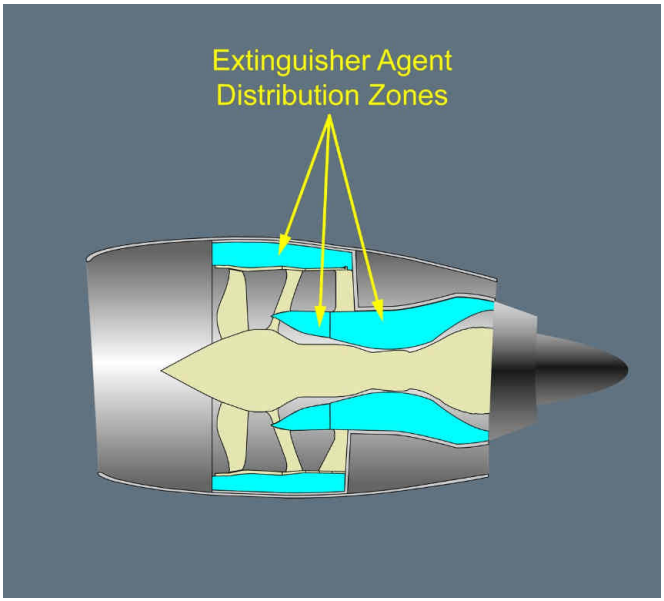
Each engine has two fire extinguisher bottles.

L3 Each bottle has two squibs that enable the discharge of fire extinguisher agent.

L1 After pressing the ENG FIRE pb, the fire extinguisher agent is discharged in the engine nacelle when the assigned AGENT pb is pressed.

L3 This occurs as soon as:
- Both fire extinguisher squibs are armed, or
- One fire extinguisher squib is armed, and the other is not operative.

Extinguisher Agent - Distribution Zones

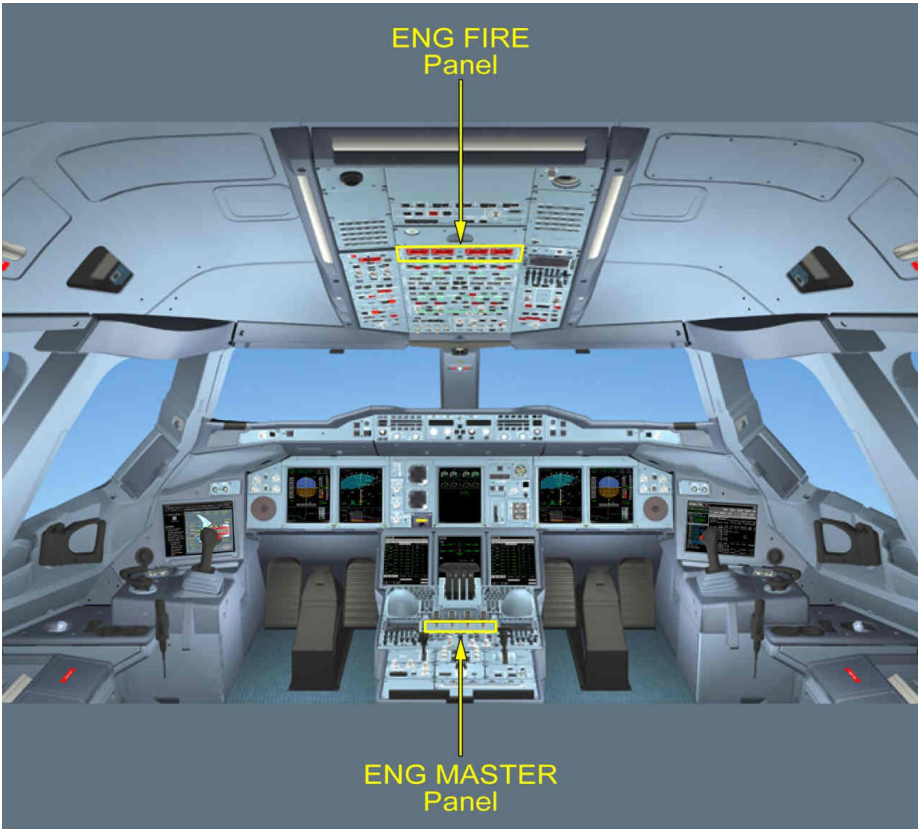


Intentionally left blank

GENERAL

Applicable to: ALL

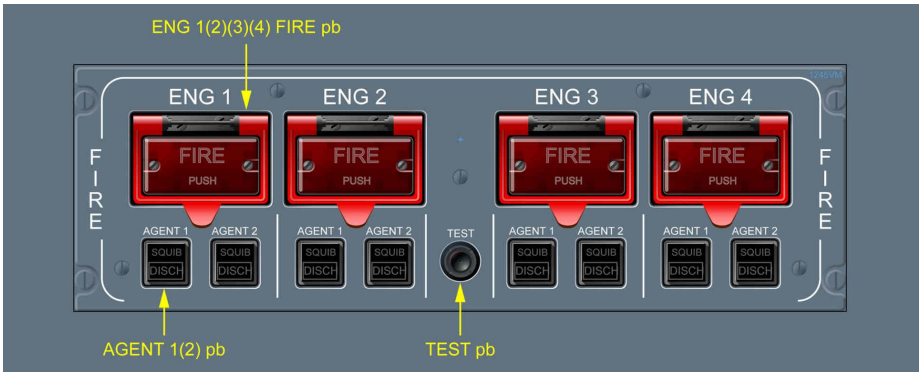
Controls and Indicators



ENG FIRE PANEL

Applicable to: ALL

ENG FIRE Panel



ENG 1(2)(3)(4) FIRE pb

Normal position. No fire is detected.

L12

- Fire is detected. The FIRE light of the ENG MASTER panel comes on, and also indicates the affected engine.

  Associated with the following ECAM warning:
  - ENG 1(2)(3)(4) FIRE (*Refer to Procedure*)

  The light remains on, until the fire is extinguished, regardless of the position of the ENG FIRE pb .
- The flight crew is pressing the ENG FIRE Panel Test pb (*Refer to Test pb*).

When pressed:
- All associated systems are isolated from the engine
- The aural fire warning stops
- The fire extinguishing system is armed, the bottles are ready to discharge.

AGENT 1(2) pb

Normal position.

The squibs of the fire extinguisher bottles are armed. The fire extinguisher bottles are ready to discharge extinguisher agent.
When pressed, the extinguisher bottles discharge and the SQUIB light goes off.

The fire extinguisher bottles discharge.

The flight crew is pressing the ENG FIRE panel TEST pb (*Refer to TEST pb*).

TEST pb

Tests the engines, the APU and the main landing gear bay fire warnings.

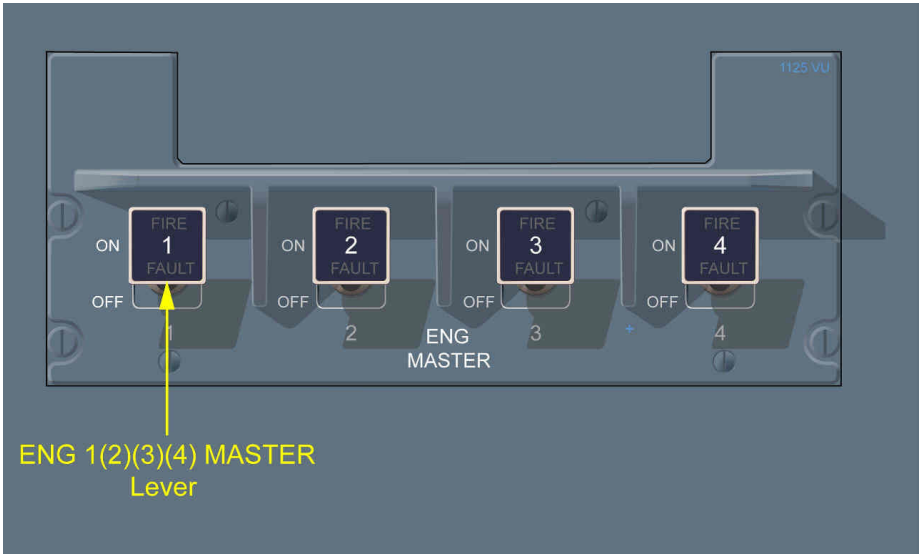
When pressed for at least three seconds, and until released, tests the operation of the engine fire detection and extinguishing system:

- The continuous repetitive chime sounds
- The MASTER WARN lights flash
- The ECAM displays ENG FIRE, APU FIRE and MLG FIRE warnings titles
- All ENG FIRE pb come on red
- The APU FIRE pb comes on red
- All SQUIB lights of the AGENT pb come on
- All DISCH lights of the AGENT pb come on
- All FIRE lights on the ENG MASTER panel come on.

ENG MASTER PANEL

Applicable to: ALL

ENG MASTER Panel



ENG 1(2)(3)(4) MASTER LEVER

No fire is detected.

Fire is detected or the flight crew is pressing the ENG FIRE panel TEST pb (*Refer to TEST pb*).

Intentionally left blank

ECAM ALERTS

Applicable to: ALL

ENG 1(2)(3)(4) FIRE (ON GROUND) (*Refer to procedure*)

ENG 1(2)(3)(4) FIRE DET FAULT (*Refer to procedure*)

ENG 1(2)(3)(4) FIRE LOOP A(B) FAULT (*Refer to procedure*)

Intentionally left blank

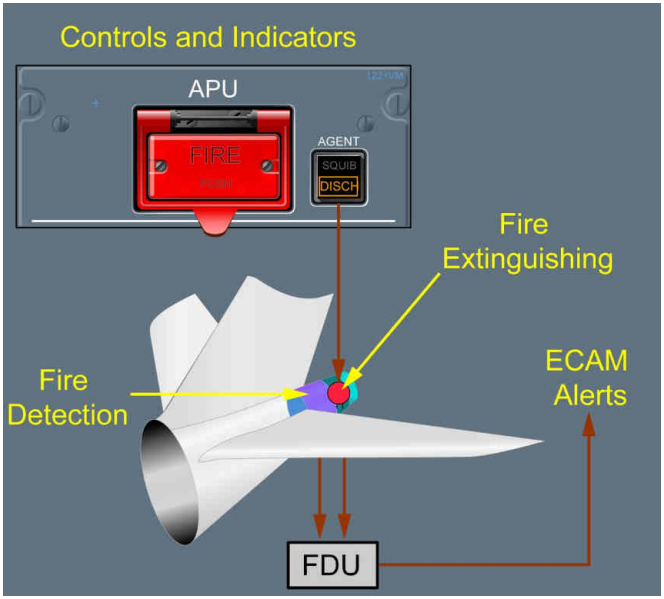
APU FIRE PROTECTION - GENERAL

Applicable to: ALL

The APU compartment has a fire protection system, with:

- A fire detection system
- One extinguisher bottle that discharges extinguisher agent
- An APU Fire panel, with assigned pushbuttons
  These pushbuttons can be used to isolate the APU from the other aircraft systems, and control fire extinguishing.
- Visual and aural alerts.

APU Fire Protection



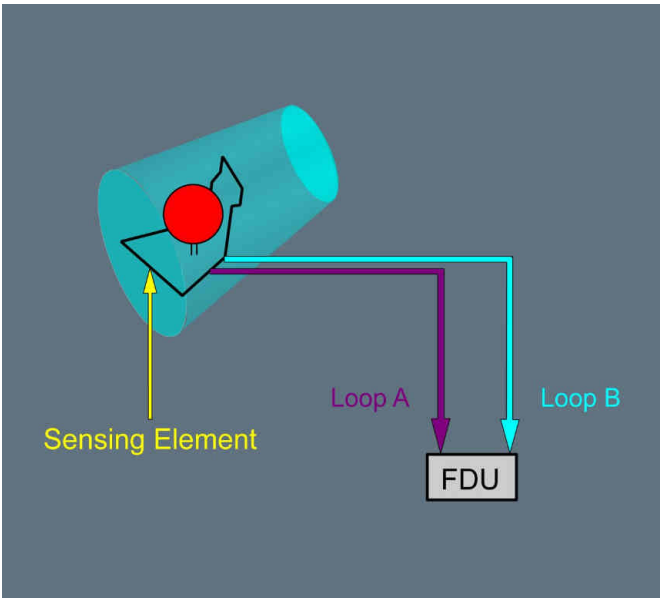
APU FIRE PROTECTION - DETECTION

Applicable to: ALL

FIRE DETECTION

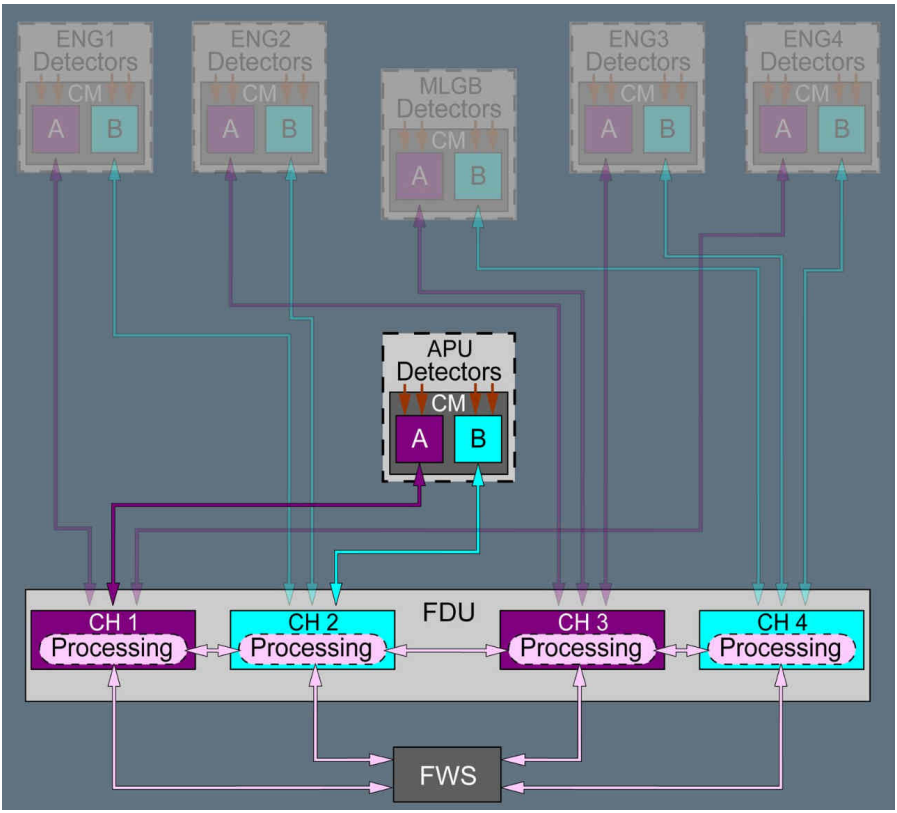
The detection system uses two identical loops (A and B). Each loop has fire detectors.
The Fire Detection Unit (FDU) receives information from the two loops. The FDU provides information to the ECAM to generate applicable fire warnings or loop cautions.

Fire Detection - Architecture



L3 The FDU has four independent channels.
The FDU uses two different channels to compare the information that it receives from both loops.

Fire Detection Unit



L1 In case the FDU detects a fire:

- In flight:
  - The continuous repetitive chime sounds
  - The MASTER WARN lights flash
  - The ECAM APU FIRE warning triggers
  - On the APU Fire panel, the FIRE light comes on.
- On ground, in addition to the warnings in the cockpit:
  - The APU automatically shuts down, and the external horn sounds
  - The APU Fire light, on the Maintenance Nose Gear panel, comes on.

L2 FIRE DETECTION AND LOOP FAULT LOGIC

The following alert(s) trigger, when the loops detect either a fire, or a fault:

Detection on LOOP A		Detection on LOOP B		Alert
Fire	Fault	Fire	Fault	
Yes	No	Yes	No	APU FIRE
No	Yes	Yes	No	APU FIRE
Yes	No	No	Yes	APU FIRE
No	Yes	No	Yes	APU FIRE If one failure occurs after the other, within 5 s.
				APU FIRE DETECTN FAULT If one failure occurs after the other, at an interval greater than 5 s.
No	Yes	No	No	APU FIRE LOOP A FAULT (1)
Yes	No	No	No	APU FIRE LOOP A FAULT (1)
No	No	Yes	No	APU FIRE LOOP B FAULT (1)
No	No	No	Yes	APU FIRE LOOP B FAULT (1)

(1) In case a failure is detected in one loop, the not affected loop continues to operate, and fire detection is still available.

APU FIRE PROTECTION - FIRE EXTINGUISHING

Applicable to: ALL

The flight crew can isolate and extinguish an APU fire from the APU Fire panel in the cockpit.

APU ISOLATION

The APU can be isolated by pressing its assigned APU FIRE pb.

L2 When pressed, the system:

- Shuts down the APU
- Stops the aural warning
- Arms the squibs on the fire extinguisher
  The fire extinguisher bottle is ready to discharge.
- Closes the low-pressure fuel valve
- Shuts off the APU fuel pumps
- Closes the APU bleed valve and crossbleed valve
- Deactivates the APU generators.

L1 FIRE EXTINGUISHING

The APU has one fire extinguisher bottle.

L3 The extinguisher bottle has two squibs that enable the discharge of fire extinguisher agent.

L1 The bottle discharges, either:
- In flight: Manually controlled from the APU Fire panel in the cockpit, or
- On ground: Automatically activated.

L2 The FDU receives signals from the Landing Gear Retraction System (LGERS), to determine whether the aircraft on ground or in flight.

L1 After pressing the APU FIRE pb, the fire extinguisher agent is discharged in the APU when the AGENT pb is pressed.

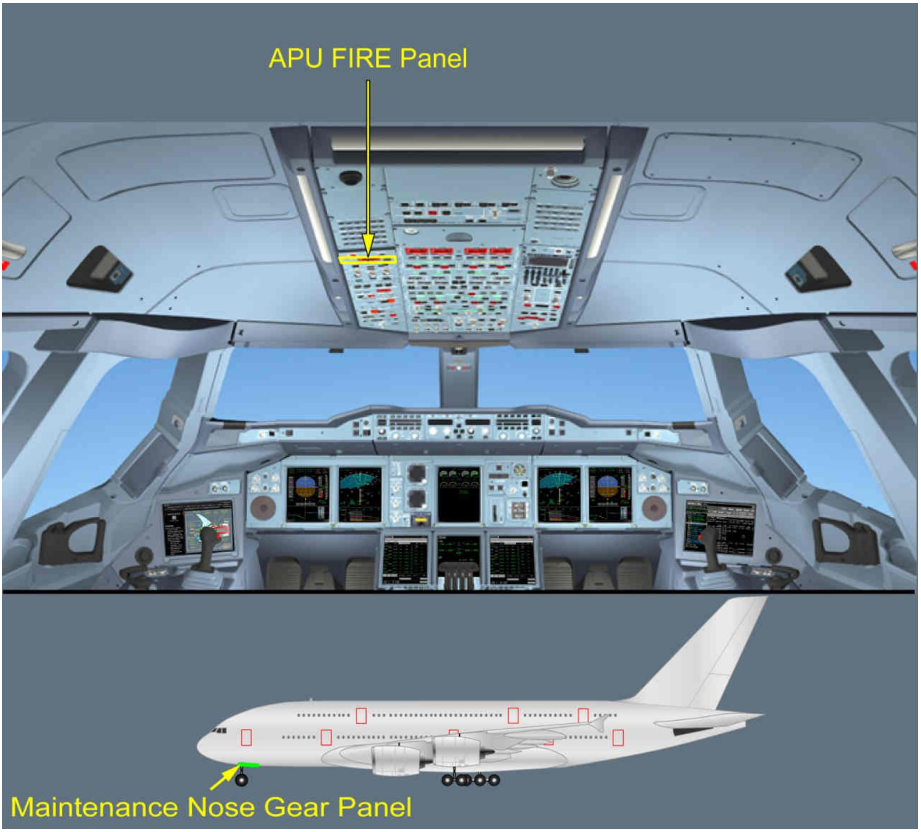
L3 This occurs as soon as:
- Both fire extinguisher squibs are armed, or
- One fire extinguisher squib is armed, and the other is not operative.

Intentionally left blank

GENERAL

Applicable to: ALL

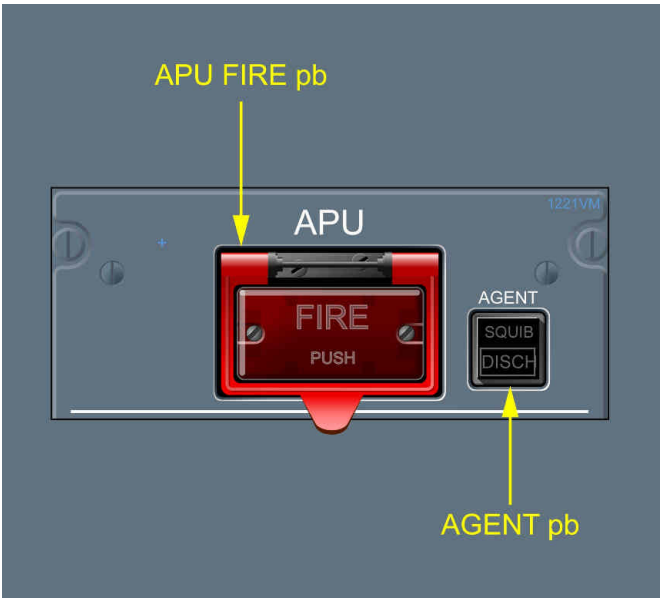
Controls and Indicators



APU FIRE PANEL

Applicable to: ALL

APU FIRE Panel



APU FIRE pb

Normal position. No fire is detected.

L12

Fire is detected.

Associated with the following ECAM warning:
- APU FIRE (*Refer to Procedure*)

The light remains on, until the fire is extinguished, regardless of the position of the APU FIRE pb .

When pressed:
- All associated systems are isolated from the APU
- The aural fire warning stops
- The fire extinguishing system is armed, the bottle is ready to discharge.

AGENT pb

Normal position.

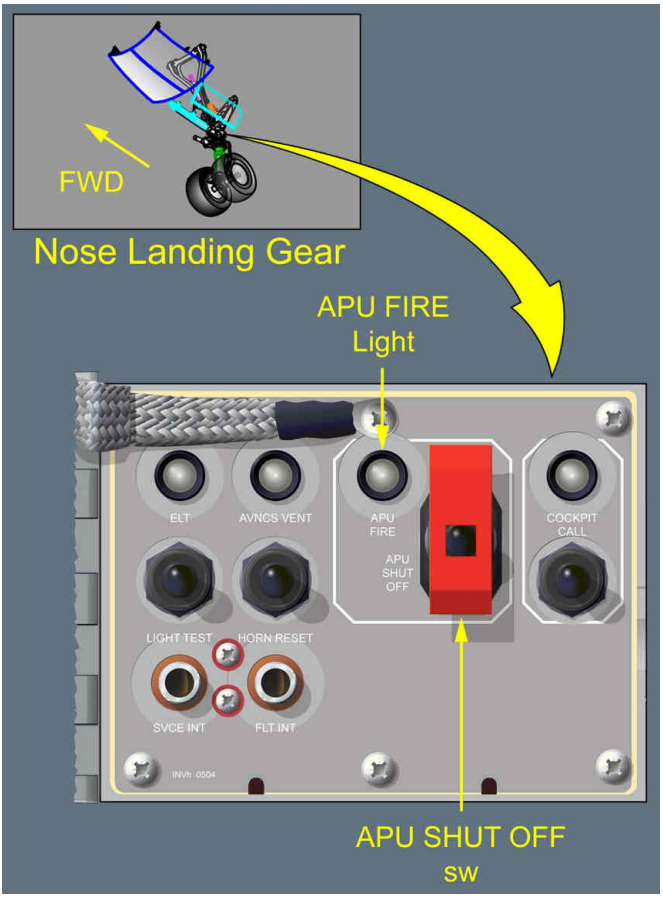
The squibs of the fire extinguisher bottle are armed. The fire extinguisher bottle is ready to discharge extinguisher agent.
When pressed, the extinguisher bottle discharges and the SQUIB light goes off.

The fire extinguisher bottle has discharged.

MAINTENANCE NOSE GEAR PANEL

Applicable to: ALL

Maintenance Nose Gear Panel



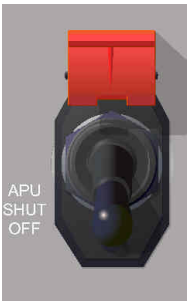
APU FIRE LIGHT

Normal position. No fire is detected.

Fire is detected in the APU compartment. In addition of the light, an external horn comes on.
The APU automatically shuts down, the APU fuel valves close, and the APU fire extinguisher discharges the agent.
The light and the horn remain on, until the fire is extinguished.

APU SHUT OFF SW

Normal position.



The ground crew has opened the guard.

When pushed down and released:
- Initiates an APU shutdown from outside the aircraft (normal operation), or
- Initiates an emergency shutdown of the APU , due to an APU failure (*Refer to the Emergency Shutdown Description*).

ECAM ALERTS

Applicable to: ALL

APU FIRE (*Refer to procedure*)

APU FIRE DET FAULT (*Refer to procedure*)

APU FIRE LOOP A(B) FAULT (*Refer to procedure*)

Intentionally left blank

MLG FIRE PROTECTION - DETECTION

Applicable to: ALL

FIRE DETECTION

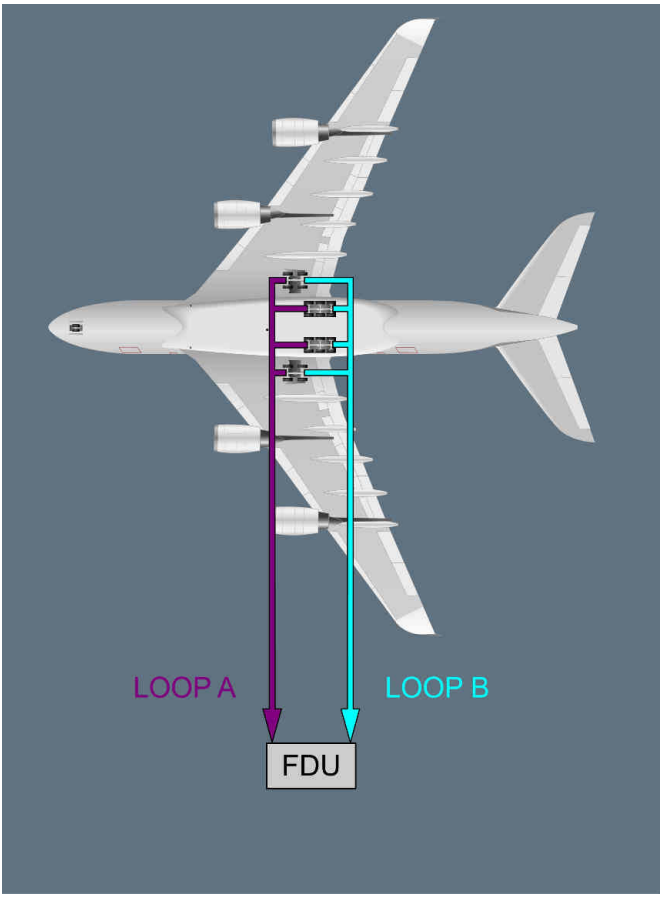
The Main Landing Gear (MLG) bays have a fire detection system with:
- A fire detection system
- Visual and aural alerts.

This system detects overheat in the:

- Two wing landing gear bays
- Two body landing gear bays.

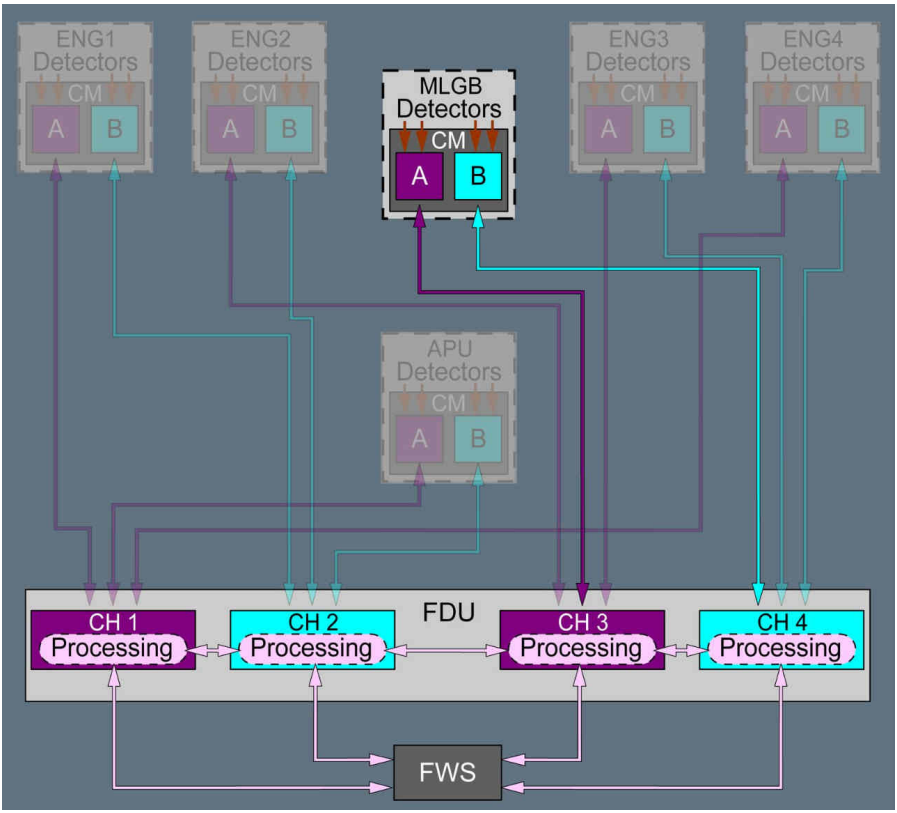
The fire detection system uses two identical loops (A and B) for each bay.
The Fire Detection Unit (FDU) receives information from the two loops. The FDU provides information to the ECAM to generate applicable fire warnings or loop cautions.

Fire Detection - Architecture



L3 The FDU has four independent channels.
The FDU uses two different channels to compare the information that it receives from both loops.

Fire Detection Unit



L1 If fire is detected in any landing gear bay:
- The continuous repetitive chime sounds
- The MASTER WARN lights flash
- The ECAM MLG BAY FIRE warning triggers
- The ECAM SD displays the WHEEL page.

L2 FIRE DETECTION AND LOOP FAULT LOGIC

The following alert(s) trigger, when the loops detect either a fire, or a fault:

Detection on LOOP A		Detection on LOOP B		Alert
Fire	Fault	Fire	Fault	
Yes	No	Yes	No	MLG BAY FIRE
No	Yes	Yes	No	MLG BAY FIRE
Yes	No	No	Yes	MLG BAY FIRE
No	Yes	No	Yes	MLG BAY FIRE DETECTN FAULT
No	Yes	No	No	MLG BAY FIRE LOOP A FAULT (1)
Yes	No	No	No	MLG BAY FIRE LOOP A FAULT (1)
No	No	Yes	No	MLG BAY FIRE LOOP B FAULT (1)
No	No	No	Yes	MLG BAY FIRE LOOP B FAULT (1)

(1) In case a failure is detected in one loop, the not affected loop continues to operate, and fire detection remains available.

AVIONICS BAYS SMOKE DETECTION

Applicable to: ALL

GENERAL

Each avionics bay, the In Flight Entertainment (IFE) bay and the Network Server System (NSS) have a smoke detection system.

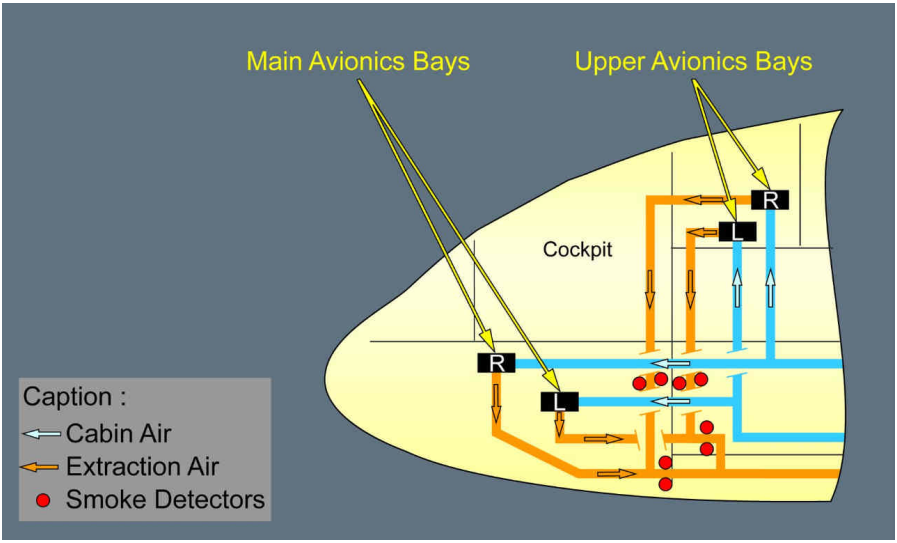
L2 Each bay has two smoke detectors. They are in the air extraction ducts of the avionics racks.

The avionics bays are:
- Main, left avionics bay
- Main, right avionics bay
- Upper, left avionics bay
- Upper, right avionics bay
- Aft avionics bay.

L1 The Smoke Detection Function (SDF) monitors the information received from the detectors of a specific bay. The SDF provides information to the ECAM to generate applicable smoke warnings, or detector fault cautions.

Note: *If the SDF detects smoke in the IFE, the Flight Attendant Panel (FAP) also triggers an alert to the cabin crew.*

Main and Upper Avionics Bays - Smoke Detection



L2 DETECTION LOGIC

- The SMOKE DET FAULT caution triggers for the applicable bay, when:
  - One detector fails, or
  - Only one detector detects smoke.
- The SMOKE warning triggers for the applicable bay, when:
  - One detector fails, and the other detects smoke, or
  - Both detectors detect smoke.

L3 MAIN AND UPPER AVIONICS

For the upper and main bays, and depending on which detectors detect the smoke, the following logic applies:

Smoke in the Main Avionics Bay	Smoke in the Upper Avionics Bay	Alert
No	Yes	SMOKE L(R) UPPER AVNCS SMOKE
Yes	No	SMOKE L(R) MAIN AVNCS SMOKE
Yes	Yes	SMOKE L(R) UPPER AVNCS SMOKE

GENERAL

Applicable to: ALL

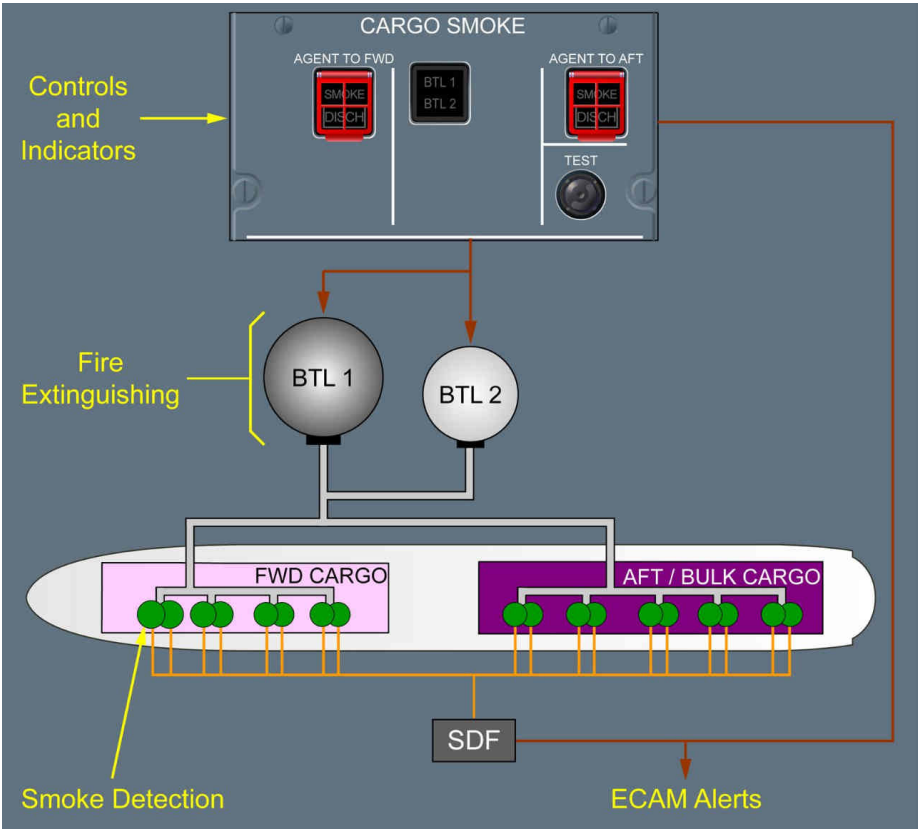
The forward and aft/bulk cargo compartments each has a fire protection system.
The fire protection system of the cargo compartments have a:

- Smoke detection system
- Fire extinguishing system.

Cargo Compartments - Fire Protection Description



CARGO COMPARTMENTS SMOKE DETECTION

Applicable to: ALL

SMOKE DETECTION

The smoke detection system has:

- Smoke detectors in the forward and aft/bulk cargo compartments.

L2 These detectors are in cavities within the ceiling panels. Each cargo compartment cavity has two detectors, and one extinguisher nozzle. There are:

- Four cavities in the forward cargo compartment
- Five cavities in the aft/bulk cargo compartment, one of which is in the bulk cargo compartment.

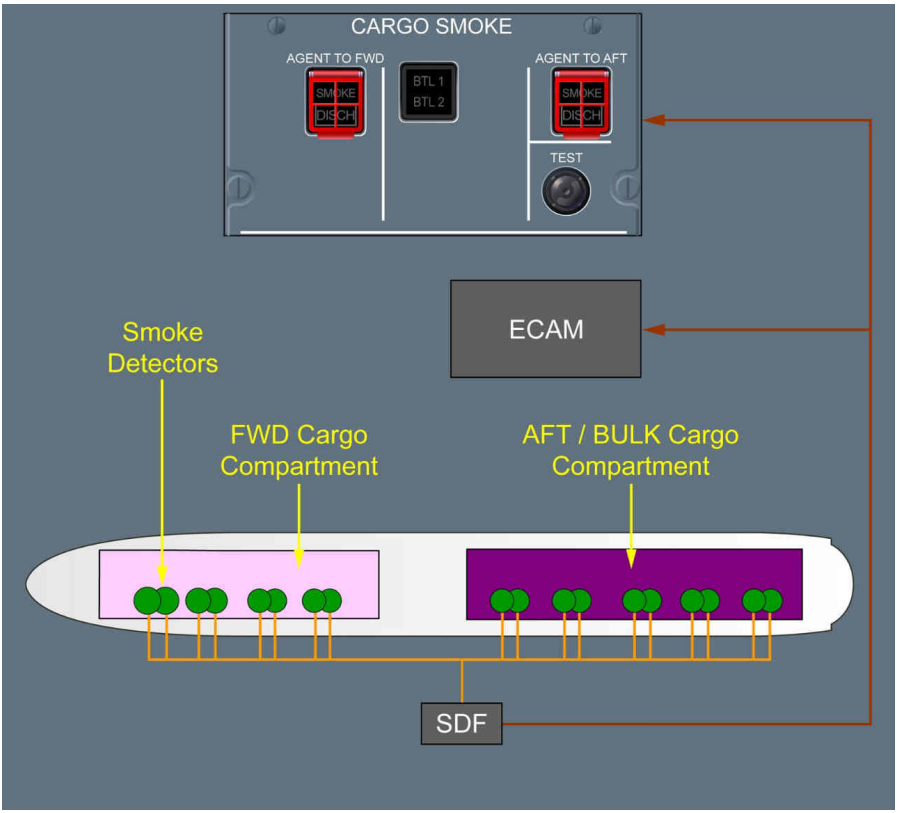
L1 - A Smoke Detection Function (SDF) that monitors the information received from the detectors of a given compartment. The SDF provides information to the ECAM to generate applicable smoke warnings, or detector fault cautions.

When smoke is detected in a cargo compartment, the associated SMOKE warning triggers.
If smoke is detected in the bulk cargo compartment, the ventilation automatically stops.

L3 Therefore:

- The isolation valves close
- The extraction fan stops.

Cargo Compartments - Smoke Detection



L2 DETECTION LOGIC

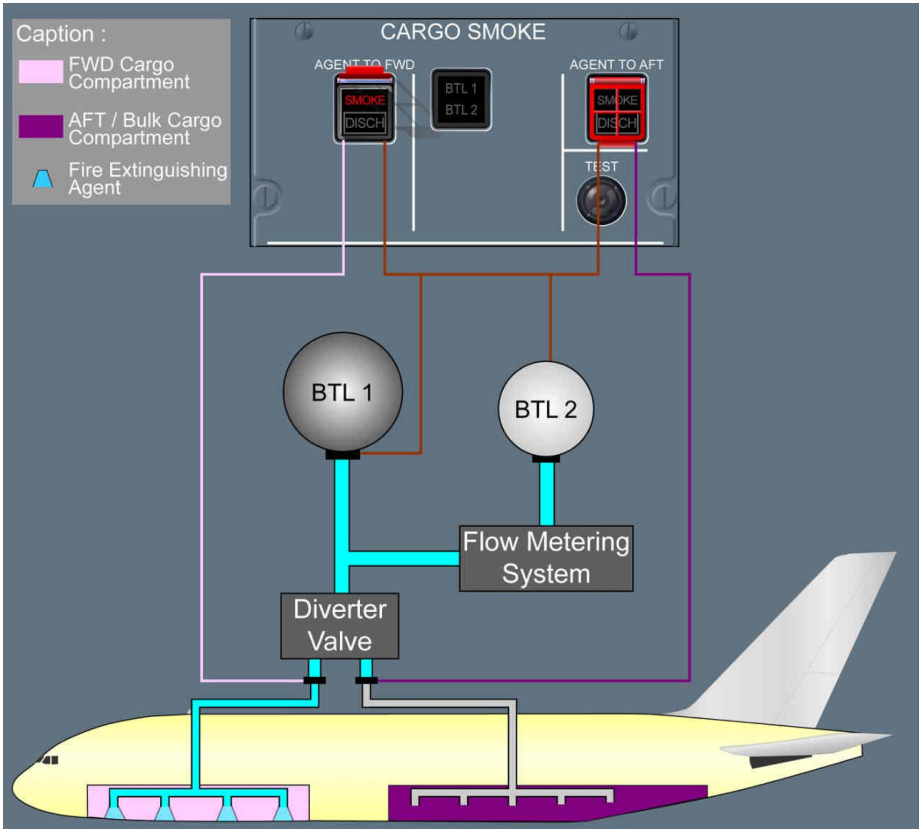
- The SMOKE DET FAULT caution triggers for the applicable compartment, when:
  - One detector fails, or
  - Only one detector detects smoke.
- The SMOKE warning triggers for the applicable compartment, when:
  - One detector fails, and the other detects smoke, or
  - Both detectors detect smoke.

FIRE EXTINGUISHING

Applicable to: ALL

There are two fire extinguisher bottles that can discharge extinguisher agent in the forward or aft/bulk cargo compartment.
When the fire extinguisher bottles discharge, the agent either extinguishes the fire, or prevents the fire from spreading for approximately four hours.

Fire Extinguishing



When the flight crew presses the assigned pushbutton, the extinguisher agent is released into the affected cargo compartment.
L3 A diverter valve directs extinguisher agent to either the forward or aft/bulk cargo compartment.

L2 - Bottle 1 first discharges extinguisher agent in the affected cargo compartment. This takes approximately one minute.

L3 Bottle 1 is bigger, and has a greater capacity of extinguisher agent than the other one, in order to saturate the affected cargo compartment with extinguisher agent.

L2 - Bottle 2 then slowly discharges extinguisher agent, to provide sufficient extinguisher agent concentration in the affected cargo compartment for approximately four hours.

L3 A flow-metering system regulates the flow of extinguisher agent.

Intentionally left blank

GENERAL

OVERVIEW

Applicable to: ALL

The flight control system is a fly-by-wire system.

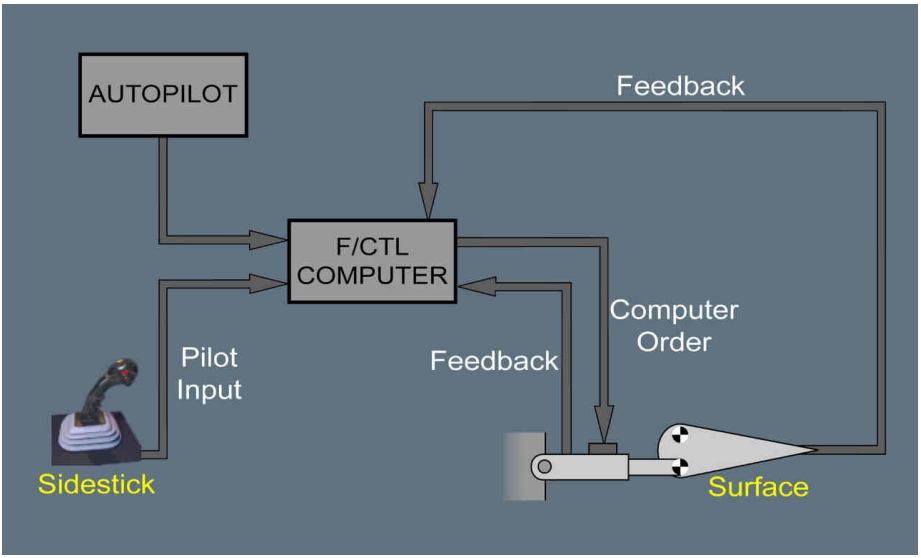
All the flight control surfaces are:
- Electrically controlled,
- Hydraulically actuated.

L2 The surfaces are actuated by one of the two hydraulic systems, or by an independent hydraulic source (EHA/EBHA).

Note: *The slats and the THS also have an electrical motor.*

L1 The flight crew uses sidesticks and rudder pedals to fly the aircraft. The flight control computers interpret the pilot's inputs, and order flight control surface movement, as necessary.
Additionally, a pitch trim switch and a rudder trim selector (with a rudder trim reset p/b) allow to trim the airplane when needed.

Basic principle

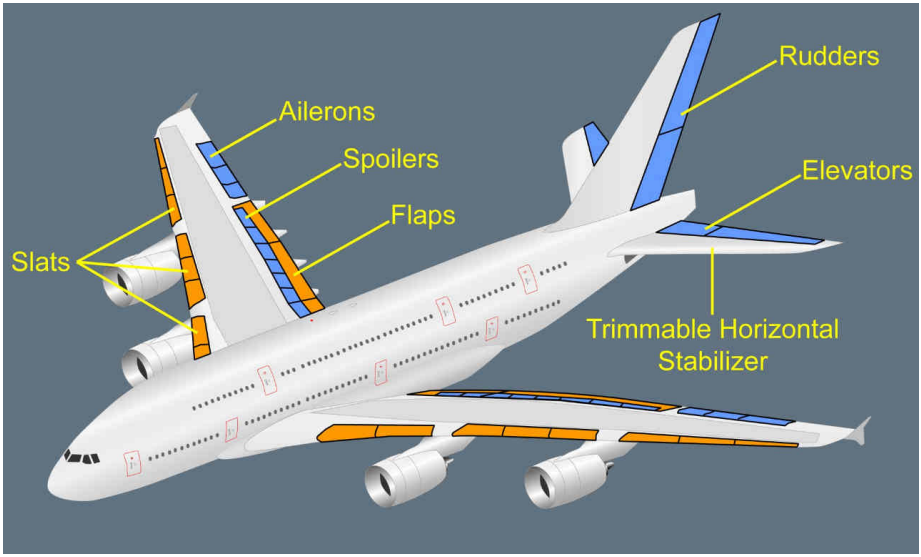


In normal law, regardless of the pilot's input, the computers will prevent excessive maneuvers and any exceedance of the safe envelope in pitch and roll.

CONTROL SURFACES

Applicable to: ALL

Control surfaces



Pitch control is provided by:
- Four elevators
- The Trimmable Horizontal Stabilizer (THS).

Roll control is provided by:
- 6 ailerons
- 12 spoilers.

Yaw control is provided by:
- Two rudders.

The speed brake and ground spoiler functions are provided by:
- 16 spoilers.

Lift augmentation is provided by:
- 16 slats
- 6 flaps.

For more information : *Refer to slats/flaps system description* .

FLIGHT CONTROL COMPUTERS

Applicable to: ALL

Six flight control computers process pilot and autopilot inputs according to normal, alternate or direct flight control laws. These computers are:

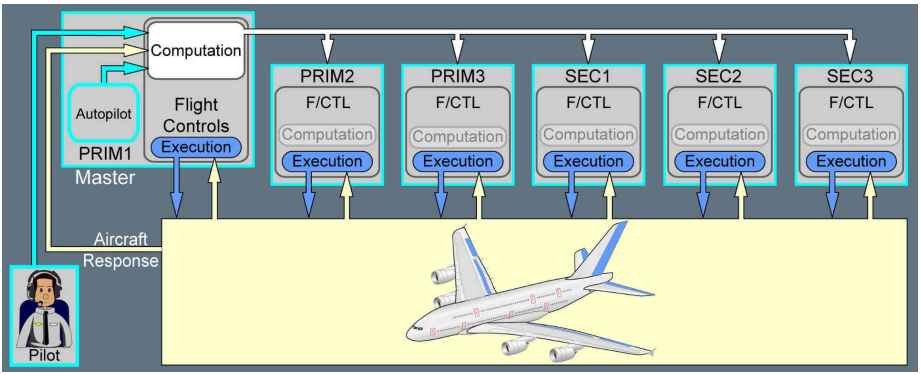
- 3 PRIMs
- 3 SECs

One computer of any type (PRIM or SEC) is capable of controlling the aircraft and of insuring safe flight and landing.

L2 In normal operation, one PRIM computer is declared to be the master (generally PRIM 1). It processes the orders and sends them to the other computers (PRIMs and SECs) which will then execute them on their associated actuators.

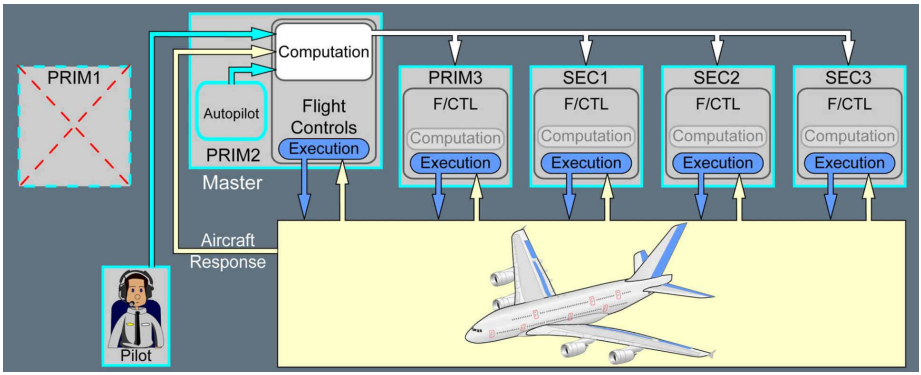
If one computer is unable to execute the orders sent by the master, another computer executes the task of the affected computer.

PRIM 1 Master



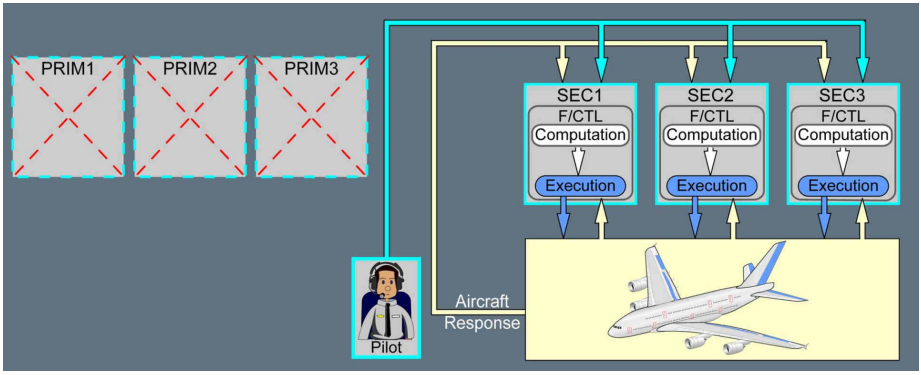
If PRIM 1 is not able to be the master, PRIM 2 (or PRIM 3 if PRIM 2 is not available) becomes the master.

PRIM 2 Master



If all PRIMs are lost, all the operative SECs compute and perform their orders independently. There is no master SEC, and direct law is active.

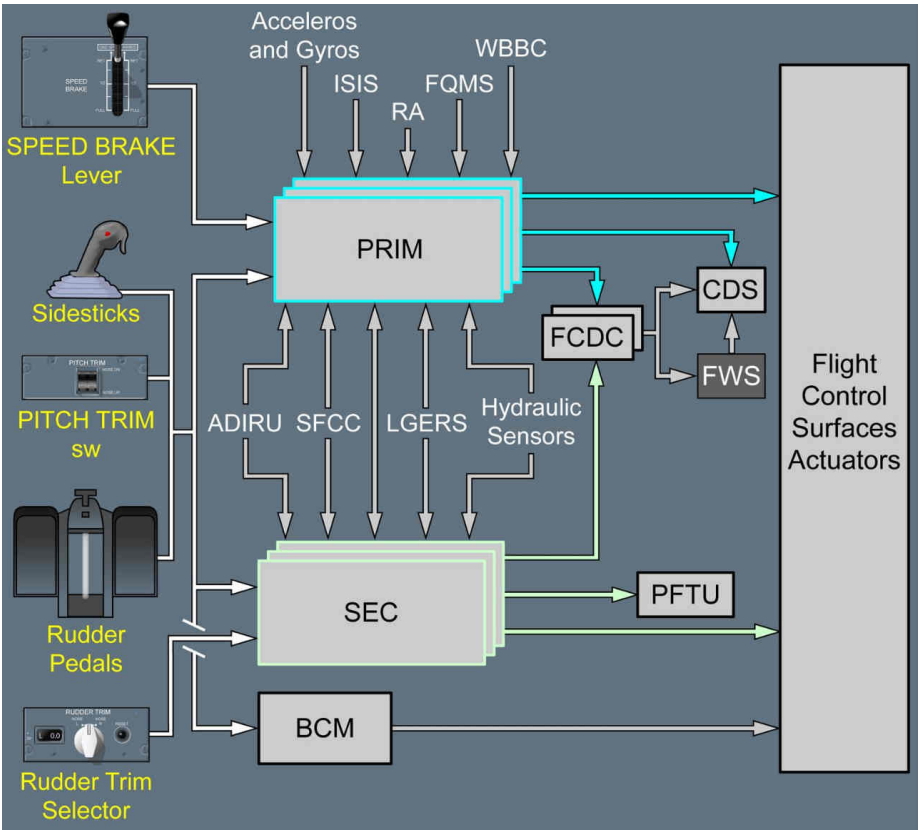
All PRIMs failed



FLIGHT CONTROL SYSTEM ARCHITECTURE

Applicable to: ALL

System Architecure



PRIM

The three PRIM s:

- Compute Normal, Alternate, and Direct control laws
- Control surfaces (ailerons, spoilers, elevators, THS and rudders)
- Compute the Load Alleviation Function (LAF) law

- Host the autopilot, flight director and autothrust functions. For more information : *Refer to AFS Architecture*
- Host the flight envelope protection functions
- Compute the characteristic speeds
- Host the inhibition function of the thrust reversers (Third line of defense). For more information: *Refer to Thrust Reverse System description* .

L3 Each PRIM is composed of two Flight Control and Guidance Units (FCGU).

L2 The PRIM s receive information from the following aircraft systems.

ADIRU

Each PRIM receives data from the three Air Data and Inertial Reference Units (ADIRU s).

L3 Each ADIRU has two parts:
- The Air Data Reference (ADR)
- The Inertial Reference (IR)

When the three IR (ADR) are valid, the used parameter is the median value.
When two IR (ADR) are valid, the used parameter is the average of both outputs.
When only one IRS is valid, its data is not used. When only one ADR is valid, its parameters are used, if monitored by the ISIS .

ISIS

There are two Integrated Standby Instrument Systems (ISIS), which use probes which are independent from the ADIRU s.
The data from the ISIS is used to monitor the ADR s. For more information: *Refer to ADR monitoring* .
The data from the ISIS is not used by the PRIM s for the computation of the flight control laws.

L2 **RA**

Each PRIM receives data from the three Radio Altimeters (RA).
L3 Each PRIM is connected to two RA s and receives data from the third RA via the other PRIM s.
When the three RA s are valid, the used parameter is the median value.
When two RA s are valid, the used parameter is the average of both outputs.
When only one RA is valid, its value is used.

L2 **FQMS**

The Fuel Quantity and Monitoring System (FQMS) provides the weight and centre of gravity data to the PRIM s.
L3 FQMS 1 sends the weight and CG information to the PRIM s. FQMS 2 takes over if FQMS 1 fails.

L2 **WBBC**

The Weight and Balance Backup Computer (WBBC) provides backup weight and CG data to the PRIM s.

L3 The data from the WBBC is used for flight control law and characteristic speeds computation in case of a dual FQMS failure, and to detect major discrepancy between the FQMS and the WBBC .

L2 For more information on the WBBC : *Refer to Fuel System Architecture* .

LGERS / BCS

The Landing Gear Extension Retraction System (LGERS) provides:
- Compressed/not compressed landing gear information
- Extended/retracted landing gear information
- L/G lever position.

The Braking Control System (BCS) provides:
- Wheel speed information
- Brake pedals position.

SFCC

The slats and flaps control units provide the slats and flaps position, and FLAPS lever position.

L3 Any slats or flaps control unit can provide the position of all the slats and flaps.

ACCELEROMETERS AND GYROMETERS

Accelerometers and gyrometers provide information for the computation of the flight control laws:
- 4 accelerometers in the center fuselage provide vertical acceleration information for the computation of the normal pitch law.
- 3 accelerometers in each outboard pylons provide vertical acceleration information for the computation of the LAF law.
- 4 accelerometers in the center fuselage provide lateral acceleration information for the lateral control law.
- 6 gyrometers in the center fuselage provide roll rate, yaw rate, and pitch rate information for the computation of the flight control laws.

HYDRAULIC SENSORS

The hydraulic sensors provide the status of the hydraulic systems and engine driven pumps. This enables flight control reconfiguration in case of hydraulic low pressure, or if only one pump remains available for one system.

SEC

The three SECs:
- Compute the Direct control law
- Control surfaces (ailerons, spoilers, elevators, THS and rudders)
- Control the rudder trim (SEC 1 and SEC 3 only).

L2 The SEC receive the same information as the PRIM from the following systems:
- ADIRU

L3 Each SEC receives data from two ADIRUs:
- SEC 1 receives data from ADIRUs 1 & 2
- SEC 2 receives data from ADIRUs 2 & 3
- SEC 3 receives data from ADIRUs 1 & 3.

L2
- SFCC
- LGERS
- Hydraulic sensors.

L3 The direct law, hosted by the SECs, is more simple than the normal and alternate laws, and requires less parameters. Therefore, the SECs are less affected by other aircraft system failures.

FLIGHT CONTROL DATA CONCENTRATOR (FCDC)

The two FCDCs acquire data from the PRIMs and SECs for:
- The F/CTL system display
- The Flight Warning System
L3 - The on-board maintenance system
- The flight data recorders.

The FCDCs are hosted in the CPIOM-C.

BACKUP CONTROL MODULE (BCM)

In the event of the temporary loss of all flight computers (PRIM s and SEC s), the Backup Control Module (BCM) provides aircraft control and stability. For more information : *Refer to DSC-27-10-40 Backup Control* .

PEDAL FEEL AND TRIM UNIT (PFTU)

The PFTU has two motors (one controlled by SEC 1, the other controlled by SEC 3) to move the zero-force position of the rudder pedals:

- For rudder trim, in manual flight
- To reflect autopilot rudder trim orders, when the autopilot is engaged.

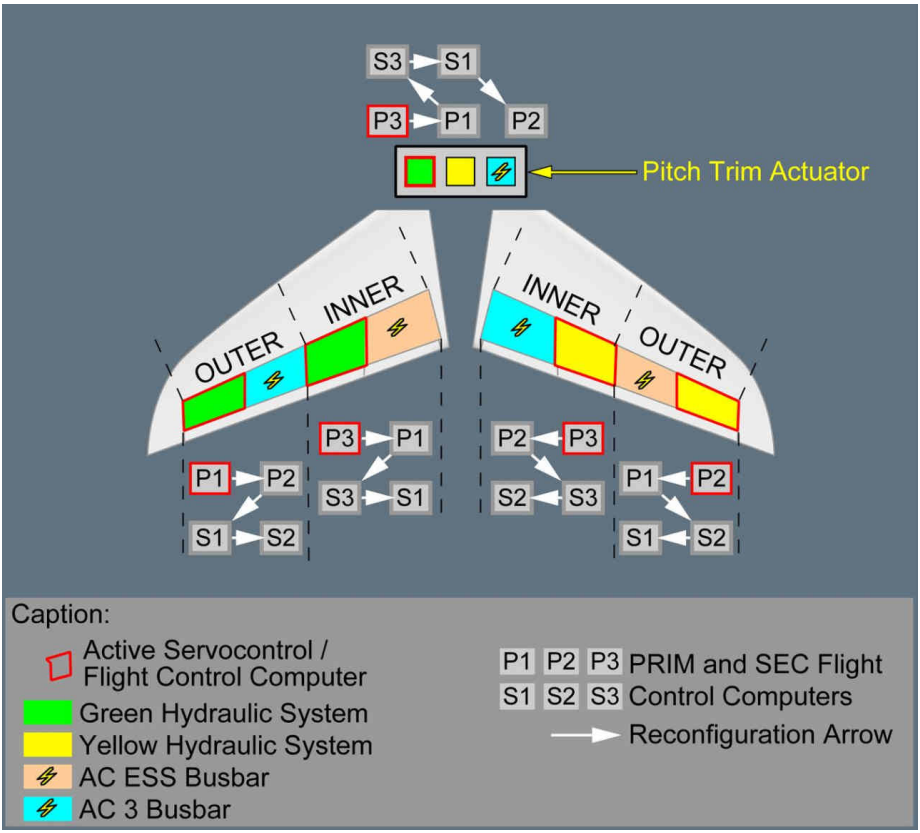
L3 The autopilot rudder trim orders are sent from the PRIM to the PFTU, via the SEC.

PITCH CONTROL

Applicable to: ALL

Four elevators and the trimmable horizontal stabilizer allow to control the aircraft in pitch.

Pitch Control



L2 *Note: In the event of an all engine flameout, all EHA s are powered via the AC ESS busbar.*

L1 **ELEVATORS**

L3 The maximum elevator deflection is 20 ° down and 30 ° up.

L1 Each elevator has two electrically-controlled actuators (conventional or EHA):
- One actuator is active (it commands the position of the surface)
- The other actuator is in damping mode (it follows the movement of the surface).

L3 Both actuators can be simultaneously active, when a high surface deflection rate or a high force to deflect the surface is required.

L1 **ELECTRICAL CONTROL**

Only one flight control computer per elevator is active. The others are in stand-by.

L2 When all systems are operative:
- PRIM 1 controls the outboard left-hand elevator
- PRIM 2 controls the outboard right-hand elevator
- PRIM 3 controls both inboard elevators.

L1 If a PRIM or a hydraulic system fails, another flight control computer and power source will take over, to ensure maximum elevator availability.

L2 For example: for the outboard left-hand elevator, if PRIM 1 or the green hydraulic system fails, PRIM 2 and the AC 3 busbar will takeover.

L1 The inboard elevators remain available in backup control (*Refer to DSC-27-10-40 Backup Control*).

TRIMMABLE HORIZONTAL STABILIZER (THS)

L3 The maximum THS deflection is 2 ° nose down and 10 ° nose up.

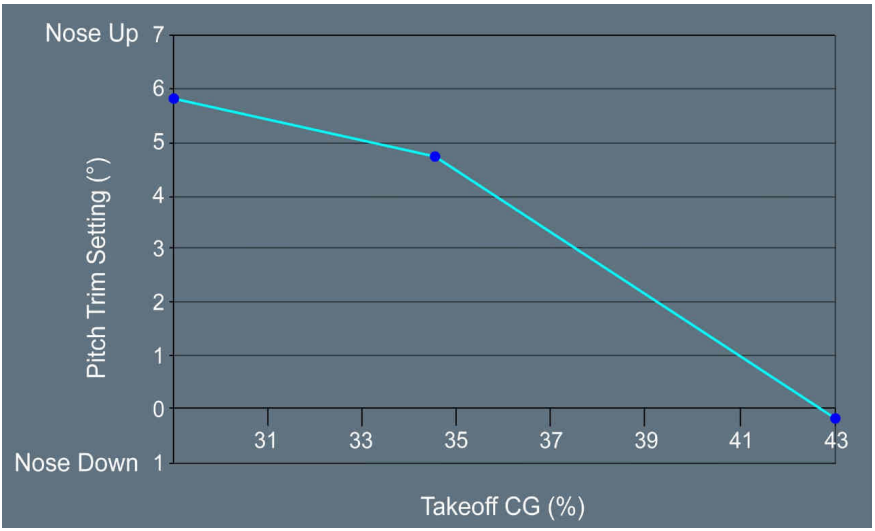
L1 The THS has two hydraulic motors and one electric motor.
Only one motor is active.
On ground, or in direct law, the THS is directly controlled via the pitch trim switch.
In flight, in normal and alternate law, the THS is controlled by the flight control computers.

AUTOMATIC PITCH TRIM SETTING

The pitch trim is automatically set for takeoff:
- When the first engine is started and a hydraulic system becomes pressurized, or
- When the flight crew arms the ground spoilers.

The pitch trim setting for takeoff is function of the takeoff CG .

Green Band



The takeoff CG used for the pitch trim setting is provided by the FQMS , based on the ZFCG entered by the flight crew in the FMS Fuel & Load page, and on the fuel distribution. It is displayed in the permanent data of the system display.

L2 *Note: In the TAKEOFF panel of the FMS PERF page, the flight crew enters the THS position for takeoff, based on the takeoff CG of the loadsheet. This input is not used for automatic pitch trim setting. It is used to trigger the F/CTL PITCH TRIM/FMS/CG DISAGREE caution, if necessary (For more information: Refer to PRO-ABN-ECAM-10-27-10-65 F/CTL PITCH TRIM/FMS/CG DISAGREE).*

During a touch and go, the pitch trim will automatically move to the takeoff position, based on the aircraft CG .

L3 The pitch trim will move when:

- Main landing gears are compressed for at least one second
- Aircraft speed is greater than 80 kt
- One of the following action is performed:
  - Slats/flaps are moved
  - Ground spoilers are disarmed
  - At least three thrust levers are not at idle.

L2 *Note: After landing, the pitch trim will move to 0° (maintenance position) when the speed goes below 30 kt .*

L1 **ELECTRICAL CONTROL**

Only one flight control computer is active. The others are in stand-by.

L2 When all systems are operative:
- PRIM 3 controls the pitch trim.

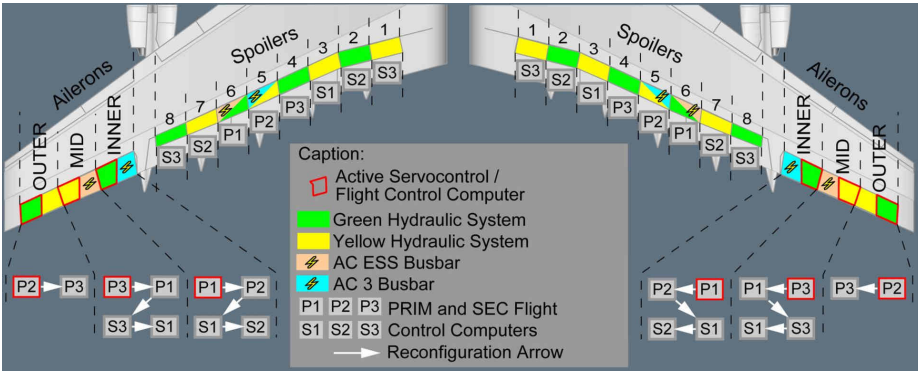
L1 If a PRIM or a hydraulic system fails, another flight control computer and power source will take over, to ensure maximum THS availability.
The THS remains available in backup control (*Refer to DSC-27-10-40 Backup Control*).

ROLL CONTROL

Applicable to: ALL

Three ailerons and the 6 outer spoilers on each wing allow to control the aircraft in roll.

Roll Control



L2 *Note: In the event of an all engine flameout, all EHA s/ EBHA s are powered via the AC ESS busbar.*

L1 **AILERONS**

L2 The outer ailerons:
- Are not deflected down above 240 kt .
- Are not deflected up above 300 kt (except for the Load Alleviation Function).

L3 The maximum aileron deflection is 20 ° down and 30 ° up.

L1 Each aileron has two electrically-controlled actuators (conventional or EHA):
- One actuator is active (it commands the position of the surface)
- The other actuator is in damping mode (it follows the movement of the surface).

ELECTRICAL CONTROL

Only one flight control computer per aileron is active. The others are in stand-by.

L2 When all systems are operative:
- PRIM 1 controls the inboard ailerons
- PRIM 2 controls the outboard ailerons
- PRIM 3 controls the mid ailerons.

L1 If a PRIM or a hydraulic system fails, another flight control computer and power source will take over, to ensure maximum aileron availability.

L2 For example: for the outboard ailerons, if PRIM 2 or the green hydraulic system fails, PRIM 3 and the yellow hydraulic system will takeover.

L1 The inboard ailerons remain available in backup control (*Refer to DSC-27-10-40 Backup Control*).

SPOILERS

L3 The maximum spoiler deflection for roll control is 45 ° .

L1 Each spoiler has one electrically-controlled actuator (conventional or EBHA), and one flight control computer.

L2 If the yellow (green) hydraulic system is available, the actuator of spoiler 5(6) operates as a conventional actuator. If the yellow(green) hydraulic system fails, the actuator of spoiler 5(6) operates as an EHA , powered by the AC 3 (AC ESS) busbar.

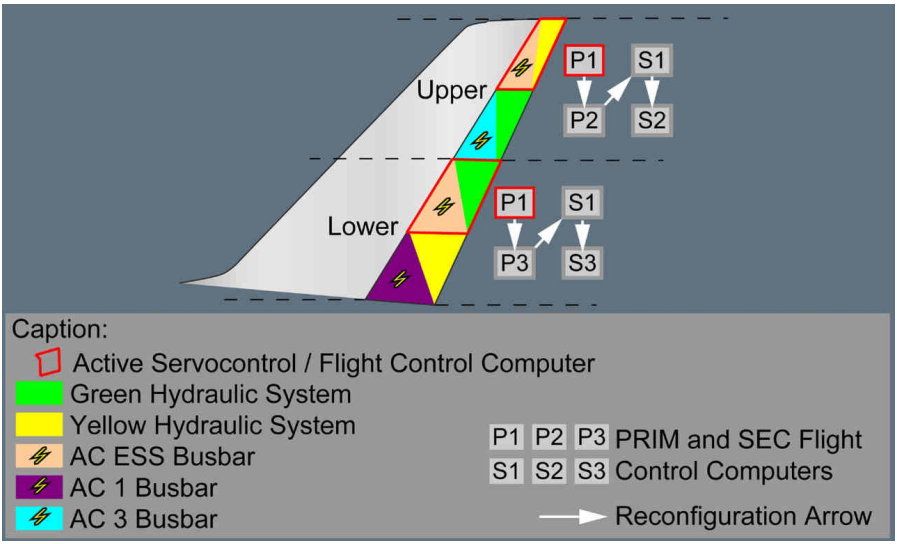
YAW CONTROL

Applicable to: ALL

RUDDER

Two rudders allow to control the aircraft in yaw.

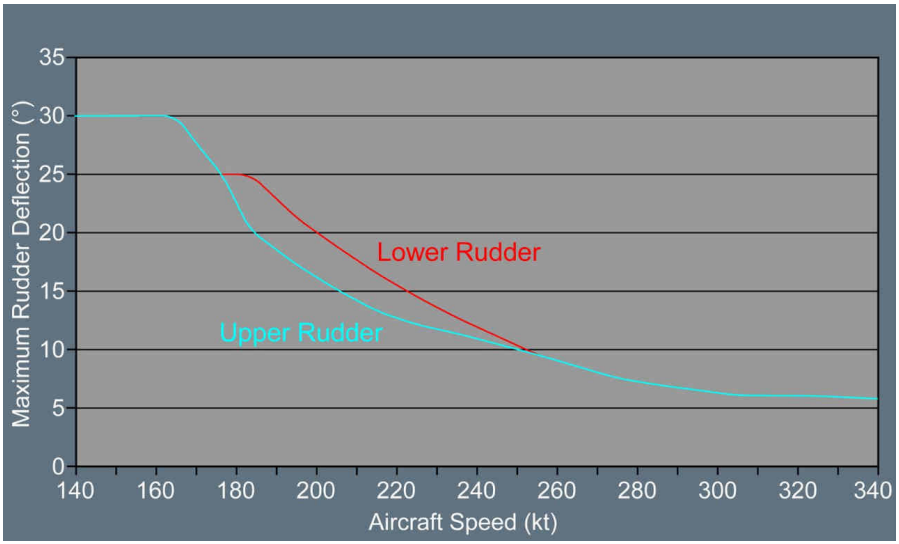
Yaw Control



L2 *Note: In the event of an all engine flameout, the EBHA that is normally powered via the AC 3 busbar is powered via the AC ESS busbar.*

L1 Maximum rudder deflection is limited as a function of the aircraft speed.

Maximum Rudder Deflection



L3 In the case the three ADR s are failed, the maximum rudder deflection is a function of the slats/flaps position. Maximum rudder deflection is available when in CONF FULL.

L2 Rudder pedal deflection is not limited. Above 165 kt , maximum rudder deflection may be achieved before reaching maximum rudder pedal deflection.

L1 Each rudder has two electrically-controlled actuators (EBHA):
- One actuator is active (it commands the position of the surface)
- The other actuator is in damping mode (it follows the movement of the surface).

Both actuators of a rudder simultaneously control the surface during takeoff, approach, and landing, or when a high rudder deflection rate is required.

ELECTRICAL CONTROL

Only one flight control computer per rudder is active. The others are in stand-by.

L2 When all systems are operative, PRIM 1 controls both rudders.

L1 If a PRIM or a hydraulic system fails, another flight control computer and power source will take over, to ensure maximum rudder availability.

L2 For example:
- If PRIM 1 fails, PRIM 2 will takeover on the upper rudder, and PRIM 3 will takeover on the lower rudder
- If the yellow hydraulic system fails, PRIM 2 and the green hydraulic system will takeover on the upper rudder only.

The actuators of the rudders are EBHA s. They operate as conventional actuators, as long as hydraulic power is available (i.e. if the green hydraulic system fails, the lower rudder will be controlled by the lower actuator, powered by the yellow hydraulic system, rather than using the upper actuator as an EHA .)

L1 Both rudders remain available in backup control (*Refer to DSC-27-10-40 Backup Control*).

RUDDER TRIM

Rudder trim is achieved via the Pedal Feel and Trim Unit (PFTU).

The PFTU has two electric motors (one controlled by SEC 1, the other controlled by SEC 3) to move the zero-force position of the rudder pedals:
- For rudder trim in manual flight
  Rudder trim is applied via the RUDDER TRIM selector on the pedestal.
- To reflect autopilot rudder trim orders, when the autopilot is engaged.

L3 The autopilot orders are sent from the PRIMs, via the SECs.

L2 The authority of the rudder trim is 85% of the maximum rudder deflection.

SPEEDBRAKES AND GROUND SPOILER CONTROL

Applicable to: ALL

SPEED BRAKE CONTROL

All the spoilers can be used as speed brakes.

L2 When a speed brake fails on one side, the symmetric one on the other wing is inhibited (except for spoilers 5 and 6).

Spoilers 3 to 8 are also used for roll control. The roll control function has priority over the speed brake function. When the sum of a roll order and a simultaneous speed brake order on one surface is greater than the maximum deflection available in flight, the symmetrical surface is retracted until the difference between the two surfaces is equal to the roll order.

The spoilers extend 5 ° up on ground, when the flaps are fully retracted or moving, and at least one engine is running. This prevents friction between the spoilers and the flaps, which could damage the spoilers.

L1 EXTENSION

The flight crew controls the speed brakes with the SPEED BRAKE lever.

L3 The maximum deflection for spoilers 1 to 5 is 20 °.
The maximum deflection for spoilers 6 to 8 is 45 °.

L2 The speed brake deflection is a function of

- The SPEED BRAKE lever position

L3 When the SPEED BRAKE lever is at the 1/2 position, the speed brakes are 3/4 extended.

L2 - The slats/flaps configuration

L3 Speed brake deflection is reduced in CONF 1+F, 2, 3, and FULL.

Speed brake n°	1–2	3–5	6–8
CONF 0 and 1	20 °	20 °	45 °
CONF 1+F	12 °	17 °	21 °
CONF 2	9 °	9 °	17 °
CONF 3	8 °	3 °	10 °
CONF FULL	6 °	0 °	10 °

Maximum Speed Brake Deflection

L2 - The load factor

L3 Maximum deflection is reduced below 0.3 g, and above 1.7 g.

L2 - Weight and altitude, in case of turbulence.

L3 Maximum deflection is reduced below 30 000 ft, when the gross weight is above 1 036 173 lb, to limit loads on the horizontal stabilizer due to the pitch compensation.

L1 AUTOMATIC RETRACTION

If extended, the speedbrakes automatically retract if:

- Alpha protection is activated, or
- Low speed stability is active, or
- A go-around is initiated.

Once retracted, the speedbrakes remain retracted, even if the conditions have disappeared. To extend the speed brakes again, the SPEED BRAKE lever must first be set to the retracted position for at least 5 s .

GROUND SPOILER CONTROL

All the spoilers and ailerons are also used as ground spoilers.

L2 When a spoiler fails on one side, the symmetric one on the other wing is inhibited (except for spoilers 5 and 6).

L1 The ground spoilers are used for lift dumping at landing, and for braking after landing and in the case of a rejected takeoff.

ARMING

The flight crew arms the ground spoilers by pulling the SPEED BRAKE lever into the armed position.

Note: The ground spoilers are automatically armed if the speed brakes are extended and the radio height is lower than 6 ft.

EXTENSION

Landing

After retard, when at least one landing gear is on ground, the ground spoilers partially extend. This partial extension, by decreasing the lift (lift dumping), will ease the touchdown of the aircraft, and will, consequently, lead to the full extension of the ground spoilers.

L3 During a partial extension:
- The deflection of spoilers 1 and 2 is 10 °
- The deflection of spoilers 3 to 8 is 15 °
- The ailerons are not deflected.

The extension rate is 5 °/s.

L1 The ground spoilers fully extend when three main landing gears are on ground.

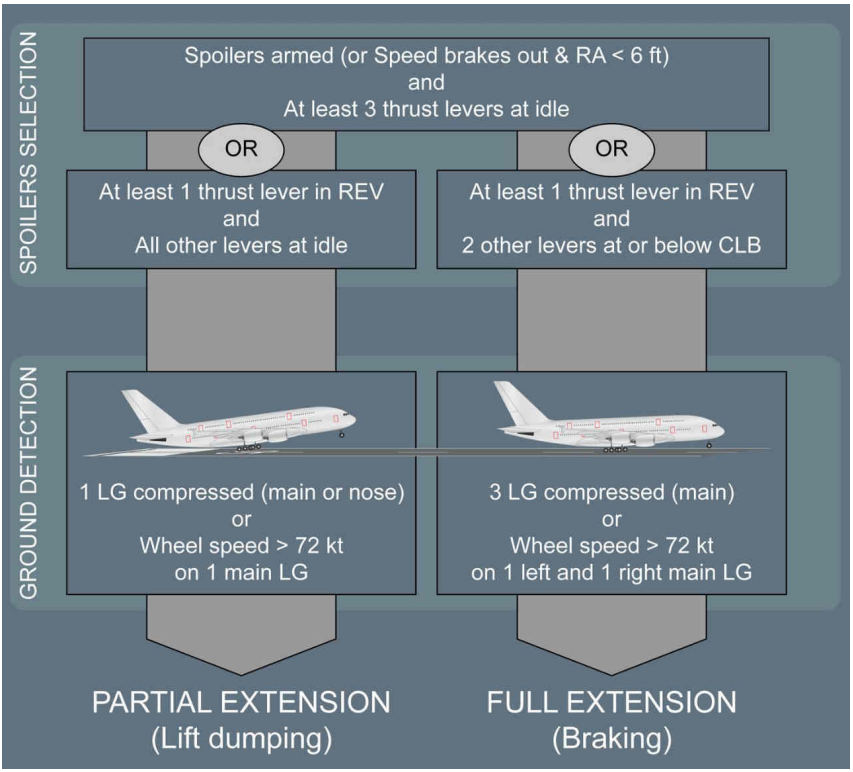
Note: If the ground spoilers are not armed, they will automatically extend when the reversers are selected.

L3 During a full extension:
- The deflection of spoilers 1 and 2 is 35 °
- The deflection of spoilers 3 to 8 is 50 °
- The deflection of the ailerons is 25 ° up.

L2 The roll function of the spoilers is inhibited below 110 kt, when the spoilers are used for the ground spoiler function. Roll control is available through ailerons.

L3 The extension rate is 17 °/s.

Ground Spoiler Logic for Landing



L1 Rejected Takeoff

The ground spoilers fully extend when the thrust levers are at idle and the speed is greater than 72 kt.

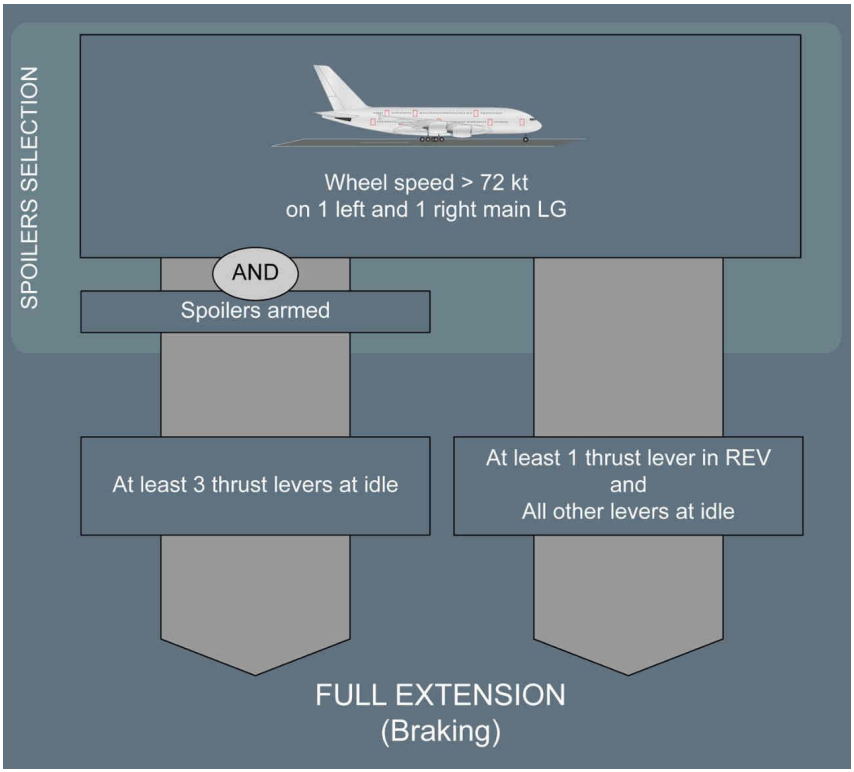
Note: *If the ground spoilers are not armed, they will automatically extend when the reversers are selected and the speed is greater than 72 kt.*

L3 During a full extension:

- The deflection of spoilers 1 and 2 is 35 °
- The deflection of spoilers 3 to 8 is 50 °
- The deflection of the ailerons is 25 ° up.

The extension rate is 17 °/s.

Ground Spoiler Logic for RTO



L2 Partial Extension with all PRIMs failed

When all PRIMs are failed, the ground spoilers partially extend, when the two body landing gears are compressed.

L1 **RETRACTION**

The ground spoilers retract when:

- The thrust reversers are stowed and the flight crew disarms the ground spoilers (by pushing down the SPEED BRAKE lever), or
- The flight crew sets at least two thrust levers above the CLB detent.

L3 The retraction rate is 17 °/s.

EHA / EBHA

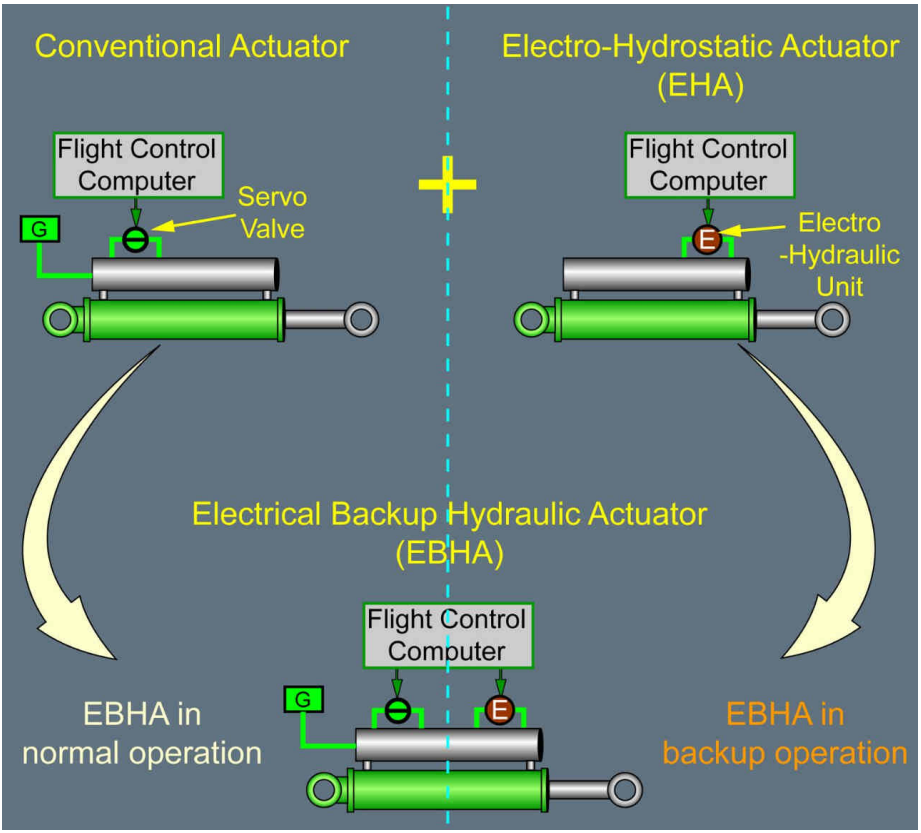
Applicable to: ALL

On most civil aircraft, there are at least three hydraulic systems, to ensure sufficient redundancy for flight controls and landing gear systems.
On the A380, to reduce the aircraft weight and maintenance costs, there are only two hydraulic systems. Equivalent redundancy is achieved with electro-hydraulic actuators.
Electro-hydraulic actuators use electrical power to locally generate their own hydraulic pressure to move a flight control surface. Each electro-hydraulic actuator has its own self-contained hydraulic reservoir.

There are two types of electro-hydraulic actuators:

- Electro-Hydrostatic Actuators (EHA) : Powered by one electric system
- Electrical Backup Hydraulic Actuators (EBHA) : Powered by one electric or one hydraulic system.

EHA / EBHA



ELECTRO-HYDROSTATIC ACTUATOR (EHA)

Except for spoilers, each surface has two actuators. When EHAs are installed, they are the backup of the conventional actuator.

Each EHA has:
- Its own hydraulic reservoir
- An electric hydraulic pump
- A hydraulic actuator.

L2 On ground, when hydraulic power is available, the reservoir of the EHA is automatically refilled, if needed. The hydraulic fluid is taken from the hydraulic systems (green or yellow).

L1 ELECTRICAL BACKUP HYDRAULIC ACTUATOR (EBHA)

The EBHA is a combination of a conventional actuator and of an EHA.
When hydraulic power is available, the EBHA behaves like a conventional actuator.
When hydraulic power is lost, the EBHA behaves as an EHA.

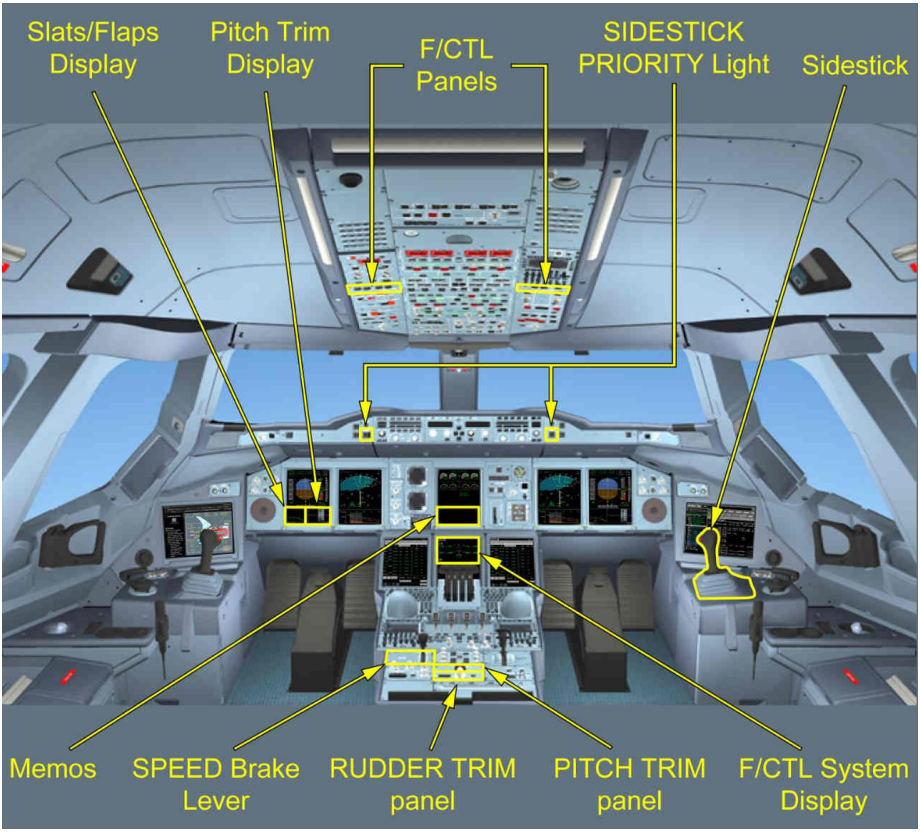
Each EBHA has:
- A servo valve for the hydraulic mode
- An electric hydraulic pump for the electric mode
- Its own hydraulic reservoir for the electric mode
- A hydraulic actuator.

L2 In electric mode, the EBHA is isolated from the hydraulic system. The reservoir is filled when hydraulic power is available.

COCKPIT VIEW

Applicable to: ALL

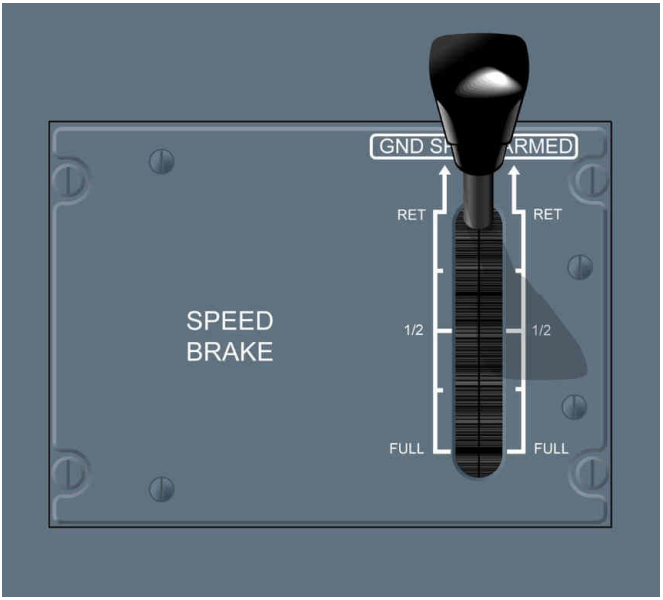
General



SPEED BRAKE lever

Applicable to: ALL

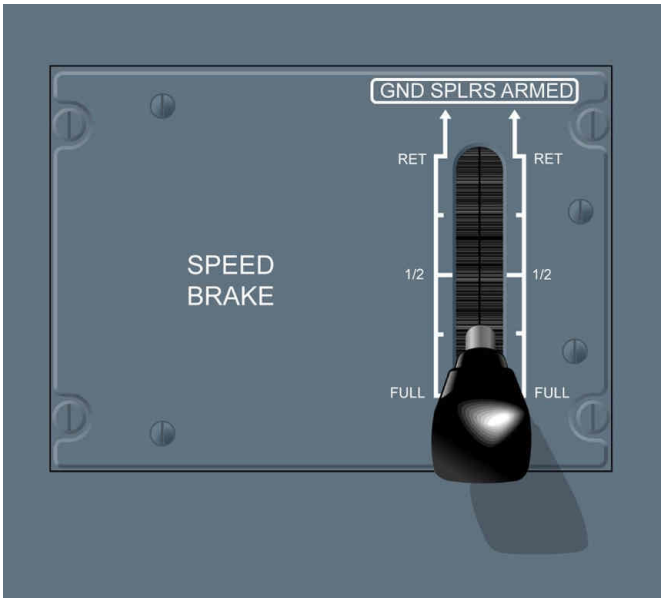
SPEED BRAKE Lever



The Speed Brake lever:

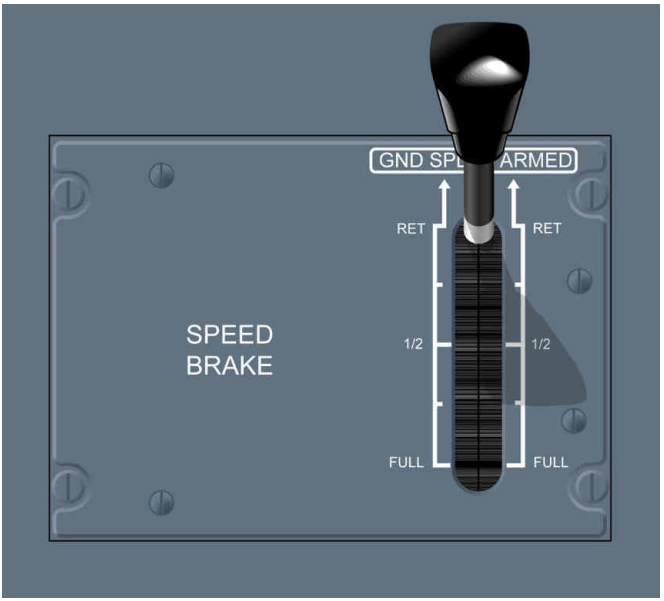
- Controls the speed brakes position
  The flight crew can set any intermediate position from RETracted to FULL.
  The flight crew must push the lever down to set it at the required position.

Speed Brakes 3/4 EXTENDED



- Arms the ground spoilers
  When the lever is in GND SPLRS ARMED position, the spoilers automatically extend at landing or in the case of a rejected takeoff.
  To arm the ground spoilers, the flight crew must pull the lever when it is in the RET position. A white band appears around the base of the speed brake lever, to indicate that the spoilers are armed.

Ground Spoilers Armed



PITCH TRIM sw

Applicable to: ALL

PITCH TRIM sw

Controls the position of the Trimmable Horizontal Stabilizer.

It moves the THS at the following speed:

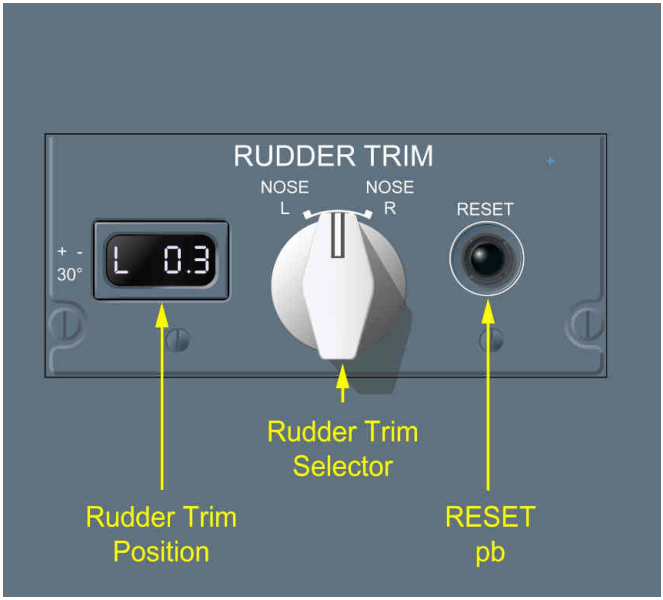
- In clean configuration : 0.15 °/s
- With slats/flaps extended : 0.25 °/s
- When both hydraulic systems are failed (electric motor only) : 0.1 °/s

The PITCH TRIM sw is composed of two switches, which are spring loaded to neutral.
In order to move the pitch trim, both switches must be pressed simultaneously.
On ground, the PITCH TRIM sw has priority over the automatic takeoff trim setting.
The PITCH TRIM sw is inhibited in flight, except in direct law. (The auto trim function is lost in direct law. USE MAN PITCH TRIM is displayed on the PFD.).

RUDDER TRIM PANEL

Applicable to: ALL

RUDDER TRIM Panel



Rudder Trim selector

Controls the rudder trim position.

L2 It moves the neutral point of the artificial feel by an equivalent of:
- In clean configuration : 0.5 °/s of rudder travel for quick inputs
  1.5 °/s for inputs longer than 1.5 s
- With slats/flaps extended : 1.5 °/s of rudder travel for quick inputs
  3 °/s for inputs longer than 1.5 s

L1 *Note: The rudder trim selector is not active with the autopilot engaged.*

RESET pb

Resets the rudder trim position.

L2 When pressed, the rudder trim position is ordered to zero at 3 °/s.

L1 *Note: The reset pb is not active with the autopilot engaged.*

RUDDER TRIM POSITION

Indicates the position of the rudder trim.

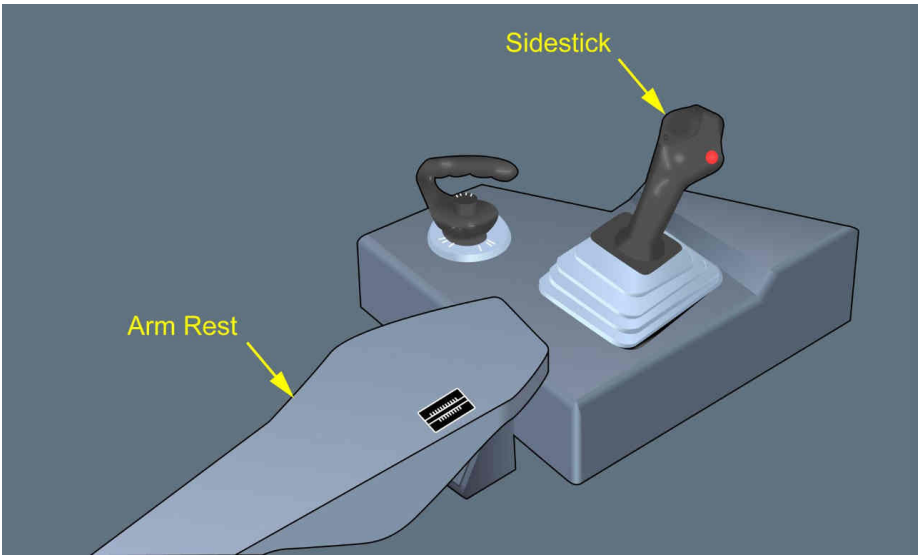
The rudder trim is 19.7 ° to the left.

The rudder trim is 6.3 ° to the right.

SIDESTICKS

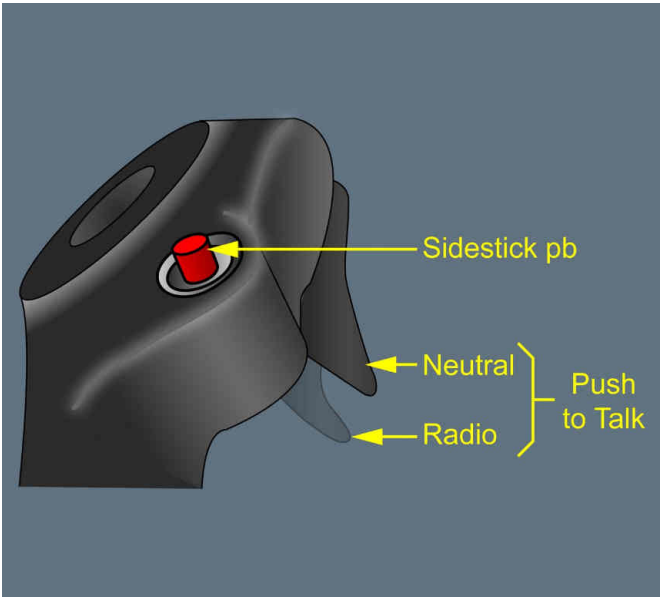
Applicable to: ALL

Lateral Console



SIDESTICKS

Sidestick



The flight crew uses two sidesticks, one on each side, to control pitch and roll.
The sidesticks are springloaded to neutral. They are not mechanically linked, and do not receive feedback from the flight control surfaces.
When the autopilot is engaged, the sidesticks are locked in the neutral position.

If a flight crewmember applies a force above a given threshold:
- The sidesticks unlock
- The autopilot disengages
- The AUTO FLT AP OFF alert triggers.

L3 The autopilot disengages when a pilot applies a force of more than 5 daN in pitch, or 3.5 daN in roll.

L1 *Note:* *This is not the recommended method for autopilot disengagement. For more information, Refer to DSC-22-FG-40-30 Manual Disengagement .*

Each sidestick has two controls:
- The Radio Push To Talk switch
- The sidestick pb , for autopilot disengagement, or sidestick priority.

SIDESTICK PRIORITY LOGIC

At all times, only one flight crewmember should fly the aircraft.
However, if both flight crewmembers use their sidesticks simultaneously, their orders are algebraically added.

L2 The flight control laws limit the combined order to the equivalent of the full deflection of one sidestick.

L1 A flight crewmember can deactivate the other sidestick and take full control, by pressing and keeping pressed the sidestick pb .
If a flight crewmember presses their sidestick pb during 30 s , the other sidestick is permanently deactivated, until any flight crewmember presses their sidestick pb .
If both flight crewmembers press their sidestick pb , the last pilot to press gets the priority.

L2 If one sidestick was deactivated on ground, the CONFIG L(R) SIDESTICK FAULT (BY TAKE-OVER) alert is triggered at takeoff power application, or during the TO CONFIG test.

ARM REST

The armrest on the sidestick side of the Captain and F/O seats are adjustable.
Correctly adjusting the seat eases the handling of the sidestick.
For information on how to adjust the armrest: *Refer to Description of CAPT and F/O seats* .

SIDESTICK PRIORITY light

Applicable to: ALL

SIDESTICK PRIORITY

No dual input

The SIDESTICK PRIORITY lights are on the glareshield.
There is no dual input, and no flight crewmember presses their sidestick pb.

DUAL INPUT

Dual Input

Both flight crewmembers simultaneously move their sidesticks.
The sidestick orders are algebraically added.
The CAPT and F/O lights flash, and the DUAL INPUT callout is triggered.

Dual Input Synthetic voice

PRIORITY LEFT

Priority Left

The Captain presses their sidestick pb. The PRIORITY LEFT callout is triggered.

Priority Left Synthetic voice
The CAPT light comes on, only if the First Officer moves their sidestick.

PRIORITY RIGHT

Priority Right

The First Officer presses their sidestick pb. The PRIORITY RIGHT callout is triggered.

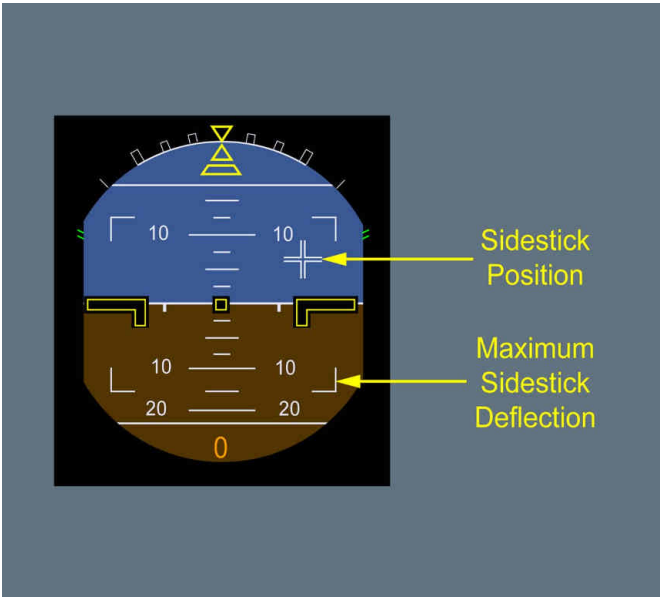
Priority Right Synthetic voice
The F/O light comes on, only if the Captain moves their sidestick.

SIDESTICK INDICATION ON PFD

Applicable to: ALL

SIDESTICK INDICATION ON PFD

Sidestick Position Indication

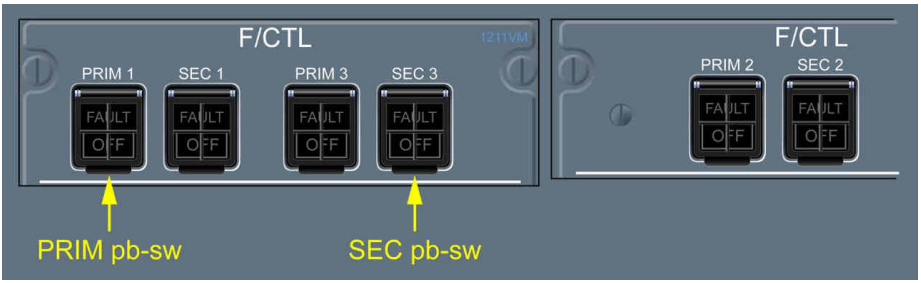


On ground, after the first engine start, the sidestick position indication appears on both PFDs.
It corresponds to the sum of both sidestick orders.
The indication disappears after liftoff.

F/CTL PANELS

Applicable to: ALL

F/CTL Panels



PRIM pb-sw

The corresponding PRIM is on.

The corresponding PRIM is off.
Switching it OFF then on resets it.

L12

The corresponding PRIM is failed.

Associated with the following ECAM alert:
- F/CTL PRIM 1(2)(3) FAULT (*Refer to procedure*).

The FAULT light goes off, when the flight crew selects OFF .
The FAULT light flashes during the PRIM safety test.

SEC pb-sw

The corresponding SEC is on.

The corresponding SEC is OFF.
Switching it OFF then on resets it.

L12

The corresponding SEC is failed.

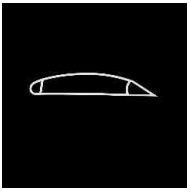
Associated with the following ECAM alert:
- F/CTL SEC 1(2)(3) FAULT (*Refer to procedure*).

The FAULT light goes off, when the flight crew selects OFF .
The FAULT light flashes during the SEC safety test.

SPOILER INDICATION ON THE SLATS/FLAPS DISPLAY

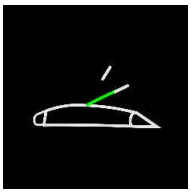
Applicable to: ALL

For slats/flaps position information: *Refer to DSC-27-20-30-273001 Slats/flaps displays*
For landing gear position information: *Refer to DSC-32-20-150 Slat/Flap Display*



The speed brakes are retracted.

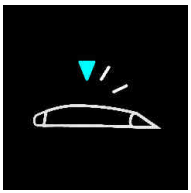
L12



The speed brakes are extended.
The speed brake scale is displayed as soon as the speed brake lever is moved out of the retracted position.

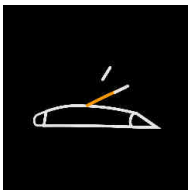
- The first line of the scale corresponds to the half extended position
- The second line of the scale represents the fully extended position in flight.

Note: The displayed position is the position of SPEED BRAKE lever . The actual position of the speed brakes is displayed on the F/CTL system display.



Ground spoilers are armed.
The blue triangle represents the fully extended position of the ground spoilers.

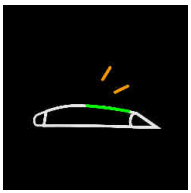
L12



Displayed when one of the following conditions is true:
- In cruise, the speed brakes have been extended for 50 s and at least one engine is not at idle.
- Below 800 ft , the speed brakes have been extended more than 5 s

Associated with the following ECAM alert:
- F/CTL SPD BRKs STILL EXTENDED (*Refer to procedure*)

L12



In cruise, the speed brake position does not correspond to the speed brake lever position.

Associated with the following ECAM alert:
- F/CTL SPD BRKs POSITION/LVR DISAGREE (*Refer to procedure*)

PITCH TRIM DISPLAY

Applicable to: ALL

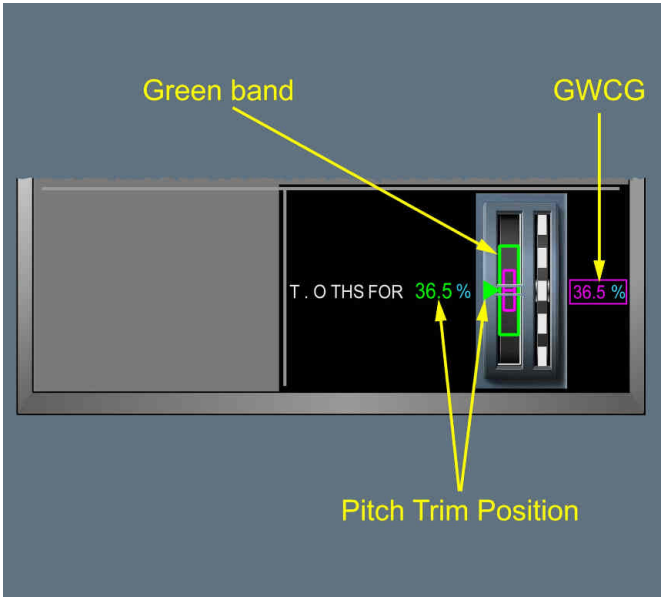
The pitch trim position is displayed on ground, before takeoff and after landing.

L3 - After takeoff, it disappears when the aircraft is 50 ft above the runway
- After landing, it is displayed when the ground speed is below 30 kt .

For touch and go:
- The pitch trim position appears, when:
  - The aircraft is on ground
  - The speed is below 80 kt
  - And, as soon as one of the following occurs:
    - Spoilers are disarmed
    - Flaps are retracted one step
    - The engine levers are moved out of idle
    - The flight crew presses the Pitch Trim switches.
- The pitch trim position disappears, when the aircraft takes off.

L1 *Note:* *The pitch trim position is also available on the F/CTL system display.*

Pitch Trim Display



The following are displayed:

- The Green Band
  The green band is the range of pitch trim positions for which takeoff has been certified, whatever the aircraft's CG inside the takeoff envelope.

L2 The green band ranges from 29 % to 43 %
This corresponds to a pitch trim position from 5.8 ° Nose Up to 0.2 ° Nose Down.

L1 - The aircraft GWCG
The GWCG is displayed before takeoff, and after first engine start.

L3 In addition, one hydraulic system must be pressurized.
The GWCG disappears, when the aircraft is 50 ft above the runway.
For touch and go, the GWCG appears and disappears with the pitch trim position.

L2 The GWCG is computed by the FQMS , based on the ZFW and ZFCG entered by the crew, and the FOB .

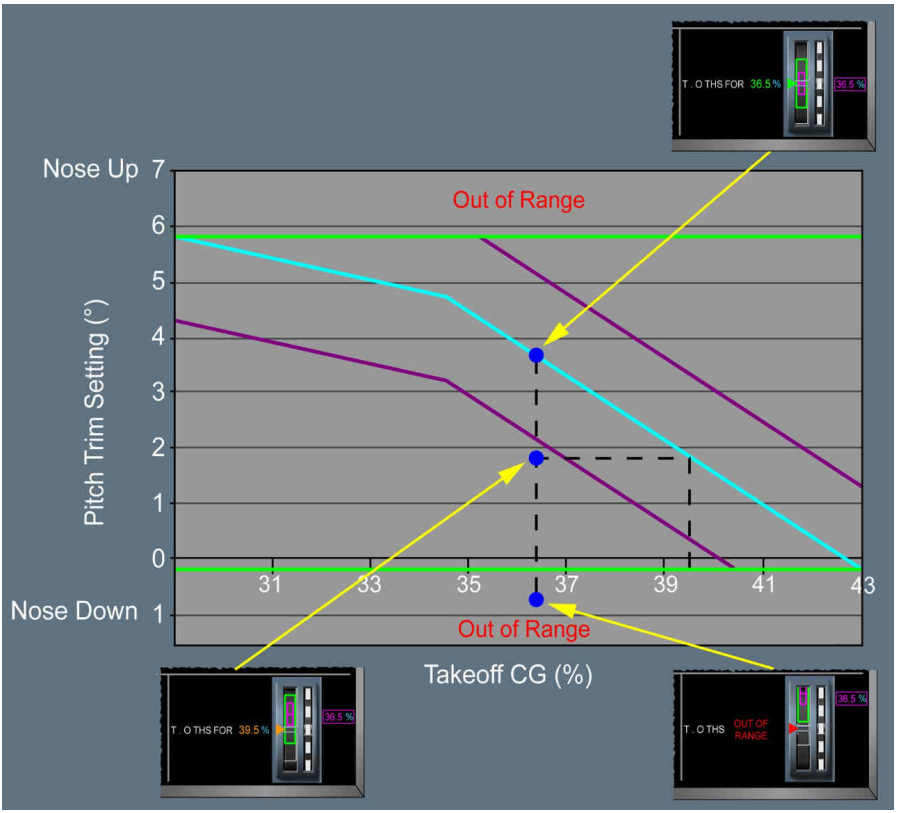
L1 - The position of the pitch trim, and the associated takeoff CG .

L2 In order to always have the same aircraft behavior at rotation, there is an optimum pitch trim setting for each takeoff CG.
This optimum pitch trim setting for takeoff is provided in the following graphic.

L1 **PITCH TRIM SETTING FOR TAKEOFF**

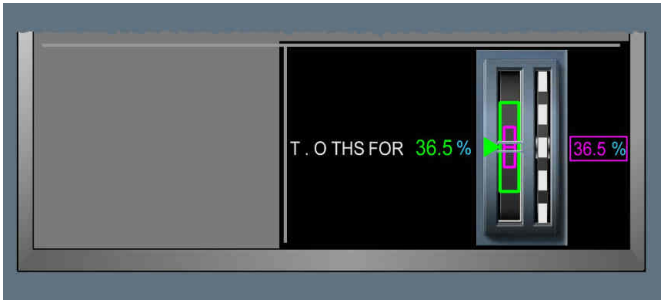
The pitch trim is automatically set for takeoff, based on the aircraft's CG (For more information: *Refer to Automatic Pitch Trim Setting*). The pitch trim display enables to check the correct setting of the pitch trim, prior to takeoff.

Pitch Trim setting for takeoff



PITCH TRIM SETTING AT TAKEOFF TARGET

Pitch Trim Position Indication

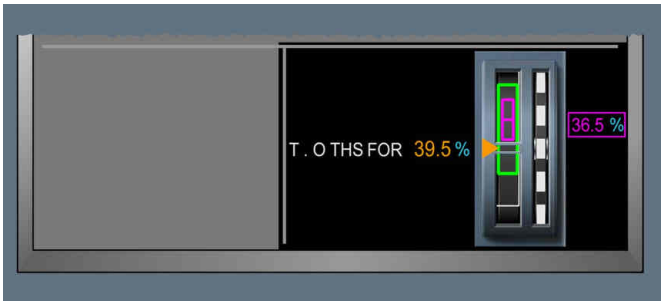


The pitch trim setting for takeoff is correct.

L2 The position of the pitch trim is within 1.5 ° of the optimum pitch trim position for takeoff for the current aircraft GWCG .

L1 **PITCH TRIM NOT AT TARGET**

Pitch Trim Not at Target



The position of the pitch trim is within the green band, but is not correct for takeoff.

L2 The position of the pitch trim is more than 1.5 ° away from the optimum pitch trim position for takeoff for the current GWCG .

In this example, the takeoff CG is 36.5%. The associated optimum pitch trim setting is 3.6 ° nose up, but the pitch trim is set at 1.8 ° nose up (i.e. beyond the 1.5 ° margin around the optimum pitch trim setting).

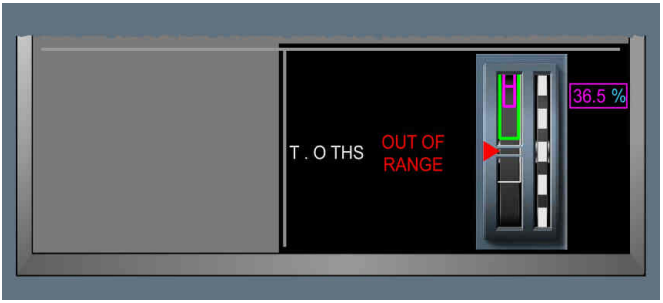
1.8 ° nose up is the optimum pitch trim setting when the takeoff CG is 39.5%.

Associated with the following ECAM alert:

- F/CTL PITCH TRIM/FMS/CG DISAGREE (*Refer to procedure*)

L1 **PITCH TRIM OUT OF THE GREEN BAND**

Pitch Trim Out of Green Band

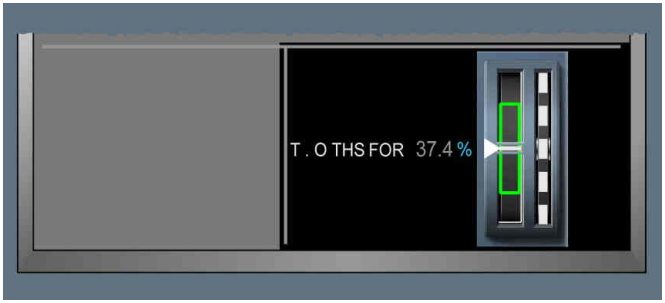


The pitch trim is out of the green band.

L2 Associated with the following ECAM alert:
- CONFIG PITCH TRIM NOT IN T.O RANGE (*Refer to procedure*)

L1 **PITCH TRIM AFTER LANDING**

Pitch Trim after landing



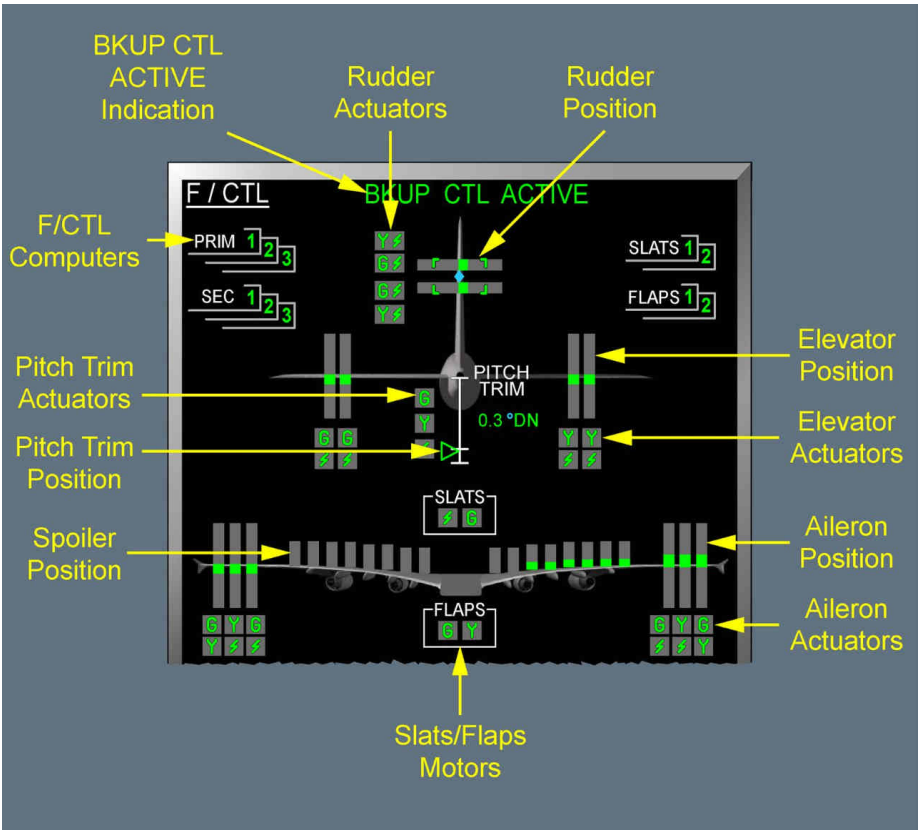
After landing, the pitch trim is reset to 0° (maintenance position).

F/CTL SYSTEM DISPLAY

Applicable to: ALL

The primary flight controls appear on the F/CTL System Display as if looking from the rear of the aircraft.

F/CTL System Display



F/CTL COMPUTERS

The status of the F/CTL computers (PRIM, SEC, SLATS and FLAPS computers) is displayed as follows:

The computers operate normally.

PRIM 2 is failed.

BKUP CTL ACTIVE INDICATION

Backup control is active.

RUDDER ACTUATORS

Each rudder is actuated by two EBHAs.
Each EBHA is powered by one hydraulic system and one electrical system.

The power supplies are available and the actuator is operating normally.

The hydraulic power supply is failed.

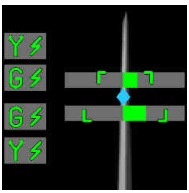
The status of the electrical power supply is not available.

The hydraulic part of the actuator is failed.

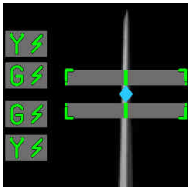
The actuator is failed.

RUDDER POSITION

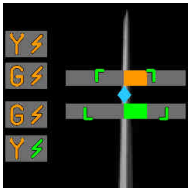
RUDDER POSITION



In flight, with the rudder travel limiter position indication.

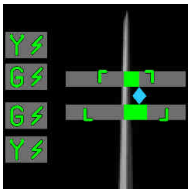


On ground, with maximum deflection indicators.
The maximum deflection indicators are displayed on ground only. They are used for the flight control check, to be sure that full surface deflection is available.
The rudder travel limiter is fully open.

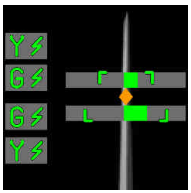


The power supplies of the upper rudder are failed.

RUDDER TRIM POSITION

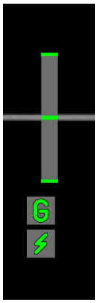


The rudder trim position is represented by a blue diamond.

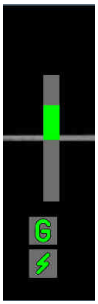


The rudder trim is failed.

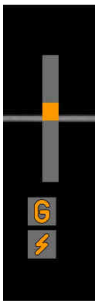
ELEVATOR POSITION



On ground, in neutral position, with maximum deflection indicators.
The maximum deflection indicators are displayed on ground only. They are used for the flight control check, to be sure that full surface deflection is available.



In flight, deflected upwards.



The power supplies of the elevator are failed.

ELEVATOR / AILERON / PITCH TRIM ACTUATORS

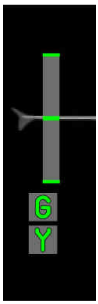
The power supply is available and the actuator is operative.

The power supply is failed.

The status of the power supply is not available.

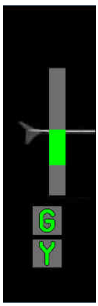
The actuator is failed, but the power supply is available.

AILERON POSITION



On ground, in neutral position, with maximum deflection indicators.
The maximum deflection indicators are displayed on ground only. They are used for the flight control check, to be sure that full surface deflection is available.

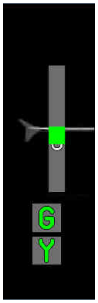
L13



In flight, deflected downwards.

Note: *In cruise, to optimize fuel consumption, the neutral position of the ailerons is 1° down.*

The power supplies of the aileron are failed.



When the flaps are extended (CONF 1+F, 2, 3, and FULL), the neutral position of the ailerons is 5 ° down.
The neutral position in high-lift configurations (aileron droop) is represented by a white round symbol.

SLATS/FLAPS MOTORS

Both power supplies are available and both motors are operative.

One power supply is failed.

The status of one power supply is not available.

One motor is failed.

SPOILER POSITION

All spoilers are used as speedbrakes and ground spoilers.
Spoilers 3 to 8 are also used for roll control.

On ground, in retracted position, with maximum roll control indicator (green line).
The maximum deflection indicator is displayed for spoilers 3 to 8, and on ground only. It is used for the flight control check, to be sure that full surface deflection is available.

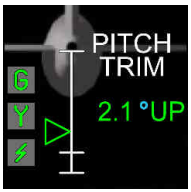
The spoiler is deflected in flight.

The spoiler is deflected and failed.

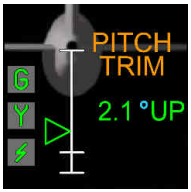
The spoiler is fully retracted and failed.

Speedbrakes indication is also displayed on the SLATS/FLAPS display (*Refer to DSC-27-10-20 Spoilers Indications on the Slats/Flaps Display*).

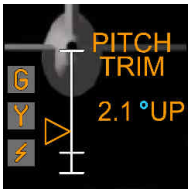
PITCH TRIM POSITION



The pitch trim is set to 2.1 ° UP.
The pitch trim position ranges from 2 ° DN to 15 ° UP.



The pitch trim command is jammed.



The pitch trim is failed due to green, yellow and electrical power supply failure.

MEMOS

Applicable to: ALL

GND SPLRs ARMED	The ground spoilers are armed.

Intentionally left blank

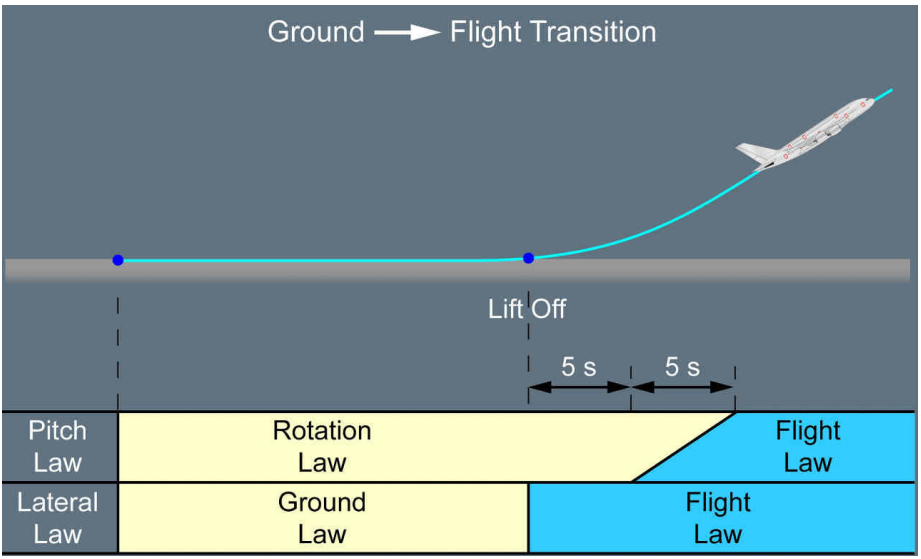
GENERAL

Applicable to: ALL

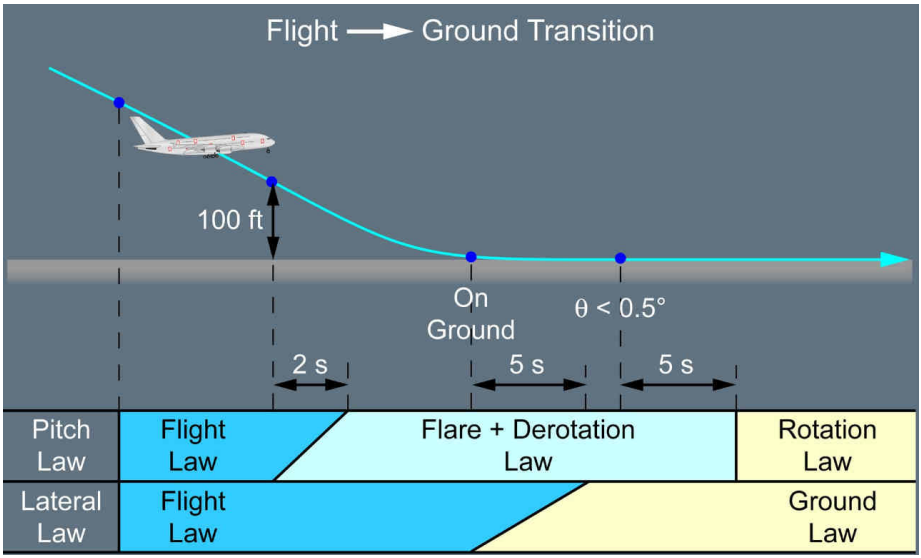
The normal flight control laws provides aircraft control on the 3 axis.

The characteristics of the normal law vary with the flight phase:
- On ground,
- In flight,
- During flare.

Ground to Flight transition



Flight to Ground transition

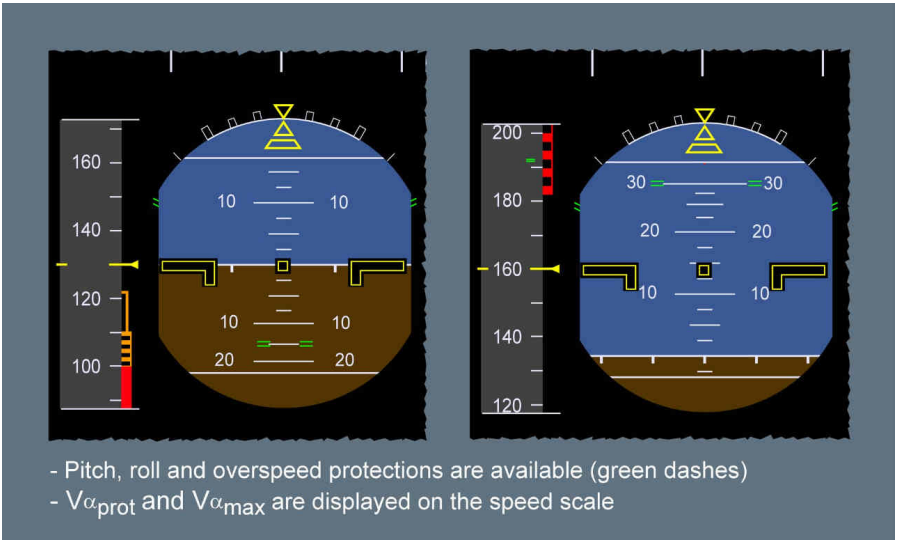


The normal law also provides the following flight envelope protections:
- Load factor protection (For more information: *Refer to DSC-22-27-20 Load Factor Protection*)
- Pitch attitude protection (For more information: *Refer to DSC-22-27-20 Pitch Attitude Protection*)
- Angle of attack protection (For more information: *Refer to DSC-22-27-20 High Angle of Attack Protection*)
- High speed protection (For more information: *Refer to DSC-22-27-20 High Speed Protection*)
- Bank angle protection (For more information: *Refer to DSC-22-27-20 Bank Angle Protection*).

The normal law also provides structural load alleviation, both in maneuver and in turbulence (*Refer to DSC-27-10-30 Load Alleviation Function*).

PFD DISPLAY

PFD Display in Normal Law



PITCH CONTROL

Applicable to: ALL

ROTATION LAW

The objective of the rotation law is to provide an homogeneous rotation for all possible weight, CG and configurations, while minimizing the risk of a tail strike.
The rotation law is a direct law, with some damping provided in case of a high pitch rate, to minimize the risk of a tail strike.

L2 This damping depends on:
- The pitch rate
- The tail clearance
- The sidestick position.

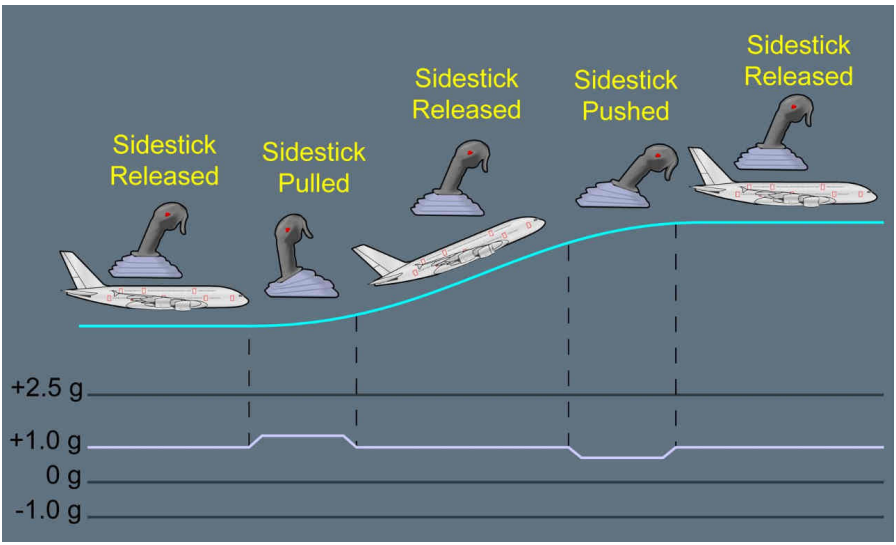
L1 *Note:* *A tailstrike indication is also available on the PFD . Refer to DSC-31-20-20-30-10 Tail Strike Pitch Limit*

The rotation law is active on ground, after nose wheel touchdown.

FLIGHT LAW

The normal law in flight is a load factor demand law with auto trim and full flight envelope protection.
In manual flight, the normal law provides elevator and pitch trim control from the sidesticks, to achieve a load factor which is a function of the sidestick deflection, independent of the aircraft speed.
With the sidestick at neutral and the wings level, the flight control system maintains 1g in pitch, corrected for pitch attitude. There is no need for the pilot to trim with speed and configuration changes.
In normal turns (up to 33° of bank), no pitch correction is required once the turn is established.

Pitch Normal Law



The normal flight law is available in flight from 5 s after liftoff, to below 100 ft during the approach. (The normal flight law is gradually phased-in during 5 s, 5 s after liftoff).
L2 The transition to the flight law is reduced to 2 s, if the angle of attack protection, or the pitch attitude protection is active.

FLARE + DEROTATION LAW

The objective of the flare law is to:
- Provide a conventional aircraft behavior during the flare
- Allow a precise control of the vertical speed and touchdown point
- Provide a smooth derotation and avoid hard nosewheel touchdown.

The flare law is a direct law without autotrim, with some damping provided by load factor and pitch rate feed back.
The flare law provides full elevator authority
The flare law is active below 100 ft.

L3 *Note: If radio altitude is lost, the flare law is active when the gear is down.*

LATERAL CONTROL

Applicable to: ALL

GROUND LAW

The objective of the lateral ground law is to facilitate aircraft handling on ground.
The lateral ground law is a full authority control law in roll and yaw, with some yaw damping. However, for small sidestick deflections, the lateral ground law helps the pilot to keep a small bank angle (less than 2 °), using only the ailerons. In particular, when the sidestick is at neutral, the law will aim to keep the wings level.

L2 When rudder pedal deflection is close to maximum, yaw damping is removed.

L1 The ground law is gradually phased in during 5 s after touchdown.

RUDDER DEFLECTION WITH DIFFERENTIAL BRAKING

In order to have adequate directional control in the case of a rudder pedal fault or jammed rudder pedals, differential braking controls the rudder and nosewheel steering.

L2 Differential braking control of the rudder is available when:
- The aircraft is on ground
- The autopilot is not engaged
- The speed is greater than 50 kt.

L1 When the differential braking is greater than 50%, the PRIMs order a rudder deflection, in addition to the rudder pedal order.

L2 *Note: The differential braking rudder deflection order is limited when the rudder pedals are not at 0 °.*

L3 **ENGINE FAILURE AT TAKEOFF**

To increase yaw efficiency in the case of an engine failure during takeoff, all the ailerons and spoiler 3 can be deflected on the wing opposite to the failed engine.

Note: Increasing yaw efficiency in the case of an engine failure on ground, reduces the VMCG, and therefore improves the takeoff performance.

The ailerons and spoiler will be deflected when:
- The aircraft is on ground
- The speed is greater than 60 kt
- The rudder pedal deflection is greater than 2/3 of the maximum rudder pedal deflection.

The inner and outer ailerons will be deflected upwards. The mid aileron will be deflected downwards. The aileron and spoiler deflection is proportional to the rudder pedal deflection.

When the rudder reaches its full deflection (30 °)
- The inner and outer ailerons reach their full upwards deflection (30 °)
- The mid ailerons reaches its full downwards deflection (20 °)
- Spoiler 3 reaches 40 °

FLIGHT LAW

The normal lateral law in flight:
- Is a roll rate demand law, by using the sidesticks
- Is a sideslip demand law, by using the rudder pedals.

The normal lateral law provides:
- Full flight envelope protection (maximum bank and sideslip angles)
- Turn coordination, and dutch roll damping.

To improve comfort, both rudders and all ailerons do not simultaneously have the same deflection. The flight law is available in flight, gradually phased-in during 5 s after liftoff.

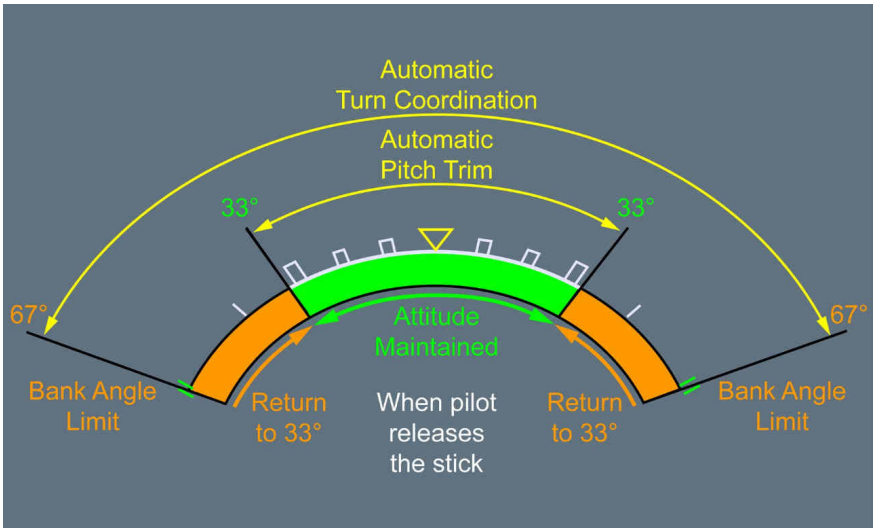
ROLL RATE DEMAND

In manual flight, the normal law provides aileron and spoiler control from the sidesticks, to achieve a roll rate which is proportional to the sidestick deflection, independent of the aircraft speed.

L3 With a full sidestick deflection, the maximum achievable roll rate is 15 °/s.

The maximum roll rate can be limited:
- To 7.5 °/s, if angle of attack protection is active
- Between 7.5 °/s and 15 °/s, in case of an engine failure, depending on the thrust asymmetry.

Bank Angle Protection



L1 When the bank angle is less than 33 °, the normal law:
- Maintains a constant bank angle when the sidestick is at neutral (neutral spiral stability)
- Provides automatic pitch trim (turn compensation).

When the bank angle is above 33 °,
- The bank angle returns to 33 ° if the sidestick is at neutral (positive spiral stability is restored)
- Automatic pitch trim is not available (aft pressure on the sidestick is needed to maintain altitude).

The maximum achievable bank angle is:
- 67 ° in clean configuration
- 60 ° in high lift configurations
- 45 ° if the minimum pitch attitude protection is active
- 45 ° if the high speed protection is active (in this case, the bank angle returns to 0 when the sidestick is at neutral)
- Limited by the maximum achievable load factor, when angle of attack protection is active (The maximum achievable bank angle is greater than 45 °).

SIDESLIP DEMAND

In manual flight, the normal law provides rudder control from the rudder pedals, to achieve a sideslip which is proportional to the pedal deflection, independent of the aircraft speed.
For a given sideslip angle, the aircraft will stabilize at a given roll angle.

The sideslip is limited by the flight control computers.

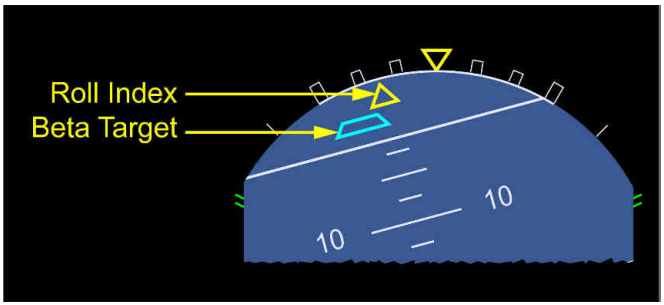
L2 The maximum sideslip is between:
- 2 ° at VMO
- 15 ° in CONF 3 and CONF FULL, at approach speed.

Note: When maximum sideslip is reached, pushing any further on the rudder pedals will have no effect.

L1 Engine Failure

In case of an engine failure, the lateral law provides sideslip and bank angle with a slowly diverging heading, as with a conventional aircraft.
During takeoff, the sideslip display is modified to ensure optimum takeoff performance. By centering the blue Beta target, the total aircraft drag is minimized. It results in a compromise between the drag produced by the flight control surfaces deflection and the drag produced by the sideslip of the airframe.

Beta target



LOAD ALLEVIATION FUNCTION

Applicable to: ALL

The aim of the Load Alleviation Function (LAF) is to reduce the fatigue and static loads on the wing.
The LAF is part of the normal pitch law.

L2 The LAF is available:
- In normal law and can also be available in alternate law
- When the speed is above 190 kt

The LAF is inhibited in CONF FULL.

L1 The LAF includes:

- The Passive Turbulence Alleviation (PTA)
- The Active Turbulence Alleviation (ATA)

PASSIVE TURBULENCE ALLEVIATION

The PTA reduces the static loads in turbulence and during maneuvers, by reducing the wing bending moment. This is done by symmetrically deflecting the ailerons and/or the outer spoilers upwards.

L2 The deflection of the ailerons and spoilers depends on the aircraft speed and the load factor.
A maximum of 15 ° of ailerons and/or spoilers can be added to the roll order.
Below 220 kt, the spoilers are not deflected. Above 220 kt, spoilers will be deflected above 1.7 g.

L3 The inner elevators are used to compensate for the ailerons and/or spoilers deflection.

L1 **ACTIVE TURBULENCE ALLEVIATION**

The ATA reduces fatigue and static loads by damping wing bending modes. This is done by symmetrically deflecting the ailerons.

L2 The deflection of the ailerons depends on the vertical acceleration measured by six accelerometers, located in the outboard engine pylons.
A maximum of 7 ° of ailerons (up or down) can be added to the roll order and/or the PTA order.

Intentionally left blank

RECONFIGURATION

Applicable to: ALL

A single failure cannot lead to the loss of the normal flight control law.
However, a combination of failures may result in a degradation of the flight control laws. The level of degradation will depend on the severity of the failures.
This degradation of the flight control laws is referred to as reconfiguration.

There are two reconfiguration levels:
- Alternate law (*Refer to DSC-27-10-40-DSC271040A Alternate Law*)
- Direct law (*Refer to DSC-27-10-40 Direct Law*).

			ELEC EMER CONFIG
			NAV ADR 1+2+3 FAULT
			3 gyrometers are failed
			FUEL WEIGHT DATA DISAGREE (if > 90 tons, and failure occurs after slats retraction)

In addition, the following enable aircraft control, in exceptional conditions:
- Abnormal attitude law, when the aircraft is far outside of the protected envelope (*Refer to DSC-27-10-40 Abnormal Attitude Law*)
- Electrical Backup mode, when all flight control computers are lost (*Refer to DSC-27-10-40 Backup Control*).

ALTERNATE LAW

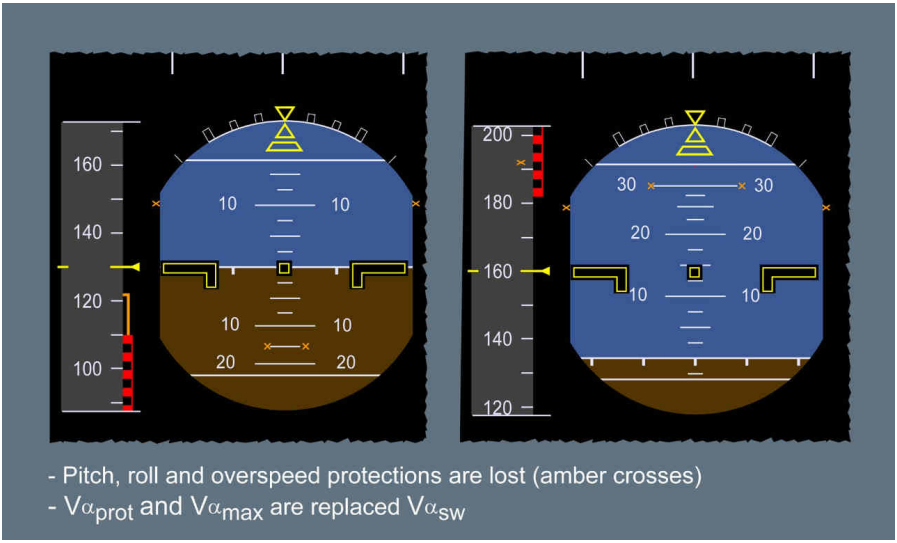
Applicable to: ALL

In alternate law:
- The pitch control is similar to the pitch control in normal law
- Depending on the failure:
  - The roll and yaw control is similar to the roll and yaw control in normal law, or
  - The roll and yaw control is almost a direct control, similar to the roll and yaw control of a conventional aircraft.
- Most flight control protections are lost

Depending on the reason for the reconfiguration in alternate law:
- The autopilot may be inoperative, and/or
- The speed is limited to 310 kt to maintain an adequate overspeed margin.

PFD DISPLAY

PFD Display in Alternate Law



L2 ALT 1

ALT 1 is very similar to the normal law.

PITCH CONTROL

The pitch control is similar to the pitch control in normal law.

LATERAL CONTROL

The lateral control law is the same as the lateral normal law.

L2 ALT 2

ALT 2 is similar to normal law in pitch, and to direct law in lateral.

PITCH CONTROL

Identical to pitch control of ALT 1. *Refer to DSC-27-10-40-DSC271040A ALT 1*

LATERAL CONTROL

The lateral control law of ALT 2 consists in roll direct law and yaw alternate law.

Roll Direct Law

In ALT 2 law, there is a direct relationship between the sidestick position and the aileron and spoiler position.
If all the roll surfaces are available (i.e. no hydraulic failure), the maximum achievable roll rate is higher than in normal law.

Yaw Alternate Law

In ALT 2 law, there is a direct relationship between the rudder pedal position and the rudder position.
The Yaw Alternate Law provides dutch roll damping and turn coordination.

PROTECTIONS

All protections are indicated as lost.
L2 Depending on the failure, some protections may still be available. However, these protections are degraded, and are therefore indicated as lost.

L1 HIGH SPEED STABILITY

When lost, the high speed protection is replaced by a high speed stability.
In this case, above VMO/MMO, a nose-up demand is introduced to avoid an excessive speed increase.
The crew can override the high speed stability.
The High speed protection indication on the speed scale is not displayed.
The overspeed warning remains available, whatever the flight control reconfiguration.

LOW SPEED STABILITY

When lost, the angle of attack protection is replaced by a low speed stability.
In this case, at low speeds, a nose-down demand is introduced to avoid further speed reduction.
L2 The nose-down demand is introduced 5 to 10 kt above the stall warning speed, depending on the aircraft weight and configuration.
L1 The pilot can override the low speed stability.
On the speed scale, Vαprot and Vαmax are not displayed. They are replaced by Vsw (Stall Warning Speed).
The STALL warning is available.

PITCH ATTITUDE PROTECTION

Pitch attitude protection may be lost.

BANK ANGLE PROTECTION

Bank angle protection may be lost.
L2 Bank angle protection remains available in ALT 1.

L1 *Note: Because the associated protections are lost, spiral stability is not restored in case of a high angle of attack or an overspeed.*

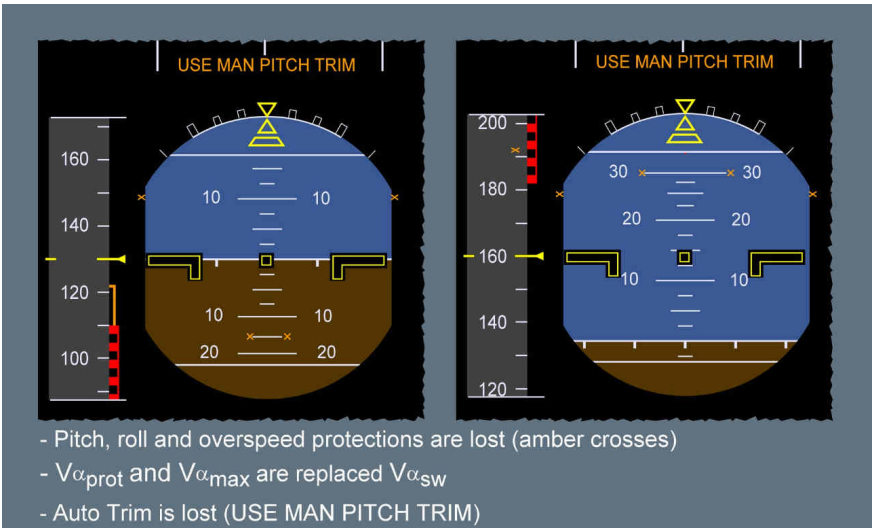
DIRECT LAW

Applicable to: ALL

DIRECT LAW

PFD DISPLAY

PFD Display in Direct Law



PITCH CONTROL

In direct law, there is a direct relationship between the sidestick position and the elevator position.
There is no autotrim. Pitch trim is adjusted via the pitch trim sw.

The speed is limited to:
- 310 kt, to maintain an adequate overspeed margin
- M .86, to maintain an adequate pitch stability.

LATERAL CONTROL

The lateral control in direct law is the same as in ALT 2 law:
- Roll direct law
- Yaw alternate law

PROTECTIONS

All protections are lost.
The OVERSPEED and STALL warnings remain available.

ABNORMAL ATTITUDE LAW

Applicable to: ALL

In the case of an extraordinary unpredictable external event (e.g. mid-air collision) the flight parameters may go far beyond the limits of the protected envelope. In this case, specific control laws are activated to ensure aircraft recovery, and to allow a safe continuation of the flight.

Note: Abnormal attitudes cannot be reached as a consequence of recorded atmospheric disturbance.

L2 The abnormal attitude law is activated if any of the following condition is true:
- Bank angle above 120°
- Pitch attitude above 50° nose up, or 30° nose down
- Speed below 70 kt , or above 420 kt
- Mach below 0.1, or above 0.96
- Angle of attack above 30°, or below -10°

L1 Once the abnormal attitude law is activated:
- The pitch direct law is active
- The roll direct law is active
- The yaw alternate law is active.

After recovery, the flight control system reverts to Alternate law for the remainder of the flight.

BACKUP CONTROL

Applicable to: ALL

In the unlikely event of the loss of all flight control computers (PRIMs and SECs), the backup control provides control and stability of the aircraft.

L2 The backup control has:

- Two Backup Power Supplies (BPS)
  The two BPS are electrical generators, each supplied by one hydraulic system. The BPS start to operate when PRIM 2 and SEC 2 are failed or no longer supplied.
- One Backup Control Module (BCM).
  The BCM is powered by either BPS. It starts to operate when all flight control computers are lost.

L1 The backup control controls the following surfaces:

- Inner ailerons
- Upper and lower rudders
- Outer elevators
- Trimmable Horizontal Stabilizer.

When the backup control is active, the flight crew controls the aircraft via:

- The sidesticks
- The rudder pedals
- The pitch trim switch.

OVERVIEW

Applicable to: ALL

The following are located on each wing, and provide lift augmentation:

- 8 slats surfaces
- L2 2 of these surfaces are droop noses.
- L1 - 3 flaps surfaces
- 3 ailerons, via the aileron droop function.

Slats are electrically and hydraulically-actuated.
Flaps are hydraulically-actuated.
The FLAPS lever is used to select the position of the slats and flaps. This lever is located on the center pedestal.

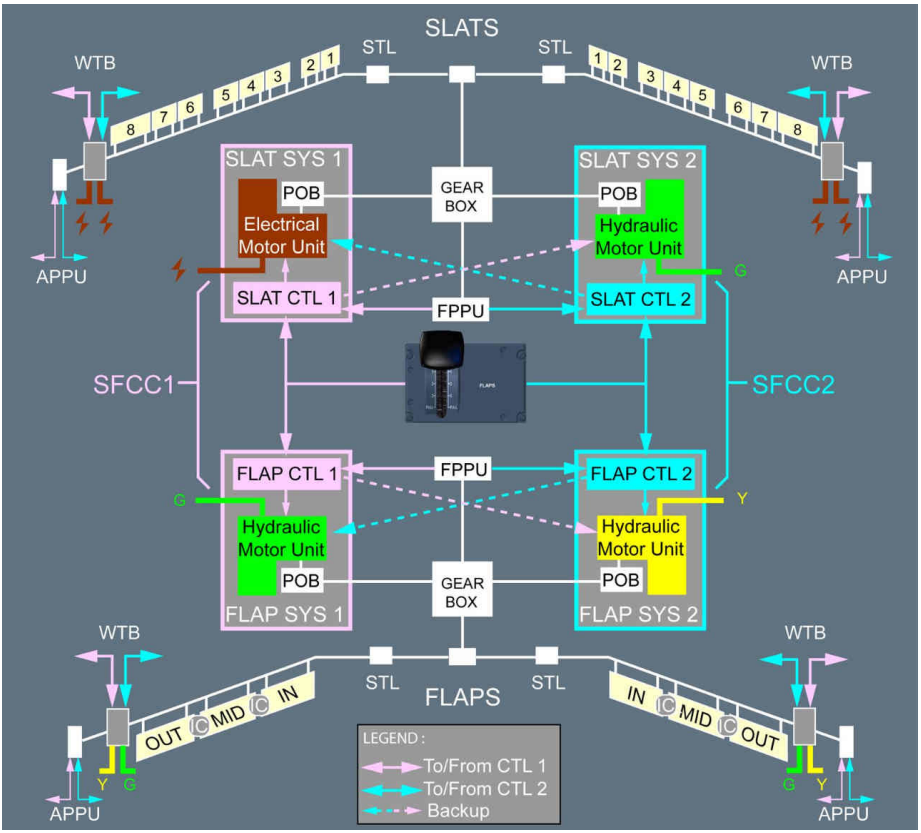
SLATS/FLAPS SYSTEM

Applicable to: ALL

Slats/Flaps architecture



SLAT (FLAP) SYSTEMS

The slats and flaps are monitored and controlled as follows:

- SLAT SYS 1 and SLAT SYS 2 monitor and control the slats
- FLAP SYS 1 and FLAP SYS 2 monitor and control the flaps.

All four systems each have:
- 1 Slats(Flaps) control unit: SLAT(FLAP) CTL 1(2)
- 1 Motor
- 1 Power-Off Brake (POB).

SLATS (FLAPS) CONTROL UNIT

Each slats(flaps) control unit monitors the slats(flaps) and controls the motor of its associated slats(flaps) system.

L2 Each slats(flaps) control unit can also control the other slats(flaps) motor, in case the other slats(flaps) control unit fails. This enables the slats(flaps) to operate normally.

L1 SLAT CTL 1(2) and FLAP CTL 1(2) are part of SFCC 1(2) (Slat Flap Control Computer).

MOTOR

Slats are actuated by:
- One electrical motor, that is supplied by the AC ESS busbar (SLAT SYS 1).

L2 *Note: On ground, the electrical motor is operative, only when the green hydraulic system is pressurized. This prevents inadvertent slats movement with ground personnel around the aircraft.*

L1 - One hydraulic motor, that is supplied by the GREEN hydraulic system (SLAT SYS 2)

Flaps are actuated by:
- One hydraulic motor, that is supplied by the GREEN hydraulic system (FLAP SYS 1)
- One hydraulic motor, that is supplied by the YELLOW hydraulic system (FLAP SYS 2).

L3 **POWER-OFF BRAKE (POB)**

The slats and flaps control units electrically control the POBs.

The POBs will mechanically lock the transmission shaft from the motor to the gearbox:
- When slats (flaps) have reached the selected position
- In case of runaway or asymmetry
- In case of a power supply failure of a motor.

L3 **GEARBOX**

The gearbox adds the speed of the motors of both slats(flaps) systems (speed-summing system). Therefore, slats(flaps) will operate at half speed, if one motor is lost.
The gearbox transfers power to the surfaces, using torque-shaft transmission.

WING TIP BRAKES (WTB)

The Wing Tip Brakes WTBs will mechanically lock the slats(flaps), in case of runaway, overspeed, or asymmetry.

L2 The WTBs will lock the slats(flaps), only if both slats(flaps) control units detect a runaway, overspeed or asymmetry.

L3 DC ESS and DC 2 keep the WTBs of the slats unlocked. In case both these busbars fail, the WTBs of the slats will mechanically lock the slats.
Both hydraulic systems keep the WTBs of the flaps unlocked. In case both hydraulic systems fail, the WTBs of the flaps will mechanically lock the flaps.

L1 If locked, the WTBs cannot be unlocked in flight.

L3 SYSTEM TORQUE LIMITERS (STL)

In case of high friction or a jam (e.g. ice accretion), the System Torque Limiters (STLs) protect against overload, by stopping the movement of the slats(flaps) surfaces.
Recycling the FLAPS lever will restore surface movement, if the overload has disappeared.

L2 ASYMMETRY POSITION PICK-OFF UNITS (APPU) AND FEEDBACK POSITION PICK-OFF UNIT (FPPU)

Each slats(flaps) system has two Asymmetry Position Pick-off Units (APPUs), and one Feedback Position Pick-off Unit (FPPU).
The APPUs and the FPPU provide slats(flaps) position feedback to the slats(flaps) control units, to monitor the deployment of the surfaces, and measure any asymmetry between the left and right wings.

L3 FLAP DISCONNECT SENSOR

The flap disconnect sensors, located between each flap, measure any excessive differential movement between the flaps. If a sensor measures any excessive differential movement, the flaps control units will inhibit flaps operation, to limit further damage.

Intentionally left blank

SLATS/FLAPS CONFIGURATIONS

Applicable to: ALL

The following table provides the configurations and associated surface positions (degrees), for each FLAPS lever position.

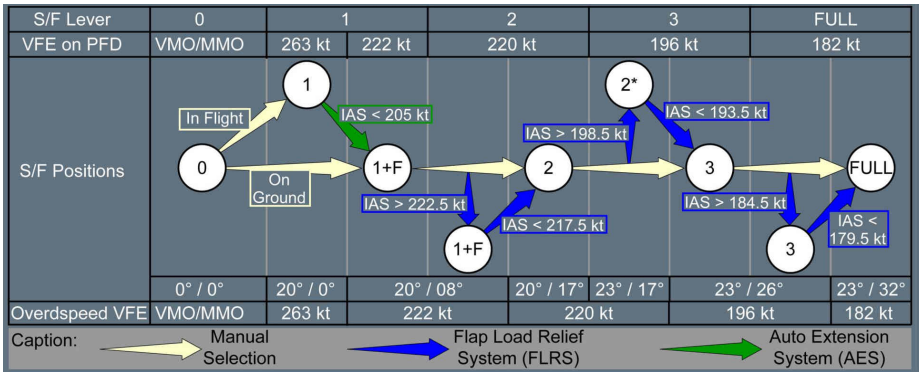
Slats/flaps configurations

FLAPS Lever Position	SLATS	FLAPS	Aileron Droop	Configuration on ECAM	Maximum Speed	Flight Phase
0	0 °	0 °	0 °		VMO/MMO	Cruise
1	20 °	0 °	0 °		263 kt	Holding
	20 °	8 °	5°		222 kt	Takeoff/ Approach
2	20 °	17 °	5°		220 kt	Takeoff/ Approach
3	23 °	26 °	5 °		196 kt	Takeoff/ Approach/ Landing
FULL	23 °	32 °	5 °		182 kt	Landing

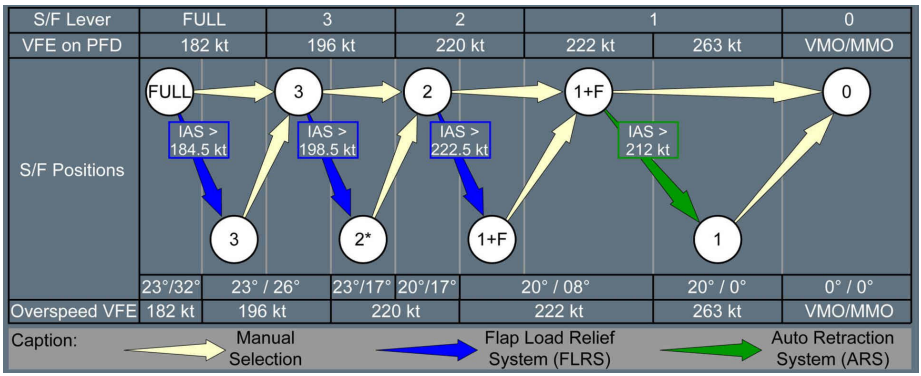
SLATS/FLAPS EXTENSION/RETRACTION

Applicable to: ALL

Slats/Flaps Extension



Slats/Flaps Retraction



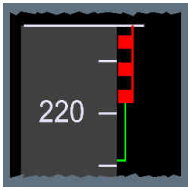
AUTO RETRACTION SYSTEM (ARS)

In CONF 1+F, the Auto Retraction System (ARS) automatically retracts the flaps, when needed. The resulting configuration is CONF 1.

L2 The ARS activates, when the aircraft reaches a speed of 212 kt, and if still in CONF 1+F.
In case of a high-weight takeoff, the S speed will be greater than 212 kt. The ARS will activate, as the aircraft accelerates towards S speed. This prevents excessive loads on the flaps, and improves climb performance.

Note: *S can also be greater than the VFE of CONF 1+F.*

L1



AUTOMATIC EXTENSION SYSTEM (AES)

In CONF 1, the Auto Extension System (AES) automatically extends the flaps, when needed. The resulting configuration is CONF 1+F.

L2 The AES activates, when the speed goes below 205 kt, and if still in CONF 1.

FLAP LOAD RELIEF SYSTEM (FLRS)

The Flap Load Relief System (FLRS) limits the loads on the flaps, in case of a VFE exceedance. The FLRS is only available in CONF 2, 3, or FULL.

L2 The flaps automatically retract at VFE + 2.5 kt (i.e. before the overspeed warning triggers at VFE + 4 kt).

L1 If the FLRS is active:

- The FLRS retracts the flaps to the next retracted flap position.
- A pulsing F RELIEF message appears in the Flap/Slat/Trim zone of the PFD.
- The PFD still indicates the VFE that corresponds to the selected lever position.
- L2 The FWS triggers an overspeed warning, if the speed exceeds the VFE of the actual slats/flaps configuration + 4 kt (i.e. the overspeed warning does not consider the selected lever position).

L1 When the VFE is no longer exceeded, the flaps automatically return to their normal (selected) position.

L2 This occurs at VFE – 2.5 kt.

SLAT ALPHA/SPEED LOCK FUNCTION

Applicable to: ALL

The slat alpha/speed lock function inhibits slats' retraction to zero at a high Angle-Of-Attack (AOA, also referred to as alpha), and/or at a very low speed.

L3 The slat alpha/speed lock function prevents the aircraft from stalling and/or losing altitude, when the slats are retracted to zero.

The slats and flaps control units use the AOA, or the airspeed, to inhibit slats' retraction. The ADIRUs provide this information to the slats and flaps control units.

L2 When the FLAPS lever is set to 0, the slats alpha/speed lock function activates and inhibits slats' retraction, if:
- AOA is greater than 9.5 °, or
- The speed is less than 155 kt.

Note: If the FLAPS lever is already set to 0, when either of the above conditions occurs, then the function will not activate.

L1 If the slat alpha/speed lock function is active:
- A pulsing A. LOCK message appears in the Flap/Slat/Trim zone of the PFD.
- The PFD indicates the VLS that corresponds to the actual slats/flaps position.

L2 Once the slats alpha/speed lock function is active, the slats retract to 0 when:
- AOA is less than 9.2 °, or
- The speed is greater than 161 kt.

SLATS/FLAPS CRUISE BAULK FUNCTION

Applicable to: ALL

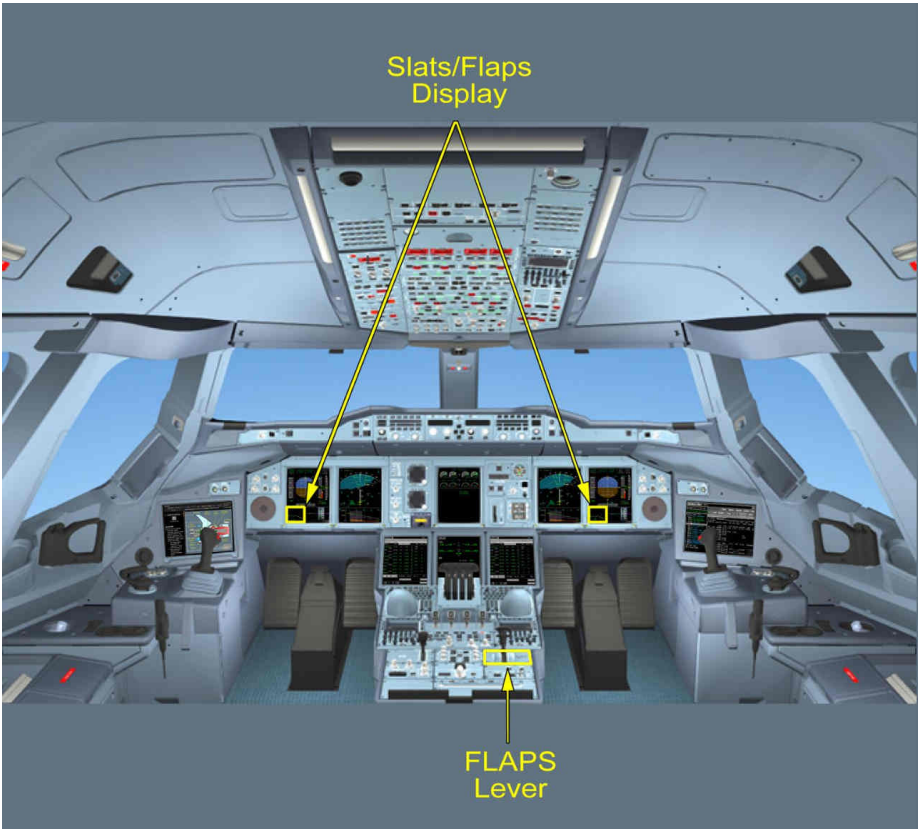
In case the FLAPS lever is inadvertently moved from 0 to 1 during cruise, the slats/flaps cruise baulk function will maintain the slats and flaps in their fully retracted position. In addition, the ECAM will trigger the F/CTL FLAP LVR NOT ZERO warning.

L2 The slats/flaps cruise baulk function activates, when the indicated airspeed is greater than the VFE of CONF 1 +2.5 kt, or the aircraft is at an altitude of more than 22 000 ft.
The slats/flaps cruise baulk function is valid only for FLAPS lever position 1. The selection of any other slats/flaps setting (2, 3, or FULL) will override the cruise baulk function, and allow slats' and flaps' extension.

COCKPIT VIEW

Applicable to: ALL

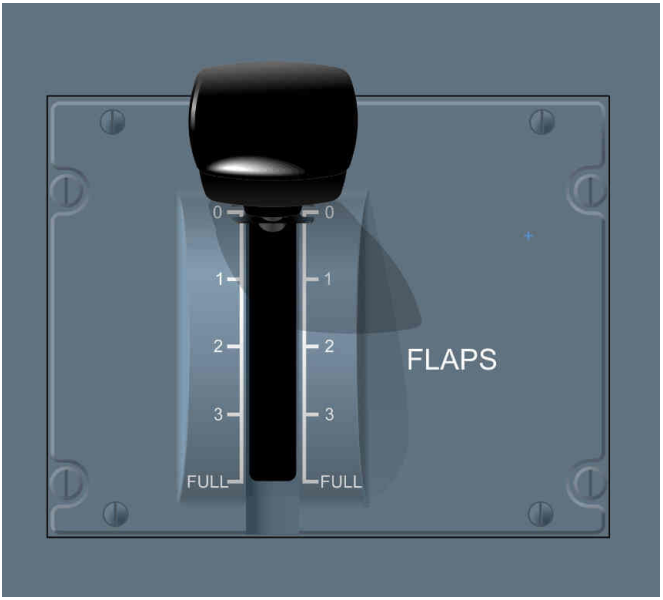
Controls and Indicators



Flaps LEVER

Applicable to: ALL

FLAPS LEVER



The FLAPS lever controls both the slats and the flaps at the same time.
There are five FLAPS lever positions, for selecting the desired configuration *Refer to DSC-27-20-20 Configuration* .

Note: *The FLAPS lever must be pulled out of detent, before it can be set to any position.*

L2 The FLAPS lever has a mechanical stop at positions 1 and 3. This prevents inadvertent excessive slats/flaps extension or retraction.
The FLAPS lever cannot be set to an intermediate lever position.

L1 **OVERRIDE MECHANISM**

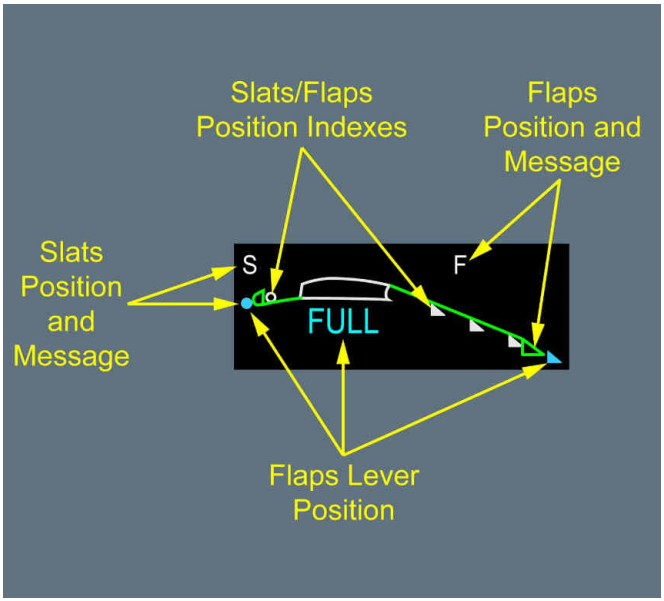
The FLAPS lever includes an override mechanism that is used in case the FLAPS lever is jammed. The override mechanism allows to extend the slats/flaps by one step (e.g. from 0 to 1, from 3 to FULL).
To use the override mechanism, the flight crew moves the lever one step with a strong force, without pulling the lever out of detent.

The override mechanism is reversible.

SLATS/FLAPS DISPLAY

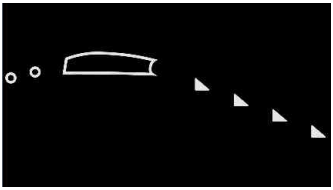
Applicable to: ALL

Slats/flaps Display

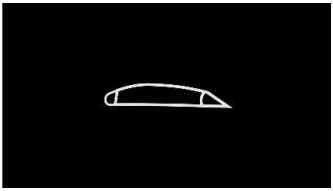


The slats/flaps display appears on the bottom left-hand side of the PFD displays.
Spoiler position information is also available on the slats/flaps display. For more information: *Refer to DSC-27-10-20 Spoilers Indications on the Slats/Flaps Display*
Landing gear position information is also available on the slats/flaps display. For more information: *Refer to Landing Gear Indication on the Slats/Flaps Display*

SLATS/FLAPS POSITION INDEXES

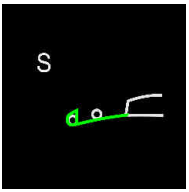


The dots indicate the slats positions that can be selected.
The triangles indicate the flaps positions that can be selected.



The slats and flaps are fully retracted.

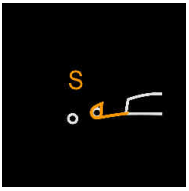
SLATS— POSITIONS AND MESSAGES



Position of the slats.

The alpha/speed lock function is active.
The indication pulses.

L12

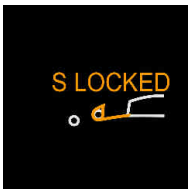


The slats are failed.

Associated with the following ECAM caution:
- F/CTL SLAT SYS 1+2 FAULT (*Refer to procedure*).

May also result from a failure of both the AC ESS and GREEN hydraulic.

L12



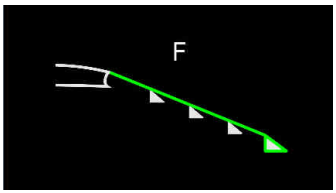
Wing-tip brakes are applied to the slats.

Associated with the following ECAM caution:
- F/CTL SLATS LOCKED (*Refer to procedure*).

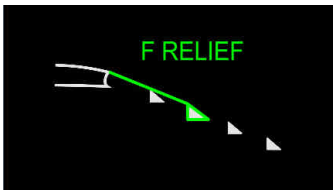
L2

The position of the slats is not valid.

FLAPS— POSITIONS AND MESSAGES

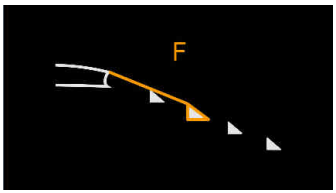


Position of the flaps.



The Flap Load Relief System is active.
The indication pulses.

L12

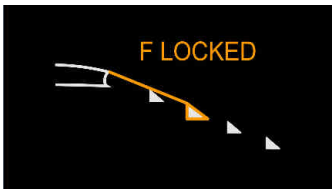


The flaps are failed.

Associated with the following ECAM caution:
- F/CTL FLAP SYS 1+2 FAULT (*Refer to procedure*).

May also result from a failure of both hydraulic systems.

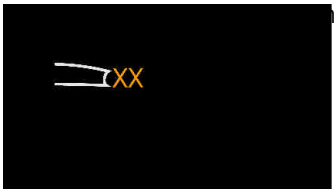
L12



Wing-tip brakes are applied to the flaps.

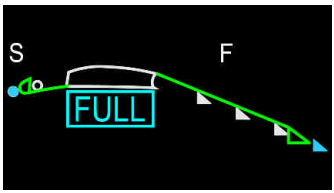
Associated with the following ECAM caution:
- F/CTL FLAPS LOCKED (*Refer to procedure*).

L2



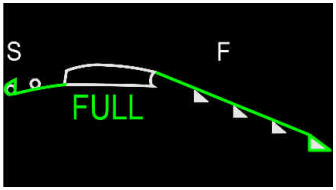
n of the flaps is not valid.

FLAPS LEVER POSITION



The slats/flaps move to the selected position.

- FULL Indicates the selected configuration (1, 1+F, 2, 3, or FULL)
-  Indicates the selected slats position
-  Indicates the selected flaps position



The slats/flaps have reached the selected position.

FULL : Indicates the current configuration.

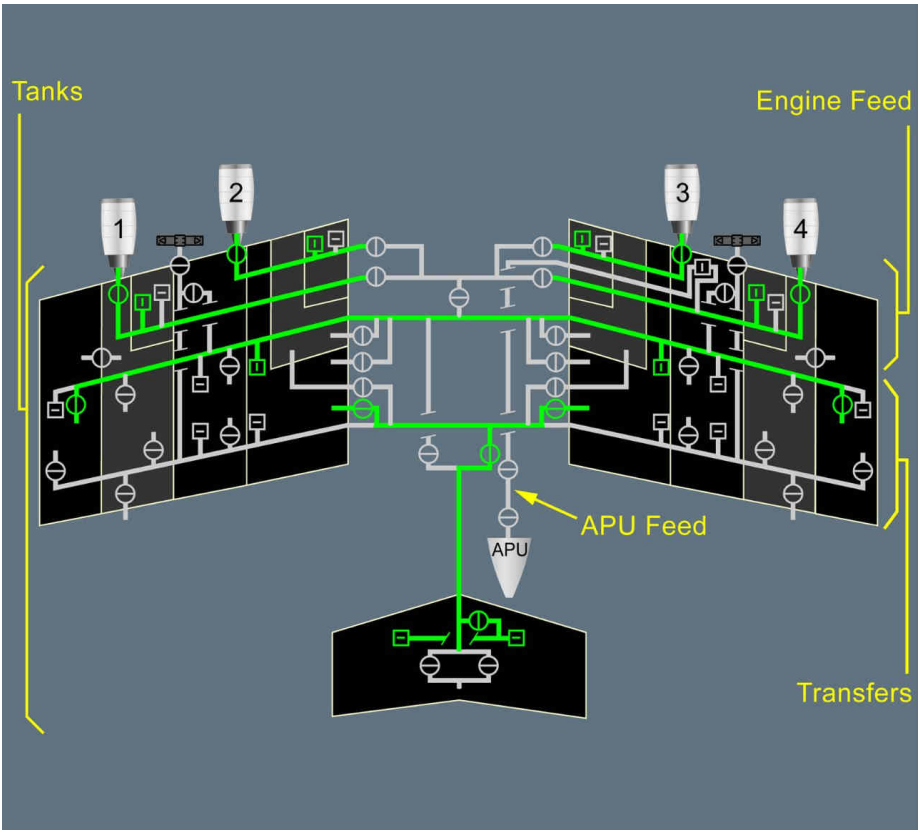
OVERVIEW

Applicable to: ALL

The fuel system stores fuel, monitors the quantity and temperature of fuel in each tank, and controls fuel transfers to:

- Supply fuel to the engines and to the Auxiliary Power Unit (APU)
- Maintain the Center of Gravity (CG) within limits
- Reduce structural loads
- Control refueling and defueling
- Enable fuel jettison, if necessary.

Fuel System



TANKS

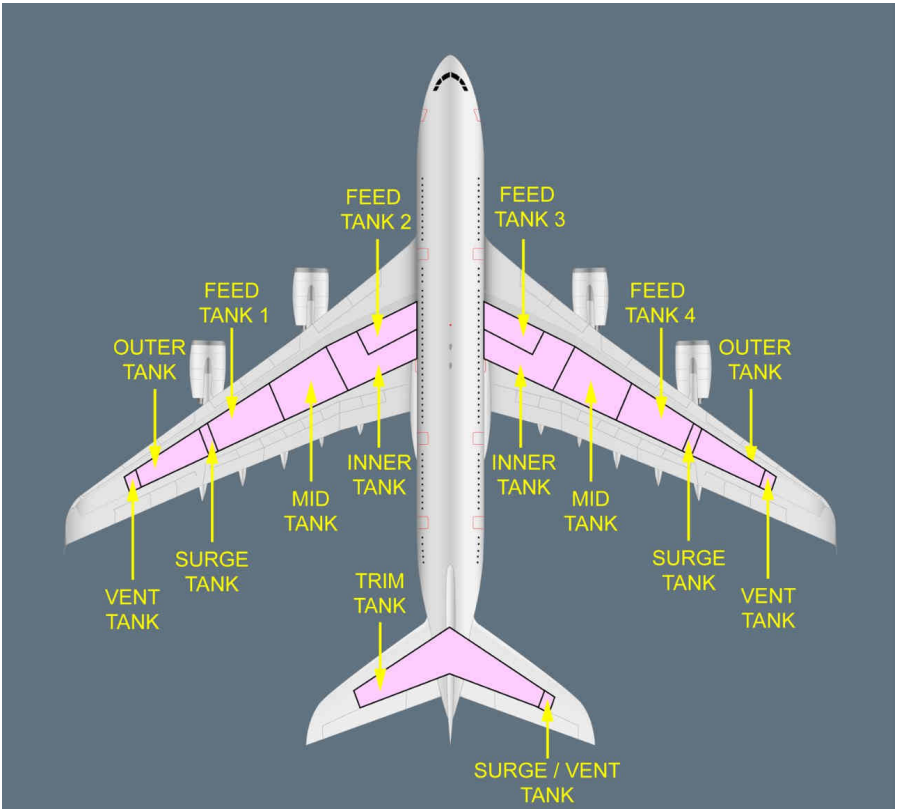
Applicable to: ALL

Fuel is stored in the:
- Wings
- Trimmable Horizontal Stabilizer (THS).

Wing tanks, and their components, are symmetrical.

TANK ARRANGEMENT

Tank Arrangement



There are 11 tanks that store fuel:

- 5 tanks in each wing:
  - 1 outer tank (OUTR TK)
  - 1 mid tank (MID TK)
  - 1 inner tank (INR TK)
  - 2 feed tanks (FEED TK).
- 1 trim tank in the THS.

Each feed tank:
- Provides fuel to the engines and the APU
- Receives fuel from all of the transfer tanks (inner, mid, outer, and trim tanks)
- Contains a collector cell that has a fuel capacity of approximately 2 866 lb.

L2 The collector cell is maintained full, to keep the fuel pumps immersed, in order to provide low or negative "g" protection to feed the engine.

Note: - *Feed tanks 2 and 3 are positioned to avoid engine 1 or 4 rotor burst.*
- *Feed tanks 1 and 4 are positioned to avoid engine 2 or 3 rotor burst.*

FUEL TANK QUANTITY

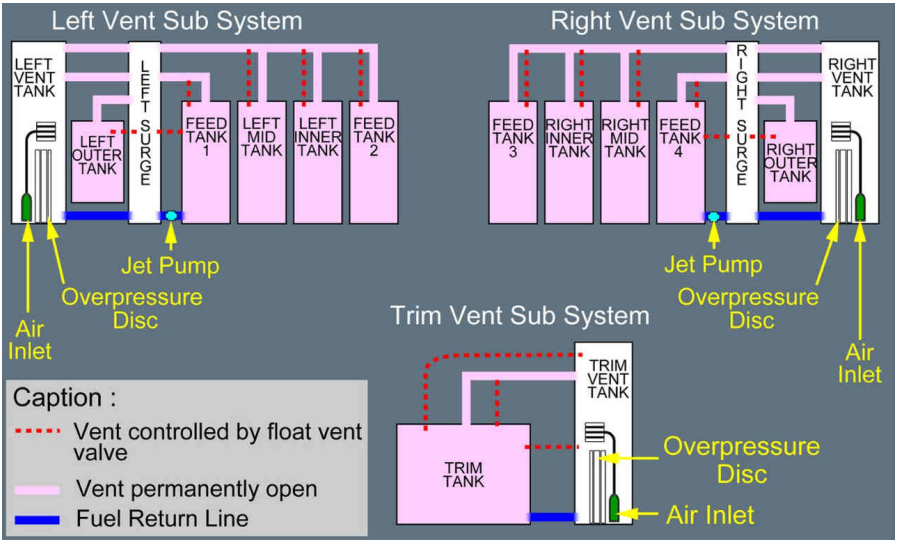
Usable Fuel (Fuel specific density: 6.55 lb/US Gal)							
	Outer Tanks (each)	Feed Tanks 1, 4 (each)	Mid Tanks (each)	Inner Tanks (each)	Feed Tanks 2, 3 (each)	Trim Tank	Total
Volume	2 731.5 US Gal	7 300 US Gal	9 633 US Gal	2 190.5 US Gal	7 754 US Gal	6 261 US Gal	85 479 US Gal
Weight	17 891 lb	47 815 lb	63 096 lb	79 848 lb	50 789 lb	41 010 lb	559 888 lb

L2 In cold temperature conditions, the specific density of the fuel can reach a maximum of 7.45 lb/US Gal. With this maximum specific density, the tanks weight is:
- 20 350 lb for each outer tank
- 54 385 lb for each feed tank 1 and 4
- 90 827 lb for each inner tank
- 57 767 lb for each feed tank 2 & 3
- 46 645 lb for the trim tank.

L3 Only the quantity of usable fuel appears on the FUEL SD page.
The quantity of unusable fuel in the tanks is less than 0.25 % of the total capacity. This percentage corresponds to 213.7 US Gal (1 400 lb for a specific density of 6.55 lb/US Gal).

L2 SURGE/VENT TANK SYSTEM

Surge/Vent Tank System



VENT TANK SYSTEM

There are three vent tanks:

- One on each wing, between the wing tip and the outer tank
- One on the right-hand side of the THS. This vent tank is also used as a surge tank.

Each fuel tank connects to the outside atmosphere via a vent tank. This limits the differential pressure between the tanks and the atmosphere, and maintains the pressure within structural limits.

L3 An air inlet connects the vent tanks with the atmosphere. In the event of over(under-)pressure in the vent tank, an overpressure protector (disc) breaks in the corresponding vent tank . This enables the fuel tanks to be vented into the atmosphere, and maintains the pressure within design limits.

L2 SURGE TANK SYSTEM

There are three surge tanks:

- One on each wing, between the outboard feed tank and the outer tank
- One on the right-hand side of the THS.

Surge tanks temporarily collect fuel that may overflow from any tank, when the quantity of fuel in that tank is close to MAX capacity (e.g. If fuel expands by more than 2%, or in case of tight turns during taxi).

Wing Surge Tank System

Each wing has a surge tank.
Fuel that enters the surge tank returns to the outboard feed tank.
L3 This is done by a surge tank jet pump. The fuel returns to the feed tank via a dedicated fuel line.

Note: If the surge tank is full, the fuel will flow into the vent tanks. If this occurs, the fuel will return to the surge tanks by gravity.

L2 THS Surge Tank System

The THS has a surge/vent tank.
Fuel that enters the surge/vent tank returns to the trim tank.
L3 A non-return valve uses gravity to return any fuel from the surge/vent tank to the trim tank, via a dedicated non-return valve.

L3 WATER DRAINING

All fuel tanks and the vent and surge tanks have water-drain valves at their lowest point. These valves are used to drain water from the tank.

ENGINE FEED

Applicable to: ALL

In normal operation, feed tank pumps independently feed each engine from its assigned feed tank. If necessary, crossfeed valves enable any engine to be fed from any feed tank.

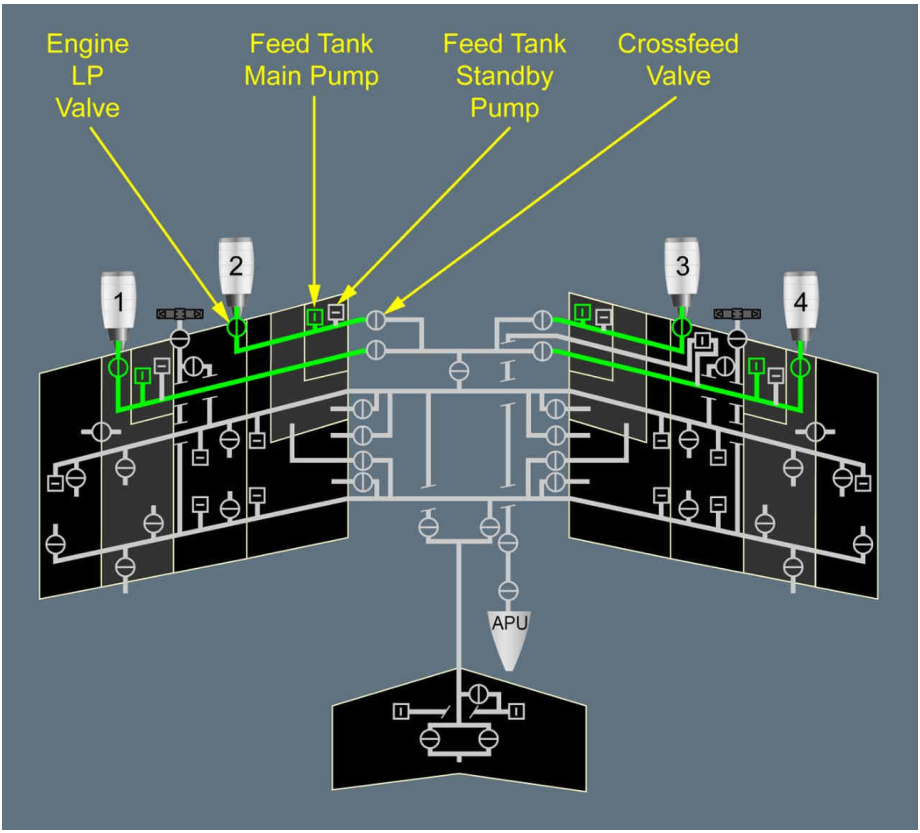
L23

Note: In the case all feed tank pumps fail, fuel can be fed to the engines by gravity, when the aircraft altitude is below the gravity feed ceiling.

The gravity feed properties of the fuel improve with time at altitude, therefore the gravity feed ceiling is:
- *FL 280 , if the flight time above FL 300 is greater than 30 min*
- *FL 050 , if the flight time above FL 300 is less than 30 min .*

When all crossfeed valves are closed, it is possible to select TOGA, up to the gravity feed ceiling.

Engine Feed



FEED TANK PUMPS

There are two identical feed tank pumps in each collector cell. One is a main pump, the other is a standby pump.
In normal operation, each main pump runs continuously, and feeds its assigned engine.
If a main pump is detected low pressure, or is switched off, the corresponding standby pump automatically takes over.

Note: *In flight, with all crossfeed valves open, two pumps can supply fuel to the four engines.*

CROSSFEED VALVES

Each engine has a crossfeed valve, that connects the engine and its assigned pumps to the crossfeed line. This valve enables the engine to be fed from any feed tank pump, if necessary (e.g. its assigned main and standby pumps are off).
Crossfeed valves allow the flight crew to manually correct any fuel imbalance in the feed tanks.

All crossfeed valves automatically open:
- In electrical emergency configuration, and the slats are retracted, or
- When required for an automatic ground transfer.

L3 The crossfeed valves are positioned to avoid rotor burst.
For redundancy, each crossfeed valve has two motors with different electrical supplies.

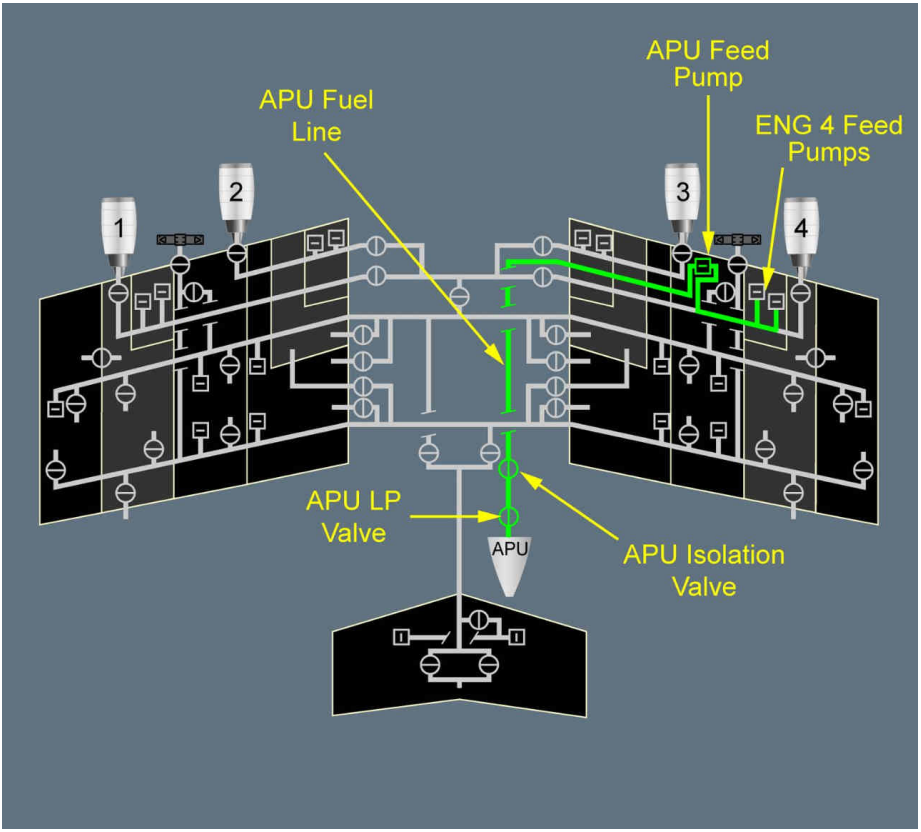
ENGINE LP VALVES

Each engine has a Low Pressure (LP) valve, that is used to stop the flow of fuel to the engine.
The ENG MASTER sw control the LP valves.
The LP valves automatically close, when their associated ENG FIRE pb is pushed.
L3 For redundancy, each LP valve has two motors with different electrical supplies.

APU FEED

Applicable to: ALL

APU Feed System



The engine-feed system feeds the APU via its assigned fuel line.

The APU can be fed by:

- The main or standby pump of Feed Tank 4, or
- The main or standby pump of any feed tank, provided that the applicable crossfeed valves are open, or
- The APU feed pump, that operates automatically, if required.

L2 The APU feed pump automatically starts to run, if the fuel pressure is too low for the APU to operate correctly.

An APU LP valve and an APU isolation valve can isolate the fuel supply to the APU . Both valves close, when the APU FIRE pb is pushed, or when the APU MASTER pb-sw is set to OFF.

L3 For redundancy, the APU LP valve has two motors with different electrical supplies.

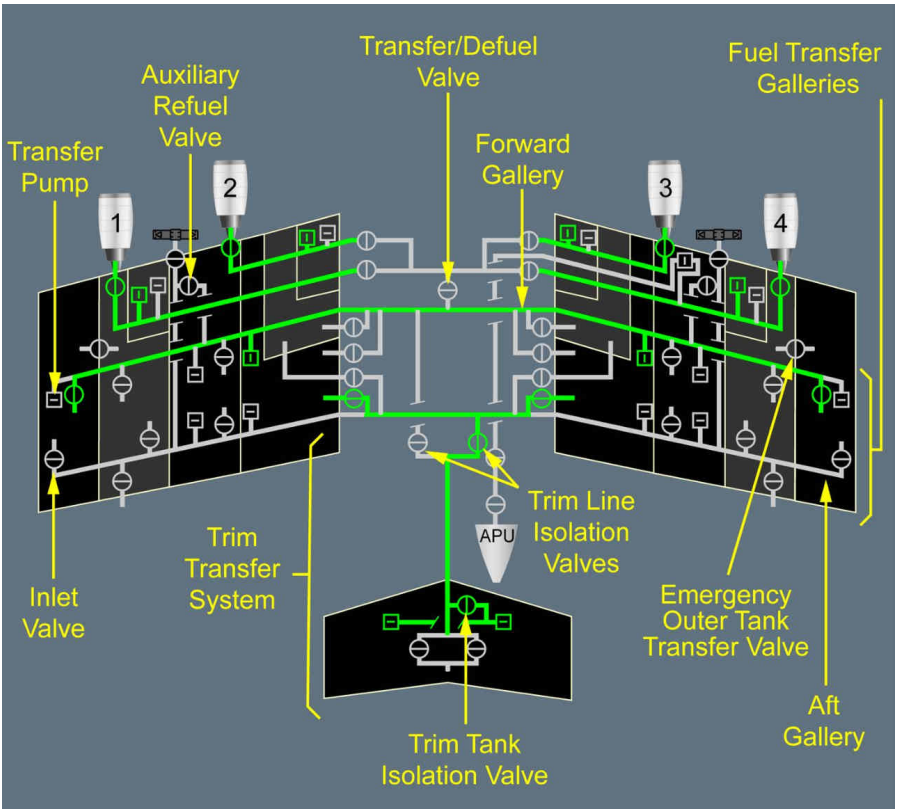
L2 If the fuel system detects any damage to the APU feed line, the APU LP valve and APU isolation valve automatically close, to avoid fuel leaks in the fuselage. If running, the APU feed pump is also turned off.

TRANSFER SYSTEM

Applicable to: ALL

GENERAL

Fuel Transfer System



The fuel transfer system enables the transfer of necessary fuel quantities from tank to tank. Fuel transfers can:

- Provide fuel to the feed tanks, from the transfer tanks (inner, mid, outer, and trim tanks). *Refer to Main Transfers*
- Reduce the loads on the structure, by controlling the quantity of fuel in the outer and trim tanks. *Refer to Load Alleviation Transfers*
- Control the Center of Gravity (CG) of the aircraft, by transferring fuel from the trim tank to the wing tanks. *Refer to CG Control Transfers*

FUEL TRANSFER GALLERIES

Two galleries (FWD and AFT) pass through all wing tanks (inner, mid, outer, and feed tanks) to enable fuel transfers.

L3 The FWD and AFT galleries:
- Can be connected to each other, via two auxiliary refuel valves (one on each side), during refueling, defueling, jettison, and some alternate transfers.
- Can be connected to the crossfeed line, via one transfer/defuel valve, when required for defuel and ground transfers. This enables the feed tanks to be defueled.

L1 **FWD GALLERY**

The transfer tanks (inner, mid, and outer tanks) each have one transfer pump connected to the FWD gallery.
Each wing tank (transfer and feed tanks) can receive fuel from the FWD gallery, via one inlet valve in each tank.

AFT GALLERY

The inner and mid tanks each have one transfer pump connected to the AFT gallery.
Each wing tank (transfer and feed tanks) can receive fuel from the AFT gallery, via one inlet valve in each tank.

In normal operation:
- The FWD gallery is for fuel transfers to the wing tanks
- The AFT gallery is for fuel transfers from the trim tank to the wing tanks.

Note: *The fuel transfer system can use the FWD and AFT galleries simultaneously to perform two different transfers (e.g. a wing tank transfer and a CG control transfer).*

In case of a failure in one of the galleries, the other gallery takes over for alternate fuel transfers (For more information: *Refer to DSC-28-40-2840B Alternate Transfers*).

L2 If the FWD gallery is no longer available:
- The mid and inner tanks each use one transfer pump connected to the AFT gallery
- The outer tanks each use their inlet valve, that is connected to the AFT gallery, as an outlet valve.

TRIM TRANSFER SYSTEM

A trim line connects the trim tank to the AFT and FWD galleries.

L3 This is done via two trim line isolation valves, one for each gallery.

L2 If the fuel system detects any damage to the trim line, it is automatically isolated, to avoid fuel leaks in the fuselage.

L1 In normal operation, fuel is transferred from/to the trim tank, via the AFT gallery.

FOR AFT TRANSFERS ON GROUND:

Fuel transfers to the trim tank, via the inlet valve.

L3 There are two inlet valves in the trim tank. However, they appear as a single valve on the FUEL System Display.

L1 FOR FORWARD TRANSFERS (ON GROUND AND IN FLIGHT):

Fuel transfers from the trim tank, using two trim transfer pumps, via the trim tank isolation valve.

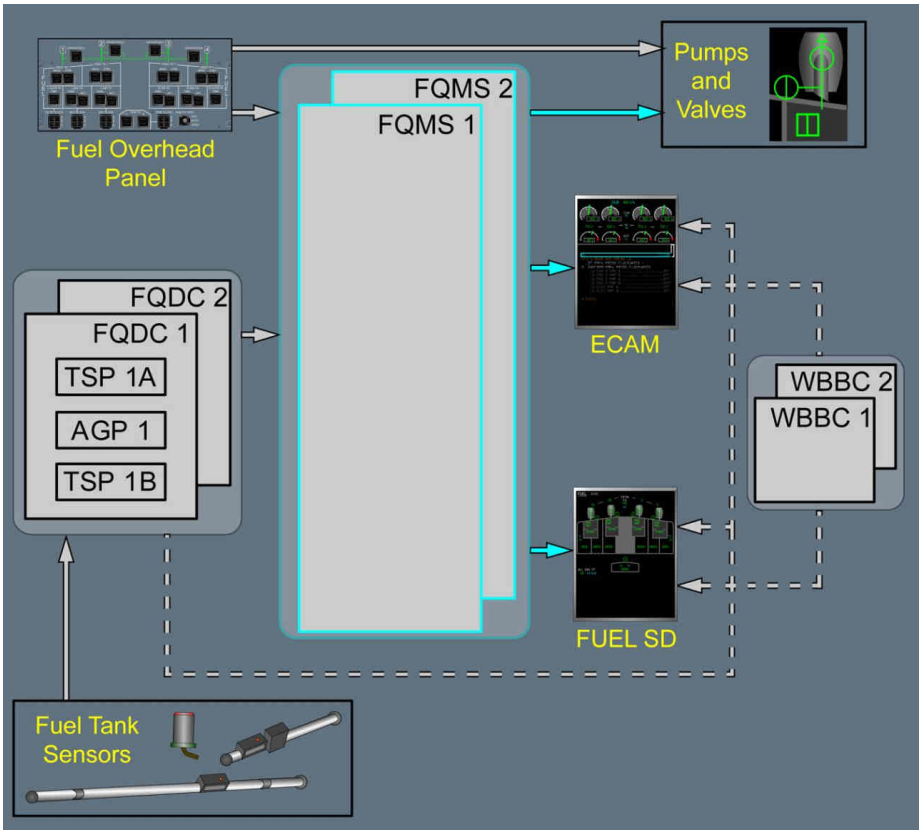
EMERGENCY OUTER TANK TRANSFER VALVE

In each wing, a valve connects the outer tank to the outer feed tank (FEED TK 1 or 4).
In normal operations, the valves remain closed.
If a manual outer tank transfer is performed with any outer tank pump off, the emergency outer tank transfer valve will automatically open (For more information: *Refer to DSC-28-40-DSC2840A Manual transfer from the outer tanks to the feed tanks*).
In some failure cases, the flight crew will open the emergency outer tank transfer valves, via the OUTR TK EMER XFR pb-sw , as requested by the ECAM.

FUEL SYSTEM ARCHITECTURE

Applicable to: ALL

Fuel System Architecture



FUEL QUANTITY MANAGEMENT SYSTEM (FQMS)

There are two FQMS , that control and monitor the fuel system.

L3 The FQMS are hosted on CPIOM -F.

L2 The FQMS :
- Measure the fuel quantity and temperature in the tanks.

L3 The FQMS receive fuel tank sensor data, via the Fuel Quantity Data Concentrator (FQDC). The FQMS compute the fuel quantity in each tank.

L2
- Compute the Gross Weight (GW) and the Gross Weight Center of Gravity (GWCG) of the aircraft, based on the Zero Fuel Weight (ZFW) and the Zero Fuel CG (ZFCG) entered by the flight crew in the FMS
- Monitor the engine feed system
- Control and monitor the APU feed system
- Control and monitor the fuel transfers (Main, Load alleviation and CG control transfers)
- Monitor manual transfers
- Control and monitor the fuel jettison system
- Control and monitor refueling, defueling and automatic ground transfers

Note: During a manual refuel/defuel, the FQMS only monitors.

- Provide fault detection for the ECAM , and fuel system indication for the FUEL System Display (SD)
- Control and monitor the Fuel/hydraulic heat exchangers (For more information: *Refer to Hydraulic System Description*).

L1 One FQMS is active and the other is in standby. If the active FQMS fails, the other takes over.

If both FQMS fail (FUEL FQMS 1+2 FAULT), the following functions remain available:
- Manual transfers, via the overhead panel
- Pumps and crossfeed valves control, via the overhead panel
- Pumps and crossfeed valves indications on the FUEL System Display
- FOB , GW and GWCG display on the FUEL System Display

L2 Depending on the failure case:
- FOB , GW and GWCG are computed by the FQMS (FUEL FQMS 1+2 FAULT is due to the failure of the fuel management function of both FQMS)
- FOB is computed by the CDS , based on the FOB at departure and the fuel used, while the GW and GWCG are computed by the WBBC (in all other failure cases). FOB , GW and GWCG are displayed with amber dashes.

L1 - Fuel tank quantity indications on the FUEL SD

L2 Depending on the failure case:
- Fuel tank quantities are computed by the FQMS (FUEL FQMS 1+2 FAULT is due to the failure of the fuel management function of both FQMS)
- Fuel tank quantities are computed by the AGP (FUEL FQMS 1+2 FAULT is due to the total failure of both FQMS). Fuel tank quantities are displayed with amber dashes.
- Fuel tank quantities are lost, and replaced by amber crosses (FUEL FQMS 1+2 FAULT is due to the disagree between the AGP and the FQMS).

L1 - Low level, overflow, excessive aft CG and lateral imbalance cautions.

If both FQMS fail, the transfer indications and the trim tank isolation valve indication are lost.

FUEL QUANTITY DATA CONCENTRATOR (FQDC)

There are two FQDCs which collect the following information from in-tank sensors:
- Fuel level
- Fuel density
- Fuel temperature.

The FQDCs transmits this data to the FQMS.

L2 Each FQDC includes:
- Two Tanks Signal Processors (TSPs)
- One Alternate Gauging Processor (AGP).

TANK SIGNAL PROCESSORS (TSP)

The Tank Signal Processors are the interface between the tank sensors and the FQMS.
The TSPs receive fuel level, density and temperature information from all the sensors located in the fuel tanks.

ALTERNATE GAUGING PROCESSOR (AGP)

The AGP receives fuel tank sensor data, via the TSPs, and computes fuel tank quantities.
The fuel tank quantities computed by the AGP are transmitted to the FQMS for comparison with the fuel tank quantities computed by the FQMS. If the FQMS computes a difference that is greater than a given threshold, the FQMS is declared faulty. This ensures the integrity of the fuel tank quantities displayed on the FUEL SD page.
The fuel quantities computed by the AGP appear on the FUEL SD page, when both FQMS are failed (except if the failure is due to a difference between the AGP and the FQMS).

Note: Fuel quantities computed by the AGP are less accurate than fuel quantities computed by the FQMS. Therefore, the quantities computed by the AGP appear with amber dashes.

The AGP is used to provide cautions in the event of low level, overflow, lateral or longitudinal (on ground only) imbalance and transfer pump faults (pump running in a dry tank), in addition to the FQMS detection.

L2 **FUEL TANK SENSORS**

The FQDCs receive information from the following fuel tank sensors:

- Fuel Quantity Indication (FQI) probes

L3 FQI probes are distributed throughout all the tanks (including surge and vent tanks).
Each fuel tank probe enables the FQMS to know the fuel level at a given point in a tank.

L2 - Temperature sensors

L3 The temperature sensors are located:

- In the outer tanks and trim tank, to trigger the FUEL TEMP LO caution
- In the feed tanks, to trigger the FUEL FEED TK 1(2)(3)(4) TEMP HI and FUEL TEMP LO cautions.

L2 - Fuel properties measurement units (FPMU)

L3 The three FPMUs (in Feed Tank 1, 2 and 3) provide fuel density, temperature and electrical characteristics.
If two FPMUs are failed, the fuel quantity indication accuracy is degraded in all tanks

L2 - Probe Compensator and Temperature (PCT) sensor

L3 There is one PCT sensor in each wing tank and two in the trim tank.
When the probe is fully immersed, it provides fuel temperature and electrical characteristics.
When the probe is not fully immersed, it provides fuel temperature and level.

WEIGHT AND BALANCE BACKUP COMPUTER

There are two WBBCs that compute the GW and CG, based on aerodynamic data and on the position of the flight control surfaces.

L2 *Note: The WBBC starts computing the GW and CG after the retraction of the slats and flaps.*

L1 The GW and CG computed by the WBBC are:

- Displayed on the permanent data of the System Display when both FQMS are failed (GW and GWCG displayed with amber dashes)
- Used to compute flight control laws and characteristic speeds when both FQMS are failed
- Used to provide a warning against excessive aft CG
- Used to detect discrepancies between the GW and CG computed by the FQMS, and the GW and CG computed by the WBBC.

L2 The WBBC computes the aircraft GW and CG by using the following parameters:

- Altitude
- Mach

- Angle of attack
- The position of the elevators and the trimmable horizontal stabilizer.

If the WBBC does not have the necessary input to compute the GW by using aerodynamic data, or after slats/flaps extension, the GW is computed by using the fuel used and the takeoff GW (as computed by the WBBC at slats/flaps retraction).
The computation of the CG is unavailable after slats/flaps extension.

COCKPIT VIEW

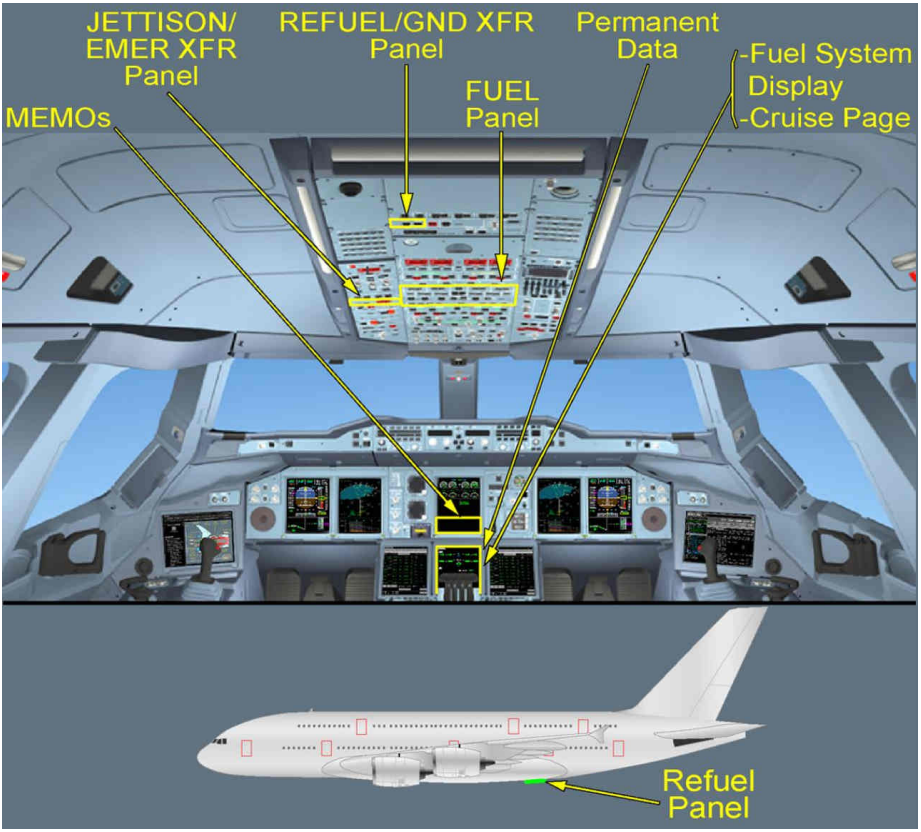
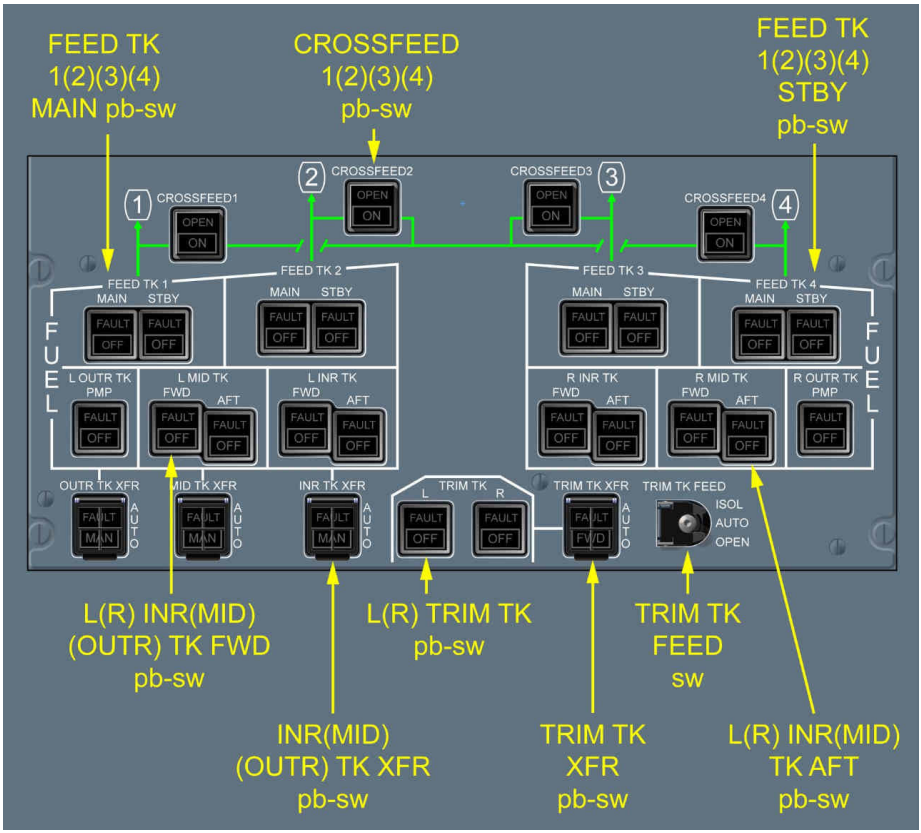
Controls and Indicators



FUEL PANEL

Applicable to: ALL

FUEL Panel



feed tk 1(2)(3)(4) MAIN pb-sw

The main pump is running.

The main pump is off.

L12

The main pump is running at low pressure or is failed.

Associated with one of the following ECAM cautions:
- FUEL FEED TK 1(2)(3)(4) MAIN PMP FAULT (*Refer to procedure*)
- FUEL FEED TK 1(2)(3)(4) MAIN + STBY PMP FAULT (*Refer to procedure*)
- FUEL L(R) WING FEED PMPs FAULT (*Refer to procedure*).

The FAULT light goes off, when the flight crew sets the FEED TK 1(2)(3)(4) MAIN pb-sw to OFF .

FEED TK 1(2)(3)(4) stby pb-sw

The standby pump runs automatically, when the associated main pump is failed, or is off.

The standby pump is off.

L12

The standby pump is running at low pressure or is failed.

Associated with one of the following ECAM alerts:
- FUEL FEED TK 1(2)(3)(4) STBY PMP FAULT (*Refer to procedure*)
- FUEL FEED TK 1(2)(3)(4) MAIN + STBY PMP FAULT (*Refer to procedure*)
- FUEL L(R) WING FEED PMPs FAULT (*Refer to procedure*)

The FAULT light goes off, when the flight crew sets the FEED TK 1(2)(3)(4) STBY pb-sw to OFF .

I(r) INR(MID)(OUTR) TK FWD pb-sw

The transfer pump runs, if necessary:
- For an automatic fuel transfer from the inner, mid, or outer tanks, via the forward gallery, or
- For a manual transfer from the outer tanks, via the forward gallery (except if any outer tank pump has been switched off), or
- During jettison.

The transfer pump is off.

L12

Comes on:

- When the transfer pump is failed, or is abnormally on

  Associated with one of the following ECAM alerts:
  - FUEL L(R) INR FWD PMP FAULT (*Refer to procedure*)
  - FUEL L(R) INR FWD+AFT PMPs FAULT (*Refer to procedure*)
  - FUEL L(R) MID FWD PMP FAULT (*Refer to procedure*)
  - FUEL L(R) MID FWD+AFT PMPs FAULT (*Refer to procedure*)
  - FUEL L(R) OUTR PMP FAULT (*Refer to procedure*).

- Or, when the transfer pump must be turned off to allow a manual gravity transfer:

  Associated with the following ECAM alert:
  - FUEL OUTR TK XFR FAULT (*Refer to procedure*)

The FAULT light goes off, when the flight crew sets the L(R) INR(MID)(OUTR) TK FWD pb-sw to OFF .

L(R) MID(INR) TK AFT pb-sw

The transfer pump runs, if necessary:

- For an automatic or manual fuel transfer from the inner, or mid tanks, via the aft gallery, or
- During jettison.

The transfer pump is off.

L12

The transfer pump is failed, or is abnormally on, or a low pressure is detected during a manual transfer

Associated with one of the following ECAM alerts:
- FUEL L(R) INR AFT PMP FAULT (*Refer to procedure*)
- FUEL L(R) INR FWD+AFT PMPs FAULT (*Refer to procedure*)
- FUEL L(R) MID AFT PMP FAULT (*Refer to procedure*)
- FUEL L(R) MID FWD+AFT PMPs FAULT (*Refer to procedure*)

The FAULT light goes off, when the flight crew sets the L(R) MID(INR) TK AFT pb-sw to OFF .

TRIM TK L(R) pb-sw

The transfer pump runs, if necessary:
- For an automatic or manual fuel transfer, or
- During jettison.

The transfer pump is off.

L12

Comes on:
- When the transfer pump is failed, or is abnormally on, or a low pressure is detected during a manual transfer

  Associated with one of the following ECAM alerts:
  - FUEL TRIM TK L(R) PMP FAULT (*Refer to procedure*)
  - FUEL TRIM TK L+R PMPs FAULT (*Refer to procedure*)
  - FUEL TRIM TK XFR FAULT (*Refer to procedure*)
- Or, when the trim line is damaged and all trim tank transfers must be inhibited.

  Associated with the following ECAM alert:
  - FUEL TRIM & APU LINES FAULT (*Refer to procedure*)

The FAULT light goes off, when the flight crew sets the TRIM TK L(R) pb-sw to OFF .

INR(MID)(OUTR) TK XFR pb-sw

Automatic fuel transfers from the inner (mid)(outer) tanks are available.
For more information: *Refer to Fuel Transfer Sequence*

Fuel manually transfers from the inner (mid)(outer) tanks to the feed tanks.

L12

Comes on:

- When automatic fuel transfers from the affected tanks are no longer possible.

  Associated with one of the following ECAM alerts:
  - FUEL MAN XFR PROCEDURE (*Refer to procedure*)
  - FUEL OUTR TK XFR FAULT (*Refer to procedure*)

- Or, when a low level is detected in one or more of the feed tanks.

  Associated with the following ECAM alerts:
  - FUEL FEED TK 1(2)(3)(4) LEVEL LO (*Refer to procedure*)
  - FUEL FEED TKs 1+2(3+4) LEVEL LO (*Refer to procedure*)
  - FUEL ALL FEED TKs LEVEL LO (*Refer to procedure*)

- Or, (for the OUTR TK XFR pb-sw only) when a low fuel temperature is detected in the outer tanks.

  Associated with the following ECAM alert:
  - FUEL TEMP LO (*Refer to procedure*)

The FAULT light goes off, when the flight crew sets the INR(MID)(OUTR) TK XFR pb-sw to MAN .

TRIM TK XFR pb-sw

Automatic fuel transfers from the trim tank are available.
For more information: *Refer to Fuel Transfer Sequence*

Fuel manually transfers from the trim tank to the inner tanks.

L12

Comes on:

- When an excessive aft CG is detected
  The Weight and Balance Backup Computer (WBBC) monitors the CG .

  Associated with the following ECAM alert:
  - FUEL EXCESS AFT CG (*Refer to procedure*)

- Or, when the CG has been previously detected at the forward limit, and the trim tank transfer can resume

  Associated with the following ECAM alert:
  - FUEL CG AT FWD LIMIT (*Refer to procedure*)

- Or, when a manual trim tank transfer is required

  Associated with the following ECAM alert:
  - FUEL TRIM XFR FAULT (*Refer to procedure*)
  - FUEL MAN XFR PROCEDURE (*Refer to procedure*)

- Or, when a low fuel temperature is detected in the trim tank

  Associated with the following ECAM alert:
  - FUEL TEMP LO (*Refer to procedure*)

- Or, when there is a low level of fuel in any feed tank, and there is still some fuel in the trim tank

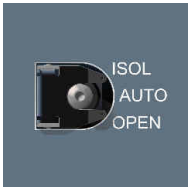
  Associated with one of the following ECAM alerts:
  - FUEL FEED TK 1(2)(3)(4) LEVEL LO (*Refer to procedure*)
  - FUEL FEED TKs 1+2 (3+4) LEVEL LO (*Refer to procedure*)
  - FUEL ALL FEED TKs LEVEL LO (*Refer to procedure*)

- Or, when an overflow of the trim tank is detected.

  Associated with the following ECAM alert:
  - FUEL TRIM TK OVERFLOW (*Refer to procedure*)

The FAULT light goes off, when the flight crew sets the TRIM TK XFR pb-sw to MAN .

TRIM TK FEED selector



The trim tank transfers are automatic.

L12

The trim tank forward transfer stops and the trim tank transfer line is isolated.

The following valves close to isolate the transfer line:
- The trim tank isolation valve
- The trim tank inlet valves
- The trim pipe isolation valves.

The following valves open, to allow gravity transfer from the trim tank to the inner tanks:
- Trim tank inlet valves
- Trim pipe isolation valve connected to the aft gallery
- Inner tank aft inlet valves.

CROSSFEED 1(2)(3)(4) pb-sw

The crossfeed valve is closed.

All crossfeed valves automatically open:
- In electrical emergency configuration, while the slats are retracted, or
- If required for an automatic ground transfer.

The CROSSFEED 1(2)(3)(4) pb-sw is set to ON and the crossfeed valve is open.

L12

The CROSSFEED 1(2)(3)(4) pb-sw is set to ON and the crossfeed valve remains closed.

Associated with the following ECAM alert:
- FUEL CROSSFEED VLV 1(2)(3)(4) FAULT (*Refer to procedure*).

The OPEN /ON lights go off, when the flight crew deselects the CROSSFEED 1(2)(3)(4) pb-sw .

L12

The CROSSFEED 1(2)(3)(4) pb-sw is deselected and the crossfeed valve is open.

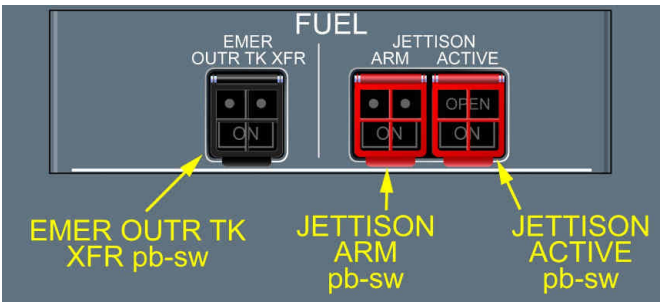
If the crossfeed valve is abnormally open, this is associated with the following ECAM alert:
- FUEL CROSSFEED VLV 1(2)(3)(4) FAULT (*Refer to procedure*).

If the crossfeed valve is automatically commanded open (automatic ground transfer or electrical emergency configuration), there is no associated alert.

JETTISON / EMER OUTR TK XFR PANEL

Applicable to: ALL

JETTISON / EMER OUTR TK XFR Panel



JETTISON ARM pb-sw

Jettison is not armed.

Jettison is armed, and can be activated using the JETTISON ACTIVE pb-sw.

JETTISON ACTIVE pb-sw

Jettison is not active.

Jettison is selected active. The jettison valves open, if the JETTISON ARM pb-sw is also ON .

The jettison valves are fully open.
The ON and OPEN lights go off, when the FQMS automatically stops the jettison, or when the flight crew presses the JETTISON ACTIVE pb-sw or JETTISON ARM pb-sw again.
Fore more information: *Refer to Fuel Jettison System Description and Operation* .

EMER OUTR TK XFR pb-sw

The emergency outer tank transfer valves are closed.

L12

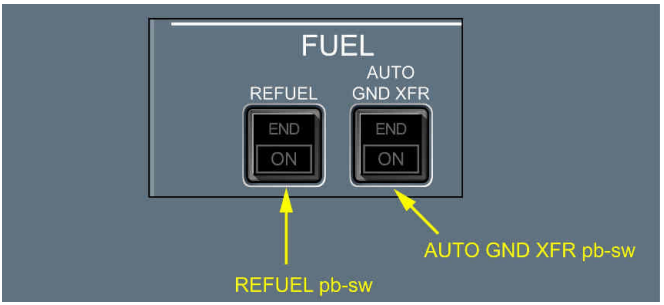
The emergency outer tank transfer valves are commanded open. Fuel transfers from the outer tanks into the outer feed tanks (FEED TK 1 or 4).

The EMER OUTR TK XFR pb-sw is used in the case of:
- ENG 1(2)(3)(4) FAIL with damage (*Refer to procedure*)
- FUEL NORM XFR FAULT (*Refer to procedure*)
- FUEL NORM + ALTN XFR FAULT (*Refer to procedure*)
- ELEC EMER CONFIG (*Refer to procedure*)
- ELEC AC BUS 2 FAULT (*Refer to procedure*)
- ELEC AC BUS 4 FAULT (*Refer to procedure*)
- ELEC AC ESS BUS FAULT (*Refer to procedure*)
- ELEC DC BUS 1 FAULT (*Refer to procedure*)
- ELEC DC BUS 2 FAULT (*Refer to procedure*)
- ELEC DC ESS BUS FAULT (*Refer to procedure*).

REFUEL/GROUND TRANSFER PANEL

Applicable to: ALL

REFUEL/AUTO GND XFR Panel



REFUEL pb-sw

Refueling is usually initiated from the external REFUEL panel, that is under the aircraft belly fairing.
However, refueling can also be initiated from the cockpit, via the REFUEL pb-sw . Cockpit refueling takes a priority over a refueling initiated from the external REFUEL panel.

Refueling from is not activated.

When pressed, refueling from the cockpit is enabled.

L12

Refueling was initiated from the cockpit and has completed, or has aborted.

If the FQMS aborts refueling, the light flashes. This is associated with the following ECAM alert:
- FUEL REFUEL FAULT (*Refer to procedure*)

AUTO GND XFR pb-sw

L12

Automatic ground transfer is not active.

Note: Only manual transfers can be initiated from the external REFUEL panel.

L12

When pressed, automatic ground transfer is activated to automatically obtain the ground CG target.

Note: All transfer pumps must selected ON to perform an automatic ground transfer.

L12

Automatic ground transfer is completed, or is aborted by the FQMS .

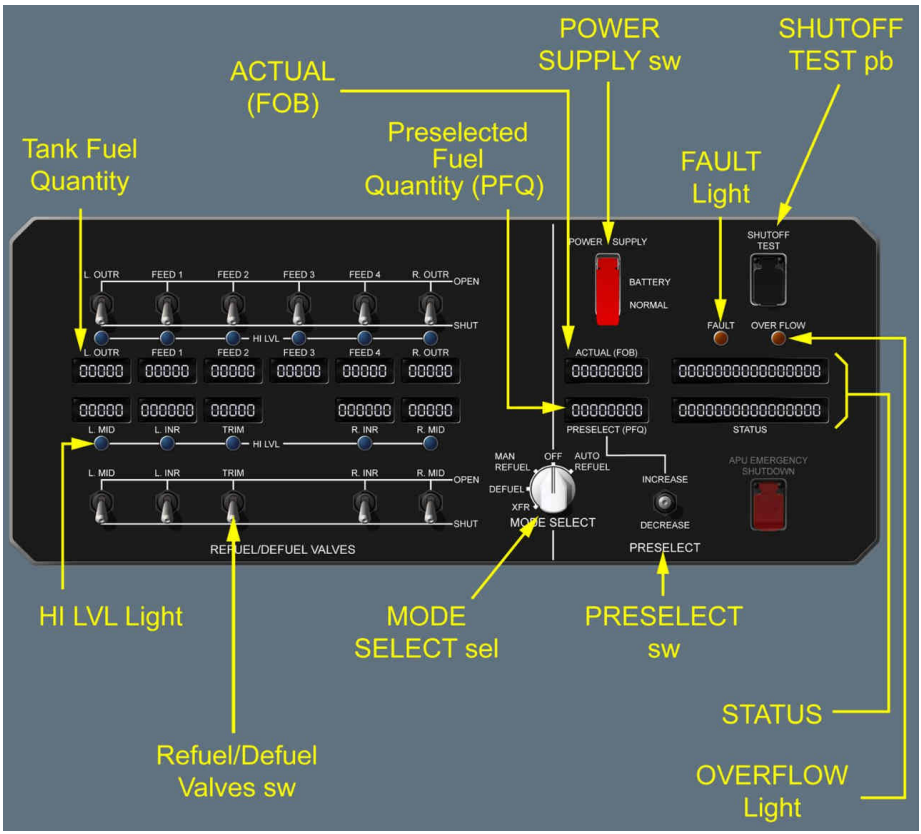
If the FQMS aborts the automatic ground transfer, the light flashes. This is associated with the following ECAM alert:
- FUEL AUTO GND XFR FAULT (*Refer to procedure*)

REFUEL PANEL

Applicable to: ALL

Refueling can be initiated from the cockpit, or from the external refuel panel.
L2 The external refuel panel is on the right-hand side of the lower belly fairing.

Refuel Panel



L3 TANK FUEL QUANTITY INDICATORS

Display the actual fuel quantity in each tank.

The fuel quantity indicators do not display the units. They use the same units that the FQMS uses for cockpit indications (i.e. kg or lbs). Theses units also appear in the ACTUAL and PRESELECT indications on the external refuel panel.

L3 PRESELECT (PFQ) INDICATOR

Displays the Preselected Fuel Quantity (PFQ) for automatic refueling.

The PFQ is selected via:
- The PRESELECT sw on the refuel panel, or
- A ground terminal, via ACARS, or
- The OIS REFUEL application, or
- The FMS FUEL & LOAD page.

L3 ACTUAL FUEL QUANTITY INDICATOR

Displays the current total fuel quantity on board.

L3 POWER SUPPLY sw

During refueling/defueling, the fuel system is powered by the external electrical power or by the APU.
If these electrical sources are not available, the fuel system can also be powered by the batteries, by using the POWER SUPPLY sw.

L3 FAULT LIGHT

Comes on in amber, if there is an equipment failure. The STATUS indicator displays the type of the failure.

L3 SHUTOFF TEST pb

When pressed, the shutoff test is initiated:
1. All the lights and displays come on
2. When released, all the inlet valves close, in the same order as during a refuel abort
3. The result of the test appears on the STATUS indicators.

L3 OVERFLOW LIGHT

Comes on in amber, if there is more than 264 US Gal of fuel in any surge tank.

L3 STATUS INDICATOR

The two lines of the STATUS indicator display the status of the refuel, transfer or defuel.
The top line displays the current mode.

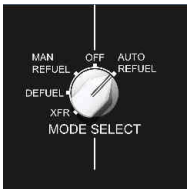
The bottom line displays any additional message or failure.

L3 PRESELECT sw

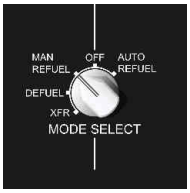
Increases or decreases the PFQ.

L3 MODE SELECT selector

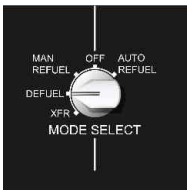
Refueling, defueling or ground transfer is not initiated from the external refuel panel.



Automatic refueling is initiated and controlled from the external refuel panel.



Manual refueling is initiated and controlled from the external refuel panel.



Defueling is initiated and controlled from the external refuel panel.

A manual ground transfer is initiated and controlled from the external refuel panel.
Automatic ground transfers can be initiated from the cockpit only.

Note: Automatic refueling or automatic ground transfer can be initiated from the cockpit at any time, whatever the position MODE SELECT selector.

L3 **Refuel/defuel Valves sw**

The refuel/defuel valves switches open the two inlet valves of the associated tank, during manual refueling, manual ground transfer or defueling (the MODE SELECT selector is set to MAN REFUEL, XFR or DEFUEL).

L3 **HI LVL LIGHT**

Comes on in blue, when a high fuel level is detected in the corresponding tank.

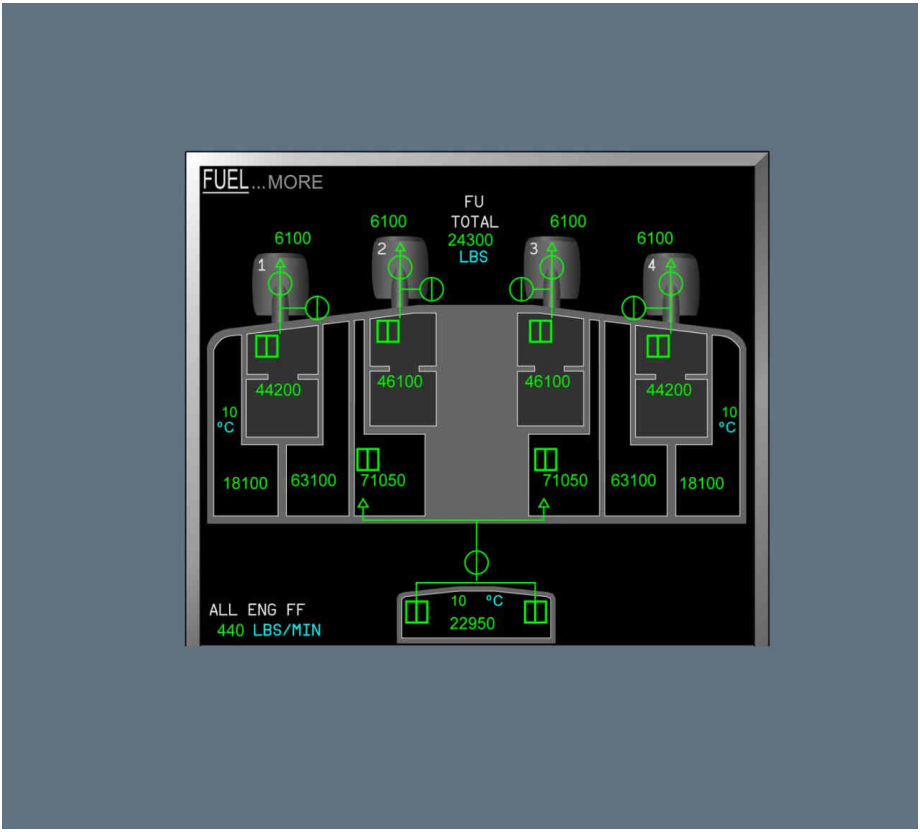
FUEL SYSTEM DISPLAY

Applicable to: ALL

The FUEL System Display provides the flight crew with information on the aircraft's fuel system and indicates the:

- Status of the fuel system components that are in use (e.g.: pumps, transfer paths)
- Fuel temperature in the Outer Tanks and Trim Tank
- Quantity of fuel in each tank
- Quantity of fuel used
- Fuel flow value.

FUEL System Display



The MORE key on the ECP can be used to display additional fuel system information. When pressed:

-

The MORE title, on the top left-hand corner of the ECAM page, changes from 

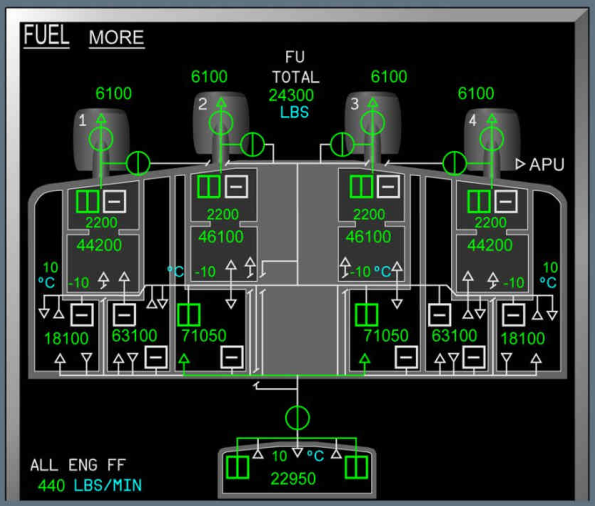
to 

- The quantity of fuel in the collector cells, and the fuel temperature in the Feed Tanks are displayed

L2 *Note:* *In the case of an abnormal feed tank temperature or collector cell quantity, the associated indication will be displayed, even if the MORE page is not selected.*

L1 - All supplementary data appears in grey.

FUEL MORE System Display



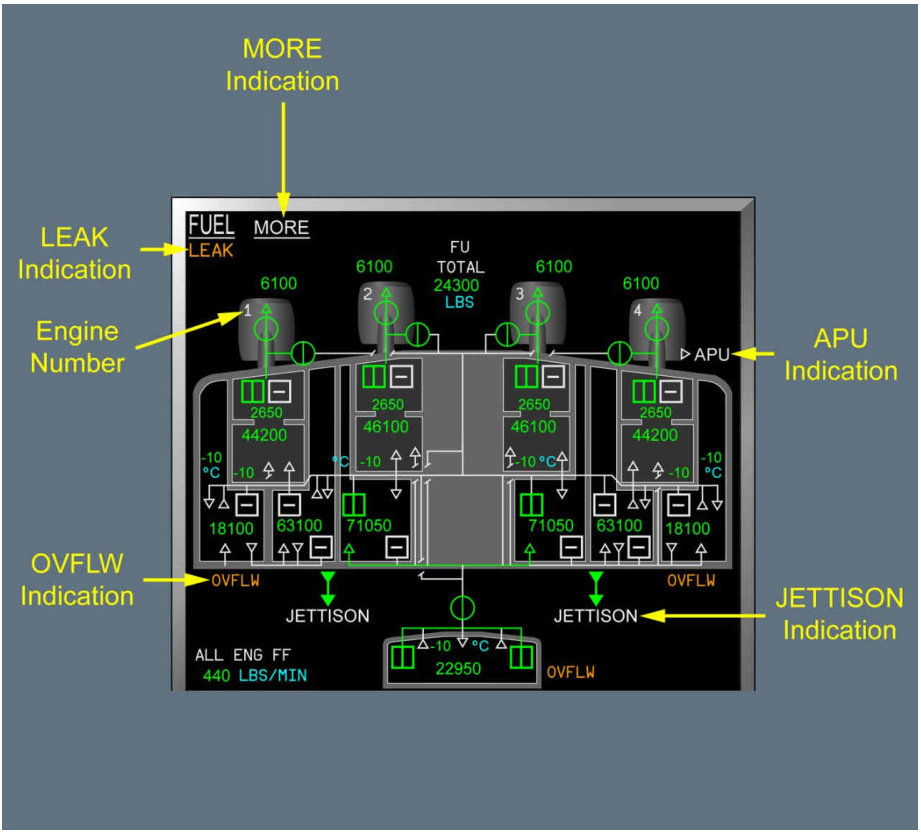
For a description of the FUEL System Display:

- *Refer to Fuel indications*
- *Refer to Fuel quantities, temperatures, Fuel Used and Fuel Flow*
- *Refer to Pumps and valves*

FUEL SYSTEM DISPLAY - INDICATIONS

Applicable to: ALL

Fuel System Display — Indications



MORE INDICATION

The fuel system components in use (e.g. the pumps that are running, the transfer paths), the fuel used, the fuel flow, and the fuel tank quantities are displayed on the FUEL system display.

Additional information (e.g. pumps on standby, collector cell quantity) is displayed.

APU INDICATION

L12

Fuel is not fed to the APU .
The APU LP valve and/or the APU isolation valve are closed.
This information appears on the MORE page only.

L12

Fuel is fed to the APU .
The APU LP valve and the APU isolation valve are open.

L12

Fuel is abnormally fed to the APU .
The APU LP valve and the APU isolation valve are abnormally open.

Associated with the following ECAM alert:
- FUEL APU FEED VLV NOT CLOSED (*Refer to procedure*).

L12

Fuel is abnormally not fed to the APU .
The APU LP valve and/or the APU isolation valve are abnormally closed.

Associated with the following ECAM alert:
- FUEL APU FEED FAULT (*Refer to procedure*).

JETTISON INDICATION

Jettison is active. The jettison valves are open.

L12

Jettison is activated, but the jettison valves are closed.

Associated with the following ECAM alert:
- FUEL JETTISON FAULT (*Refer to procedure*).

L12

Either jettison valve is abnormally open.

Associated with the following ECAM alert:
- FUEL JETTISON VLV NOT CLOSED (*Refer to procedure*).

OVERFLOW INDICATION

L12

OVFLW

- For the wing tanks: Appears when a L(R) vent overflow is detected, or fuel is detected in the L(R) surge tank
- For the trim tank: Appears when a trim vent overflow is detected.

Associated with one of the following ECAM alerts:
- FUEL WING TK OVERFLOW (*Refer to procedure*)
- FUEL TRIM TK OVERFLOW (*Refer to procedure*)

The indication disappears, when the overflow is no longer detected.

ENGINE NUMBER INDICATION

1

Engine 1(2)(3)(4) is running.

1

Engine 1(2)(3)(4) is not running.

LEAK INDICATION

L12

LEAK

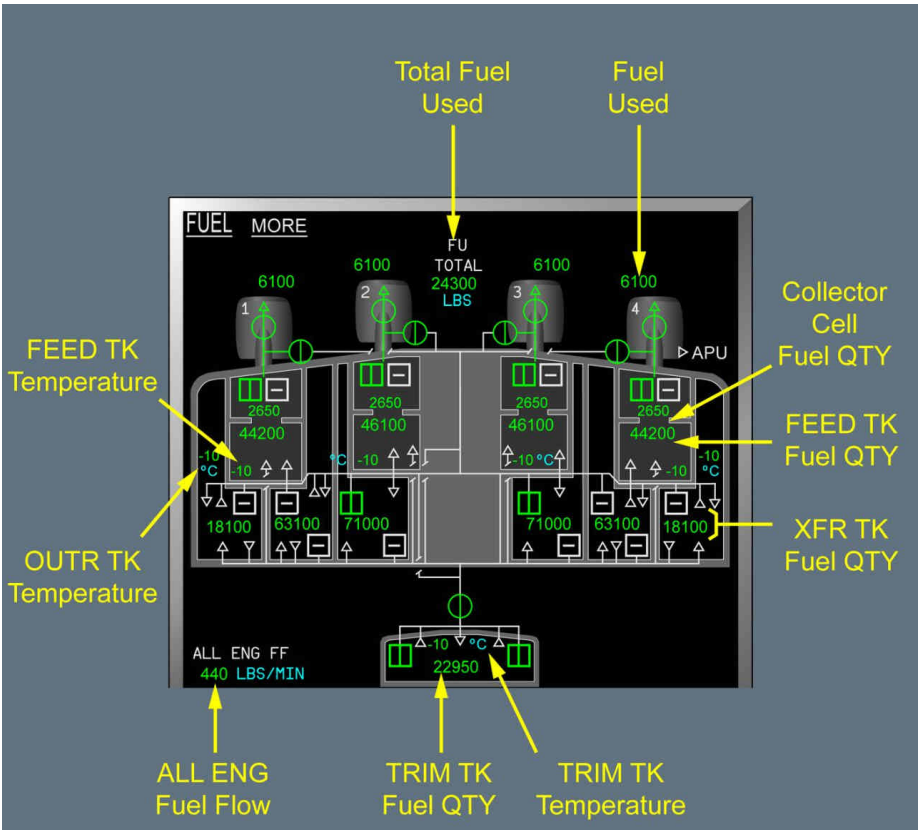
Indicates a fuel leak.
Appears only in the event that the ECAM does not display the FUEL LEAK DETECTED alert.

Note: The ECAM will not display the FUEL LEAK DETECTED alert if the communication between the FQMS and the FWS is failed. In this case, the flight crew can activate the FUEL LEAK DETECTED alert, via the not sensed procedures.

FUEL SYSTEM DISPLAY - FUEL QTY, TEMP, FU AND FF

Applicable to: ALL

FUEL System Display — QTY, TEMP, FU and FF



FUEL USED (FU) INDICATION

L12

6100

Indicates the fuel used by each engine.
This value automatically resets on ground, at the next engine start.
Appears in multiples of 100 lb.

The accuracy of the displayed value is degraded.

TOTAL FUEL USED INDICATION

L2 This indication automatically resets on ground, at the first engine start.

L12

Indicates the total fuel used by the four engines and the APU.
Appears in multiples of 100 lb.

L1

Indicates the total fuel used by the four engines. The fuel used by the APU is not available.

The total fuel used accuracy is degraded, because the fuel used accuracy of at least one engine is degraded.

The all engine fuel used accuracy is degraded, because the fuel used accuracy of at least one engine is degraded. The fuel used by the APU is not available.

COLLECTOR CELLS - FUEL QUANTITY INDICATION

The collector cell fuel quantity appears, in case of a low collector cell fuel quantity, or when the MORE key is pressed.

L12

The fuel quantity of collector cell 1(2)(3)(4) is within a normal range.
This information appears on the MORE page only.
The value is displayed in multiples of 50 lb .

L12

A low fuel quantity is detected in the collector cell.

Associated with the following ECAM alert:
- FUEL COLLECTOR CELL 1(2)(3)(4) NOT FULL (*Refer to procedure*).

The collector cell fuel quantity indication disappears, when the fuel quantities in all collector cells return to normal.

FEED TANK FUEL QUANTITY INDICATION

L12

The fuel quantity in feed tank 1(2)(3)(4) is within a normal range.
The value is displayed in multiples of 50 lb .

L12

The value accuracy is degraded.

Associated with one of the following ECAM alerts:
- FUEL GAUGING FAULT (*Refer to procedure*)
- FUEL FQMS 1+2 FAULT (*Refer to procedure*)

L12

A low fuel quantity is detected in the corresponding feed tank.

Associated with one of the following ECAM alerts:
- FUEL FEED TK 1(2)(3)(4) LEVEL LO (*Refer to procedure*)
- FUEL FEED TKs 1+2(3+4) LEVEL LO (*Refer to procedure*)
- FUEL ALL FEED TKs LEVEL LO (*Refer to procedure*)

As soon as the fuel quantity returns to normal, the indication becomes green.

L12

The fuel quantity in feed tanks 1(2) is not balanced with the fuel quantity in feed tank 4(3).

Associated with the following ECAM alert:
- FUEL WINGS NOT BALANCED (*Refer to procedure*)

When the fuel is balanced, the FUEL WINGS BALANCED (*Refer to procedure*) caution appears.

L12

Some of the fuel in the feed tank is not usable.

Associated with one of the following ECAM alerts:
- FUEL FEED TK 1(2)(3)(4) MAIN + STBY PMPs FAULT (*Refer to procedure*)
- FUEL L(R) WING FEED PMPs FAULT (*Refer to procedure*)

L12

The fuel in the feed tank is not usable.

Associated with the following ECAM alert:
- FUEL CROSSFEED VLV 1(2)(3)(4) FAULT (*Refer to procedure*)

L (R) INNER (MID) (OUTER) TANK FUEL QUANTITY INDICATION

L12

The fuel quantity of the left (right) inner (mid) (outer) tank.
The value is displayed in multiples of 50 lb .

L12

The value accuracy is degraded.

Associated with one of the following ECAM alerts:
- FUEL GAUGING FAULT (*Refer to procedure*)
- FUEL FQMS 1+2 FAULT (*Refer to procedure*)

L12

The fuel quantity in the left inner (mid) (outer) tank is not balanced with the fuel quantity in the right inner (mid) (outer) tank.
Associated with the following ECAM alert:

- FUEL WINGS NOT BALANCED (*Refer to procedure*)

When the fuel is balanced, the FUEL WINGS BALANCED (*Refer to procedure*) caution appears.

L12

The fuel in the tank is not usable.

Associated with one of the following ECAM alerts:
- FUEL NORM + ALTN XFR FAULT (*Refer to procedure*)
- FUEL L(R) INR TK FWD + AFT PMP FAULT (*Refer to procedure*)
- FUEL L(R) MID TK FWD + AFT PMP FAULT (*Refer to procedure*)

L12

Some of the fuel in the tank is not usable.

Associated with one of the following ECAM alerts:
- FUEL NORM + ALTN XFR FAULT (*Refer to procedure*)
- FUEL L(R) OUTR TK PMP FAULT (*Refer to procedure*)

OUTER AND TRIM TANKS - FUEL TEMPERATURE INDICATION

When there is fuel in the outer and trim tanks and the temperature sensors are immersed, their associated fuel temperatures are displayed on the FUEL SD page.

L2 The temperature sensor immersion thresholds for cruise pitch & roll conditions (at average fuel density) are approximately:
- 8 819 lb in the outer tanks
- 13 890 lb in the trim tank.

L1 When the fuel temperature sensors are not immersed, the associated fuel temperatures are not displayed.

The fuel temperature in the left(right) outer(trim) tank is within a normal range.

L12

The fuel temperature is below -40 °C .
Associated with the following ECAM alert:

- FUEL TEMP LO (*Refer to procedure*).

TRIM TANK FUEL QUANTITY INDICATION

L12

The fuel quantity in the trim tank.
The value is displayed in multiples of 50 lb .

L12

The value accuracy is degraded.

Associated with one of the following ECAM alerts:
- FUEL GAUGING FAULT (*Refer to procedure*)
- FUEL FQMS 1+2 FAULT (*Refer to procedure*)

L12

The fuel in the trim tank is not usable.

Associated with one of the following ECAM alerts:
- FUEL TRIM TK XFR FAULT (*Refer to procedure*)
- FUEL TRIM & APU LINES FAULT (*Refer to procedure*)

L12

Some fuel in the trim tank is not usable.

Associated with one of the following ECAM alerts:
- FUEL TRIM TK XFR FAULT (*Refer to procedure*)
- FUEL TRIM TK L+R PMPs FAULT (*Refer to procedure*)

ALL ENGINE FUEL FLOW (ALL ENG FF) INDICATION

L12

The fuel flow of all engines.
The value is displayed in multiples of 20 lb/min.

The value accuracy is degraded.

FEED TANK - FUEL TEMPERATURE INDICATION

The feed tank temperature appears, in case of low or high temperature, or when the MORE key is pressed.

The fuel temperature is within a normal range.

L12

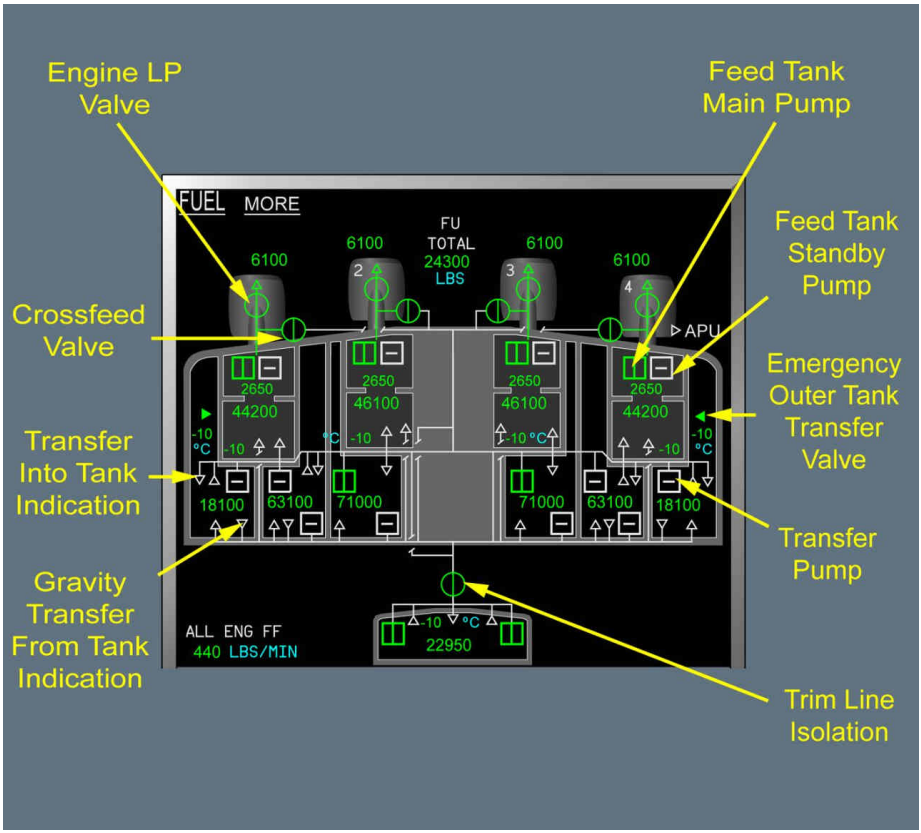
The fuel temperature is above 53 °C , or below -40 °C .
Associated with one of the following ECAM alerts:

- FUEL TEMP LO (*Refer to procedure*)
- FUEL FEED TK 1(2)(3)(4) TEMP HI (*Refer to procedure*).

FUEL SYSTEM DISPLAY - PMPS, VALVES

Applicable to: ALL

FUEL System Display - PMPs Valves and Transfers



ENGINE LP VALVE

The valve is open.

L12

The valve is abnormally open.

Associated with the following ECAM alert:
- FUEL ENG 1(2)(3)(4) LP VLV FAULT (*Refer to procedure*).

L12

The valve is normally or abnormally closed.

If the valve is abnormally closed, it is associated with the following ECAM alert:
- FUEL ENG 1(2)(3)(4) LP VLV FAULT (*Refer to procedure*).

FEED TANK MAIN PUMP

The pump is running.

The pump is abnormally running.

L12

The pump is failed or is turned off by the flight crew.

Associated with the following ECAM alert:
- FUEL FEED TK 1(2)(3)(4) MAIN PMP FAULT (*Refer to procedure*)

The pump is on, and the pump pressure is below normal.

FEED TANK STANDBY PUMP

The feed tank standby feed pump is not running, because the feed tank main pump is running.
This information appears on the MORE page only.

The standby pump is running.
The main engine pump pressure is below normal.

The standby pump is abnormally running.

L12

The main and standby pumps are failed or turned off.

Associated with the following ECAM alert:
- FUEL FEED TK 1(2)(3)(4) MAIN + STBY PMPs FAULT (*Refer to procedure*).

The standby pump is on, and the pump pressure is below normal.

EMERGENCY OUTER TANK TRANSFER VALVE

The emergency transfer valve between the outer tank and the outer feed tank is open.

The emergency transfer valve is abnormally open or abnormally closed.

TRANSFER PUMPS

The transfer pump is not running.
This information appears on the MORE page only.

The transfer pump is running.

L12

The transfer pump is abnormally running.

Associated with one of the following ECAM alerts:
- FUEL L(R) INR(MID) TK FWD PMP FAULT (*Refer to procedure*)
- FUEL L(R) INR(MID) TK AFT PMP FAULT (*Refer to procedure*)
- FUEL L(R) INR TK FWD + AFT PMP FAULT (*Refer to procedure*)
- FUEL L(R) MID TK FWD + AFT PMP FAULT (*Refer to procedure*)
- FUEL L(R) OUTR TK PMP FAULT (*Refer to procedure*)
- FUEL TRIM TK L(R) PMP FAULT (*Refer to procedure*)
- FUEL TRIM TK L+R PMP FAULT (*Refer to procedure*)

L12

The transfer pump is failed or is turned off.

Associated with one of the following ECAM alerts:
- FUEL L(R) INR(MID) TK FWD PMP FAULT (*Refer to procedure*)
- FUEL L(R) INR(MID) TK AFT PMP FAULT (*Refer to procedure*)
- FUEL L(R) INR TK FWD + AFT PMP FAULT (*Refer to procedure*)
- FUEL L(R) MID TK FWD + AFT PMP FAULT (*Refer to procedure*)
- FUEL L(R) OUTR TK PMP FAULT (*Refer to procedure*)
- FUEL TRIM TK L(R) PMP FAULT (*Refer to procedure*)
- FUEL TRIM TK L+R PMP FAULT (*Refer to procedure*)

L12

The transfer pump is on, and:
- The pump pressure is below normal, or
- The pump is used for a manual transfer and the associated tank is empty, or
- The pump is used for a manual transfer, the pump pressure is below normal, and the associated tank is not empty.

Associated with one of the following ECAM alerts:
- FUEL L(R) INR(MID) TK AFT PMP FAULT (*Refer to procedure*)
- FUEL L(R) OUTR TK PMP FAULT (*Refer to procedure*)
- FUEL TRIM TK L(R) PMP FAULT (*Refer to procedure*)
- FUEL TRIM TK L+R PMP FAULT (*Refer to procedure*)

TRIM LINE ISOLATION

This valve represents the isolation of the trim line.

L123

The trim tank isolation valve is open.

Note: In flight, when there is fuel in the trim tank, and the TRIM TK FEED selector is set to AUTO, the trim tank isolation valve is open. The trim tank isolation valve is closed for takeoff. It opens above FL 250, or as soon as a CG transfer is required.

L12

The trim line is isolated.

The following valves are closed:
- The trim tank isolation valve
- The trim line isolation valves
- The trim tank inlet valves.

L12

The trim line is abnormally isolated.

- During an automatic transfer:
  - Both trim line isolation valves are abnormally closed, or
  - Both trim tank inlet valves and the trim tank isolation valves are abnormally closed.
- During a pumped manual trim tank transfer:
  - The trim line isolation valve connected to the aft transfer gallery is abnormally closed, or
  - The trim tank isolation valve is abnormally closed.
- During a gravity trim tank transfer:
  - The trim tank isolation valve is abnormally closed, or
  - Any trim tank inlet valve is abnormally closed.

L12

The trim line is abnormally not isolated.

At least one of the following valves is abnormally open:
- The trim tank isolation valve
- The trim tank inlet valves
- The trim line isolation valves.

TRANSFER INTO TANK INDICATION

No fuel transfer into the tank.
This information appears on the MORE page only.

Automatic fuel transfer into the tank.

Manual fuel transfer into the tank.

Abnormal fuel transfer into the tank.

OUTLET VALVE

L2 The inlet valves of the trim, mid, and outer tanks can also be used as outlet valves for gravity transfers.

L1

No gravity transfer from the tank.
This information appears on the MORE page only.

Automatic gravity transfer from the tank.

Manual gravity transfer from the tank.

Abnormal gravity transfer from the tank.

CROSSFEED VALVE

The crossfeed valve is closed.

The crossfeed valve is open.
If at least two crossfeed valves are open, the ECAM displays the CROSSFEED OPEN memo.
During takeoff, this memo is in amber.

L12

The crossfeed valve is abnormally closed.

Associated with the following ECAM alert:
- FUEL CROSSFEED VLV 1(2)(3)(4) FAULT (*Refer to procedure*).

L12

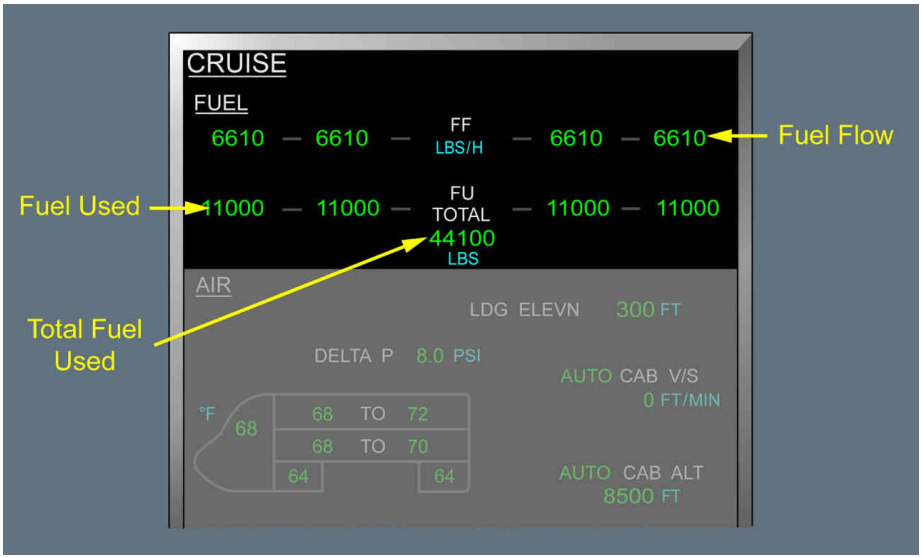
The crossfeed valve is abnormally open.

Associated with the following ECAM alert:
- FUEL CROSSFEED VLV 1(2)(3)(4) FAULT (*Refer to procedure*).

CRUISE PAGE - UPPER PART

Applicable to: ALL

CRUISE System Display — Upper Part



FUEL FLOW INDICATION

L12

3000	The fuel flow of each engine. The value is displayed in multiples of 10 lb/h.
3000	The value accuracy is degraded.

TOTAL FUEL USED INDICATION

L12

Indicates the total fuel used by the four engines and the APU.
Appears in multiples of 100 lb.

L12

Indicates the total fuel used by the four engines only. The APU fuel used value is not valid.
Appears in multiples of 100 lb.

The total fuel used accuracy is degraded, because the fuel used accuracy of at least one engine is degraded.

The all engine fuel used accuracy is degraded, because the fuel used accuracy of at least one engine is degraded. The fuel used by the APU is not available.

FUEL USED (FU) INDICATION

L12

Indicates the fuel used by each engine.
This value automatically resets on ground, at the next engine start.
Appears in multiples of 100 lb.

The accuracy of the displayed value is degraded.

PERMANENT DATA - SYSTEM DISPLAY

Applicable to: ALL

PERMANENT DATA

FUEL ON BOARD INDICATION

quantity on board the aircraft.
displayed in multiples of 100 lb.

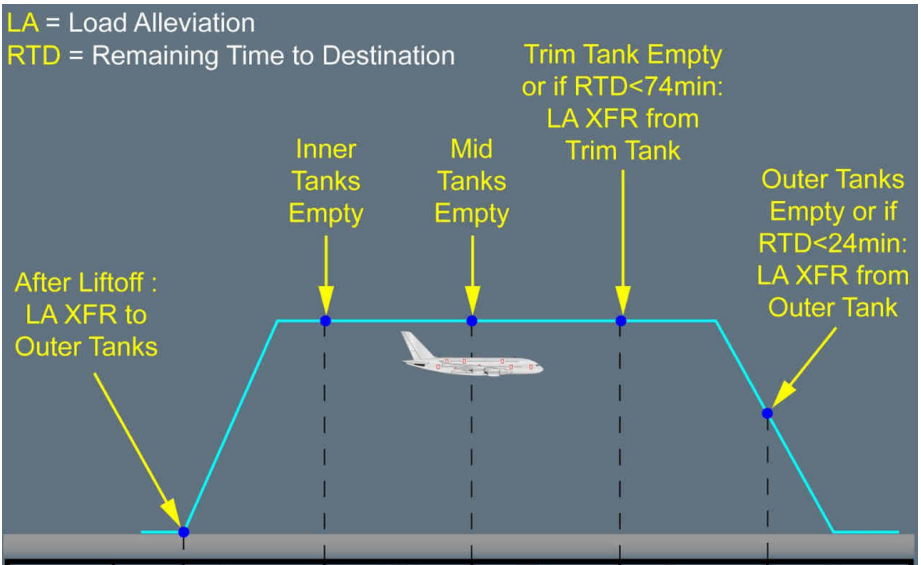
FUEL TRANSFER SEQUENCE

Applicable to: ALL

The following illustration indicates the fuel transfer sequence that is most likely to occur in flight:

Fuel transfer sequence



Main Transfer	From	Inner Tanks	Mid Tanks	Trim Tank	Outer Tanks	No Transfer
	To	Feed Tanks				
CG Transfer	From	Trim Tank				
	To	Inner Tanks	Mid Tanks	Feed Tanks	No Transfer	

MAIN TRANSFERS

Applicable to: ALL

Fuel transfers from the other tanks to the feed tanks are performed to compensate for engine fuel burn.
These transfers are automatic, and are referred to as main transfers.

Main transfers occur in the following sequence:
1. Inner tanks to feed tanks
2. Mid tanks to feed tanks, when the inner tanks are empty
3. Trim tank to feed tanks, when the mid tanks are empty
4. Outer tanks to feed tanks, when the trim tank is empty.

At any moment, only one tank (or pair of symmetric tanks) will provide fuel for main transfers.

L2 **MAIN TRANSFERS FROM THE INNER OR MID TANKS**

The main transfers from the inner or mid tanks to the feed tanks maintain the quantity of fuel in the feed tanks between the transfer threshold and the transfer threshold + 2 200 lb:
- The transfer threshold for feed tanks 1 and 4 is 43 100 lb
- The transfer threshold for feed tanks 2 and 3 is 45 950 lb.

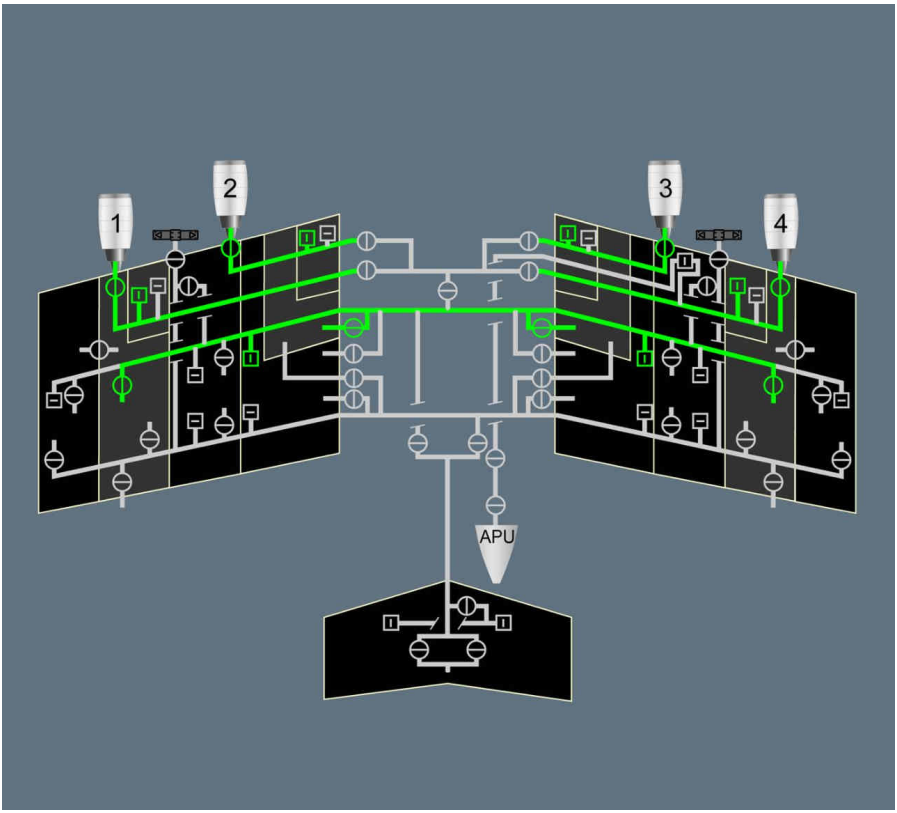
L23

Note: *If the remaining time to destination is less than 90 min:*
- *The transfer threshold for feed tanks 1 and 4 is 36 500 lb*
- *The transfer threshold for feed tanks 2 and 3 is 39 350 lb.*

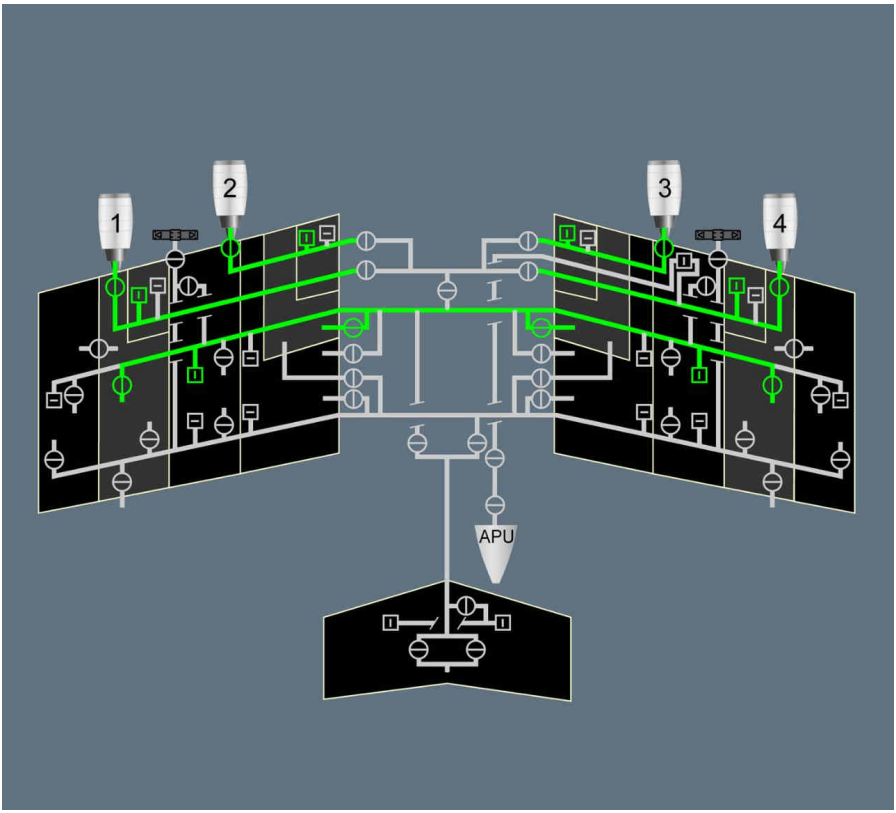
The transfer threshold are reduced to be sure that the feed tanks will not be full at landing. This ensures that sufficient fuel uplifted during refuel goes through the fuel properties measurement units in feed tanks 1, 2 and 3.

Fuel transfers to the feed tanks, via the forward gallery.

Main Transfer from the Inner Tanks



Main Transfer from the Mid Tanks

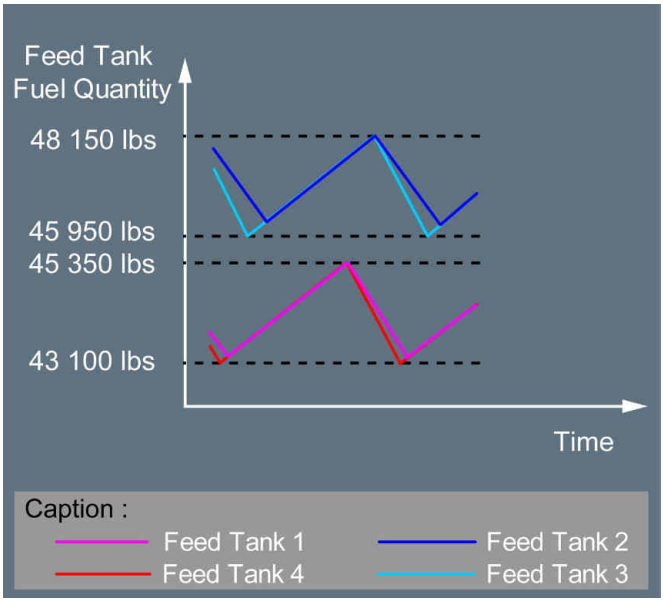


L3 The fuel transfer rate from the inner or mid tanks to the feed tanks is approximately 22 050 lb/h per feed tank.
Due to variations in fuel burn, the fuel quantities in the symmetric feed tanks may decrease at different rates.

In this case, in order to balance the fuel quantities in the symmetric feed tanks, transfer to these tanks will not start simultaneously:

- When the lower feed tank reaches its transfer threshold, transfer starts to this feed tank
- When both tanks become balanced, transfer starts to the other feed tank.

Main transfer from the inner tanks



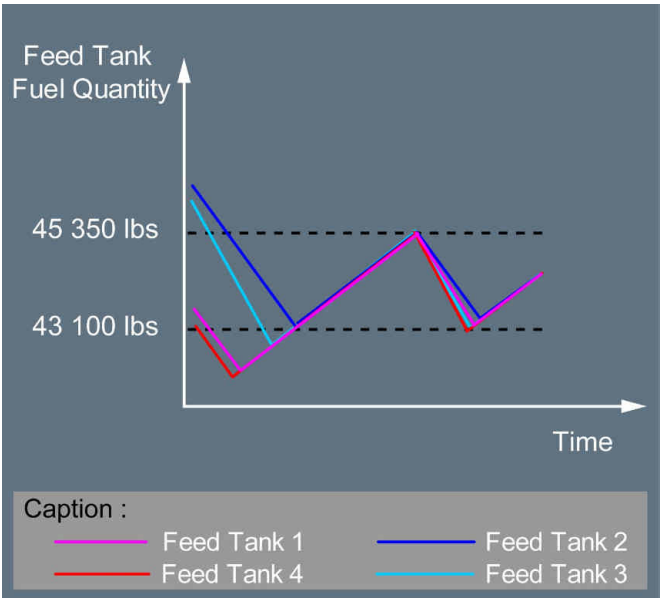
L2 When the sum of the fuel in both mid tanks is less than 17 650 lb, the transfer threshold for all feed tanks becomes 43 100 lb. The fuel quantities in the feed tanks are maintained between this transfer threshold and this transfer threshold + 2 200 lb, until the mid tanks are empty.

L3 The fuel quantities in all the feed tanks are balanced as follows:

1. A transfer from the mid tanks to the feed tank with the least fuel in it starts, when :
   - The fuel quantity in the feed tank with the least fuel in it is below the transfer threshold, and
   - The fuel quantities in all the feed tanks are below the transfer threshold + 2 200 lb.
2. When the fuel quantity in the receiving feed tank reaches the fuel quantity of another feed tank, a transfer to this feed tank starts.
3. The transfers stop, when all the feed tanks have reached the transfer threshold + 2 200 lb.

These steps are repeated, until the mid tanks are empty.

Main transfer from the mid tanks



L2 MAIN TRANSFER FROM THE TRIM TANK

When the inner and mid tanks are empty, fuel can be transferred from the trim tank to the feed tanks.
The main transfer from the trim tank starts, when the fuel quantity in any feed tank is less than 13 250 lb, and stops when the trim tank is empty.

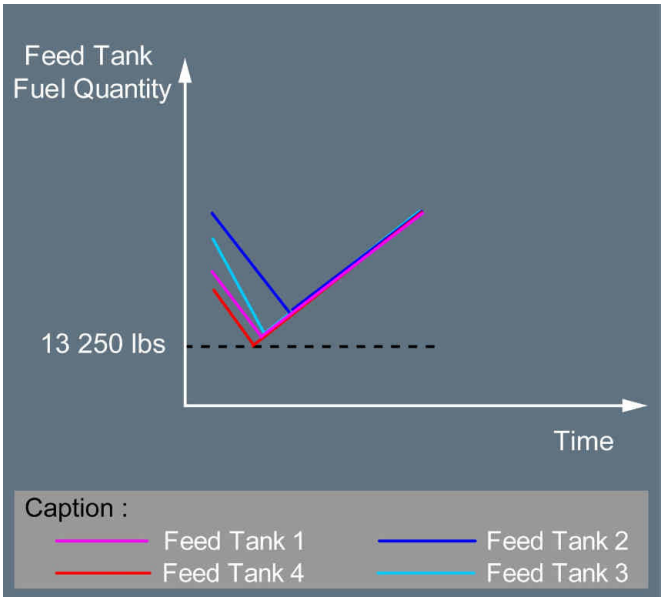
Depending on the fuel quantity in the trim tank, two types of main transfer from the trim tank can occur:

- If there is enough fuel in the trim tank, the fuel system aims to balance the fuel quantity in all the feed tanks:

L3

1. When the fuel quantity in the lowest feed tank reaches 13 250 lb, a main transfer to this tank starts.
2. When the fuel quantity in the receiving feed tank reaches the fuel quantity of another feed tank, a transfer to this feed tank starts.

Main transfer from the trim tank



L2

- When there is not enough fuel in the trim tank to balance the fuel quantities in all the feed tanks, the fuel system aims to balance the fuel quantity in each pair of symmetric feed tanks:

L3

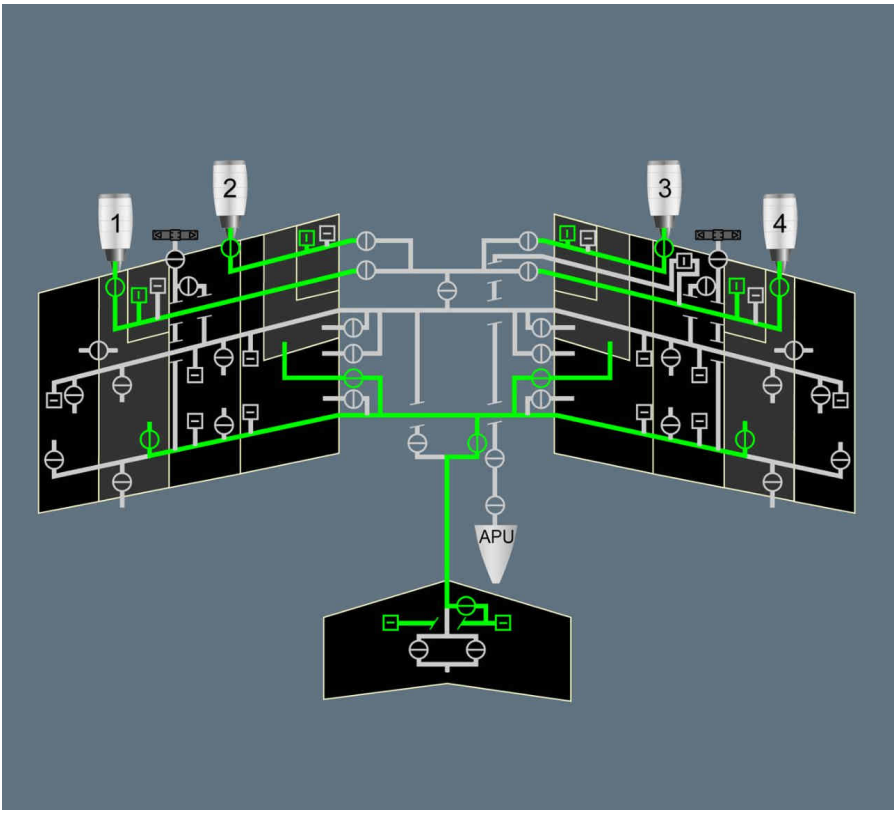
1. When the fuel quantity in any feed tank reaches 13 250 lb, a main transfer to this tank starts.
2. When the fuel quantity in the receiving feed tank reaches the fuel quantity of the symmetric feed tank, a transfer to this feed tank starts.
3. When the sum of fuel in the pair of receiving feed tanks equals the sum of fuel in the other pair, the main transfer stops.

Note: *The transfers stop only when the receiving feed tanks are balanced*

4. When the fuel quantity in any feed tank of the other pair reaches 13 250 lb, a main transfer to this tank starts.
5. When the fuel quantity in the receiving feed tank reaches the fuel quantity of the symmetric feed tank, a transfer to this feed tank starts.
6. The transfer continues until the trim tank is empty.

L2 Fuel transfers from the trim tank to the feed tanks via the aft gallery.

Main transfer from the trim tank

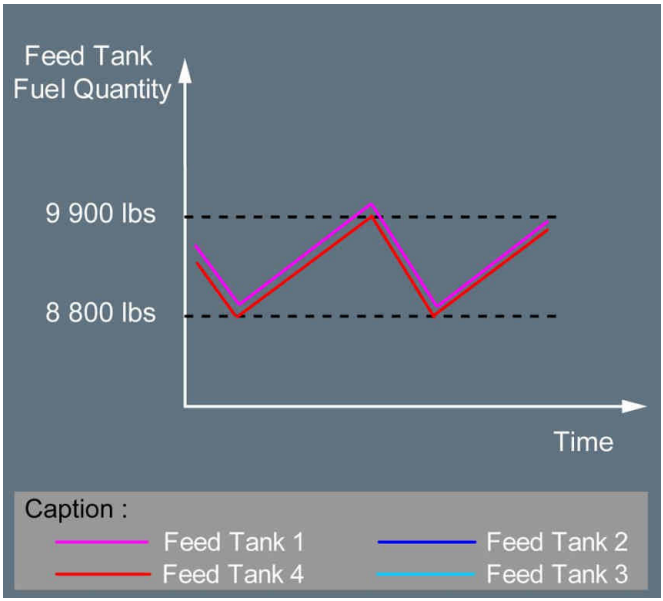


L3 The transfer rate from the trim tank to the feed tanks is approximately 11 000 lb/h per feed tank.

L2 MAIN TRANSFERS FROM THE OUTER TANKS

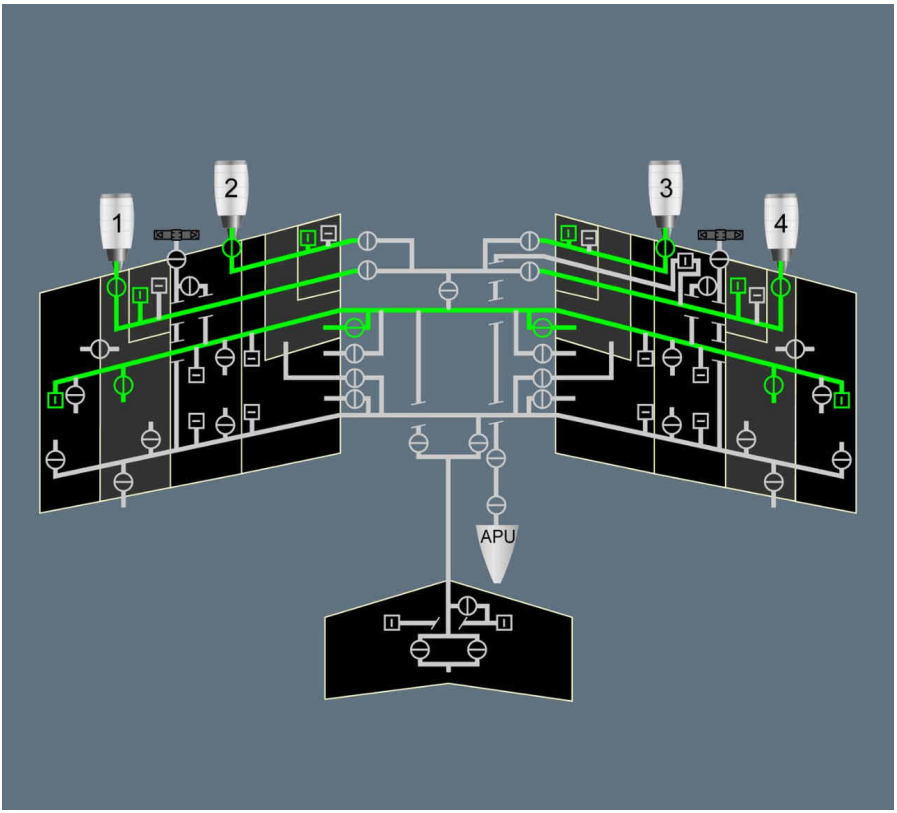
When the inner, mid, and trim tanks are empty, fuel can be transferred from the outer tanks to the feed tanks.
A main transfer to a pair of symmetric feed tanks starts, when the fuel quantity in any of these feed tanks is less than 8 800 lb.
The main transfer stops, when the fuel quantity in each of these feed tanks is greater than 9 900 lb.

Main transfer from the outer tanks



Fuel transfers from the outer tanks to the feed tanks via the forward gallery.

Main Transfers from the Outer Tanks



L3 The transfer rate from the outer tanks to the feed tanks is approximately 17 650 lb/h per outer tank.

LOAD ALLEVIATION TRANSFER

Applicable to: ALL

The distribution of fuel has an important impact on the aircraft structure. An appropriate fuel distribution reduces the loads on the structure.

For the wing:

- In flight, the lift produced by the wing creates an important upward bending moment. Maintaining fuel in the outer tanks as long as possible reduces this bending moment.
- On ground, the weight of the engines creates a downward bending moment. Fuel in the outer tanks increases this bending moment. This is why the outer tanks are not completely filled on ground (except if all the other fuel tanks are already full).

For the fuselage:

- At touchdown, the weight of the fuselage aft of the landing gear creates a downward bending moment. This bending moment is reduced by emptying the trim tank before landing.

The following load alleviation transfers will occur in flight:

1. After takeoff: Transfer to the outer tanks, until the outer tanks are full
2. Before landing:
   - Transfer from the trim tank, until the trim tank is empty
   - Transfer from the outer tanks, until the outer tanks are half-empty.

L2 LOAD ALLEVIATION TRANSFER TO THE OUTER TANKS

A load alleviation transfer to the outer tanks occurs, when:

- The FOB is greater than 110 200 lb
- The outer tanks are not full
- The aircraft is in flight.

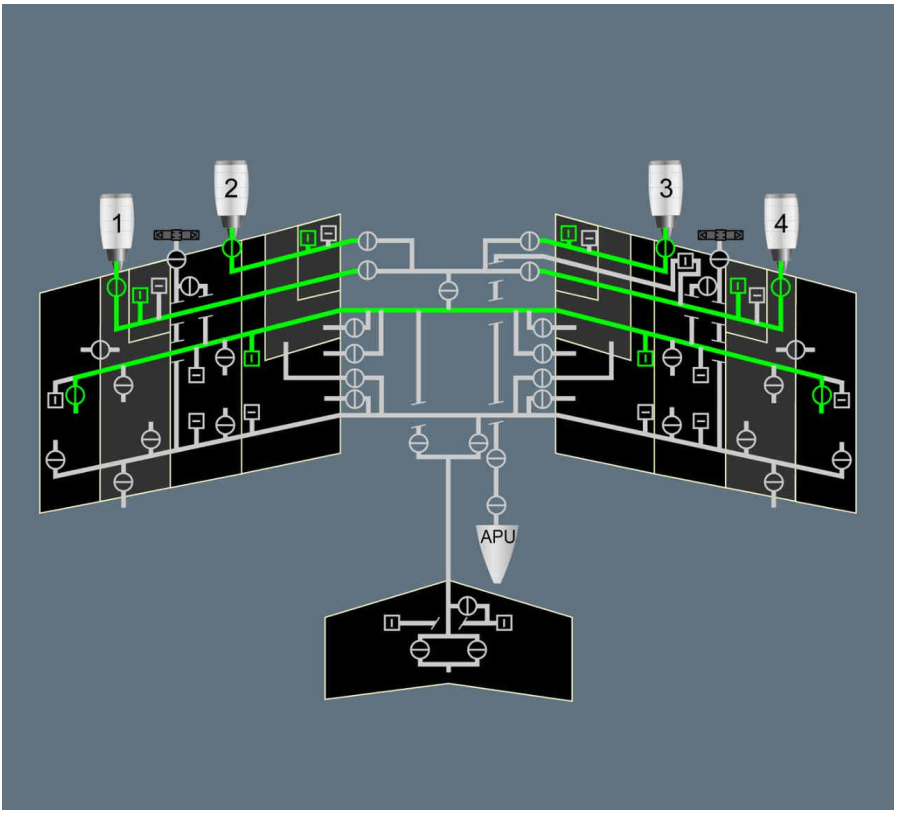
The load alleviation transfer stops, when the outer tanks are full.

Fuel transfers to the outer tanks, via the forward galley, from the:

- Inner tanks, or
- Mid tanks, when the inner tanks are empty.

Note: *After refueling, if the FOB is greater than 110 200 lb, there will be sufficient fuel in the inner tanks.*

Load Alleviation Transfer to the Outer tanks



L3 The fuel transfer rate to the outer tanks is approximately 44 100 lb/h per outer tank.

L2 LOAD ALLEVIATION TRANSFER FROM THE TRIM TANK

A load alleviation transfer from the trim tank occurs, when the Remaining Time to Destination (RTD) is less than 78 min.

L3 *Note:* *The transfer starts when:*

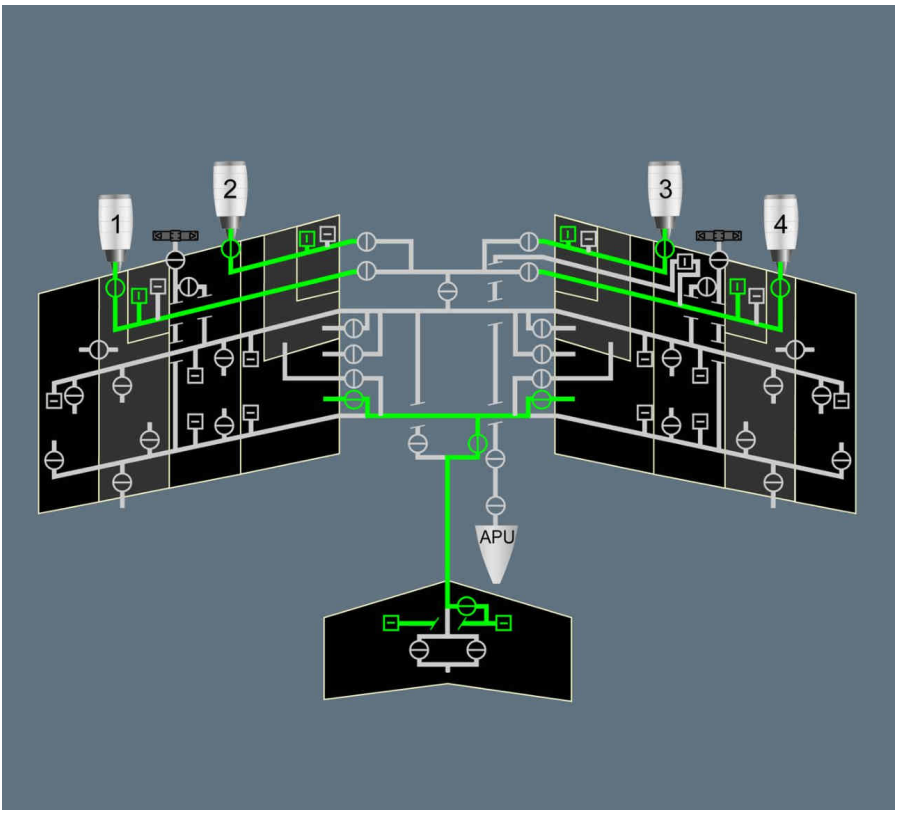
- *The RTD has been below 80 min, for 3 min, or*
- *The altitude goes below FL 245, if it was previously above FL 255.*

L2 Fuel transfers from the trim tank, via the aft gallery, to the:
- Feed tanks, or
- Mid tanks, if the feed tanks are full, or
- Inner tanks, if the feed tanks and mid tanks are full.

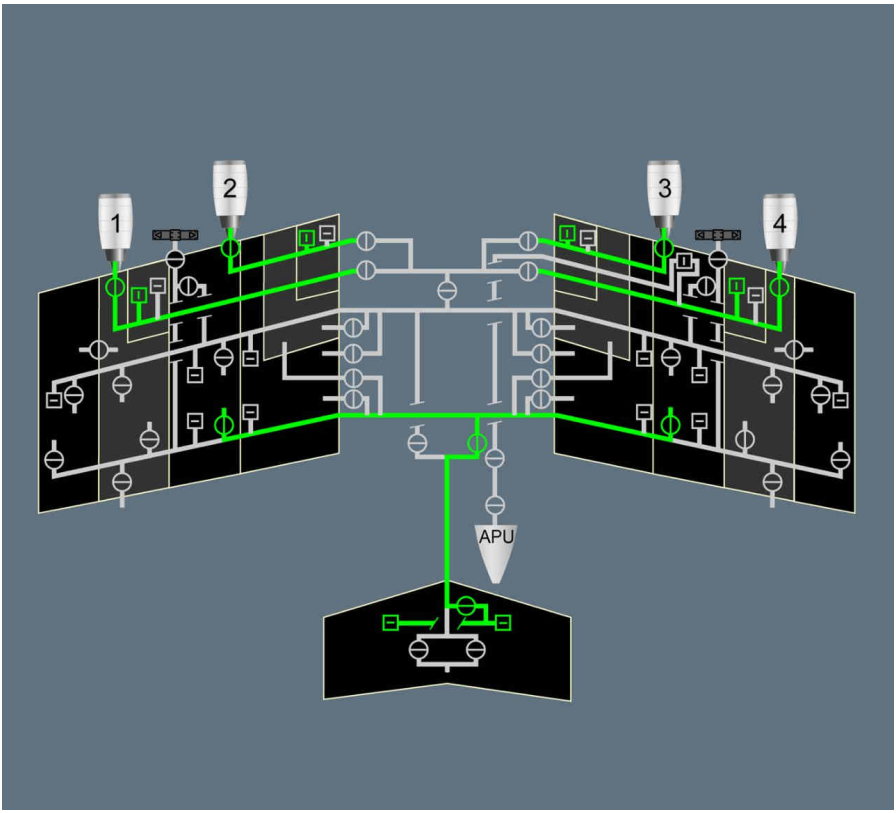
The load alleviation transfer stops, when the trim tank is empty.

The transfer also stops if:
- The TRIM TK FEED sw is set to ISOL, or
- The RTD goes above 80 min.
  This can happen if the FMS flight plan modification leads to a new RTD above 80 min. In this case, the transfer resumes when the RTD goes below 78 min.

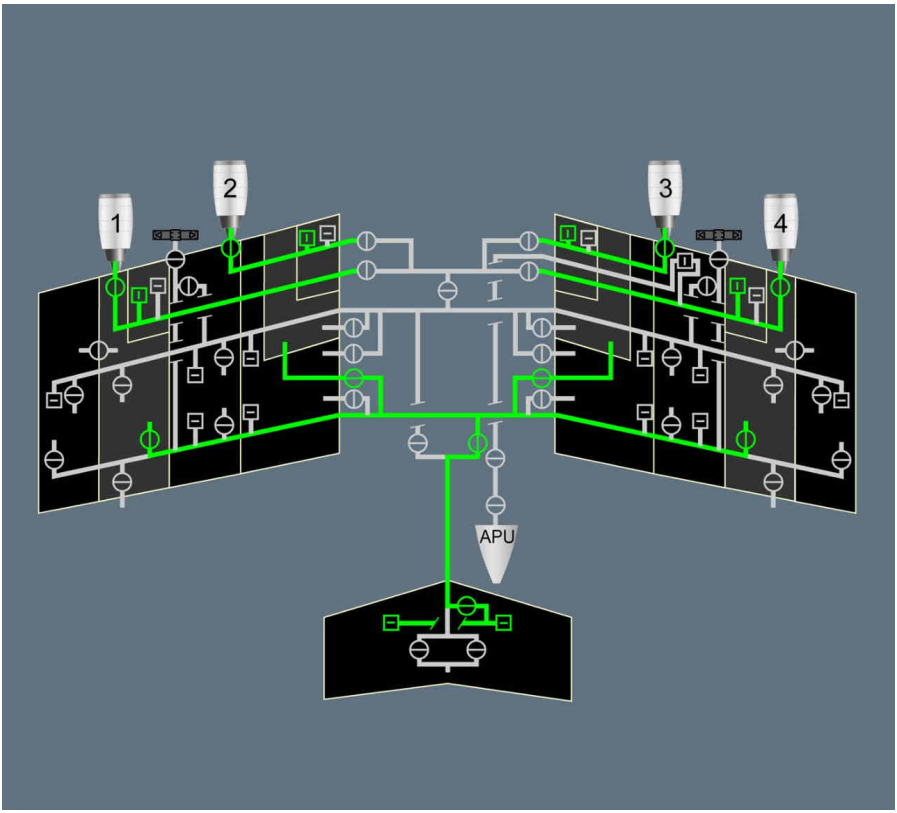
Load Alleviation Transfer from the Trim Tank to the Inner Tanks



Load Alleviation Transfer from the Trim Tank to the Mid Tanks



Load Alleviation Transfer from the Trim Tank to the Feed Tanks



L3 The transfer rate from the trim tank is approximately 44 100 lb/h.

L2 LOAD ALLEVIATION TRANSFER FROM THE OUTER TANKS

A load alleviation transfer from the outer tanks occurs, when the Remaining Time to Destination (RTD) is less than 28 min, and the fuel quantity in any outer tank is greater than 8 800 lb.

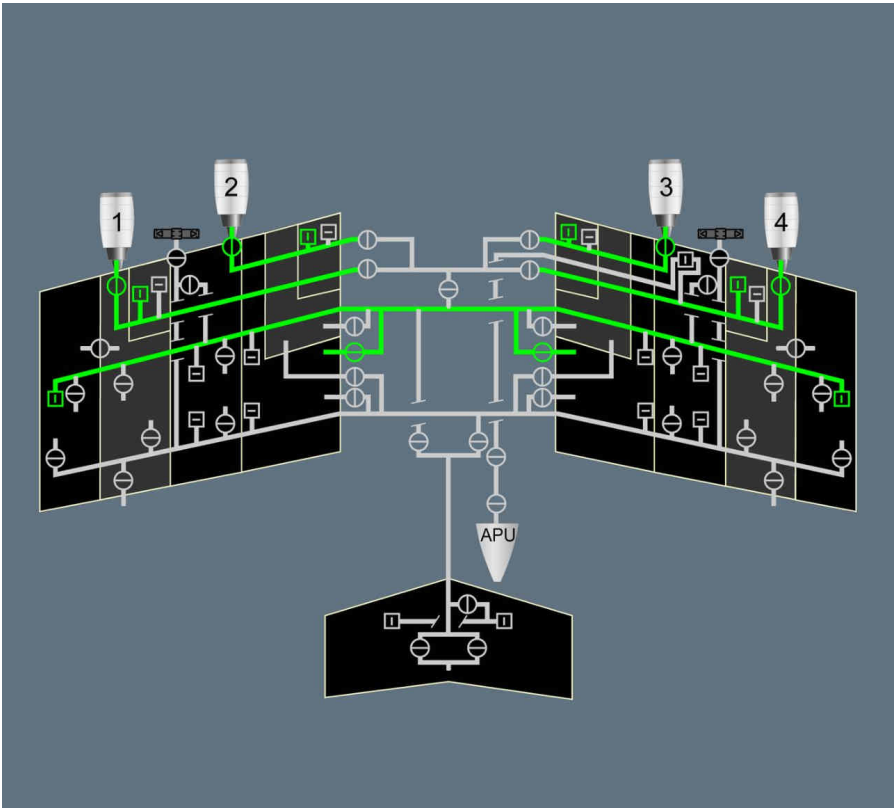
L3 *Note:* *The transfer starts when:*

- *The RTD has been below 30 min, for 3 min, or*
- *The altitude goes below FL 245, if it was previously above FL 255.*

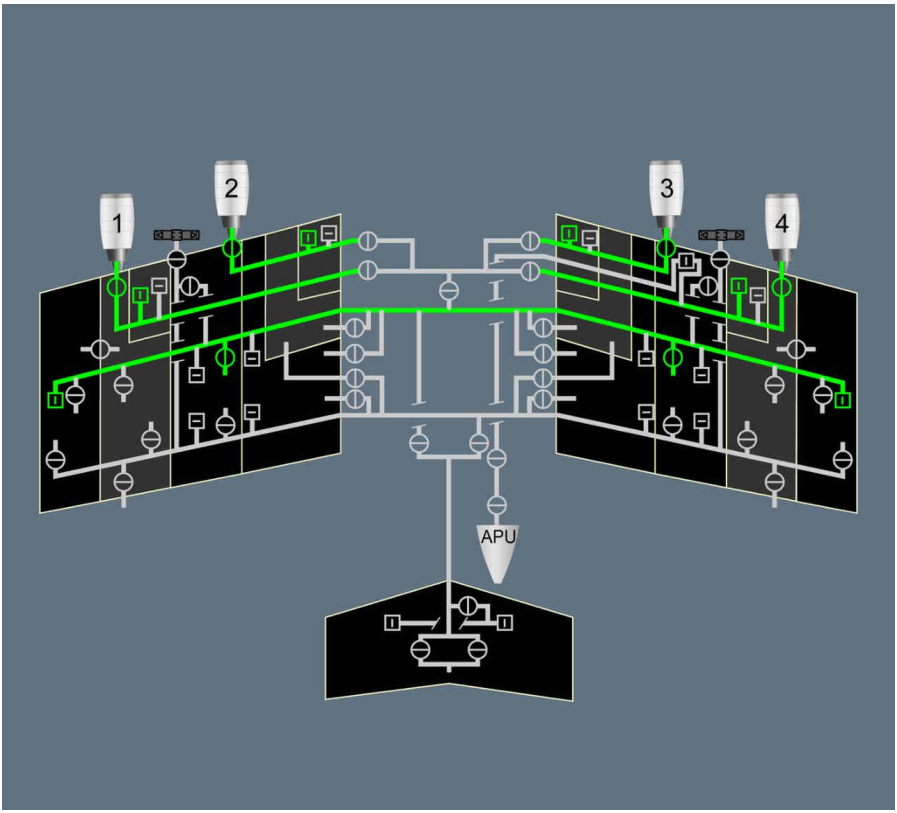
L2 Fuel transfers from the outer tanks, via the forward gallery, to the:
- Feed tanks, or
- Mid tanks, if the feed tanks are full, or
- Inner tanks, if the feed tanks and mid tanks are full.

The load alleviation transfer stops if:
- The fuel quantity in each outer tank reaches 8 800 lb (i.e. half-full), or
- The RTD goes above 30 min.
  This can happen if the FMS flight plan modification leads to a new RTD above 30 min. In this case, the transfer resumes when the RTD goes below 28 min.

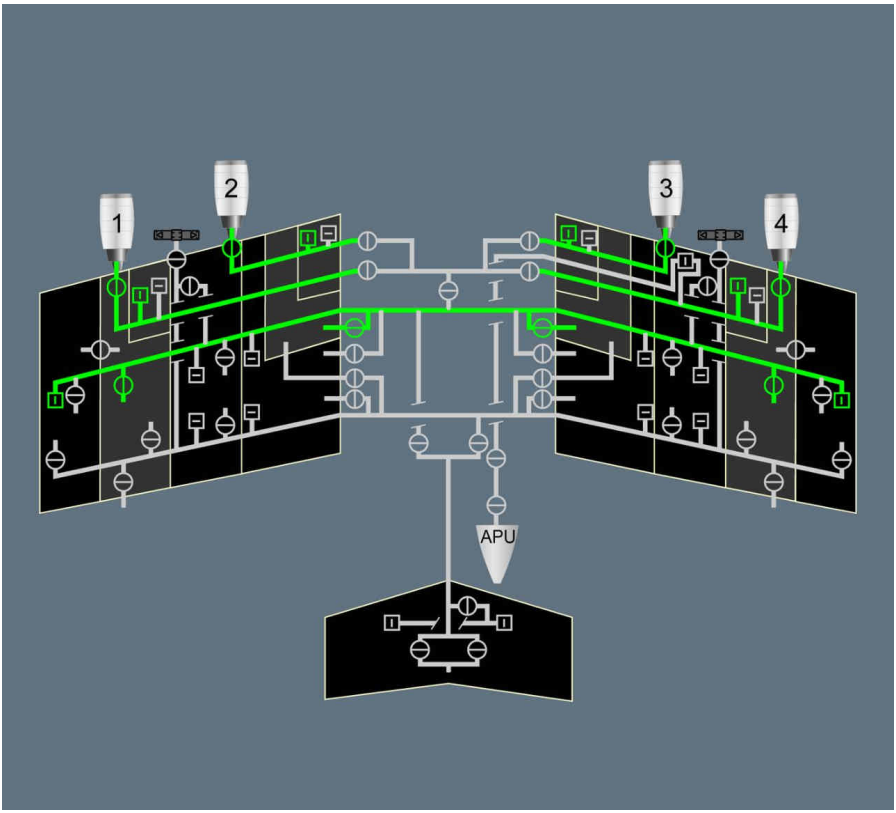
Load Alleviation Transfer from the Outer Tanks to the Inner Tanks



Load Alleviation Transfer from the Outer Tanks to the Mid Tanks



Load Alleviation Transfer from the Outer Tanks to the Feed Tanks



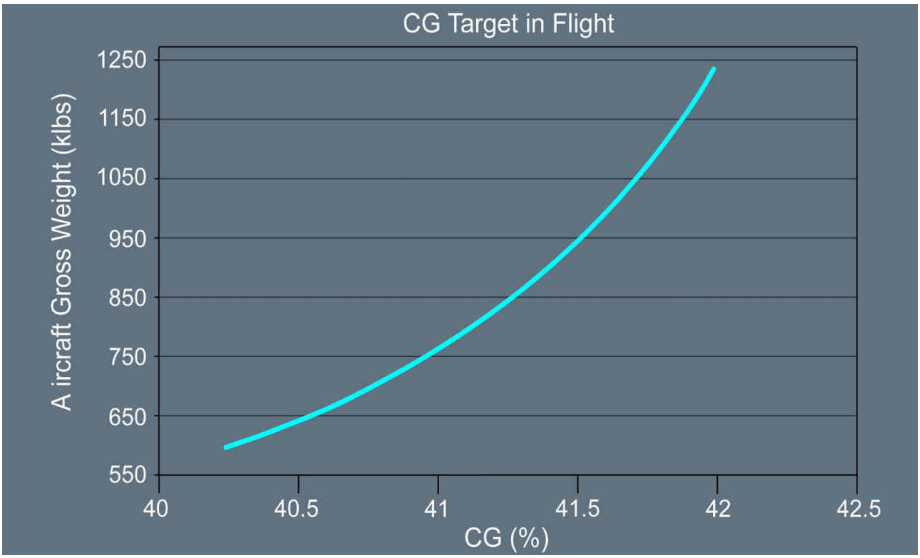
L3 The transfer rate from the outer tanks is approximately 33 050 lb/h per outer tank.

CG CONTROL TRANSFERS

Applicable to: ALL

CG Control transfers maintain the aircraft's Center of Gravity (CG) forward of the aft certified limit.
L2 A CG control transfer occurs, when the aircraft's CG reaches the aft CG target.

CG Target in Flight



Fuel transfers from the trim tank, via the aft gallery, to the:

- Inner tanks, or
- Mid tanks, if the inner tanks are empty, or
- Feed tanks, if the inner and mid tanks are empty.

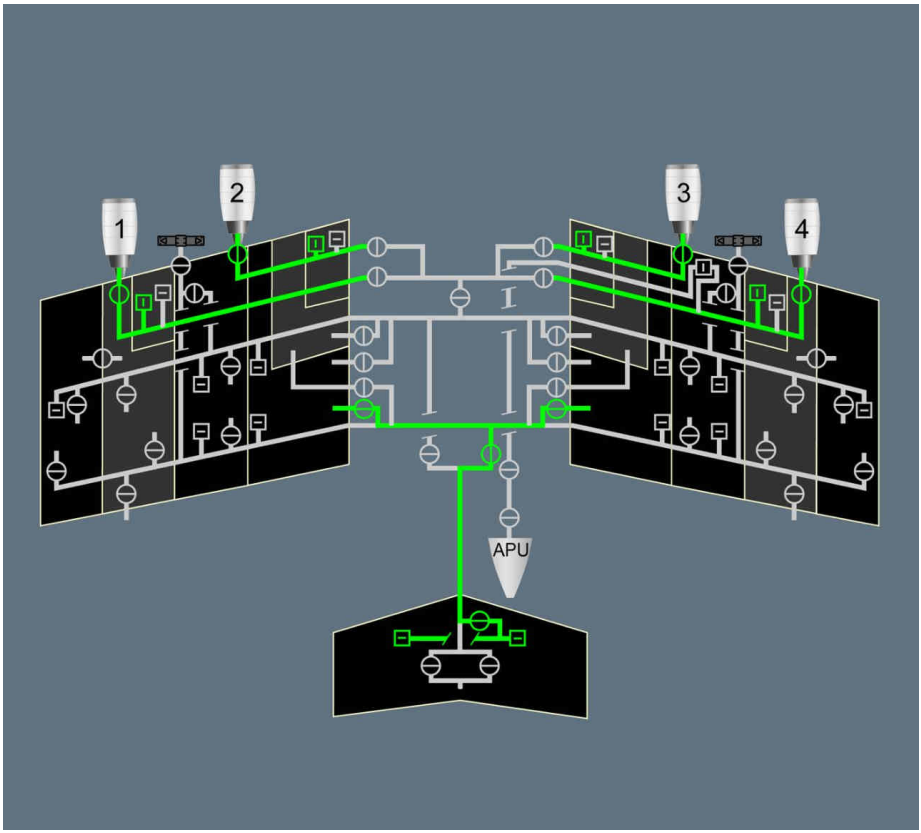
L3 When fuel is transferred to the inner(mid)(feed) tanks, fuel will first be transferred to the inner(mid)(feed) tank that contains less fuel. Fuel will be transferred to both inner(mid) tanks (or to the symmetric feed tank), as soon as the tanks are balanced.

L2 The CG control transfer stops, when the CG is 1% forward of the aft CG target.

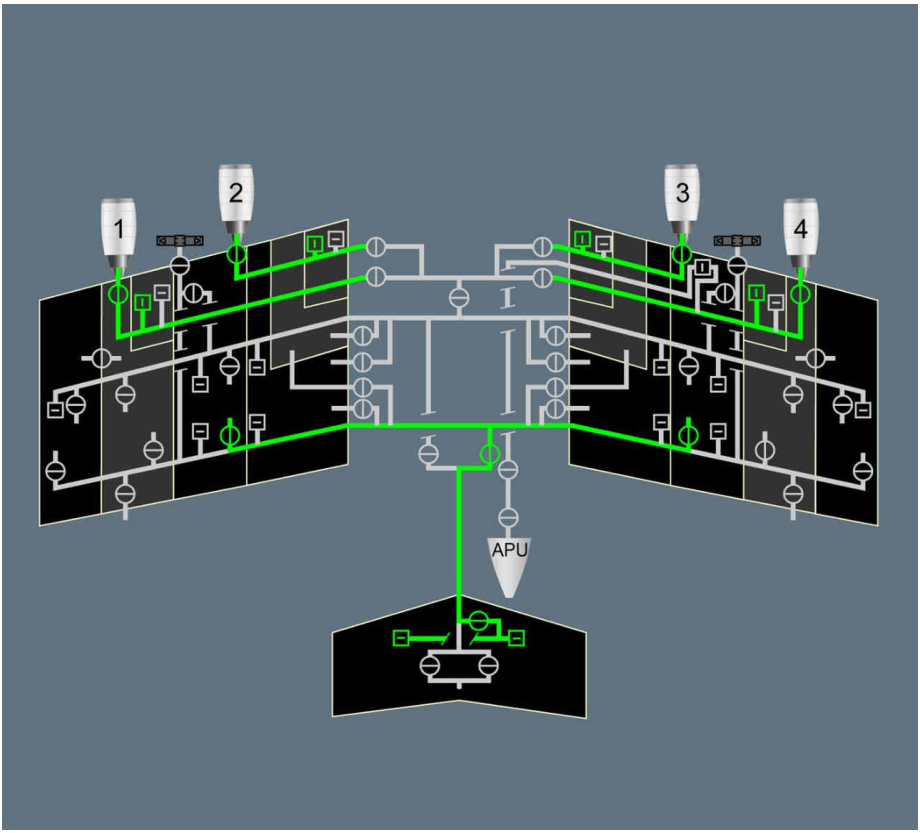
L3 There are no aft CG transfers, because:

- The CG is aft for takeoff, due to the CG targeting during automatic refuel (For more information: *Refer to DSC-28-50-10-DSC285010A REFUEL DISTRIBUTION*)
- The CG will move further aft during the load alleviation transfer to the outer tanks.

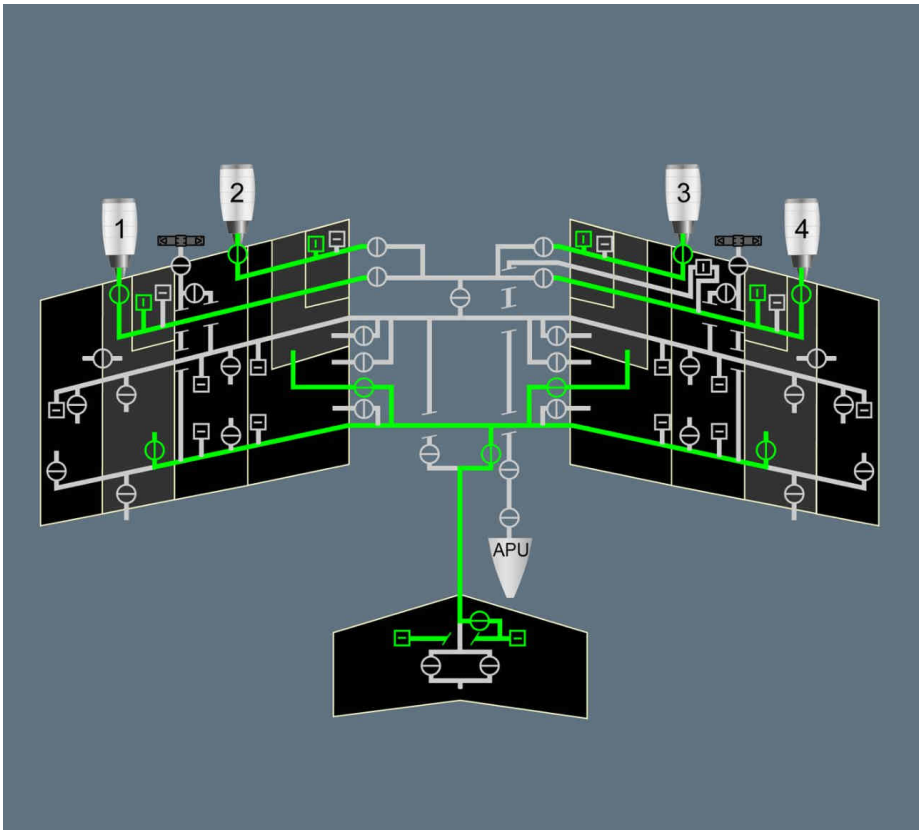
CG Transfer to the Inner Tanks



CG Transfer to the Mid Tanks



CG Transfer to the Feed Tanks



COLD FUEL TRANSFER

Applicable to: ALL

In cold weather conditions, fuel temperature in the outer tanks may decrease more rapidly than in the other tanks.

Therefore, in order to avoid fuel freezing, the FQMS automatically transfers fuel from the outer tanks to the feed tanks, if:

- The temperature of the fuel in any outer tank is less than -35 °
- Any feed tank is less than 39 683 lb.

The FQMS stops all other transfers to the feed tanks.

L2 The FQMS transfers fuel from the outer tanks to the feed tanks via the forward gallery. When the feed tanks are full, the FQMS transfers fuel from the outer tanks to the mid tanks. When the mid tanks are full, it transfers fuel from the outer tanks to the inner tanks.

The automatic cold fuel transfer stops if any failure occurs leading to an alternate transfer.

Intentionally left blank

ALTERNATE TRANSFERS

Applicable to: ALL

When a failure affects the fuel system (eg: pump or valve failure), the FQMS remains capable of performing automatic transfers.

Depending on the failure:
- Normal transfers remain available, or
- Normal transfers are lost. Alternate automatic transfers takeover. In some cases, flight crew action may be required, based on the associated ECAM procedure.

If a second failure affects the fuel system, the alternate transfers are usually available. However, in some cases, or when a third failure affects the fuel system, alternate transfers are lost. The flight crew must perform any available remaining transfers manually, as required by the ECAM procedure (*Refer to PRO-ABN-ECAM-10-28-320 FUEL NORM + ALTN XFR FAULT*).

L2 The following table presents the applicable alternate transfers for single failures.

Failed equipment	Status	ECAM Alert	Alternate Transfer
Aft Gallery			
OUTR TK inlet valve	Open	FUEL NORM XFR FAULT	*Refer to Case 1*
MID TK inlet valve	Open or closed		*Refer to Case 1*
INR TK inlet valve	Open or closed		*Refer to Case 1*
FEED TK inlet valve	Open or closed		*Refer to Case 1*
Jettison valve	Open		*Refer to Case 1*
Forward Gallery			
OUTR TK inlet valve	Open	FUEL NORM XFR FAULT	*Refer to Case 2*
	Closed		*Refer to Case 3*
MID TK inlet valve	Open		*Refer to Case 2*
INR TK inlet valve	Open		*Refer to Case 2*
FEED TK inlet valve	Open or closed		*Refer to Case 2*
INR TK PMP	Failed	FUEL L(R) INR TK FWD PMP FAULT	*Refer to Case 4*
MID TK PMP	Failed	FUEL L(R) MID TK FWD PMP FAULT	*Refer to Case 4*
OUTR TK PMP	Failed	FUEL L(R) OUTR TK PMP FAULT	*Refer to Case 5*
Trim Transfer System			
Trim to Aft gallery isolation valve	Closed	FUEL NORM XFR FAULT	*Refer to Case 1*
Trim to FWD gallery isolation valve	Open		*Refer to Case 1*
	Closed		*Refer to Case 6*

CASE 1: ALL TRANSFERS ON THE FWD GALLERY ONLY

The FUEL NORM XFR FAULT caution is triggered (*Refer to procedure*).

The following automatic transfers are inhibited:
- CG Transfers
- Load Alleviation transfers from the outer tanks.

The other transfers occur via the forward gallery.

L2 The transfers occur in the following order:
1. Load Alleviation transfer from the inner tanks to the outer tanks
2. Main transfer from the inner tanks to the feed tanks, as long as the CG remains forward of the CG target
3. When the CG has reached the CG target: Main transfer from the trim tank to the feed tanks
   The transfer is stopped when the CG reaches the forward CG limit. It resumes when the CG is 0.5% aft of the forward limit.

   Note: *If the CG does not reach the CG target, the main transfer from the trim tank occurs after the main transfer from the mid tanks.*

4. Main transfer from the inner tanks to the feed tanks
5. Main transfer from the mid tanks to the feed tanks
6. Main transfer from the outer tanks to the feed tanks.

CASE 2: ALL TRANSFERS ON THE AFT GALLERY ONLY

The FUEL NORM XFR FAULT alert is triggered (*Refer to procedure*).

The following automatic transfers are inhibited:
- CG Transfers
- Load Alleviation transfers from the outer tanks.

The other transfers occur via the aft gallery.

L2 The transfers occur in the following order:
1. Load Alleviation transfer from the inner tanks to the outer tanks
2. Main transfer from the inner tanks to the feed tanks, as long as the CG remains forward of the CG target
3. Main transfer from the trim tank to the feed tanks
   The transfer stops when the CG reaches the forward CG limit. It resumes when the CG is 0.5 % aft of the forward limit.

   Note: *If the CG does not reach the CG target, the main transfer from the trim tank occurs after the main transfer from the mid tanks.*

4. Main transfer from the inner tanks to the feed tanks
5. Main transfer from the mid tanks to the feed tanks
6. Gravity transfer from the outer tanks to the feed tanks.

The transfer starts when the lowest feed tank quantity goes below 28 660 lb . The fuel transfers from the outer tanks to feed tanks 2 and 3, via the aft gallery.
Simultaneously, the FUEL NORM XFR FAULT alert is recalled. The ECAM procedure requests to open the emergency outer tank transfer valves, to allow fuel to transfer from outer tanks to feed tanks 1 and 4.
Because the transfer rate is greater to feed tanks 1 and 4, the flight crew should consider if it is necessary to correct the fuel imbalance (in accordance with the ECAM not-sensed procedure).

CASE 3: TRANSFER TO THE OUTER TANKS ON THE AFT GALLERY

The FUEL NORM XFR FAULT caution is triggered (*Refer to procedure*).
The load alleviation transfer to the outer tanks occurs on the aft gallery, instead of the forward gallery.
All the other transfers are normal.
The CG transfers are inhibited while the load alleviation transfer to the outer tanks is in progress.

CASE 4: GALLERY FUNCTIONALITY SWAP

The FUEL L(R) INR(MID) TK FWD PMP FAULT caution is triggered (*Refer to procedure*).

For the affected tank:
- Main transfers and load alleviation transfers from/to the outer tanks are done via the aft gallery
- CG transfers and load alleviation transfers from the trim tank are done via the forward gallery

All the other transfers are normal.

CASE 5: GRAVITY TRANSFER FROM THE OUTER TANKS

The FUEL L(R) OUTR TK PMP FAULT alert is triggered (*Refer to procedure*).
The transfers from the outer tanks are done by gravity.
All the other transfers are normal.

L2 The transfer starts when the lowest feed tank quantity goes below 28 660 lb . Thus the transfer from the outer tanks to the feed tanks occurs before the transfer from the trim tank.
Simultaneously, the FUEL NORM XFR FAULT alert is triggered. The ECAM procedure requests to open the emergency outer tank transfer valves.

Fuel transfers from the outer tanks:
- To feed tanks 1 and 4, via the forward gallery, and via the emergency outer tank transfer valves
- To feed tanks 2 and 3, via the aft gallery.

Because the transfer rate is greater to feed tanks 1 and 4, the flight crew should consider if it is necessary to correct the fuel imbalance (in accordance with the ECAM not-sensed procedure).

CASE 6: TRIM TANK TRANSFER

The FUEL NORM XFR FAULT caution is triggered (*Refer to procedure*).
The trim tank is transferred in one shot, as soon as the CG reaches the target.
The transfer is stopped when the CG reaches the forward CG limit. It resumes when the CG is 0.5% aft of the forward limit.
All the other transfers are normal.

MANUAL TRANSFERS

Applicable to: ALL

In normal operation, fuel transfers are fully automatic and require no crew action. However, the flight crew can initiate manual transfers, via the FUEL overhead panel, as requested by ECAM procedures.

L2 Manual transfers are requested, in the event that:
- The automatic transfers fail, and no automatic alternate transfer is possible.
- The fuel in the outer tanks or in the trim tank is cold enough to trigger the FUEL TEMP LO alert. It must be transferred to another tank before it freezes.

L1 The following manual transfers are possible:
- From any wing tanks to the feed tanks
- From the trim tank to the inner tanks.

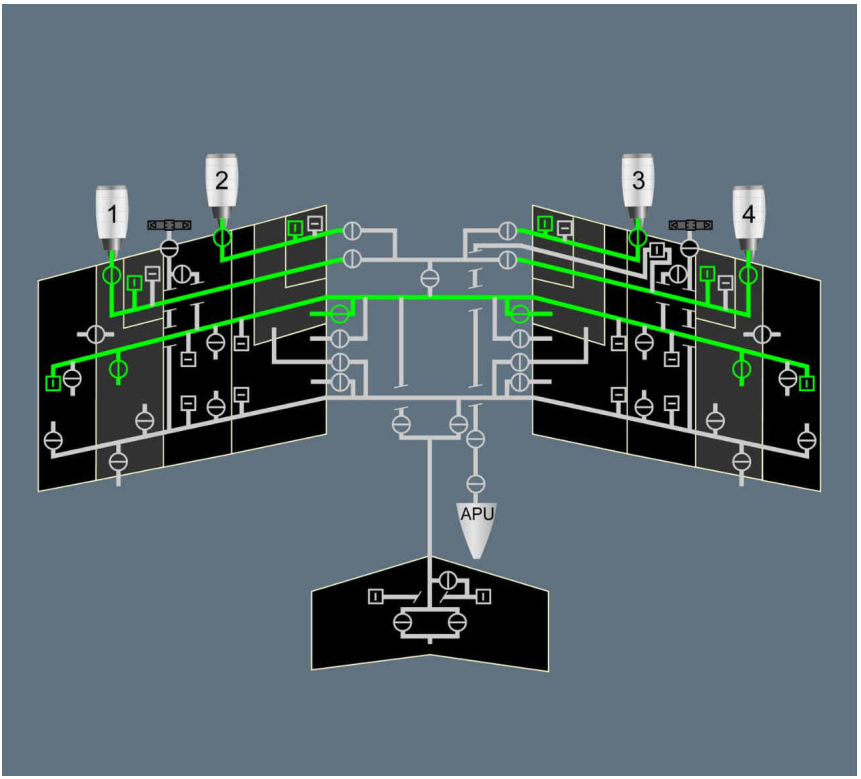
L2 When a manual transfer is in progress, some automatic transfers may be inhibited. They resume when the manual transfer is completed (MAN XFR pb-sw deselected).

L2 MANUAL TRANSFER FROM THE OUTER TANKS TO THE FEED TANKS

The flight crew initiate the transfer, by pressing the OUTR TK XFR pb-sw.

- **If both outer tank pumps are running (L(R) OUTR TK PMP pb-sw are not set to OFF)**
  The fuel transfers via the forward gallery, using the outer tank pumps.

Pumped Manual Transfer

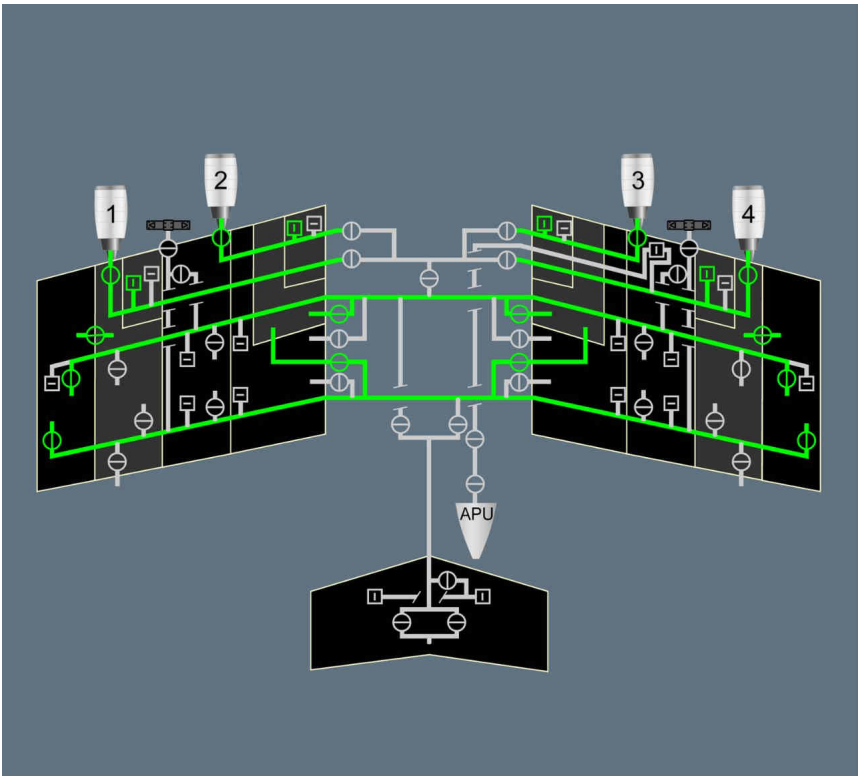


- **If any outer tank pump is not running (L(R) OUTR TK PMP pb-sw is set to OFF)**

  From the outer tanks to the outer feed tanks (FEED TK 1 and 4):
  - Fuel transfers via the outer tank emergency transfer valves.

  From the outer tanks to the inner feed tanks (FEED TK 2 and 3):
  - Fuel transfers via the forward and aft galleries
  - Fuel exits the outer tank via the inlet valves, that are used as outlet valves.

Gravity Manual Transfer

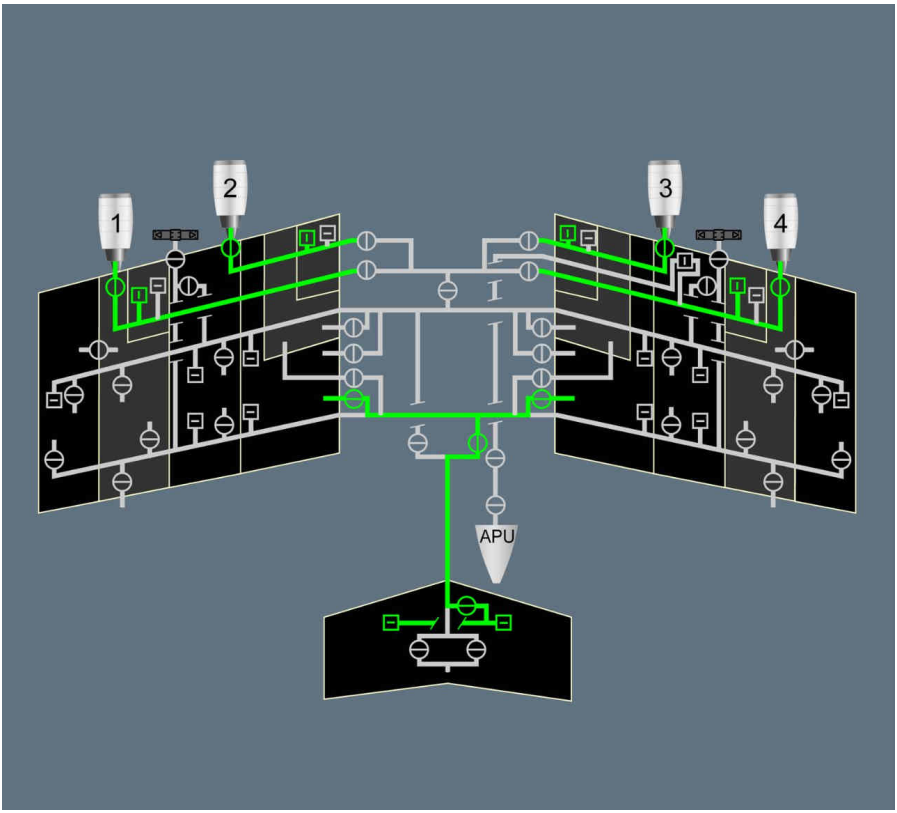


Note: *If another manual transfer is selected:*
- *The transfer from the outer tanks stops on the aft gallery (it continues via the forward gallery and the outer tank emergency transfer valves)*
- *The other transfer is performed via the aft gallery.*

L2 MANUAL TRANSFER FROM THE TRIM TANK TO THE INNER TANKS

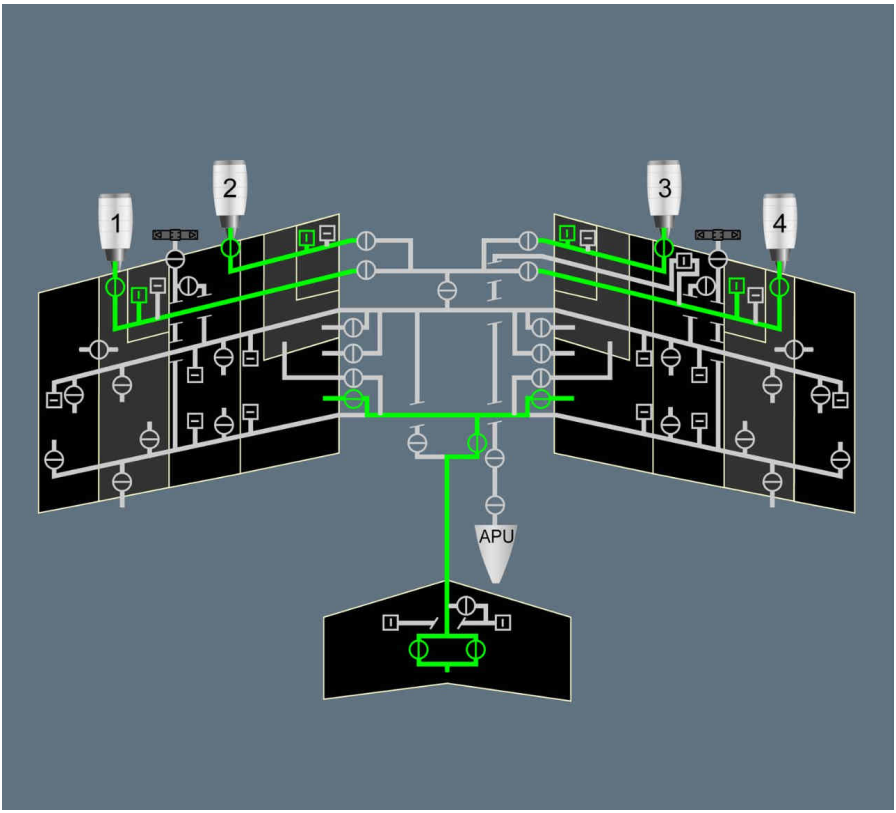
Fuel transfers from the trim tank via the aft gallery, using the trim tank pumps.
The flight crew initiate the transfer, by pressing the TRIM TK XFR pb-sw.

Pumped Trim Tank Transfer



If the trim tank isolation valve is failed in the closed position, the fuel can be transferred by gravity, via the trim tank inlet valves.
The flight crew initiates the gravity transfer, by setting the TRIM TK FEED selector to OPEN.

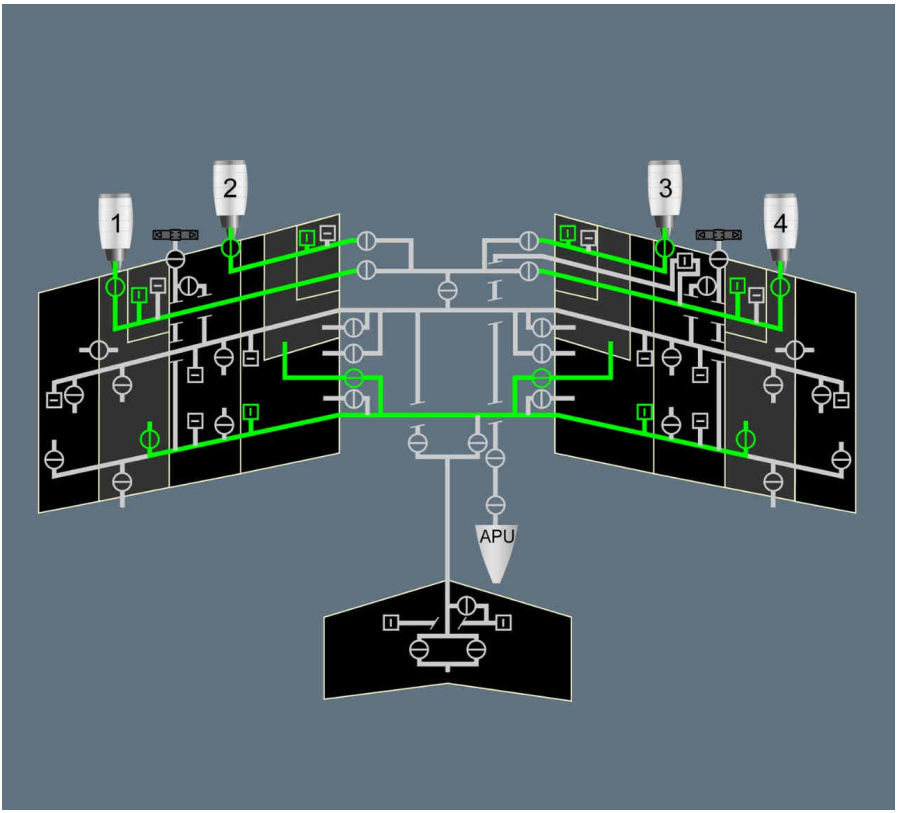
Gravity Trim Tank Transfer



L2 MANUAL TRANSFER FROM THE INNER TANKS TO THE FEED TANKS

The flight crew initiates this transfer, by pressing the INR TK XFR pb-sw.
Fuel transfers via the aft gallery, using the inner tank pumps.

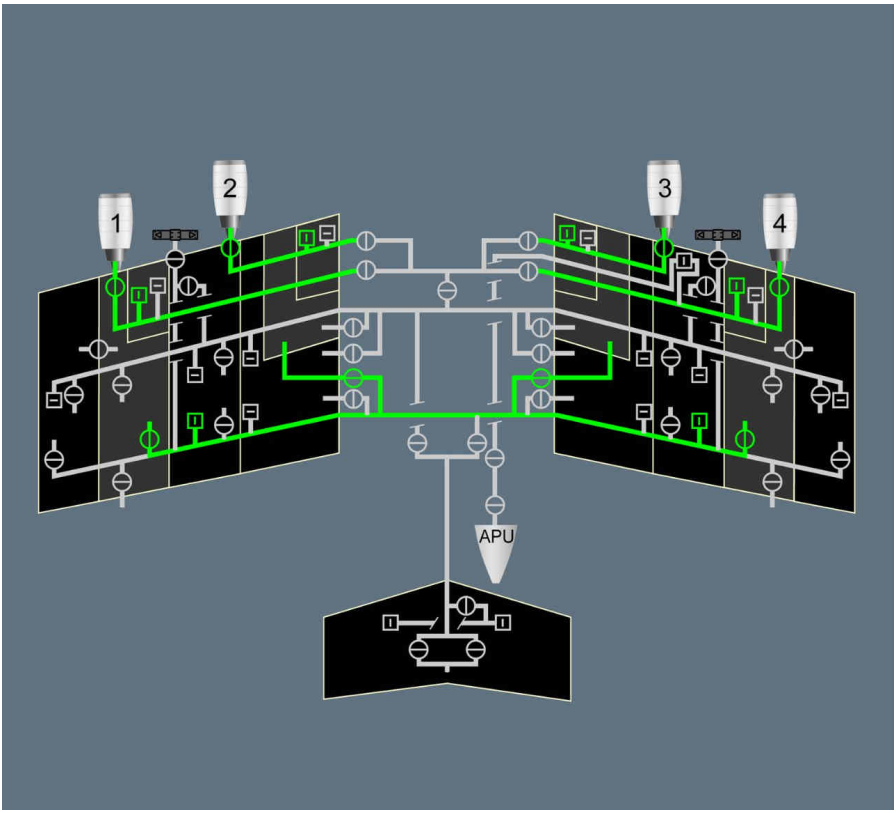
Inner Tank Transfer



L2 MANUAL TRANSFER FROM THE MID TANKS TO THE FEED TANKS

The flight crew initiates this transfer, by pressing the MID TK XFR pb-sw.
Fuel transfers via the aft gallery, using the mid tank pumps.

Mid Tanks Transfer



FUEL JETTISON

Applicable to: ALL

To rapidly reduce the aircraft gross weight, the jettison system can be used to discharge fuel overboard. The output rate is approximately 330 693 lb/h (5 512 lb/min).
Fuel is jettisoned simultaneously from all the transfer tanks (inner, mid, outer and trim tanks). Fuel in the feed tanks cannot be jettisoned.

Note: *It is not possible to jettison fuel from the feed tanks. Therefore, it is not always possible to reduce the aircraft gross weight below the Maximum Landing Weight. The flight crew should consider the Overweight Landing procedure (Refer to PRO-ABN-ECAM-10-80-50 MISC OVERWEIGHT LDG).*

JETTISON OPERATION

In accordance with the procedure (*Refer to PRO-ABN-ECAM-10-28-80 FUEL JETTISON*), to initiate fuel jettison, the flight crew:

- Enters the jettison final gross weight in the FMS FUEL & LOAD page (For information on the FUEL & LOAD page, *Refer to FMS Controls and Indicators — FUEL & LOAD Page*)
- Presses the JETTISON ARM pb-sw and the JETTISON ACTIVE pb-sw on the JETTISON / EMER XFR panel (*Refer to DSC-28-20-DSC2820B Jettison / EMER OUTR TK XFR panel*).

Note: *Jettison starts as soon as both pushbuttons are pressed, even if no jettison final gross weight has been entered. The jettison final gross weight can be entered or updated at any time.*

L2 When fuel jettison is initiated:

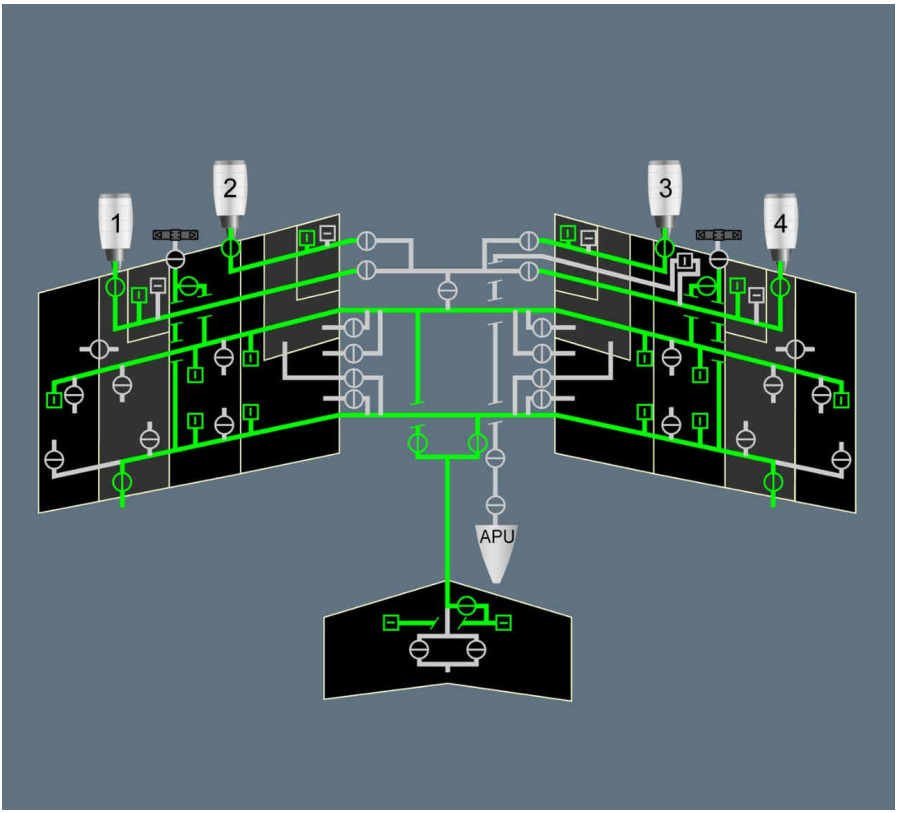
- All fuel transfers stop
- All transfer pumps run

- The forward gallery connects to the aft gallery
- The jettison valves open.
  There are two jettison valves, that are on the aft gallery. These jettison valves connect the aft gallery to two discharge points through which the fuel is jettisoned. There is one discharge point on the trailing edge of each wing.

The FQMS controls and monitors the fuel jettison. All transfer tanks are emptied simultaneously. When there is fuel in the trim tank, the CG moves forward during jettison. If the CG reaches the forward certified takeoff and landing limit, the FQMS momentarily stops the trim tank transfer pumps. When the CG is 0.5 % aft of the forward certified takeoff and landing limit, the FQMS resumes jettison from the trim tank.

L3 For redundancy, each jettison valve has two motors with different electrical supplies.

Fuel Jettison



L1 **JETTISON TERMINATION**

Jettison stops when one of the following occurs:

- The gross weight reaches the jettison final gross weight entered in the FMS FUEL & LOAD page

L2 The FQMS stops the jettison, and the FUEL JETTISON COMPLETED procedure appears on the ECAM (*Refer to procedure*).

L1 - The flight crew stops jettison by turning off any of the two JETTISON pushbuttons on the overhead panel
- The inner, mid, outer, and trim tanks are empty.

L2 The FQMS stops jettison, and the FUEL JETTISON COMPLETED procedure appears on the ECAM (*Refer to procedure*).

L1 *Note: This occurs when the jettison final gross weight cannot be reached because the fuel in the feed tank cannot be jettisoned, or because the flight crew did not enter any jettison final gross weight in the FMS FUEL & LOAD Page.*

FUEL SYSTEM IN ELECTRICAL EMERGENCY CONFIGURATION

Applicable to: ALL

The following describes the behavior of the fuel system, in the event of an electrical emergency configuration (*Refer to PRO-ABN-ECAM-10-24-250 ELEC EMER CONFIG*).

While the slats are retracted:

- All crossfeed valves open
- The main pump of feed tank 2 and the standby pump of feed tank 3 run
- The left trim tank pump runs, if there is fuel in the trim tank.

Transfers to feed tank 2 and feed tank 3 will occur, via the aft gallery, in the following sequence:

1. From the trim tank, using the left trim tank pump
2. From the outer tanks, by gravity, when the trim tank is empty.

L3 The fuel transfer rate is approximately 13 250 lb/h .

L1 3. From the outer tanks, via the emergency outer tank transfer valves
As requested by the ECAM procedure, the flight crew will press the EMER OUTR TK XFR pb-sw when there is less than 28 660 lb in feed tank 1 or in feed tank 4.

L3 The fuel transfer rate is approximately 30 850 lb/h .

L1 4. From feed tanks 1 and 4, by gravity, when the outer tanks are empty.
The fuel transfer stops when the fuel quantity in feed tanks 1 and 4 is less than the fuel quantity in feed tanks 2 and 3. It resumes when the difference is greater than 1 100 lb .

L3 The fuel transfer rate is approximately 15 450 lb/h .

L1 When the slats are extended, all the pumps stop and crossfeed valves close. Fuel is fed by gravity from all the feed tanks.

FUEL GAUGING DEGRADATION

Applicable to: ALL

In normal operations, the FQMS uses the tanks sensors via the FQDCs to compute the fuel tank quantities.
The FQDC performs an alternate gauging used for checking the data computed by the FQMS, and for display in the case of a dual FQMS failure.

PRIMARY GAUGING

Fuel tank sensors are in all the tanks, for fuel quantity computation.

L2 When all tank sensors are available, the accuracy error of the fuel quantity indications on the FUEL SD page is:
- Less than ± 1 % of tank capacity, on ground
- Less than ± 2 % of tank capacity, in flight.

L1 LOW DEGRADATION

If some tank sensors fail in a tank (e.g. FQI probes), the FQMS is still able to compute the fuel tank quantities, but the accuracy is degraded.

In this case:
- The ECAM triggers the FUEL GAUGING FAULT alert with the GAUGING LO DEGRADATION subtitle
- The fuel quantity of the affected tank appears with amber dashes
- FOB, GW and GWCG appear with amber dashes.

L2 For the affected tank, the accuracy error of the fuel quantity indication is:
- Between ± 1 % and ± 2 % of tank capacity, on ground
- Between ± 2 % and ± 4 % of tank capacity, in flight.

L1 If multiple tanks are in low degradation, the fuel leak detection is not operative.
All the automatic transfers are operative.

MEDIUM DEGRADATION

If additional tank sensors fail in a tank, the FQMS is still able to compute the fuel tank quantities, but the accuracy is further degraded.

In this case:
- The ECAM triggers the FUEL GAUGING FAULT alert with the GAUGING MEDIUM DEGRADATION subtitle
- The fuel quantity of the affected tank appears with amber dashes
- FOB, GW and GWCG appear with amber dashes.

L2 For the affected tank, the accuracy error of the fuel quantity indication is:
- Between ± 2 % and a value depending on the affected tank (between 5 % and 10 % of tank capacity), on ground
- Between ± 4 % and a value depending on the affected tank (between 5 % and 10 % of tank capacity), in flight.

L1 The fuel leak detection is not operative.
In flight, all the automatic transfers are operative. On ground, the automatic refuel and the automatic ground transfers are not available. Only the manual refuel and manual transfers are available.

FAILURE

If additional tank sensors fail, the FQMS is no longer able to compute the fuel quantity of the affected tank.

In this case:
- The ECAM triggers the FUEL FQI FAULT alert
- The fuel quantity of the affected tank is lost (replaced by amber crosses)
- FOB may appear with amber dashes after fourth engine start, or is lost (replaced by amber crosses)
  The FOB is computed by using the initial FOB and the fuel used.

L2 After the fourth engine start, the FQMS initializes the FOB taking into account the MMEL procedure:
- In the case of FQI failure in a wing tank, the FQMS considers that the fuel quantity in the failed tank is the same as the fuel quantity in the opposite tank
- In the case of FQI failure in the trim tank, the FQMS considers that the trim tank is empty.

L1 - GW and GWCG may appear with amber dashes, or may be lost (replaced by amber crosses).

In flight, as required by the ECAM, the flight crew should use manual transfers if the failure occurs in a feed tank, or in more than one tank. In all other failure cases, the automatic transfers are operative. On ground, the automatic refuel and the automatic ground transfers are not available. Only the manual refuel and manual transfers are available.

ALTERNATE GAUGING

The FQDC computes the alternate gauging by using the same tank sensors as the primary gauging.
The FQMS uses the alternate gauging to check that the primary gauging is correct.
The alternate gauging is also used for display on the FUEL SD page, if the primary gauging is failed but the tank sensors are still available.

In this case:

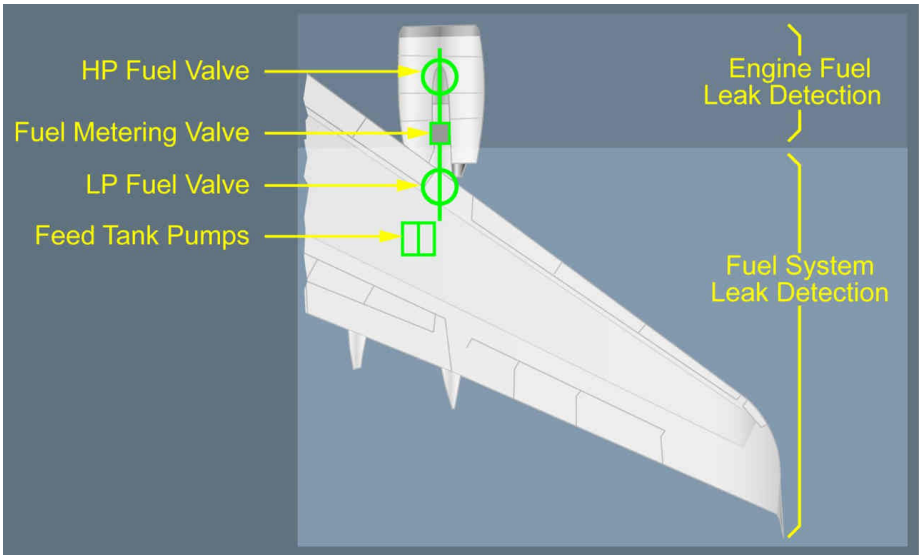
- The ECAM triggers the FUEL FQMS 1+2 FAULT alert
  ALTN GAUGING ONLY indicates that the alternate gauging is used for display on the FUEL SD page.
- The fuel quantity of the all the tanks appears with amber dashes
- If the FOB is computed by using the FOB at departure and the Fuel Used, the ECAM displays FOB COMPUTED FROM FU and FOB appears with amber dashes. In all other cases, FOB is lost (replaced by amber crosses).
- If the Weight and Balance Backup Computer (WBBC) computes GW and GWCG, GW and GWCG appear with amber dashes. In all other cases, GW and GWCG are lost (replaced by amber crosses).

FUEL LEAK DETECTION

Applicable to: ALL

Fuel leaks can occur in the fuel system (Tanks, Transfer lines...) or in the engine fuel system (i.e. downstream of the fuel metering valve).

Fuel Leak Detection



A leak in the fuel system:
- Is detected by an increasing difference between the BLOCK fuel and the sum of the Fuel On Board (FOB) and the Fuel Used (FU)
- L2 Is detected by the FQMS (*Refer to DSC-28-40-2840A Fuel system leak detection*)
- L1 Triggers the FUEL LEAK DETECTED ECAM caution (*Refer to PRO-ABN-ECAM-10-28-120 FUEL LEAK DETECTED*).

A leak in the engine fuel system:
- Is detected by an abnormally high fuel flow on one engine
- L2 Is detected by the FWS (*Refer to DSC-28-40-2840A Engine Fuel leak Detection*)
- L1 Triggers the ENG FUEL LEAK ECAM caution (*Refer to PRO-ABN-ECAM-10-70-310 ENG 1(2)(3)(4) FUEL LEAK*).

L2 FUEL SYSTEM LEAK DETECTION

The FQMS performs the fuel system leak detection.

There are two types of fuel system leak detection:
- A slow leak detection
- A fast leak detection.

The fuel system leak detection is inhibited in the case of:
- Engine shutdown
- Loss or degradation of any engine Fuel Used
- Invalid FOB
- Fuel jettison in progress
- Abnormal flight attitude
- Degraded Fuel Quantity Indications (FQI) for more than one tank
- Any FQI is failed.

If the fuel system leak detection is inhibited, the ECAM triggers the FUEL LEAK DET FAULT alert. The slow leak detection is lost until the end of the flight. The fast leak detection is recovered if the inhibition conditions are no longer true.

SLOW LEAK DETECTION

The slow leak detection compares the BLOCK fuel with the sum of the FOB and the Fuel Used. If the difference is greater than 15 450 lb, the ECAM triggers the FUEL LEAK DETECTED alert.

L3 The 15 450 lb threshold takes into account the measurement errors of the fuel quantities and fuel used.

L2 **FAST LEAK DETECTION**

The fast leak detection compares the Fuel Used during the previous 30 min, with the delta FOB during the previous 30 min. If the difference is greater than 4 400 lb, the ECAM triggers the FUEL LEAK DETECTED alert.

L3 The 4 400 lb threshold ensures that all fuel leaks with a rate of more than 8 800 lb per hour are rapidly detected.

L2 **ENGINE FUEL LEAK DETECTION**

The FWS performs the engine fuel leak detection.

Engine fuel leak detection is based on:
- The engine Fuel Flow, or
- The engine Fuel Used.

L3 The engine fuel leak detection is inhibited when:
- The aircraft is below FL 290 and the engine N1 is less than 62 %, or
- The A/THR is not active, or
- A thrust lever is set below the CLB detent, or
- The Fuel Flow measurement of any engine is degraded or lost.

L2 **LEAK DETECTION BASED ON FUEL FLOW**

If the highest fuel flow is greater than 3.8 times the average of the other fuel flows, the ECAM triggers the ENG FUEL LEAK alert.

LEAK DETECTION BASED ON FUEL USED

If the highest Fuel Used during the last five minutes is 25 % higher than the average of the other fuel used during the last five minutes, the ECAM triggers the ENG FUEL LEAK alert.

REFUEL SYSTEM

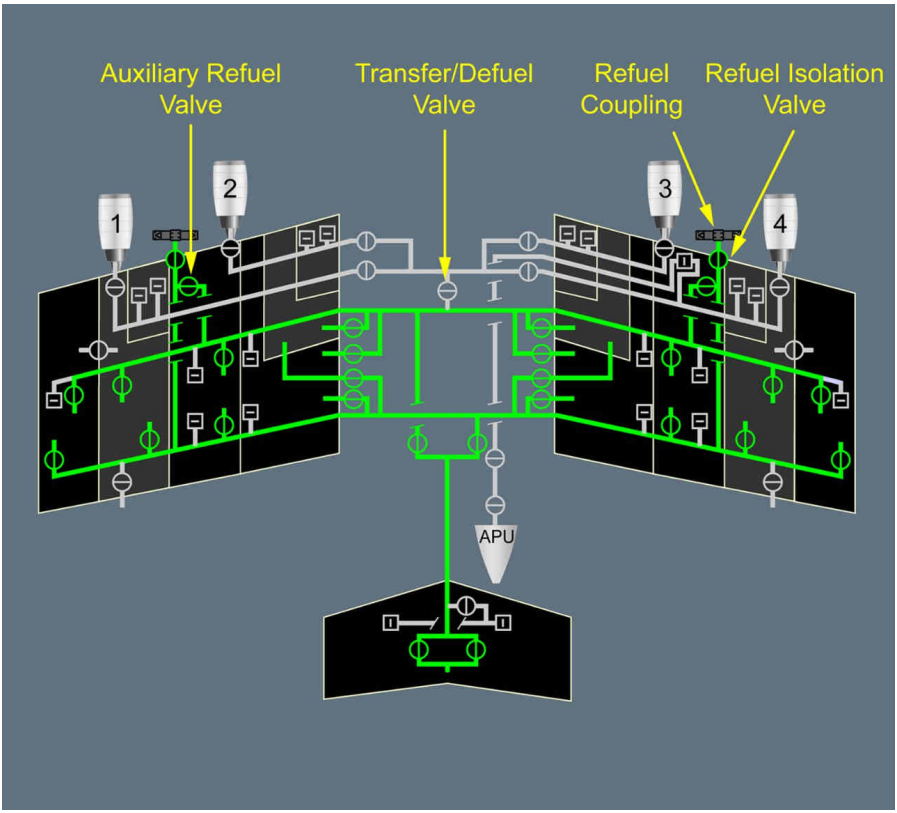
Applicable to: ALL

L2 REFUEL COUPLINGS

Two refuel couplings are installed under the wings. They are installed in the leading edge between the two engine pylons, at a height of approximately 20 ft . Two refueling hoses can be attached to each coupling.

L3 The refuel couplings are connected to the aft gallery, and to the forward gallery via refuel/defuel valves.

Refuel system



L2 When both couplings are used, it takes approximately 45 min to uplift 68 949 US Gal of fuel (with four refueling hoses and a refuel pressure of 40 PSI).

L3 It is not possible to achieve gravity refueling.

L2 **REFUEL PANEL**

The external refuel panel is located on the aircraft belly fairing. It is used for to control refueling operations.

L1 **REFUELING OPERATIONS**

Refueling can be performed automatically under the full control of the FQMS , or can be performed manually, via the FQMS .

AUTOMATIC REFUEL

In normal operations, refueling is performed under the full control of the FQMS .
Refueling can be initiated from the refuel panel.

L2 In this case, the operator must:
- Enter the Preselected Fuel Quantity (PFQ). The PFQ corresponds to the targeted FOB.
- Select AUTO REFUEL on the MODE SELECT selector

L1 Refueling can also be initiated from the cockpit. In this case, the flight crew must:
- Enter the BLOCK on the FMS FUEL & LOAD page.
- Press the REFUEL pb-sw on the overhead panel.

L3 Once the refueling has been initiated, the FQMS will determine the refuel distribution using the CG targeting method (*Refer to DSC-28-50-10-DSC285010A REFUEL DISTRIBUTION*) and the refuel valves (Refuel isolation valves and Auxiliary refuel valves) will open. The inlet valves of all the tanks that require refueling will open, and all these tanks will be refueled simultaneously. The inlet valves will close in sequence when the required quantity has been reached, or when a high level is detected.

L2 The FQMS will automatically stop the refuelling once the FOB is equal to the PFQ (+/- 882 lb). The refuelling valves will close.

L1 **MANUAL REFUEL**

Manual refueling is also possible from the external refuel panel, if necessary (e.g. failure cases). In this case, refueling is controlled by an operator, via the FQMS .

L3 The operator must:
- Determine the required fuel distribution
- Select MAN on the MODE SELECT selector . The refuel valves (Refuel isolation valves and Auxiliary refuel valves) open
- Open the inlet valves of the tanks which need to be refuelled using the Refuel/Defuel Valves switches

- Close the inlet valves of tanks, once the required fuel quantity has been reached
- Select OFF on the MODE SELECT selector when the targeted FOB has been reached. The refuel valves will close.

REFUEL DISTRIBUTION

Applicable to: ALL

For flexibility in payload loading, the refuel distribution varies, depending on the ZFW and ZFCG, in order to obtain a post-refuel CG of 39.5%, whenever possible. This is referred to as CG targeting.

CG TARGETING

CG targeting is used in automatic refuel mode only.

L3 During manual refueling, the ground operator is responsible for the fuel distribution and CG control.

L1 The FQMS controls the fuel loading and distribution to obtain a ground CG target of 39.5%, whenever possible.

L2 During refueling, the FQMS will simultaneously:
- Determine the quantity of fuel that must be loaded into the trim tank, in order to obtain the ground CG target.
- Distribute the remaining fuel in the wing tanks.
  Fuel is distributed in the wing tanks in accordance with a defined refuel distribution (*Refer to DSC-28-50-10-DSC285010A Wing distribution*).

Note: *1. CG targeting is not active, if the preselected fuel quantity is less than 103 617 lb . In this case, the trim tank will remain empty.*
2. When close to full fuel capacity, fuel distribution may not allow to reach the ground CG target of 39.5%

L1 **ZFW / ZFCG INPUT**

ZFW and ZFCG are necessary for CG targeting.

There are three ways to enter ZFW and ZFCG :
- The ground operations can enter the ZFW and ZFCG into the OIS Refuel application, via ACARS .
- Ground personnel can enter the ZFW and ZFCG into the OIS Refuel application, via the OMT or OIT on board the aircraft.
- Pilots can enter the ZFW and ZFCG into the FMS , via the MFD .

If no ZFW / ZFCG values have been entered, the FQMS uses the default ZFW / ZFCG values, to start the refueling.

L3 These default values are:
- ZFW : 621 704 lb
- ZFCG : 36.5%

L1 **ZFW/ZFCG UPDATE**

At any time during refueling, it is possible to update the ZFW and ZFCG values, using one of the three ways described above.

L2 When the FQMS receives new ZFW and ZFCG values, it computes again the fuel distribution required to obtain the ground CG target of 39.5%, when achievable. If the level of one or more tanks is already above its new target, fuel will not be discharged from these tanks. As a result, it is possible that the ground CG target of 39.5% will not be obtained.

L1 After refueling, if the CG target of 39.5% has not been obtained, it is possible to start an automatic ground transfer. *Refer to DSC-28-50-20 AUTOMATIC GROUND TRANSFER* .

L2 **WING REFUEL DISTRIBUTION**

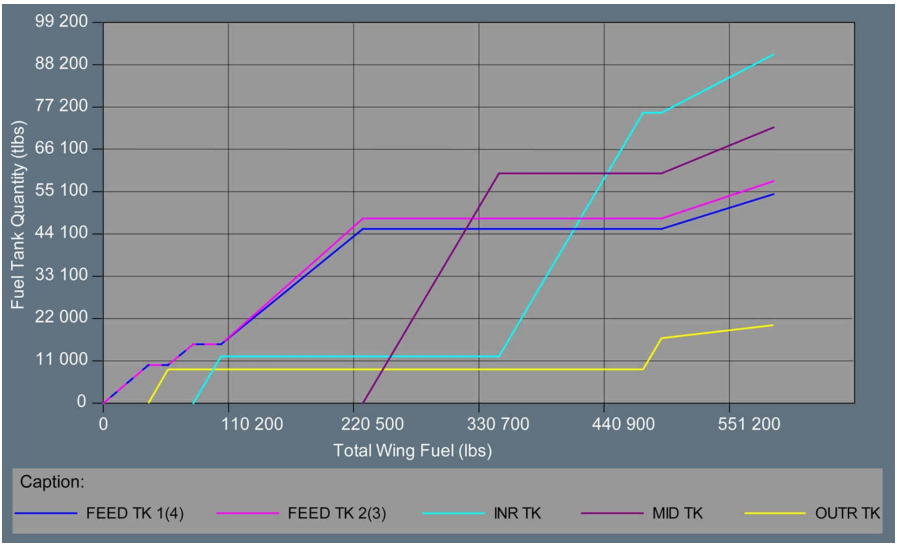
Fuel in the wing tanks is distributed as follows:

Total wing tank quantity (lbs)	Feed tank 1/4 (lbs)	Feed tank 2/3 (lbs)	Outer tanks (lbs)	Mid tanks (lbs)	Inner tanks (lbs)
0	0	0	0	0	0
39 700	9 900	9 900	0	0	0
57 300	9 900	9 900	8 800	0	0
79 350	15 450	15 450	8 800	0	0
103 600	15 450	15 450	8 800	0	12 150
228 813	45 323	48 140	8 800	0	12 150
348 423	45 323	48 140	8 800	59 805	12 150
475 541	45 323	48 140	8 800	59 805	75 685
491 824(1)	45 323	48 140	16 960	59 805	75 685
590 318(2)	54 399	57 780	20 355	71 782	90 841

(1) This corresponds to full wing tanks, at minimum fuel density

(2) This corresponds to full wing tanks, at maximum fuel density

Wing Refuel Distribution



Intentionally left blank

AUTOMATIC GROUND TRANSFER

Applicable to: ALL

When refueling is complete, the actual CG may be different from the ground CG target of 39.5%. This occurs, when the final ZFW / ZFCG values are available after refueling, or when CG targeting is no longer effective (*Refer to DSC-28-50-10-DSC285010A REFUEL DISTRIBUTION*).

If the actual CG is out of the takeoff limits, the flight crew can start an automatic ground transfer. This will redistribute the fuel, to obtain the ground CG target (+/- 1%), based on the final ZFW / ZFCG values entered in the FMS . The ground CG target will only be reached when this is achievable with the current ZFW, ZFCG and FOB.

L3 Fuel transfers from(to) the trim tank to(from) a pair of symmetric tanks. This enables the lateral balance of the aircraft to be maintained. If a fuel imbalance exists at the start of the automatic ground transfer, it will be corrected during the transfer sequence.

L2 During the ground transfer, the flight crew can monitor the transfers on the ECAM fuel page, and on the GWCG indication.

L1 The automatic ground transfer is complete in less than 25 min , if the FQMS has used the default ZFW/ZFCG values for refuel. It can be stopped at any time by the crew.

The automatic ground transfer is started and stopped with the AUTO GROUND XFR pb-sw on the overhead panel. All the transfer pumps must be on to perform the automatic ground transfer.

An automatic ground transfer should not be performed if the aircraft is moving (e.g. during towing.) It is inhibited as soon as at least two engines are running.

Intentionally left blank

DEFUEL

Applicable to: ALL

The fuel system can defuel. This enables the aircraft's fuel to be removed and collected.
Defueling may be necessary for maintenance reasons, or if the fuel in the aircraft is contaminated.
Defueling is manually controlled via the FQMS, by using the external refuel panel. The discharged fuel is collected through the refuel couplings.

L3 There are three methods for defueling:

- Suction defueling
  Fuel is sucked out of the aircraft.
  The operator sets the MODE SELECT selector on the refuel panel to DEFUEL. This opens the refuel isolation valves and the auxiliary refuel valves. The operator then opens all the tank inlet valves via the refuel/defuel valves switches on the external refuel panel.
- Pressure defueling
  The aircraft's fuel pumps are used to discharge the fuel from the aircraft.
  The operator sets the MODE SELECT selector on the refuel panel to DEFUEL. This opens the refuel isolation valves and the auxiliary refuel valves, and connects the engine feed gallery to the transfer galleries, by opening the Transfer/Defuel valve. All the pumps must be switched ON on the overhead panel. The crossfeed valves must be selected open, if defuel from the feed tanks is required.
- Suction-assisted pressure defueling
  As for pressure defueling, with the addition of suction from the bowser to assist the aircraft pumps and therefore increase the defuel rate.

OVERVIEW

Applicable to: ALL

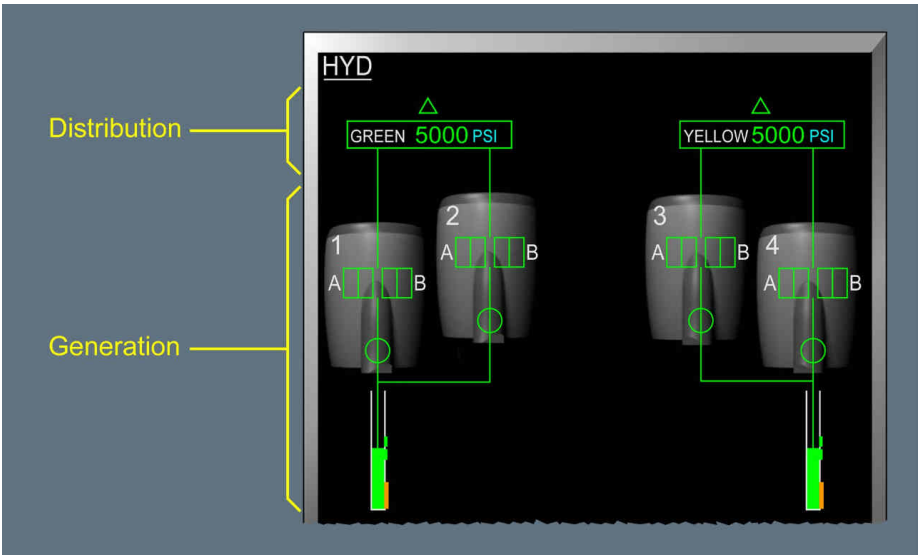
The aircraft has two identical and independent hydraulic systems, referred to as GREEN and YELLOW . These two systems operate continuously, and power the flight controls, the landing gear systems, and the cargo doors. Hydraulic fluid cannot be transferred from one system to the other.

In case one or both hydraulic systems fail, the following hydro-electrical backups are available:
- For flight controls: The Electro-Hydrostatic Actuators (EHA s) and the Electrical Backup Hydraulic Actuator (EBHA). For information on EHA s and EBHA s: *Refer to EHA/EBHA description* .
- For braking and nose wheel steering: The Local Electro-Hydraulic Generation System (LEHGS). For more information on the LEHGS : *Refer to Braking System Architecture* and *Refer to Nose Wheel Steering System* .

The normal operating pressure of each hydraulic system is 5 000 PSI .
Each hydraulic system is monitored and controlled by its assigned Hydraulic System Monitoring Unit (HSMU).

The hydraulic systems ensure:
- Hydraulic generation
- Hydraulic distribution.

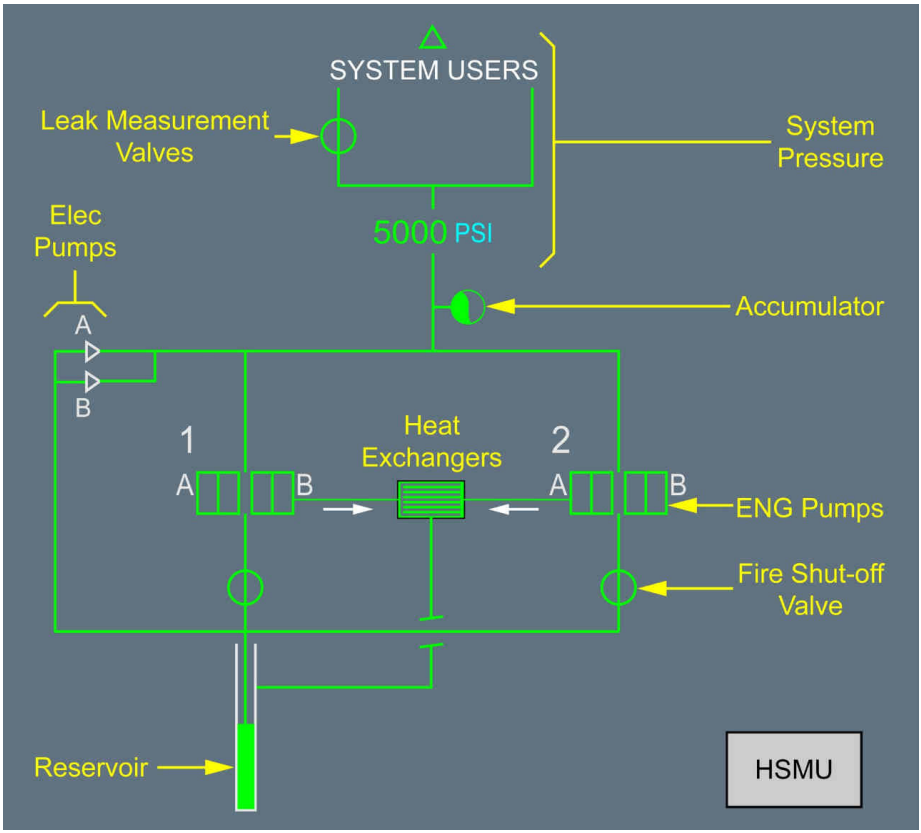
Hydraulic system



HYDRAULIC GENERATION

Applicable to: ALL

Hydraulic Generation



The two hydraulic systems are identical. Therefore, only one system is illustrated and described below.

HYDRAULIC FLUID RESERVOIR

The reservoir provides hydraulic fluid to the system.
To prevent pump cavitation, the hydraulic fluid reservoir is automatically pressurized by bleed air.

L3 The outer engine provides this high pressure air. If the pressure is not sufficient, the reservoir can be pressurized via the aircraft bleed system.
The reservoir is located close to the hydraulic pumps, in the pylon of the outer engine. This also prevents pump cavitation.
The total volume of the reservoir is 31.70 US Gal.

FIRE SHUTOFF VALVES

There is one fire shutoff valve per engine. It is between the reservoir and the engine-driven pumps.
The fire shut-off valves close, when the ENG FIRE pb-sw is pressed.
In case of an engine fire, closing the fire shutoff valves will prevent hydraulic fluid from flowing into, and sustaining, the fire.

ENGINE-DRIVEN PUMPS (ENG PMP)

Each hydraulic system is pressurized by four engine-driven pumps (two per engine).
- The pumps of Engines 1 and 2 pressurize the GREEN hydraulic system
- The pumps of Engines 3 and 4 pressurize the YELLOW hydraulic system.

L2 Two engine-driven pumps are sufficient to provide hydraulic pressure to the users.

If only one engine-driven pump is operative:
- Ailerons, elevators, rudders and the THS switch to the other hydraulic system or to an electrical backup.
- Slats and flaps hydraulic motors and spoilers remain available.
- Landing gear retraction/extension is available, but retraction time is longer than in normal operation.
- Normal braking and nose wheel steering remain available.

The engine accessory gearbox drives the pumps.
In the case of a hydraulic reservoir low level, or a system overheat (only if the pump depressurization is not successful), the ECAM requests the disconnection of the engine pump from the engine accessory gearbox. Disconnection prevents engine pump damage.
If the pumps are disconnected, they cannot be reconnected by the flight crew. Maintenance action is required.

ELECTRIC PUMPS (ELEC PMP)

Two electric pumps can provide hydraulic power on ground only.
The green (yellow) electric pumps can pressurize the GREEN (YELLOW) hydraulic system, if the engines 1 and 2 (3 and 4) are not running.

L3 Theelectricpumps needs400 Hz AC power. Because of the variable frequency of the engine generators, the green (yellow) electric pumps are inhibited as soon as the engine 1 or 2 (3 or 4) is running.

L1 The electric pumps operate automatically for cargo door actuation, and for Body Wheel Steering (BWS).

L2 The electric pumps of the GREEN hydraulic system automatically start, when the cargo doors are being operated.
The electric pumps of the YELLOW hydraulic system automatically start, when BWS is required for pushback or towing.

L1 When the green (yellow) electric pumps operate automatically, only cargo door actuation (BWS) is pressurized.

L2 One green (yellow) electric pump is sufficient to pressurize cargo door actuation (BWS).

For maintenance purposes, the electric pumps can also be started manually, via the ELEC PMP sw on the GND HYD panel:
- When the yellow electric pumps are started manually , the YELLOW hydraulic system powers all the systems
- When the green electric pumps are started manually , the GREEN hydraulic system powers all the systems, except the cargo door actuation.

L3 In the case of an overheat, the HSMU automatically switches off the affected electric pump.

HYDRAULIC SYSTEM MONITORING UNIT (HSMU)

Each hydraulic system is monitored and controlled by its assigned Hydraulic System Monitoring Unit (HSMU).

L2 The HSMU monitors:
- The pressure of the engine pumps
- The pressure and temperature of the electric pumps
- The pressure and level of the reservoir
- The position of the fire shut-off valves
- The temperature of the system.

In addition, the HSMU controls the electric pumps and the heat exchangers.

L3 Each HSMU has two channels: A and B:

- Channel A of the green (yellow) HSMU:
  - Monitors the pressure of the ENG 1 (4) pumps
  - Monitors the position of the fire shut-off valve of ENG 1 (4)
  - Controls the green (yellow) elec pumps and monitors their pressure and temperature
  - Controls the green (yellow) air heat exchanger fan of the ENG 1(4) case drain
  - Controls the green (yellow) fuel heat exchanger, via the FQMS
  - Detects system overheat.
- Channel B of the green (yellow) HSMU:
  - Monitors the pressure of the ENG 2 (3) pumps
  - Monitors the position of the fire shut-off valve of ENG 2 (3)
  - Monitors the green (yellow) reservoir pressure and level
  - Controls the green (yellow) air heat exchanger fan of the ENG 2(3)
  - Controls the green (yellow) fuel heat exchanger, via the FQMS
  - Detects system overheat.

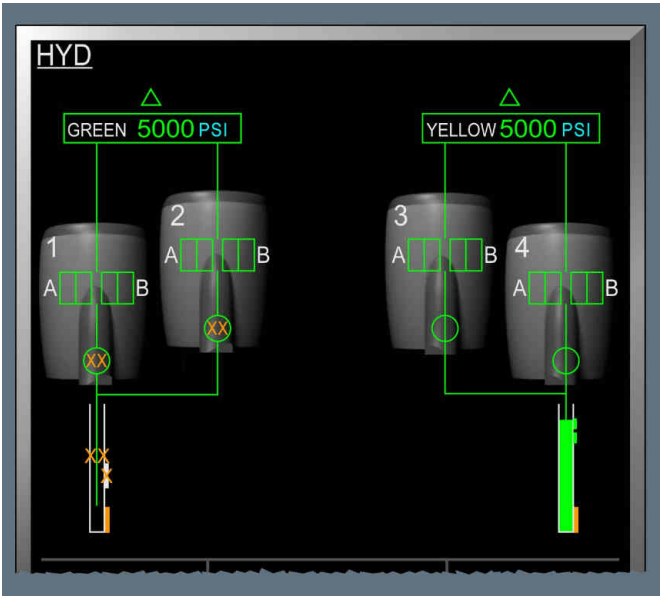
L2 If one HSMU fails:

- Its associated hydraulic system remains operative

  Note: *The electric pumps are lost.*

- The fire shut-off valve indications, and reservoir level indications are lost
- The system pressure, reservoir air pressure, reservoir level, and pump pressure remain monitored.

Green HSMU fault



L3 ACCUMULATOR

An accumulator helps to maintain a constant pressure by compensating for transient demands during normal operation.

L3 LEAK MEASUREMENT VALVES

There are four leak measurement valves between the hydraulic pumps and the system users. These valves are used to detect any abnormal internal leaks in the system.
Only maintenance personnel operate these valves, via the OMS.

SYSTEM PRESSURE

The hydraulic system supplies a constant pressure of around 5 000 PSI to the applicable system users.

L3 The hydraulic pressure is between 5 000 PSI and 5 200 PSI in normal operation.

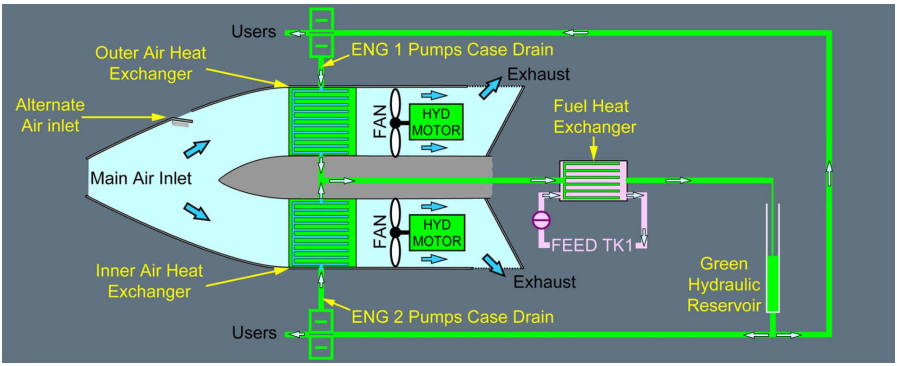
HYDRAULIC HEAT EXCHANGERS

Both hydraulic circuits have a cooling system, that prevents the overheat and thermal degradation of hydraulic fluid.

This cooling system has:
- Two air/hydraulic heat exchangers
- One fuel/hydraulic heat exchanger, that is a backup to the air/hydraulic heat exchangers.

In the engine pumps, a part of the hydraulic flow is used to lubricate the pumps. This flow is not pressurized to provide hydraulic power. It returns to the hydraulic reservoir through the heat exchangers, via the engine-pump case drain.

Hydraulic Heat Exchanger



AIR/HYDRAULIC HEAT EXCHANGER

There are two air/hydraulic heat exchangers for each hydraulic system.

L3 These heat exchangers are in flap-track fairing n°5.

L1 The air/hydraulic heat exchangers use ambient air to cool the hydraulic fluid. The ambient air comes through the main air inlet that is at the front of the flap track fairing.
On ground, and at low aircraft speeds, hydraulically-powered fans ensure that there is sufficient airflow.

L3 For the inner heat exchanger, the HSMU:
- Turns the fans on when the reservoir temperature exceeds 55 °C
- Stops them when the reservoir temperature goes below 35 °C.

For the outer heat exchanger, the HSMU:
- Turns the fans on when the reservoir temperature exceeds 20 °C
- Stops them when the reservoir temperature goes below 0 °C.

The fans are inhibited when the aircraft exceeds M 0.45. However, they are not inhibited if wing anti-ice has been turned on during the flight.

L1 If the main air inlet is blocked (e.g. due to ice accretion), the door of the alternate air inlet, located on the side of the flap-track fairing, will open.

Note: The door of the alternate air inlet is open on ground.

L2 The door of the alternate air inlet is kept open by a spring. When the airflow coming from the main air inlet is sufficient, the door will close. When the airflow decreases due to a blockage of the main air inlet, the pressure of the airflow will not be sufficient to keep the door closed, and the door will open.

L1 FUEL/HYDRAULIC HEAT EXCHANGER

When both air/hydraulic heat exchangers are operative, the hydraulic fluid is cool enough to return to the reservoir. The hydraulic fluid flows through the fuel/hydraulic heat exchanger. However, fuel does not flow through the heat exchanger.
The fuel/hydraulic heat exchanger is active when an air/hydraulic heat exchanger fails.
The fuel comes from engine feed tank 1(4).

L3 The failure of an air/hydraulic heat exchanger is detected by an abnormal increase of the hydraulic reservoir temperature.
The HSMU, via the FQMS, controls the fuel/hydraulic heat exchanger valves, and opens the valves, if the temperature in the hydraulic reservoir exceeds 85 °C, and closes the valves when the temperature goes below 40 °C.

The FQMS inhibits the fuel/hydraulic heat exchanger if:
- Low quantity of fuel in feed tank 1(4)
- High fuel temperature in feed tank 1(4) (above 53 °C)
- Crossfeed valves are open
- Gravity feed
- Low pressure in the feed pumps
- Electrical Emergency Configuration.

HYDRAULIC DISTRIBUTION

Applicable to: ALL

The GREEN and YELLOW hydraulic systems power the following:

1. Flight controls:

L2
- Inboard ailerons (GREEN)
- Midboard ailerons (YELLOW)
- Outboard ailerons (GREEN and YELLOW)
- Spoilers 1, 3, 5, 7 (YELLOW)
- Spoilers 2, 4, 6, 8 (GREEN)
- Rudder (GREEN and YELLOW)
- Elevators (GREEN and YELLOW)
- Trimmable Horizontal Stabilizer (GREEN and YELLOW)
- Slats (GREEN)
- Flaps (GREEN and YELLOW).

L1 2. Landing gear systems:

L2
- Body landing gear: Actuation (gears and doors), braking, and steering (YELLOW)
- Wing landing gear: Actuation (gears and doors) and braking (GREEN)
- Nose landing gear: Actuation (gears and doors) and nosewheel steering (GREEN)

L1 3. Cargo door actuation (GREEN)

L2 *Note: Cargo door actuation is possible only via the electric pumps in automatic mode.*

L3 The green hydraulic system powers RAT retraction, on ground.

L123

Pumps A and B are connected to the engine accessory gearbox.

L12

Pumps A and B are disconnected from the engine accessory gearbox.

Note: *When disconnected, they cannot be reconnected by the flight crew. Maintenance action is required.*

The hydraulic system is failed, and cannot be recovered before the end of the flight. Therefore, the pumps must be disconnected from the engine accessory gearbox.

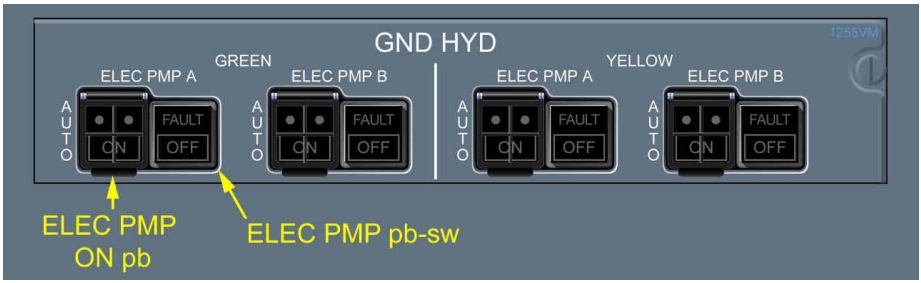
Associated with one of the following ECAM alerts:
- HYD G(Y) RSVR LEVEL LO (*Refer to procedure*).
- HYD G(Y) SYS OVHT (If pump depressurization failed) (*Refer to procedure*).
- HYD G(Y) SYS TEMP EXCESS HI (*Refer to PRO-ABN-ECAM-10-29-60 HYD G(Y) SYS TEMP EXCESS HI*)

The FAULT light goes off, when the crew selects DISC .

GND HYD PANEL

Applicable to: ALL

GND HYD PANEL



ELEC PMP ON pb

The electric pump is not running.

The pump is running, and has either been automatically-controlled or manually-selected.
The electric pumps can be manually set to ON, but this is not operationally recommended.

Note:
- *When the electric pumps operate in automatic mode, any action on the ELEC PMP ON pb is disregarded*
- *When the electric pumps operate in manual mode, the automatic mode is disregarded (e.g. cargo door actuation).*

CAUTION	When the pump is manually-selected, the hydraulic system is fully pressurized. Do not pressurize the hydraulic system without clearance from the ground crew.

ELEC PMP pb-sw

The electric pumps are fully automatic and do not require any crew action, unless requested by the ECAM .

The HSMU automatically controls the pump.

The pump is OFF and can neither be started by the HSMU , nor by the flight crew.

L12

The pump is failed, or the pump must be stopped because of a hydraulic system failure.

Associated with one of the following ECAM alerts:

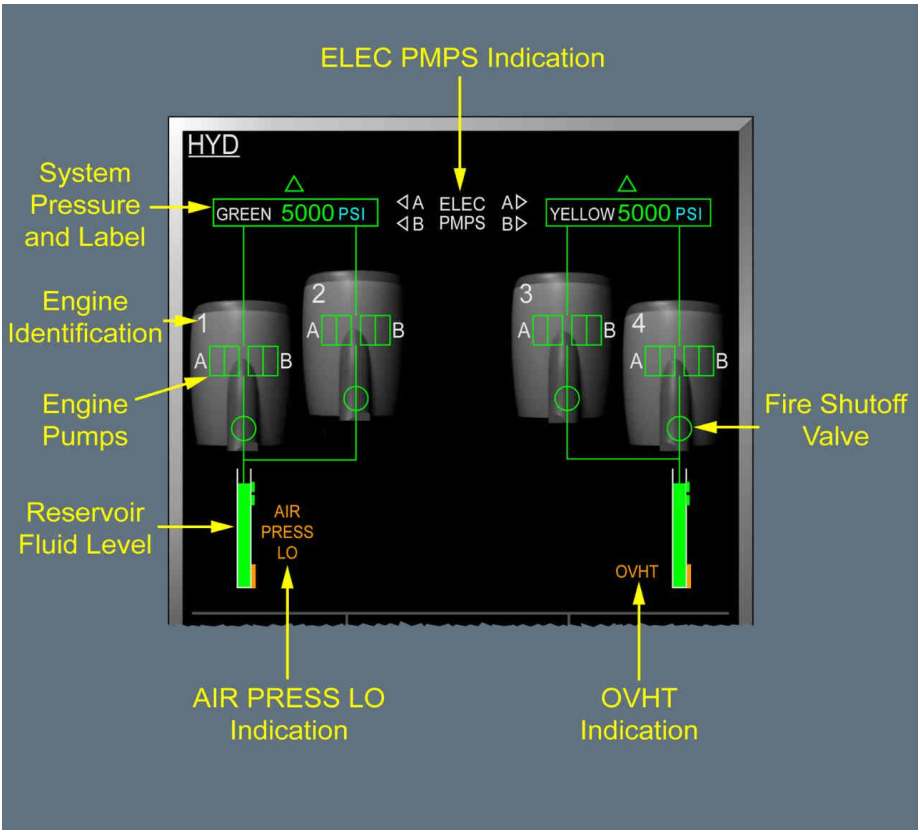
- HYD G(Y) ELEC PMP A (B) FAULT (*Refer to procedure*)
- HYD G(Y) SYS OVHT (on ground, with engines OFF) (*Refer to procedure*)
- HYD G(Y) SYS TEMP EXCESS HI (on ground, with engines OFF) (*Refer to procedure*).
- HYD G(Y) RSVR LEVEL LO (on ground, with engines OFF) (*Refer to procedure*).
- HYD G(Y) RSVR AIR PRESS LO (on ground, with engines OFF) (*Refer to procedure*).

The FAULT light goes off, when the flight crew selects OFF . However, in case of an overheat, the FAULT light will remain on, until the overheat disappears.

HYDRAULIC SYSTEM DISPLAY

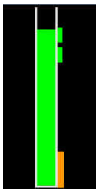
Applicable to: ALL

Hydraulic System Display



RESERVOIR FLUID LEVEL

L123

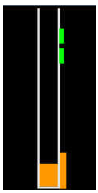


The fluid level is within normal range.
The normal filling range is displayed in green on the right hand side of the reservoir. It is corrected for temperature.
The normal filling range is increased when the landing gear is retracted.
The normal filling range is around 12 US Gal , when the temperature in the reservoir is 20 °C .

L13

The HSMU is unable to compute the normal filling range.
The index is set at 12 US Gal .

L12



The fluid level is below the low level limit.

Associated with the following ECAM alert:
- HYD G(Y) RSVR LEVEL LO (*Refer to procedure*)

RESERVOIR OVHT

L12

The temperature in the reservoir is above normal.

Associated with the following ECAM alert:
- HYD G(Y) SYS OVHT (*Refer to procedure*)
- HYD G(Y) SYS TEMP EXCESS HI (*Refer to procedure*).

RESERVOIR AIR PRESS LO

L12

The air pressure in the reservoir is below normal.

Associated with the following ECAM alert:
- HYD G(Y) RSVR AIR PRESS LO (*Refer to procedure*)

FIRE SHUTOFF VALVE

The valve is open.

The valve is closed.

ENGINE PUMPS

The engine pump is on, and hydraulic pressure is normal.

The engine pump is depressurized.

The engine pump is abnormally pressurized (ENG PMP pb-sw is OFF).

L12

- The engine pump is on, and the engine pump pressure is below normal

  Associated with the following ECAM alert:
  - HYD G(Y) ENG 1 or 2 (3 or 4) PMP A or B PRESS LO (*Refer to procedure*)
- On ground, the associated engine is not running.

L12

The pump is disconnected from the engine accessory gearbox, via the ENG PMP A+B DISC pb .

Note: If the pump has been disconnected by maintenance prior to dispatch, the engine pump will be shown as depressurized.

ENGINE IDENTIFICATION

The engine is running.

The engine is not running.

ELEC PMPS

The ELEC PMPs indication is displayed on ground, when the engines are not running.

The electric pump is running.

The electric pump is in automatic mode, and is not running.

L12

The electric pump is running, and is failed.

Associated with the following ECAM alert:
- HYD G(Y) ELEC PMP A(B) FAULT (*Refer to procedure*)

L12

The electric pump is either switched OFF, or is failed and stopped.

In case of failure, it is associated with the following ECAM alert:
- HYD G(Y) ELEC PMP A(B) FAULT (*Refer to procedure*)

SYSTEM PRESSURE AND LABEL

Indicates the actual pressure of the hydraulic system.

Hydraulic pressure is above 2 900 PSI .

L12

Hydraulic pressure is below 2 900 PSI .

Associated with the following ECAM alert:
- HYD G(Y) SYS PRESS LO (*Refer to procedure*)

OVERVIEW

Applicable to: ALL

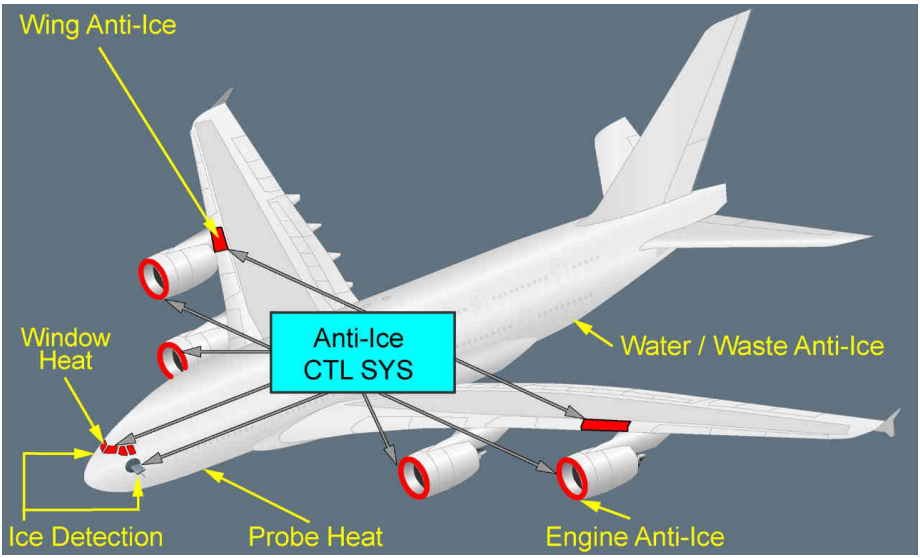
The ice protection system allows unrestricted operation of the aircraft in icing conditions.

This system protects the critical areas of the aircraft against ice, by using:

- Hot bleed air for:
  - Engine anti-ice
  - Wing anti-ice.
- Electrical power for:
  - Window heating
  - Water/Waste drain masts heating
  - Probe heating.

An ice detection system measures ice accretion via the anti-ice control system and provides this information to the flight crew.

Ice protection



ANTI-ICE CONTROL SYSTEM

Applicable to: ALL

The anti-ice control system monitors and controls:

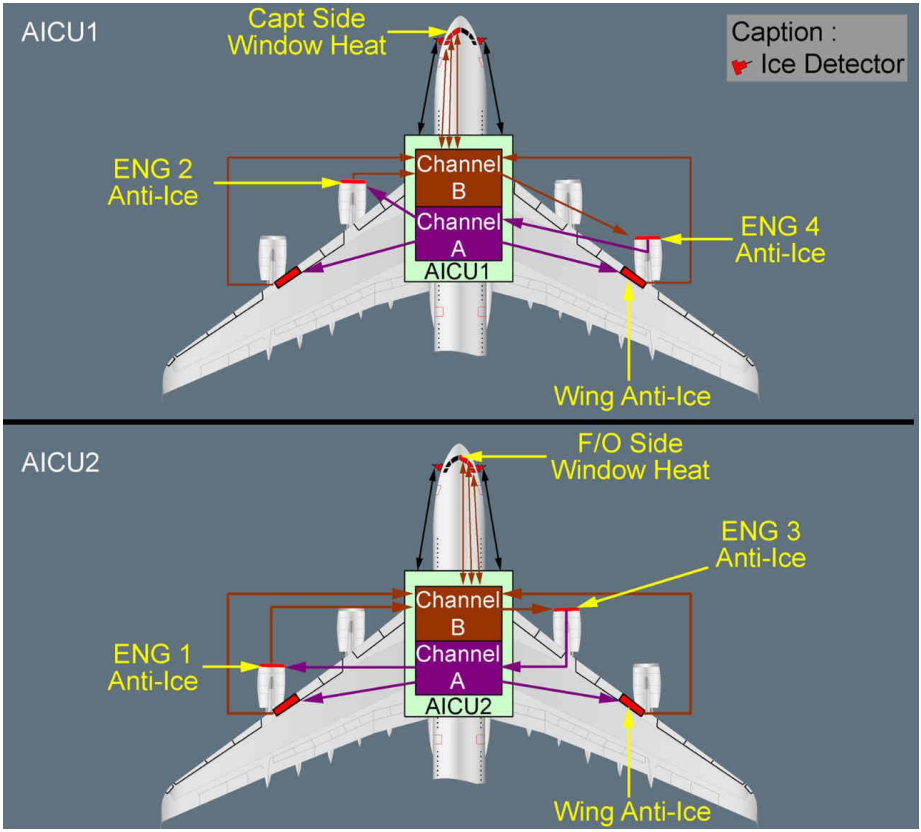
- Wing anti-ice
- Engine anti-ice
- Window heat
- Rain repellent.

The anti-ice control system has two Anti-Ice Control Units (AICUs).

L2 Each AICU has two channels: A and B.

Each channel monitors and/or controls the anti-ice systems, as shown on the following diagram.

Anti-Ice Control Units



AICU 1	Channel A	Wing Anti-ice Control
		ENG 2 Anti-ice Control
		ENG 4 Anti-ice Monitoring
	Channel B	Wing Anti-ice Monitoring
		ENG 2 Anti-ice Monitoring
		ENG 4 Anti-ice Control
		Captain's side Window Heating
AICU 2	Channel A	Wing Anti-ice Control
		ENG 1 Anti-ice Control
		ENG 3 Anti-ice Monitoring
	Channel B	Wing Anti-ice Monitoring
		ENG 1 Anti-ice Monitoring
		ENG 3 Anti-ice Control
		F/O's side Window Heating

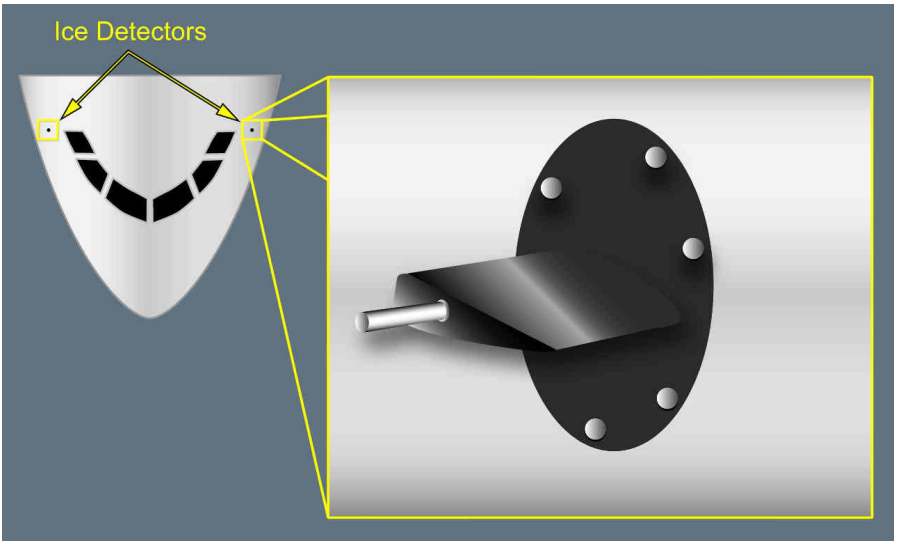
ICE DETECTION

Applicable to: ALL

ICE DETECTION SYSTEM

The ice detection system has two ice detectors that measure ice accretion. If icing, or severe icing conditions exist, the ice detectors provide this information to the flight crew.
There is one ice detector on each side of the fuselage, next to each fixed cockpit side window.

Ice detectors



L3 Each ice detector has a probe that measures icing. The probe is located outside the boundary layer.

L1 - If at least one ice detector detects icing conditions, and if engine anti-ice is off: The ECAM triggers the A-ICE ICE DETECTED caution.

L3 If 0.5 mm of ice builds up on any probe, the ice detection system informs the anti-ice control system of icing conditions.
An internal heating device deices the probes, to permit subsequent ice detection.

L1 - If at least one ice detector subsequently detects severe icing conditions, and if wing anti-ice is off: The ECAM triggers the A-ICE SEVERE ICE DETECTED caution.

L3 If 0.5 mm of ice builds up 7 times on the same probe, the ice detection system informs the anti-ice control system of severe icing conditions. This number of ice detections corresponds to approximately 5 mm of ice accretion on the airframe. The ice detection counter resets to zero, when wing anti-ice is on.

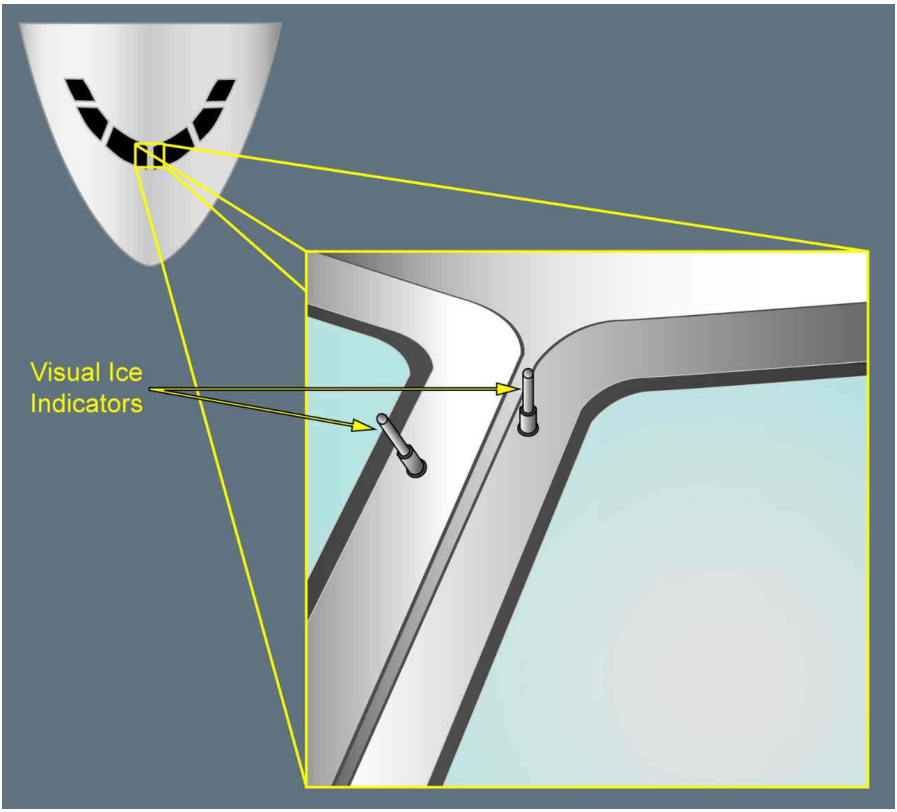
L1 - If icing is not detected for approximately 2 min, and if wing anti-ice and/or engine anti-ice are on: The ECAM displays the ICE NOT DETECTED memo.

VISUAL ICE INDICATORS

There are two visual ice indicators outside the aircraft, between the two windshields. They provide the flight crew with a visual backup to the ice detection system.

The visual ice indicators can be illuminated (*Refer to ICE IND & STBY COMPASS light*).

Visual Ice Detectors



ENGINE ANTI-ICE

Applicable to: ALL

Each engine has its own anti-ice system, with an independent hot bleed air source.

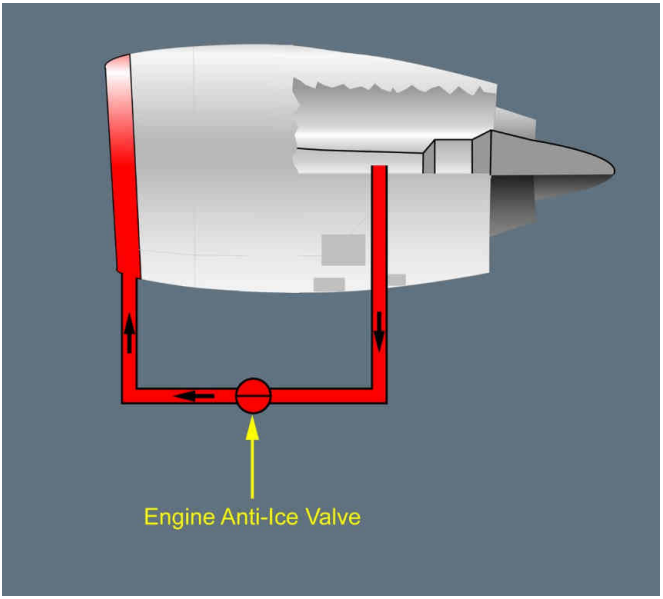
L3 This bleed air comes from the 3rd stage of the High Pressure Compressor to anti-ice the engine air inlet.

L1 An anti-ice valve on each engine enables the flow of hot air.

L2 - AICU 1 controls the anti-ice valves on Engines 2 and 4
- AICU 2 controls the anti-ice valves on Engines 1 and 3.

L3 Each valve is electrically-controlled and pneumatically-actuated. The valve opens, if it loses its power supply.

Engine anti-ice



L1 By setting the applicable engine ANTI ICE pb to ON, the flight crew activates the engine anti-ice valve of that selected engine.

WING ANTI-ICE

Applicable to: ALL

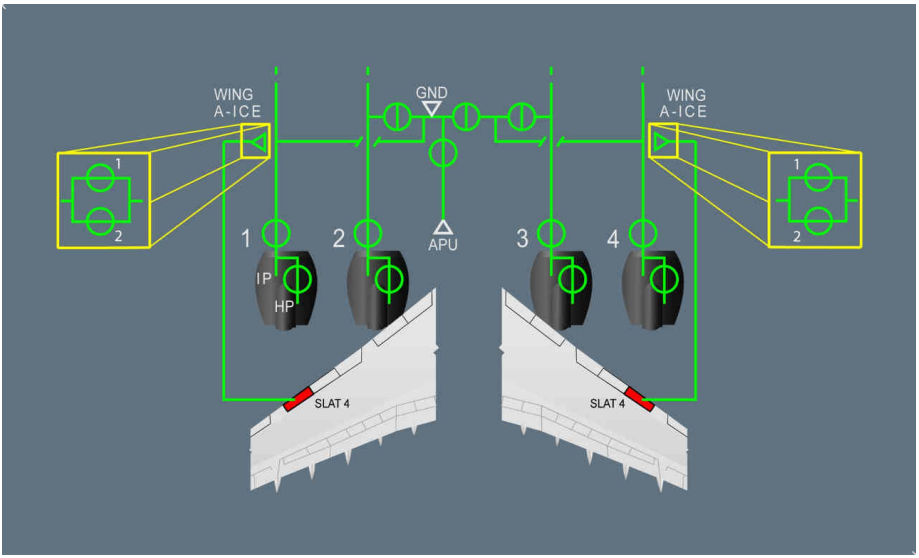
Hot air from the pneumatic system can be used to prevent ice accretion on slat 4.

L3 The A380 is less affected by icing than smaller aircraft, due to the size and thickness of its wings. Therefore, slat 4 is the only part of the leading edge that is deiced.

L1 In each wing, wing anti-ice valves enable the flow of hot air.

L2 There are two redundant wing anti-ice valves per wing:
- AICU 1 controls the outer wing anti-ice valves
- AICU 2 controls the inner wing anti-ice valves.

Wing anti-ice



When the crew sets the WING ANTI ICE pb to ON, both wing anti-ice valves in both wings will open.
L1 On ground, if the WING ANTI ICE pb is set to ON, the wing anti-ice valves will open for 30 s . Wing anti-ice will then be inhibited for 10 min, provided the aircraft is not in flight.
Wing anti-ice is also inhibited during takeoff, until takeoff thrust reduction.
L3 Each valve is electrically-controlled and pneumatically-actuated. The valve closes, if it loses its power supply.

WATER/WASTE ANTI-ICE

Applicable to: ALL

The water lines are automatically heated to prevent ice formation, which could lead to damage and/or obstruction of the water lines.
L3 Water lines heating is monitored and controlled by two Ice Protection Control Units (IPCU).

The following areas are heated:
- The drain masts
- The sections of the water/waste lines coming from the galleys and lavatory wahsbassins, which are located below the cargo compartment floor
- The drain tubes of the waste tanks

- The water servicing panel
- The potable water lines, located close to the potable water tanks, close to the forward drain panel, and inside the wing center section.

Sensors measure the temperature in these areas. For each area, the IPCUs compare the temperature to a reference temperature. When the actual temperature is below the reference temperature, the IPCUs activate the heating in the affected area.

COCKPIT WINDOW HEATING

Applicable to: ALL

The cockpit windows (windshield and side windows) are electrically-heated.

L2 - The windshields are heated to prevent icing and to defog.
- The side windows are heated to defog only.

L1 The heating system is fully automatic, and operates as soon as any engine is started.
However, before engine start, the crew can manually activate the system, via the PROBE / WINDOW HEAT pb-sw.

L2 Each Anti-Ice Control Unit (AICU) monitors and controls the windows on its side:
- AICU 1: The windows on the Captain's side
- AICU 2: The windows on the First Officer's side.

L3 The AICUs:
- Regulate cockpit window temperature
- Operate the windshield heating at half power, on ground, and at normal power, in flight
- Operate the side window heating at normal power, on ground and in flight.

PROBE HEAT

Applicable to: ALL

The pitot TAT AOA probes, the static probes, and the side slip angle probes are automatically heated to prevent ice formation. The pitot probe and the static probe of the ISIS are also automatically heated.
The probe heating system is fully automatic, and operates as soon as any engine is started.
However, before engine start, the crew can manually activate the system, via the PROBE / WINDOW HEAT pb-sw.

COCKPIT VIEW

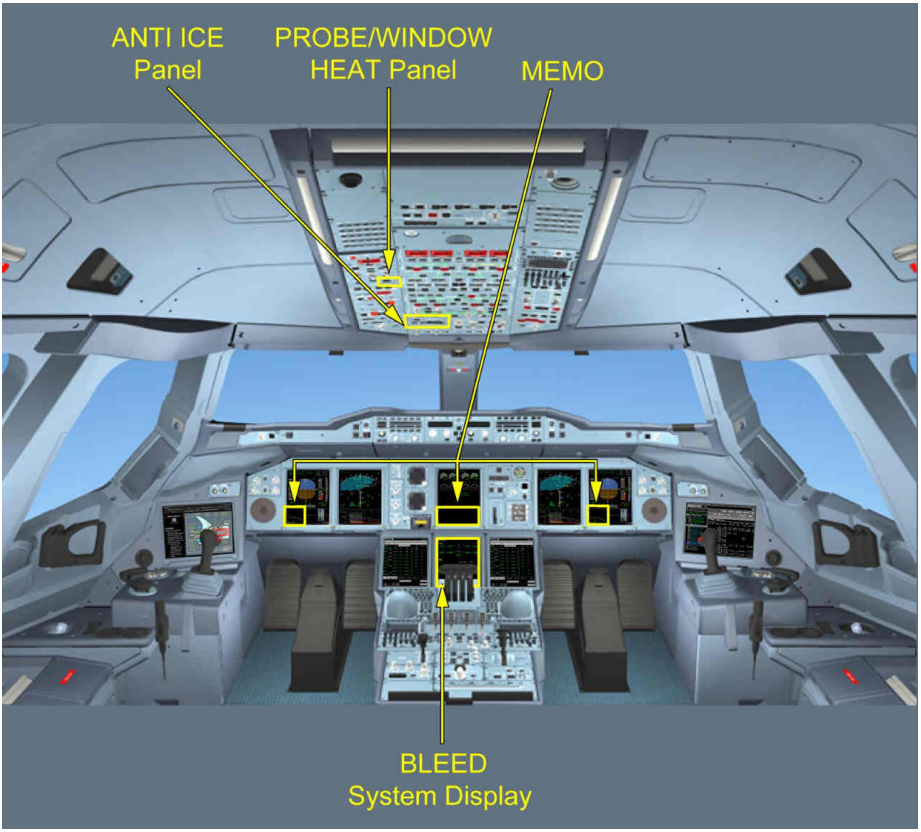
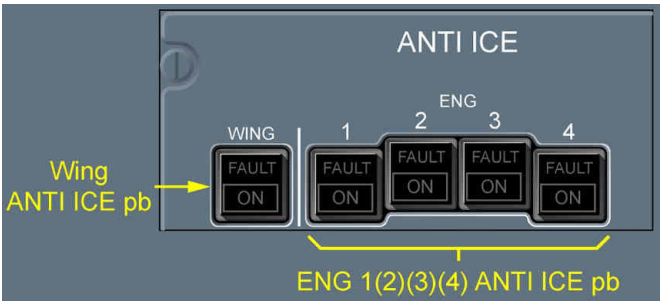
Controls and indicators



ANTI ICE OVERHEAD PANEL

Applicable to: ALL

ANTI ICE Overhead Panel



ENG 1(2)(3)(4) ANTI ICE pb

The anti-ice of the applicable engine is off.

The anti-ice of the applicable engine is on.
The ECAM displays the ENG A-ICE memo.

L12

The anti-ice valve position disagrees with the requested position.

Associated with one of the following ECAM alerts:
- A-ICE ENG 1(2)(3)(4) VALVE CLOSED (*Refer to procedure*)
- A-ICE ENG 1(2)(3)(4) VALVE OPEN (*Refer to procedure*)

Wing ANTI ICE pb

Wing anti-ice is off.

L12

Wing anti-ice is on.
The ECAM displays the WING A-ICE memo.
On ground, the wing anti-ice valves will open for 30 s . Wing anti-ice will then be inhibited for 10 min , provided the aircraft is not in flight. If the flight crew does not switch off wing anti-ice, the ON light will remain on, even though wing anti-ice is off. The wing anti-ice valves will then reopen after takeoff thrust reduction.

L12

- The anti-ice valve position disagrees with the requested position.

  Associated with one of the following ECAM cautions:
  - A-ICE L(R) WING VLV CLOSED (*Refer to procedure*)
  - A-ICE L(R) WING VLV OPEN (*Refer to procedure*)

- Or, the anti-ice valve is open, but a low pressure is detected.

  Associated with the following ECAM caution:
  - A-ICE L(R) WING VLV PRESS LO (*Refer to procedure*)

The FAULT light goes off, when the affected wing anti-ice system is recovered, after applying the procedure. If the system cannot be recovered, the FAULT light will remain on for the remainder of the flight.

PROBE WINDOW HEAT

Applicable to: ALL

Probes / Window Heat pb-sw

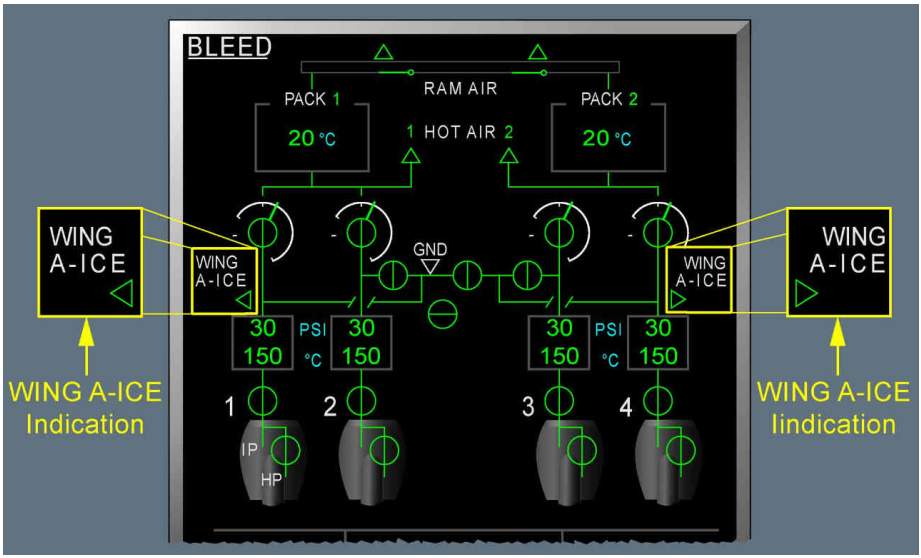
Probe and window heating is automatic, and will operate as soon as any engine is started.

Probe and window heating is selected on.

BLEED SYSTEM DISPLAY

Applicable to: ALL

BLEED System Display



WING A-ICE INDICATION

The indication is not displayed when wing anti-ice is off.

Wing anti-ice is on.

L12

Wing anti-ice is commanded on but remains off.

Associated with the following ECAM caution:

- A-ICE L(R) WING VLV CLOSED (*Refer to procedure*)

L12

- Wing anti-ice is commanded off but remains on.

  Associated with the following ECAM caution:
  - A-ICE L(R) WING VLV OPEN (*Refer to procedure*)

- Or, an abnormal pressure is detected.

  Associated with one of the following ECAM cautions:
  - A-ICE L(R) WING VLV PRESS HI (*Refer to procedure*)
  - A-ICE L(R) WING VLV PRESS LO (*Refer to procedure*)

MEMO

Applicable to: ALL

ENG A-ICE	Engine anti-ice is on. Appears on the PFDs and on the EWD.
WING A-ICE	Wing anti-ice is on. Appears on the PFDs and on the EWD.
ICE NOT DETECTED	Wing anti-ice and/or engine anti-ice are ON, and the ice detectors have not detected any ice for approximately 2 min.

Intentionally left blank

WIPERS

Applicable to: ALL

The Captain and First Officer windshields each have a two-speed electric wiper.
The wipers can be used during taxi, takeoff, holding, approach, and landing.
Each windshield wiper is controlled by its assigned WIPER selector.

L3 When the wipers are not in use: They are out of view, and do not rest on the surface of the windshield. This prevents the accretion of sand and dust, that could scratch the windshield.

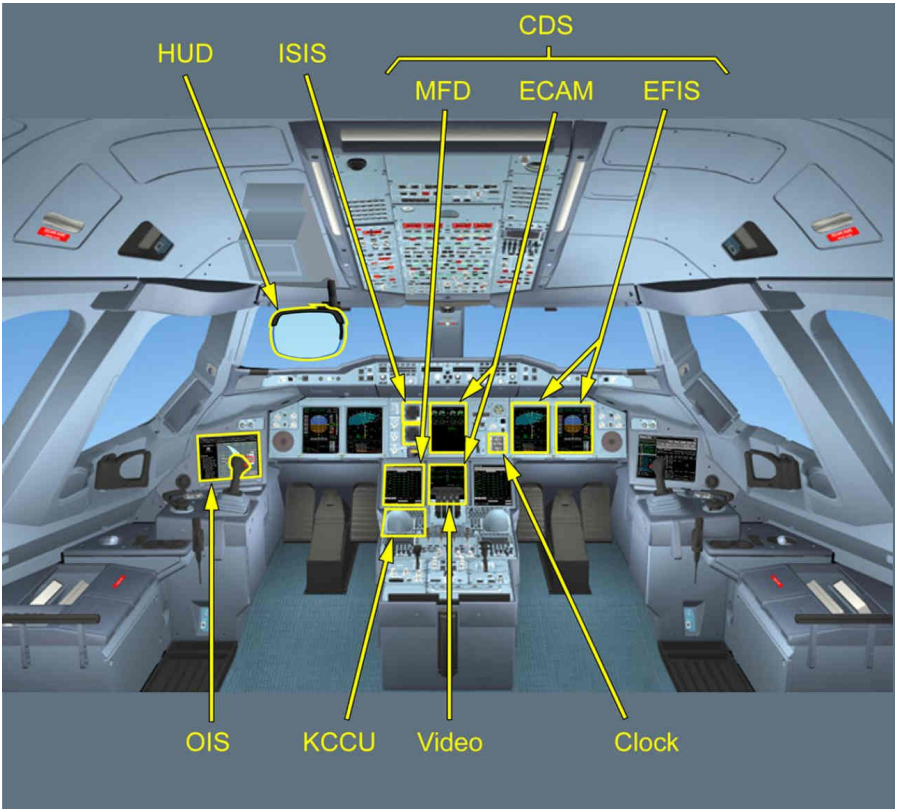
INDICATING AND RECORDING

Applicable to: ALL

INDICATING

Systems Overview



The following systems and displays provide the flight crew with the information necessary to operate the aircraft:

- A Control and Display System (CDS) has 8 Display Units (DU s). Each pilot uses a Keyboard and Cursor Control Unit (KCCU) to interact with the systems displayed on the DU s.

  The CDS uses the following functions to display information to the flight crew:
  - Electronic Flight Instrument System (EFIS)
  - Electronic Centralized Aircraft Monitoring (ECAM)
  - Multi-Function Display (MFD).
- A Head-Up Display (HUD) provides guidance to the flight crew by gathering primary flight display information. It displays this information by superimposing symbols on external parameters. The HUD is in the primary and forward field of vision of the pilots.
  For more information on the HUD, *Refer to DSC-31-60-20-10 Overview* .
- An Onboard Information System (OIS) provides access to flight operations manuals and applications (e.g. performance computation modules). The Captain and First Officer both have an OIS terminal and an OIS keyboard.
  For more information on the OIS , *Refer to DSC-46-20-10-10 Overview* .
- A clock operates independently from other systems, and provides time data to all the aircraft systems that require a time reference.
- A backup flight and navigation instrument display, also referred to as Integrated Standby Instrument System (ISIS), provides information in the case of loss of PFD , or ND .
  For more information on the ISIS , *Refer to DSC-34-10-20-10 Overview* .

RECORDING

There are two recorders system:

- The Flight Data Recording System (FDRS) that records all flight parameters
  For more information, *Refer to FDRS* .
- The Cockpit Voice Recorder System (CVRS) that records all the conversations and sounds in the cockpit.
  For more information, *Refer to CVRS* .

CDS PRESENTATION

Applicable to: ALL

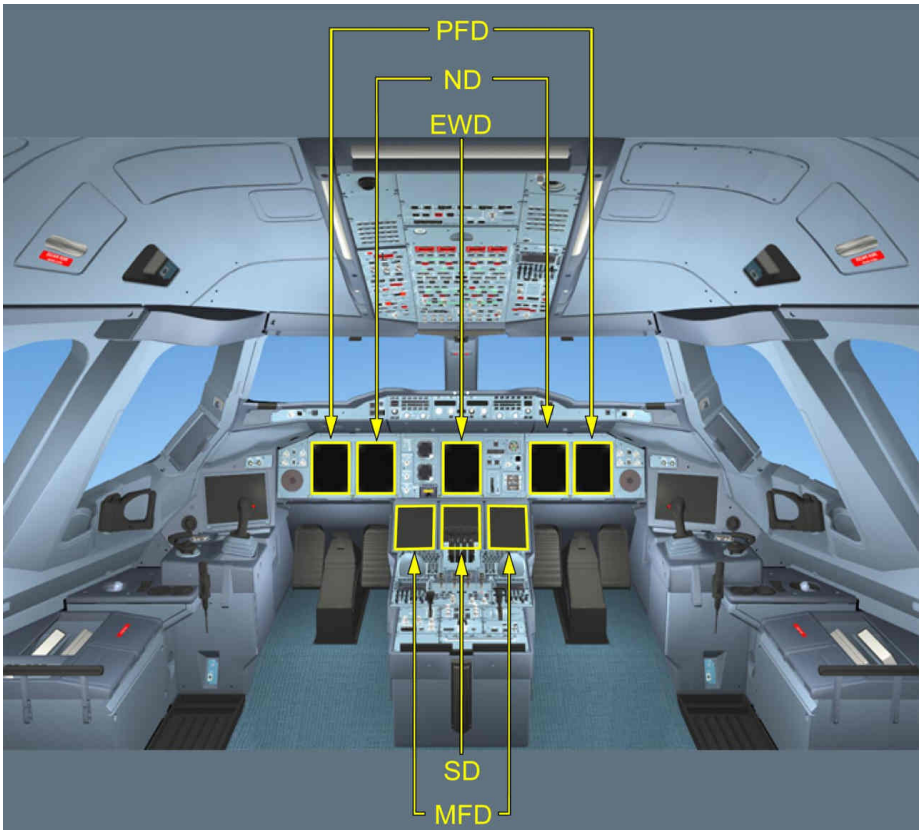
The Controls and Display System (CDS) has 8 Display Units (DU s) that display information to the flight crew, using the following functions:

- The Electronic Flight Instrument System (EFIS) displays flight parameters and navigation data on:
  - Two Primary Flight Displays (PFD s) for short-term flight information, and
  - Two Navigation Displays (ND s) for medium and long-term flight information.
- The Electronic Centralized Aircraft Monitoring (ECAM) displays monitored aircraft systems on:
  - One Engine/Warning Display (EWD)
  - One System Display (SD)
  - The lower section (or part) of the PFD s.
- Two Multi-Function Displays (MFD s) interface with the:
  - Flight Management System (FMS). *Refer to DSC-22-FMS-10-10-22FMS10A General - Description*
  - Air Traffic Control (ATC). *Refer to DSC-46-10-10-10 General*
  - Aircraft Environment Surveillance System (AESS). *Refer to DSC-34-20-10 Overview*
  - FCU backup function for the AFS . *Refer to DSC-22-FG-90-10 Overview*
  - Video system display. *Refer to DSC-31-80-10 Overview*

The CDS also has the following three control panels to interface with the above functions:

- An EFIS-CP , to interface with the EFIS
- An ECAM-CP , to interface with the ECAM
- Two KCCU s, one for each flight crewmember, to interface with the applicable functions available on the MFD , ND , and SD .

CDS Presentation



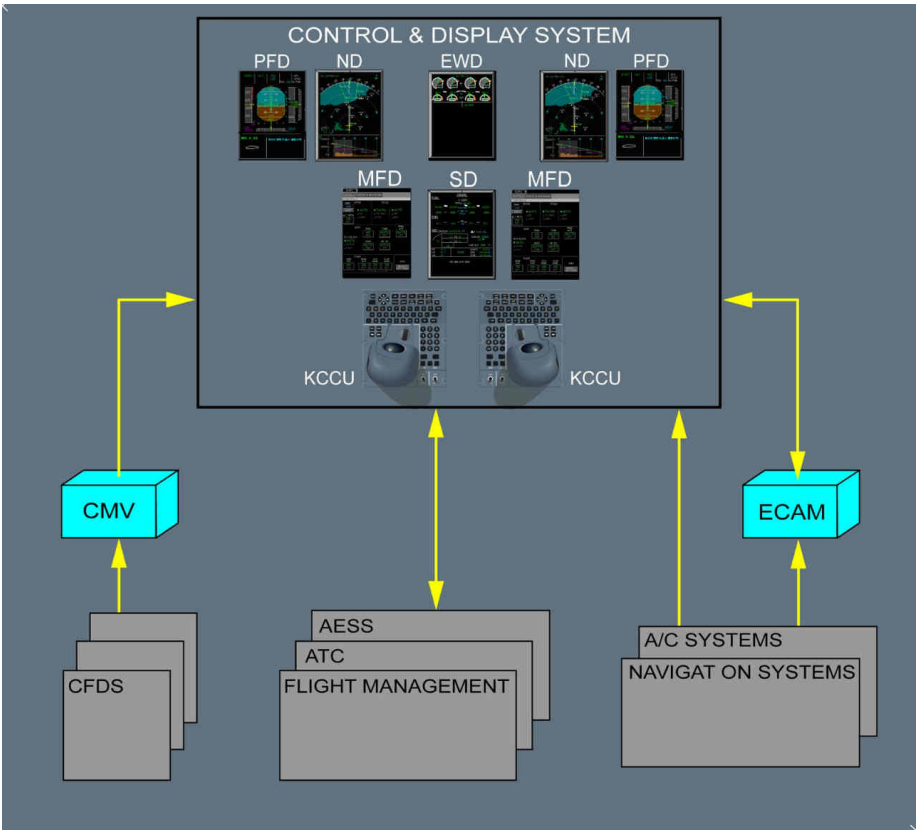
CDS ARCHITECTURE

Applicable to: ALL

The CDS displays information to the flight crew, using the:

- Flight Management System (FMS)
- Air Traffic Control (ATC)
- Aircraft Environment Surveillance System (AESS)
- Concentrator and Multiplexer for Video (CMV), for the video system
- Electronic Flight Instrument Systems (EFIS), for aircraft attitude and navigation systems
- Electronic Centralized Aircraft Monitoring (ECAM).

CDS architecture



DISPLAY UNITS

Applicable to: ALL

The Display Units (DUs) of the CDS are based on Liquid Crystal Display (LCD) technology. The 8 DUs are identical.

L3 Each DU is directly connected to the AFDX bus, and has:

- A display area that is 15.6 cm x 20.8 cm (6.17 in x 8.22 in)
- Fiber-optic video capability
- Bitmap capability, via AFDX.

L1 The 8 DUs are:
- The CAPT PFD
- The CAPT ND
- The CAPT MFD
- The E/WD
- The SD
- The F/O MFD
- The F/O ND
- The F/O PFD.

DISPLAY UNIT - USER INTERFACE RULES

Applicable to: ALL

ENTRY FIELD

The flight crew uses the entry field to select and change data.

The entry field may:
- Be blank for free text: Data entry is optional
- Contain  : Data entry is optional
- Contain  : Data entry is mandatory.

When applicable, the entry field also contains the unit of measurement.

Entry Field

The flight crew can edit an entry field, by moving the cursor over the field. When the blue box appears, it is possible to modify the data, without first pressing the Validation pb.
When the data is entered, the flight crew presses the Validation pb, and the cursor jumps to the field that is most likely to be used next.

OPTION-LIST

The flight crew can select one of the listed items, by scrolling the wheel of the cursor control device, or by using the direction arrow keys.

Option-List

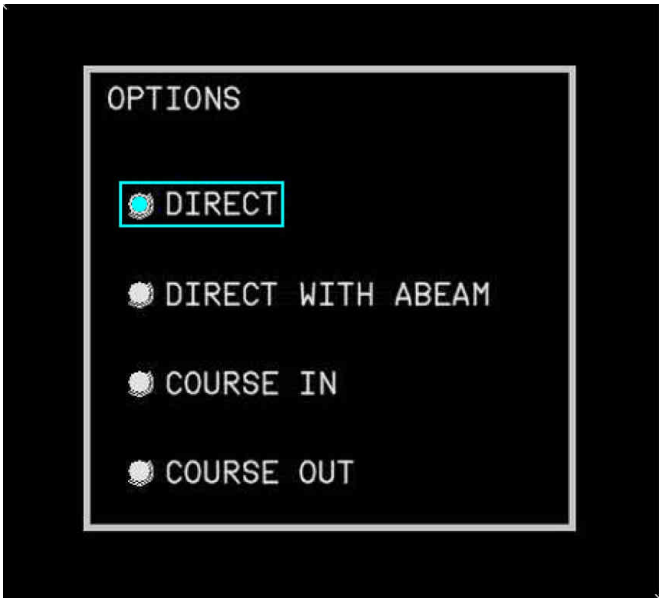
When the item is selected, the flight crew presses the Validation pb, and the cursor moves to the field that is most likely to be used next.

Note: *For some option-lists, the flight crew can type in data, other than those listed. When the data is typed, the list disappears.*

BULLETED ITEM

The flight crew can select only one of the options in a bulleted list, by clicking on the option.

Selection Bullet



TICK-BOX

The flight crew can validate/invalidate one or more of the items listed in a tick-box, by clicking on the applicable item(s).
When validated, a tick appears next to the applicable item.

Tick-box

DISPLAY UNIT MONITORING

Applicable to: ALL

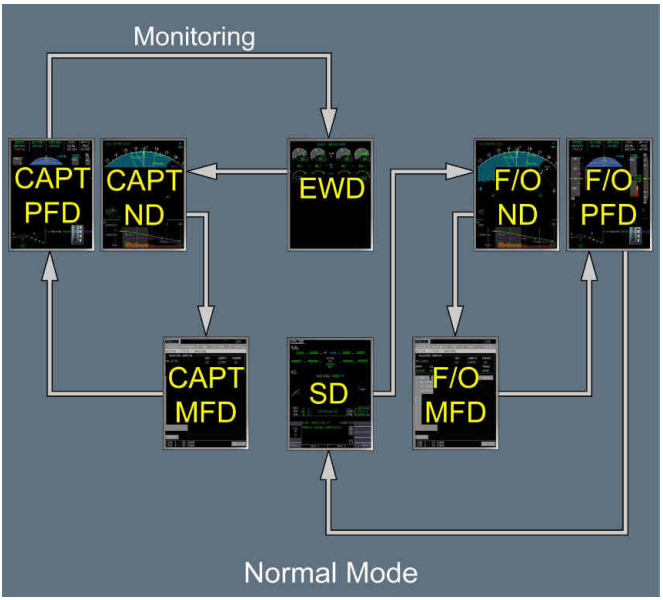
DU MONITORING

Each DU has a Display Unit Monitoring function, which detects erroneous display of the following indications:

- Altitude, speed, pitch, roll, heading, FD bars on the PFD.
- Heading on the ND.
- The clock second for the MFD.
- Thrust, N1, EGT on the EWD.
- The Fuel On Board (FOB) on all SD pages; FOB, N2, Fuel Flow when the SD Engine pages is displayed; FOB and Fuel Flow when the SD Cruise page is displayed.

L2 A DU monitors another DU, which in turn monitors another DU. This makes a monitoring "loop". There are two independent feedback-monitoring loops, and each loop has four DUs.

Normal Mode



L3 Aircraft systems send raw data including critical parameters to the CDS. Each DU performs a display process with an image signature sent to the adjacent DU. This adjacent DU performs a

reversion of the display process in order to compare critical parameters with those sent by the aircraft systems.

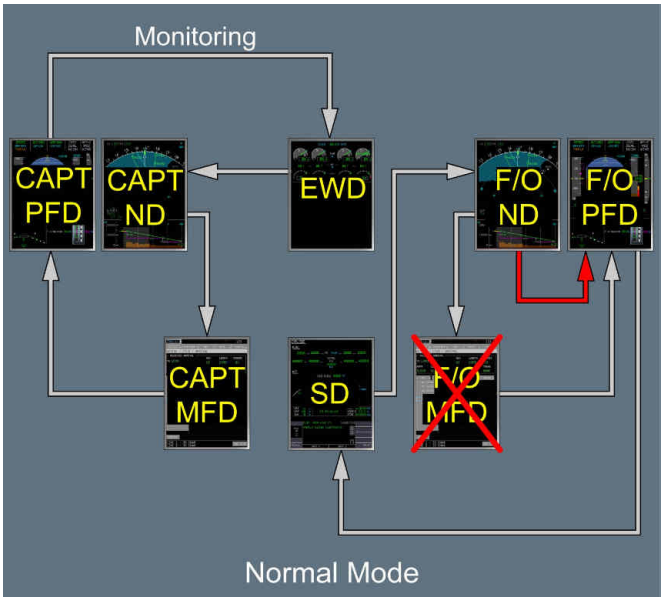
L1 If a DU detects a discrepancy between the data that it receives from a given system and the data displayed on another DU, the ECAM will trigger the following alert : CDS DISPLAY DISAGREE.
If the monitoring of a DU is no longer available, the ECAM will trigger the following alert: CDS CAPT PFD(CAPT ND)(EWD)(F/O PFD)(F/O ND) DU NOT MONITORED.

DU MONITORING IN CASE OF DU FAILURE

If a DU fails, The DU monitoring loops are automatically reconfigured. For example:
- In normal configuration, the F/O ND DU monitors the F/O MFD DU.
- The F/O MFD DU monitors the F/O PFD DU.

If the F/O MFD DU fails, the F/O ND DU will monitor the F/O PFD DU.

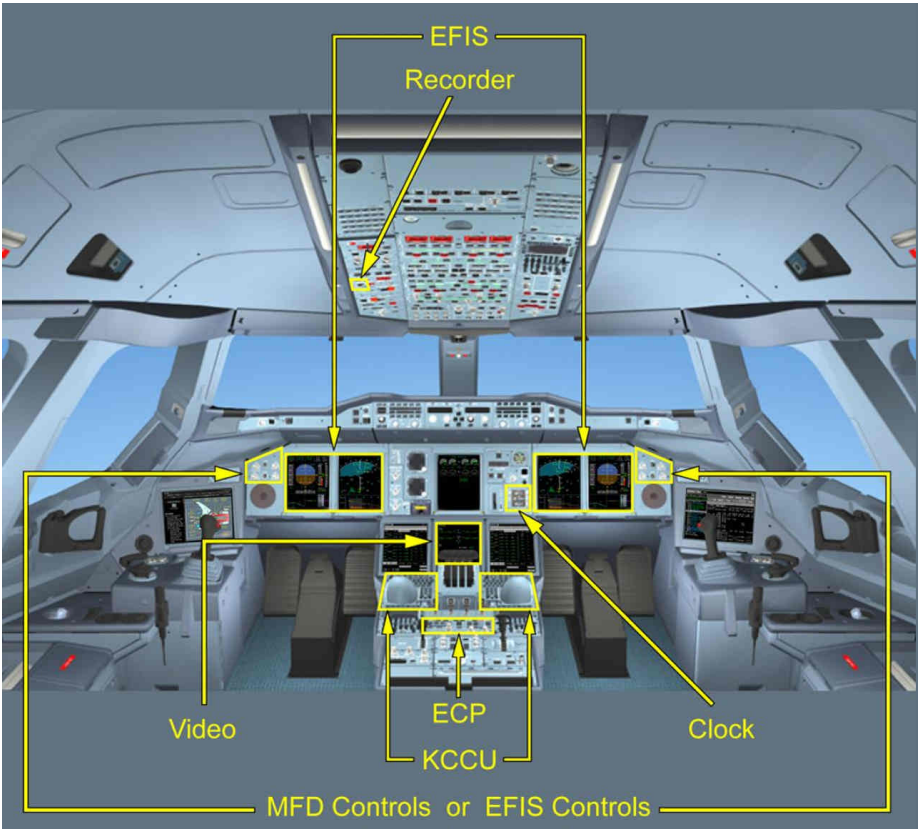
Abnormal Operation



COCKPIT OVERVIEW

Applicable to: ALL

cockpit overview



Intentionally left blank

GENERAL

Applicable to: ALL

When one or more display units (DU) fail, there is a re-organization of the displays to provide the flight crew with the necessary information when required. This is called display unit reconfiguration.
Two types of reconfiguration are possible: Automatic or on-request.

AUTOMATIC RECONFIGURATION

Applicable to: ALL

Two displays are considered as more important for continuing the flight. They are the Primary Flight Display (PFD) and Engine and Warning Display (EWD).
They are normally and respectively displayed on the CAPT (F/O) PFD DU and the EWD DU.
If the CAPT (F/O) PFD DU fails, the PFD is automatically displayed on the CAPT (F/O) ND DU.
If the EWD DU fails, the EWD is automatically displayed on the SD DU.

MANUAL RECONFIGURATION

Applicable to: ALL

In case of a display unit failure, the flight crew can manually reconfigure one of the remaining display units to recover the lost display.

This manual reconfiguration is done using:
- either the reconfiguration pushbutton (DU RECONF pb)
- or, the KCCU function keys.

This DU RECONF pb is active only if there is a failed on-side display unit. The EWD DU and SD DU can be reconfigured from both sides.
The push-button acts on the following display unit, in the given order.

For the CAPT side:
1. The MFD DU
2. The ND DU, if the MFD DU is failed
3. The PFD DU, if both the ND DU and MFD DU are failed.

For the F/O side:
1. The ND DU, if the PFD DU and ND DU are both operative
2. The MFD DU, if either the PFD DU or the ND DU is failed

L3 *Note:* *This is to favor the display of the PFD on either the PFD or ND DU.*

L1 3. The PFD DU, if both the ND DU and MFD DU are failed.

Note: - *If the EWD DU, and/or SD DU fails, the EWD and/or the SD can be displayed on either side*
- *The EWD (SD) cannot be displayed on both sides at the same time*

DISPLAY UNIT CAPABILITY

Applicable to: ALL

The following table summarizes the displays that can be shown on each display unit and the display sequence when using the DU RECONF pb.

Display Unit	Display	Access mode
EWD DU	EWD	Normal
SD DU	SD	Normal
	EWD	Automatic
CAPT (F/O) PFD DU	PFD	Normal
	ND	Manual
	MFD	Manual
CAPT (F/O) ND DU	ND	Normal
	MFD	Manual
	EWD	Manual
	SD	Manual
	PFD	Automatic
CAPT (F/O) MFD DU	MFD	Normal
	EWD	Manual
	SD	Manual
	PFD	Manual
	ND	Manual

DISPLAY UNIT RECONFIGURATION OVERVIEW

Applicable to: ALL

The aside illustration provides an overview of the use of the two pushbuttons for reconfiguring display units in an event of a failure.
Click on a display unit to set it failed, and press one of the available pushbuttons to view the reconfiguration.
In this illustration, up to two display units may be set as failed.

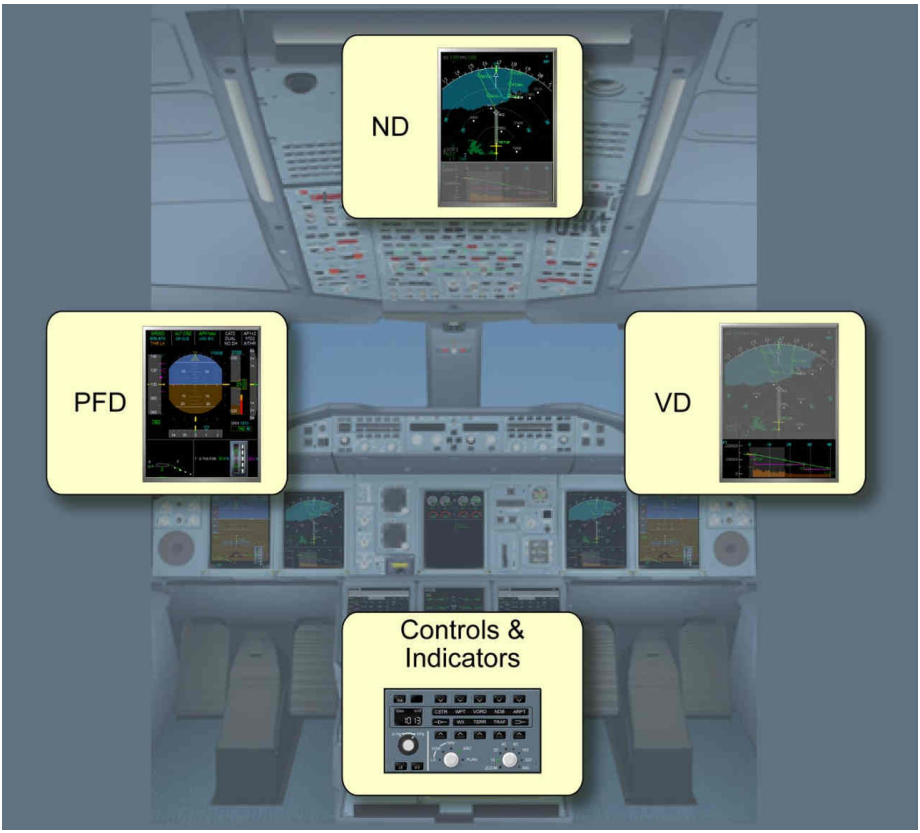
OVERVIEW

Applicable to: ALL

The Electronic Flight Instrument System (EFIS) controls the flight parameters displayed on the Primary Flight Displays (PFD s), and the navigation data displayed on the Navigation Displays (ND s).

The ND s indicate:
- The lateral navigation data on the upper part of the ND display unit (ND)
- The vertical navigation data on the lower part of the ND display unit (VD).

EFIS Overview



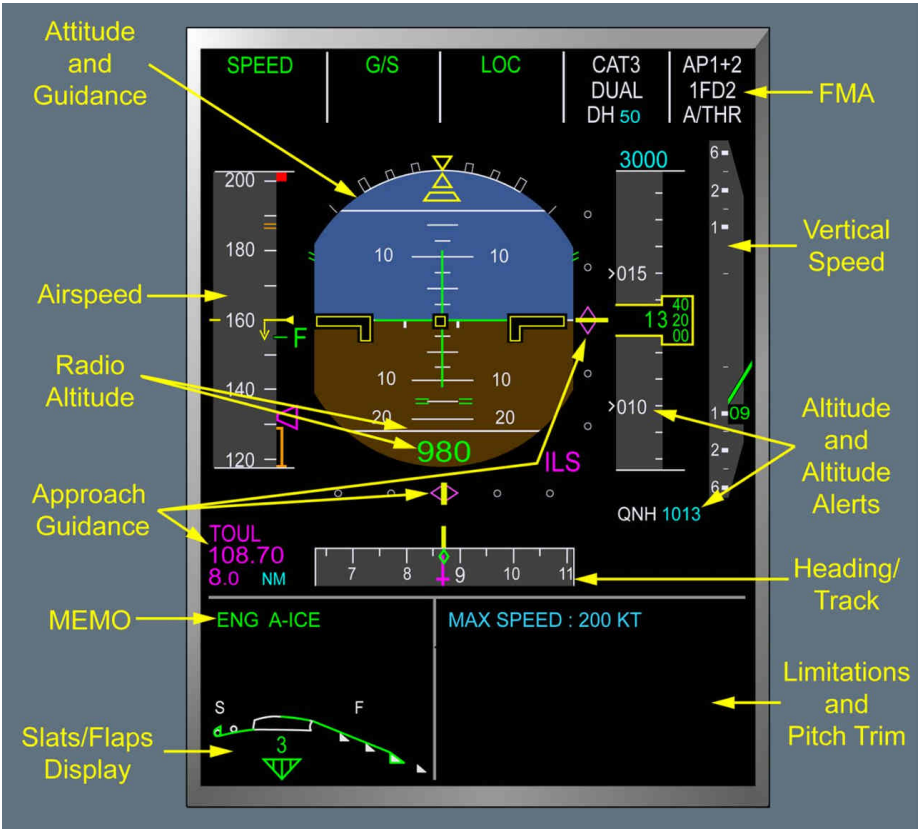
Intentionally left blank

Overview

OVERVIEW

Applicable to: ALL

PFD Overview



Some indications only appear on ground: *Refer to DSC-31-20-20-20-10 On Ground Indications* .
The backup speed scale and the backup altitude scale automatically appear, if necessary: *Refer to DSC-31-20-20-130-10 Backup Scales* .

In addition, the surveillance (SURV) system can display:

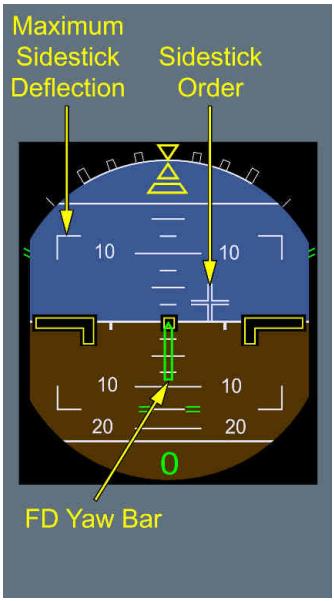
- The TAWS messages
  Refer to DSC/34-Surveillance/TAWS/CONTROLS and INDICATORS/PFD
- The WINDSHEAR messages
  Refer to DSC/34-Surveillance/WXR/CONTROLS and INDICATORS/PFD
- The TCAS messages.
  Refer to DSC/34-Surveillance/TCAS/CONTROLS and INDICATORS/PFD

On Ground Indications

ON GROUND INDICATIONS

Applicable to: ALL

On Ground Indications



SIDESTICK ORDER

L3 The FCDC provides the sidestick order.

L1 

Indicates the total combination of the captain's and first officer's sidestick orders.
Appears on ground, when one engine starts.

Note: *The flight crew must not use the sidestick order indication to check the flight controls after engine start, because this indication does not show the position of the flight controls .*

MAXIMUM SIDESTICK DEFLECTION

On ground, the maximum sidestick deflection appears on the PFD, when one engine starts.

L2 The maximum sidestick deflection is equal to ± 15 ° in pitch and ± 19 ° in roll.

FD YAW BAR

L3 The PRIM provides the FD yaw bar information.

L1 
Indicates the FD yaw orders, in order for the flight crew to maintain the aircraft on the runway centerline.

Appears:
- When the FD s are engaged
- In RWY , FLARE , or ROLL OUT modes.
  For more information, *Refer to DSC-22-FG-30-20 FD Display* .

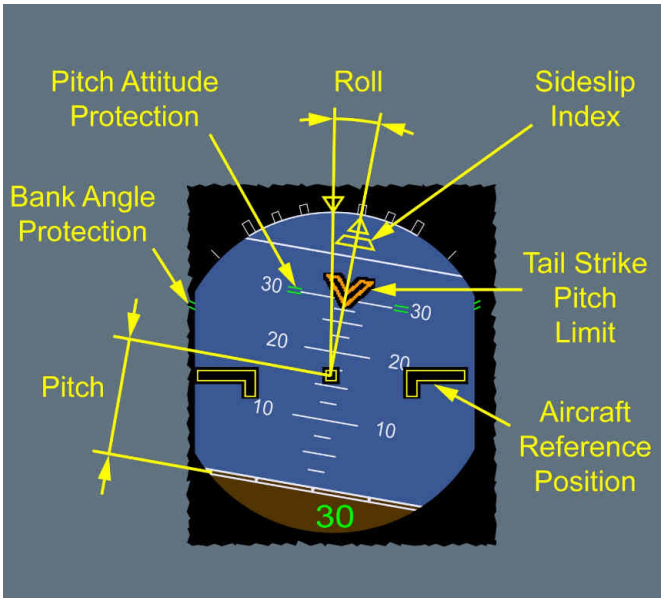
L2 The yaw scale has markers every 10 ° .

Attitude

ATTITUDE

Applicable to: ALL

Attitude



L12

ATT — No attitude data is available. The attitude and guidance indications no longer appear.
Flashes for 9 s , then remains steady.

L12

CHECK ATT — Attitude data on both PFD s differs by more than 5 ° .
Flashes for 9 s , then remains steady.

AIRCRAFT REFERENCE POSITION

Indicates the fixed reference position of the aircraft.

ROLL

Indicates the bank angle of the aircraft.

L3 The ADIRS provide the bank angle information.

L2 arkers at 0 °, 10 °, 20 °, 30 °, and 45 ° of bank.

BANK ANGLE PROTECTION

L3 The FCDC provides the value of the bank angle protection.

L12

Indicates the limit of the bank angle protection in normal law.
Indicates a bank angle of ±67 °.

L1 The bank angle protection is lost. The aircraft is in alternate, or direct law.

PITCH

L3 The ADIRS provide the pitch attitude information.

L1 The scale indicates the pitch attitude of the aircraft.

L2 Degrees are indicated in increments of:
- 10 °, between 80 ° nose down, and 80 ° nose up
- 2.5 °, between 10 ° nose down, and 30 ° nose up.

L12

Indicates that the pitch attitude of the aircraft is too high, and the direction to take in order to reduce it.
Appears if the pitch attitude is more than 30 °, or less than -30 °.

PITCH ATTITUDE PROTECTION

L3 The FCDC provides the information of the pitch attitude protection.

L12

Indicates the limit of the pitch attitude protection in normal law.
Indicates a pitch attitude of 15 ° nose down, and 30 ° nose up.

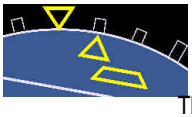
L1 Pitch attitude protection is lost. The aircraft is in alternate, or direct law.

For more information on the normal law, *Refer to 27-Flight Controls/Normal Law* .

For more information on the alternate law, *Refer to 27-Flight Controls/Alternate Law* .
For more information on the direct law, *Refer to 27-Flight Controls/Direct Law* .

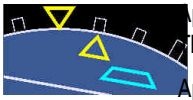
SIDESLIP INDEX

L123



On ground, indicates the aircraft lateral acceleration
In flight, indicates the sideslip of the aircraft.
If the sideslip is not available, indicates the lateral acceleration of the aircraft.
The ADIRS provide the sideslip and the lateral acceleration.
0.39 in between the roll, and the sideslip index corresponds to a 0.2 g acceleration.
Sideslip index reaches its stop at 0.3 g (i.e. 0.59 in on the scale).

L13

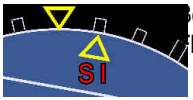


Appears, when one engine fails during takeoff, or go-around.
The sideslip index then corresponds to the beta target.

Appears, when:
- The flight crew selects CONF 1, 2, or 3
- The N1 of at least one engine is above 80%
- The difference between the N1 of two engines is above 40%.

The PRIMs provide the beta target information.

L12



Both sideslip and lateral acceleration indications are not valid.
Flashes for 9 s, then remains steady.

TAIL STRIKE PITCH LIMIT

L13

Indicates the maximum pitch attitude, in order to avoid tail strike at takeoff and landing.
The PRIMs provide the tail strike pitch limit.

L2

During Takeoff

- The indication moves from the pitch limit value, with main landing gear compressed, to the pitch limit value, with main landing gear extended.
- No longer appears 3 s after liftoff.

During Landing

- Appears, when the aircraft is below 400 ft radio altitude, at a fixed value corresponding to the compressed main landing gear .
- No longer appears:
  - When the ground speed is less than 50 kt
  - 4 s after a go-around is initiated.

Airspeed

AIRSPEED

Applicable to: ALL

The following general indications concerning the airspeed of the aircraft can appear during all flight phases:
- The speed reference line
- The airspeed target
- The speed trend arrow
- The Mach number.

Refer to DSC-31-20-20-40 General Airspeed Indications .

The following airspeed indications appear in flight:
- During takeoff:
  - V1
  - VR
  - V2
  - The short term managed speed
  - F speed
  - S speed
  - Green dot
  - The automatic retraction speed.

  Refer to DSC-31-20-20-40-10 Airspeed Indications During Takeoff .
- During descent:
  - VFE next
  - F speed
  - S speed
  - The short term managed speed
  - Lower and upper speed range limits.

  Refer to DSC-31-20-20-40 Airspeed Indications During Descent
- After touchdown:
  - The speed trend arrow
  - The DECEL indication

  Refer to DSC-31-20-20-40 Airspeed Indications After Touchdown

During the flight, the airspeed scale also displays the following protection speeds:
- VMAX, and the high speed protection indication
- VLS
- $V\alpha_{prot}$

- $V\alpha_{max}$
- $V\alpha_{sw}$.

Refer to DSC-31-20-20-40 Airspeed Protections .

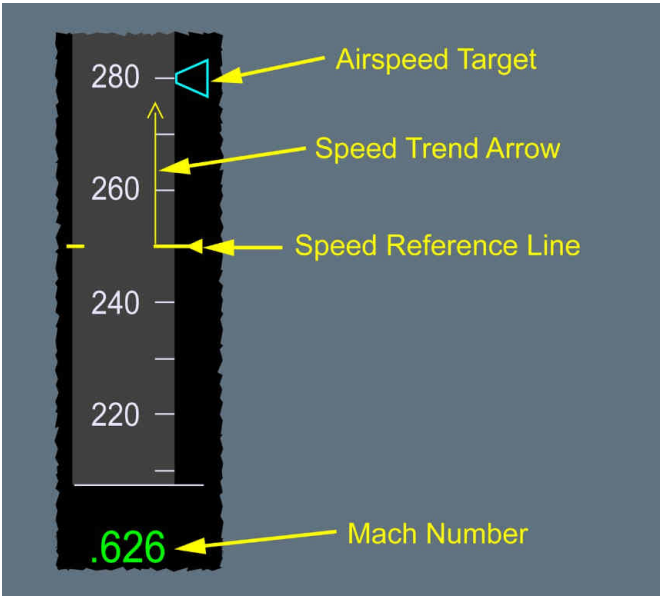
The backup speed scale automatically appears on the PFD , if necessary (*Refer to DSC-31-20-20-130-10 Backup Speed Scale*).

GENERAL AIRSPEED INDICATIONS

Applicable to: ALL

L2 The airspeed scale has markers every 10 kt, and starts at 30 kt.

General Airspeed Indications



L12

SPD	Appears, instead of the airspeed scale, when no speed information is available. Flashes for 9 s, then remains steady.

L12

Appears, when characteristic speeds computation is no longer available.

The following airspeed indications do not appear on the airspeed scale:
- VLS
- S speed
- F speed
- Green dot speed
- Speed trend arrow
- VFE next
- $V\alpha_{sw}$.

Appears, when:
- The three PRIMs are lost, or
- Both SFCC slats channels are lost, or
- Both SFCC flaps channels are lost.

Flashes for 9 s, then remains steady.

L1 **SPEED REFERENCE LINE**

L13

Indicates the current airspeed of the aircraft.
The ADRs provide the current airspeed information.

SPEED TREND ARROW

L123

Indicates the airspeed that the aircraft will reach in 10 s, if its current acceleration(deceleration) remains constant.
Appears, when the speed trend is more than 2 kt.
No longer appears, when the speed trend is less than 1 kt.
The PRIMs provide the speed trend information.

AIRSPEED TARGET

Indicates the airspeed target, or the airspeed corresponding to the Mach target.

L3 The PRIMs provide the airspeed target information. If all three PRIMs are lost, the FCU backup provides the airspeed target information.

L1

- The flight crew selects the airspeed target (manually selected on the AFS CP, or manually entered in the FMS)
- The airspeed target is within the airspeed scale.

- The flight crew selects the airspeed target (manually selected on the AFS CP, or manually entered in the FMS)
- The airspeed target is not within the airspeed scale.

- The airspeed target is managed (computed by the FMS)
- The airspeed target is within the airspeed scale.

- The airspeed target is managed (computed by the FMS)
- The airspeed target is not within the airspeed scale.

L12

SPD SEL — The airspeed selected on the AFS CP is not available.
Flashes for 9 s, then remains steady.

MACH NUMBER

L3 The ADIRS provide the Mach number information.

L1 0.626 — Appears below the airspeed scale, if the aircraft speed is more than M 0.5.
No longer appears, if the aircraft speed is less than M 0.45.

L12

MACH — The Mach data is not available.
Flashes for 9 s, then no longer appears.

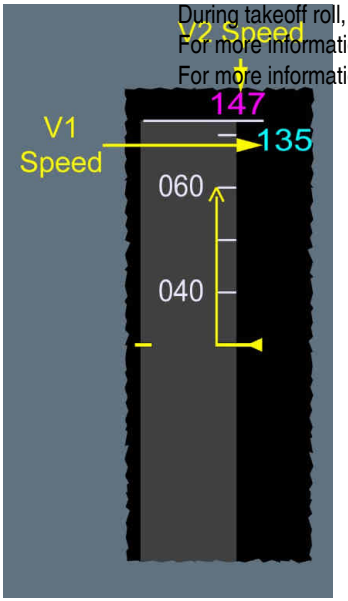
AIRSPEED INDICATIONS DURING TAKEOFF

Applicable to: ALL

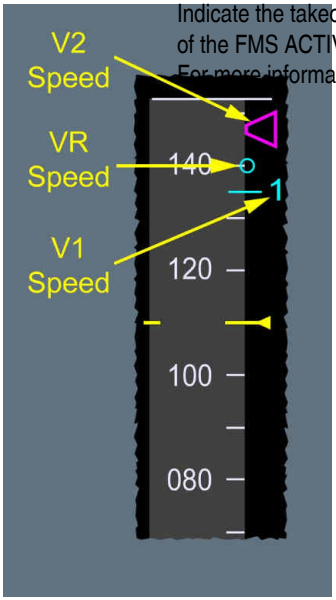
BEFORE LIFTOFF

L3 The FMS provides V1, VR , and V2 information.

L1



During takeoff roll, V1, and V2 are outside the airspeed scale.
For more information about V1, *Refer to 22-27/Operating Speeds* .
For more information about V2, *Refer to 22-27/Operating Speeds* .



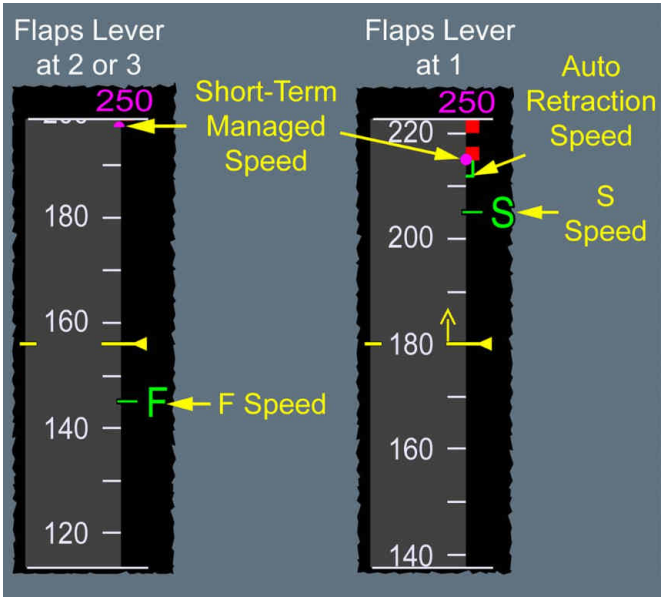
Indicate the takeoff speeds that the flight crew manually enters in the T.O panel of the FMS ACTIVE/PERF page (V1, the rotation speed VR, and V2).
For more information about VR, *Refer to 22-27/Operating Speeds* .

L2 V1 and VR no longer appear after liftoff.
L12

V1 is not valid.
Flashes for 9 s , then remains steady.

AFTER LIFTOFF

After Liftoff



L3 The PRIM provides these speeds.

L1

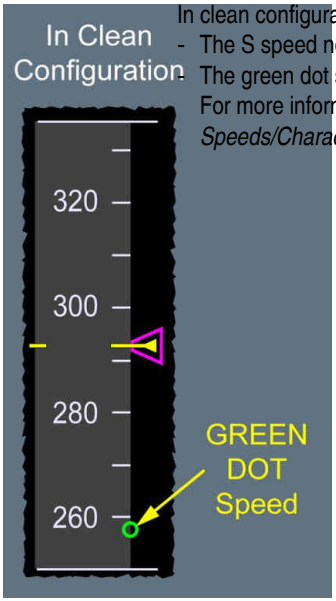
In managed speed/Mach, the short-term managed speed indicates the current speed target in accordance with the configuration of the aircraft.
In selected speed/Mach, the short-term managed speed is the speed/Mach target, that would be used if the flight crew engages the managed speed/Mach control.
For more information about the short-term managed speed, *Refer to 22-FG/Speed-Mach Control/Managed Speed/Short-term Managed Speed* .

When the FLAP lever is set to 2 or 3, indicates the minimum flap retraction speed, also referred to as F speed.
For more information about F speed, *Refer to 22-27/Operating Speeds/Characteristic Speeds/F* .

When the FLAP lever is set to 1 (CONF 1+F), indicates the Automatic Retraction Speed (ARS).
For more information about the automatic retraction speed, *Refer to 27/Slats-Flaps/Configurations/ARS* .

When the FLAP lever is set to 1, indicates the minimum slat retraction speed, also referred to as S speed.
For more information about S speed, *Refer to 22-27/Operating Speeds/Limit Speeds/S* .

IN CLEAN CONFIGURATION

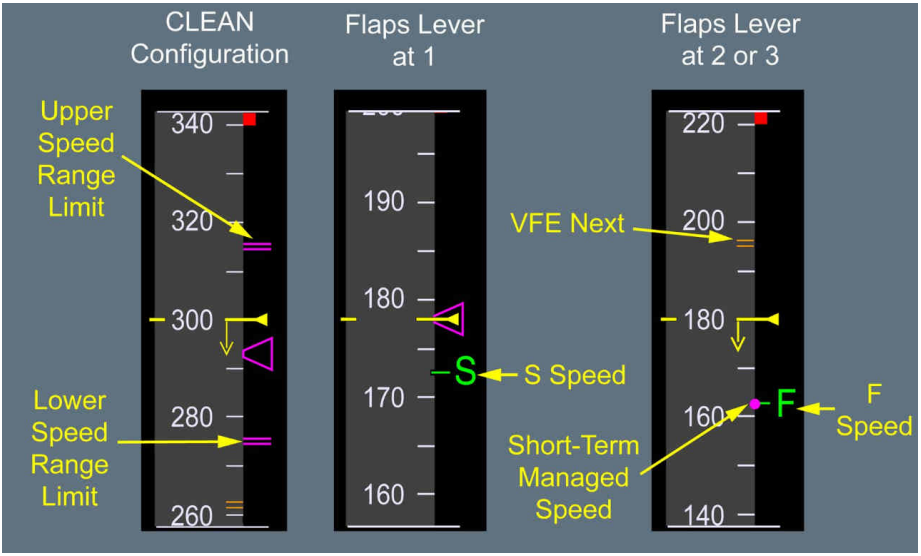


In clean configuration:
- The S speed no longer appears
- The green dot speed appears.

For more information about the green dot speed, *Refer to 22-27/Operating Speeds/Characteristic Speeds/Green Dot* .

AIRSPEED INDICATIONS DURING DESCENT

Applicable to: ALL



L123

Indicates the range of aircraft speed, in order for the flight crew to maintain the appropriate vertical trajectory.
Appears during a managed descent.
The PRIM provides the speed range limits.

Note: *When the FMS flight phase is the descent phase, and the DES mode is engaged, the FG does not accurately maintain the ECON speed/Mach(RTA speed/Mach). However, the managed speed/Mach should not go beyond the high and low speed margins.*
For more information on high and low speed margins, Refer to 22-FMS/System Description/Performance/Flight Phases and Speed Profiles .

When the FLAPS lever is set to 1, indicates the target speed in managed mode, also referred to as S speed.
For more information about S speed, *Refer to 22-27/Operating Speeds/Characteristic Speeds/S* .

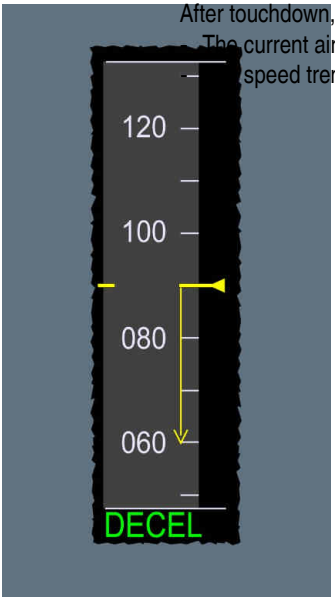
When the aircraft is below 20 000 ft , indicates the next flap limiting speed, also referred to as VFE next.
For more information about VFE next, *Refer to 22-27/Operating Speeds/Limit Speeds/VFE next* .

In managed speed/Mach, the short-term managed speed indicates the current speed target in accordance with the configuration of the aircraft.
In selected speed/Mach, the short-term managed speed is the speed/Mach target, that would be used if the flight crew engages the managed speed/Mach control.
For more information about the short-term managed speed, *Refer to 22-FG/Speed-Mach Control/Managed Speed/Short-term Managed Speed* .

When the FLAPS lever is set to 2 or 3, indicates the target speed in managed mode, also referred to as F speed.
For more information about F speed, *Refer to 22-27/Operating Speeds/Characteristic Speeds/F* .

AIRSPEED INDICATIONS AFTER TOUCHDOWN

Applicable to: ALL



After touchdown, the only indications that appear on the airspeed scale are:
- The current airspeed
- The speed trend arrow.

L123

DECEL — The autobrake is active, and the aircraft decelerates as selected via the AUTO BRK mode selector.
Appears, when the aircraft deceleration is at least 80 % of the selected deceleration.
No longer appears, when the aircraft deceleration is less than 70 % of the selected deceleration.
The BCS provides the DECEL information.

Note: *On a slippery runway, the A-SKID may be activated before the aircraft reaches the selected deceleration. Therefore, the DECEL indication may not appear, even if the autobrake is active.*

AIRSPEED PROTECTIONS

Applicable to: ALL

L3 The PRIM s provide speed protection information. If all three PRIM s are lost, the ADIR s provide the VMO / MMO information.

L1 **VMAX**

Indicates the VMAX speed, that is the lowest of the following speeds:
- VMO , or the speed corresponding to MMO
- VLE
- VFE .

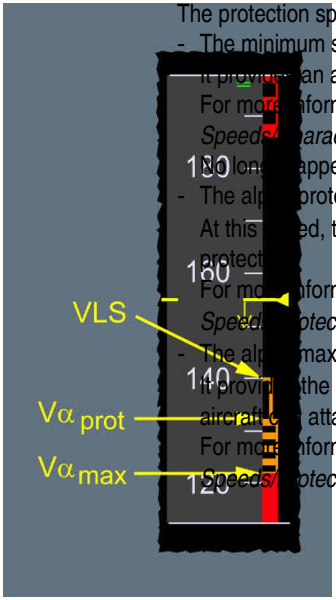
For more information on the VMAX definition, *Refer to 22-27/Operating Speeds/Protection Speeds/VMAX* .

In normal law, when the aircraft reaches the speed indicated by the symbol , the high speed protection activates.
For more information on high speed protection, *Refer to 22-27/Protections/High Speed Protections* .

In alternate or direct law, the VMAX indication remains displayed, but the high speed protection is not available.
appears, instead of the high speed protection symbol.

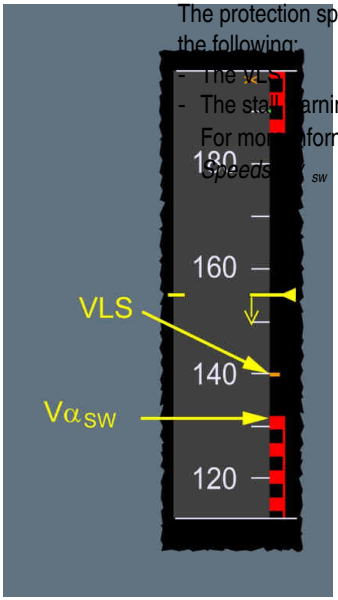
MINIMUM SPEEDS

L12



The protection speeds, with flight controls in normal law, are:

- The minimum selectable speed, also referred to as the VLS
  It provides an appropriate margin for the stall speed.
  For more information on the VLS , *Refer to 22-27/Operating Speeds/Characteristic Speeds/VLS* .
  No longer appears on ground.
- The alpha protection speed, also referred to as $V\alpha_{prot}$
  At this speed, the Angle-of-Attack of the aircraft activates the alpha protection.
  For more information on the $V\alpha_{prot}$, *Refer to 22-27/Operating Speeds/Protection Speeds/$V\alpha_{prot}$* .
- The alpha max speed, also referred to as $V\alpha_{max}$.
  It provides the speed associated with the maximum Angle-of-Attack that the aircraft can attain, in pitch normal law.
  For more information on the $V\alpha_{max}$, *Refer to 22-27/Operating Speeds/Protection Speeds/$V\alpha_{max}$* .



The protection speeds, with flight controls in alternate law, or in direct law, are the following:

- The VLS
- The stall warning speed, also referred to as $V\alpha_{sw}$.

For more information on $V\alpha_{sw}$, *Refer to 22-27/Operating Speeds/Protection Speeds/*$V\alpha_{sw}$.

AIRSPEED TOLERANCES

Applicable to: ALL

L2 The following values apply to an aircraft in symmetrical flight (no sideslip), in clean configuration, and in a straight and level flight.

The maximum differences in speed or Mach number indications between the different sources, and displays are:

		Comparison of Speed and Mach Number Indications between:				
		ADR 1 and ADR 2 (on the PFD)		ADR 3 and ADR 1, or ADR 3 and ADR 2 (on the PFD)		Standby Flight Display (SFD) and ADR 1(2)(3)
Flight Level	Speed or Mach Number	Speed	Mach Number	Speed	Mach Number	Speed Number
FL 50	250 kt	4 kt	Not displayed	4 kt	Not displayed	7 kt
FL 100	250 kt	4 kt	M 0.005	4 kt	M 0.006	7 kt
FL 200	320 kt	4 kt	M 0.007	4 kt	M 0.008	6 kt
FL 300	M 0.85	4 kt	M 0.008	4 kt	M 0.008	6 kt
FL 410	M 0.85	4 kt	M 0.009	4 kt	M 0.009	6 kt

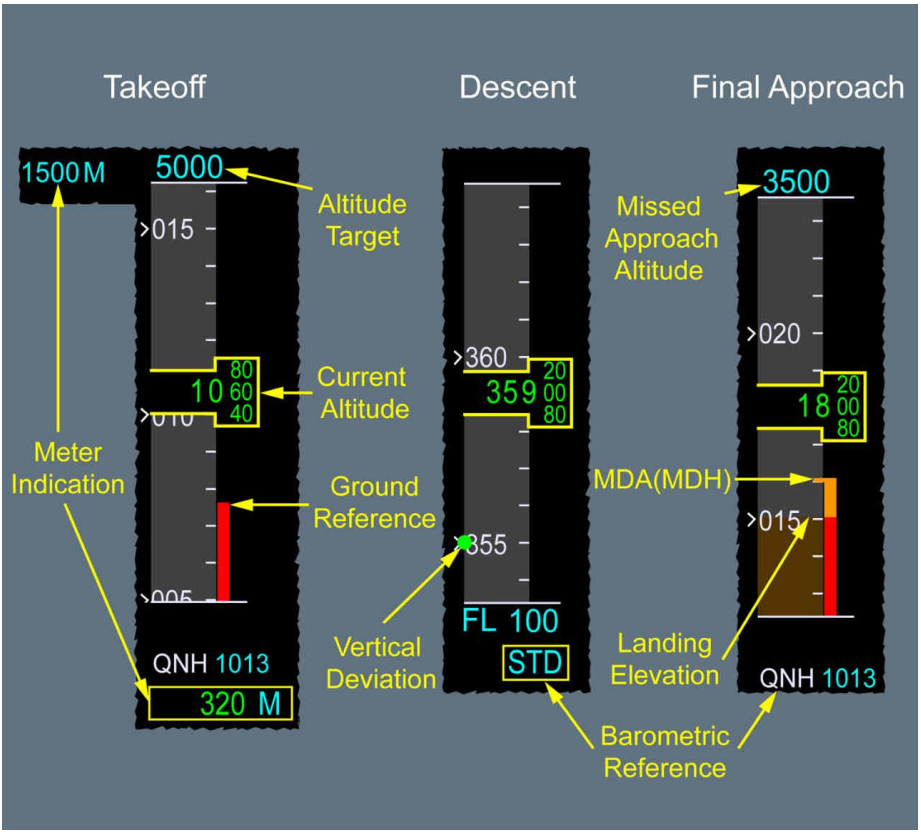
Intentionally left blank

Altitude

ALTITUDE

Applicable to: ALL

Altitude



L12

ALT — Appears, instead of the altitude scale, when the altitude data, with the reference selected on the AFS CP , is not available.
Flashes for 9 s , then remains steady.

L12

The altitude indicated on both PFD s is different.

Appears, when:
- The barometric reference selected by the Captain is the same as the barometric reference selected by the First Officer
- The difference between the two PFD s altitude indications is:
  - Above 250 ft , when the barometric reference is QNH , or
  - Above 500 ft , when the barometric reference is STD .

  Flashes for 9 s , then remains steady.

L2 **MAXIMUM DIFFERENCES BETWEEN ALTITUDE INDICATIONS**

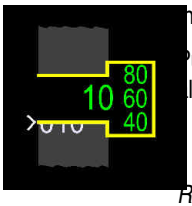
		Comparison of Altitude Indications (ft)		
Flight Level	Speed or Mach Number	ADR 1 and ADR 2 (on the PFD)	ADR 3 and ADR 1(2) (on the PFD)	ISIS and ADR 1(2)(3)
Ground Check	-	20	20	30
FL 50	250 kt	55	60	120
FL 100	250 kt	60	70	140
FL 200	320 kt	120	125	220
FL 300	M 0.85	150	150	320
FL 410	M 0.85	150	150	360

CURRENT ALTITUDE

L3 The ADR s provide the current altitude information.

L2 The altitude scale has markers every 100 ft .

L12



ndicates the current altitude.

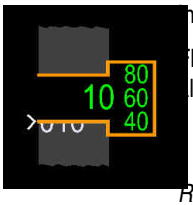
ulses, when the difference between the current altitude and the selected ltitude:

Decreases

Is between 200 ft and 750 ft .

Refer to DSC-31-20-20-60 Altitude Alerts .

L12

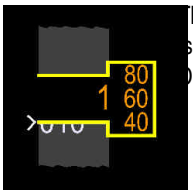


ndicates the current altitude.

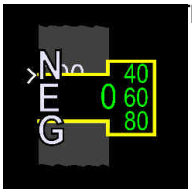
lashes, when the difference between the current altitude and the selected ltitude:
Increases
Is above 200 ft .

Refer to DSC-31-20-20-60 Altitude Alerts .

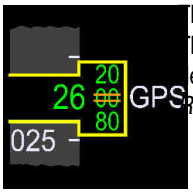
L1



he aircraft flies a Non-Precision Approach (NPA), and the current altitude s equal to, or below the Minimum Descent Altitude (MDA), or the Minimum escent Height (MDH).



he current altitude is negative.



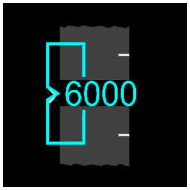
he altitude is no longer available from the ADR s.
he GPS altitude remains available via the IR s. The accuracy of the altitude is egraded, and the altitude appears with a precision around +/- 500 ft .
efer to DSC-31-20-20-130-10 Backup Altitude Scale .

ALTITUDE TARGET

L3 The PRIMs provide the altitude target. If all three PRIMs are lost, the FCU backup provides the altitude target.

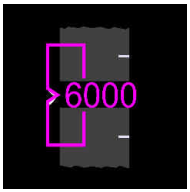
L1 Indicates:
- Altitude, if the selected barometric reference is QNH, or
- FL, if the selected barometric reference is STD.

Indicates the AFS CP selected altitude if the vertical guidance is either selected or managed
The altitude target is not within the altitude scale.



Indicates the AFS CP selected altitude if the vertical guidance is either selected or managed
The altitude target is within the altitude scale.

Indicates an altitude constraint if the vertical guidance is managed
The next altitude target is not within the altitude scale.



- Indicates an altitude constraint if the vertical guidance is managed
- The next altitude target is within the altitude scale.

Note: *If a vertical approach mode is engaged, the altitude target appears in cyan when the flight crew selects the go-around altitude on the AFS CP.*

L12

ALT SEL

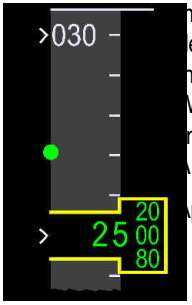
Appears, when the following information cannot be displayed:
- The altitude selected by the flight crew on the AFS CP
- The altitude selected by the flight crew on the FCU backup
- The altitude constraint from the FMS.

Flashes for 9 s, then remains steady.

VERTICAL DEVIATION

L3 The FMS provides the vertical deviation.

L12



ndicates the altitude of the theoretical vertical profile of the FMS . The vertical eviation is the difference between the current altitude of the aircraft, and the heoretical vertical profile of the FMS .
When the vertical deviation is above 540 ft , the symbol remains at the range mit, and the exact value of the vertical deviation appears on the DES and PPR panels of the FMS PERF page.

ppears when:
The aircraft reaches the Top of Descent (T/D), or
The FMS flight phase is descent, or approach.

L2 *Note: When the aircraft is in a holding pattern, the vertical deviation is the difference between the altitude of the aircraft, and the altitude of the holding exit: Refer to 22-FMS/System Description/Flight Planning/Lateral Revisions/Hold .*

MINIMUM DECISION ALTITUDE(HEIGHT) (MDA, MDH)

L3 The FMS provides the MDA(MDH) information.

L12

Indicates the Minimum Decision Altitude(Height) (MDA, MDH).
Appears when the difference between the current aircraft altitude and the MDA(MDH) is less than 570 ft.

LANDING ELEVATION

L2 The FMS provides the landing elevation information.

L12

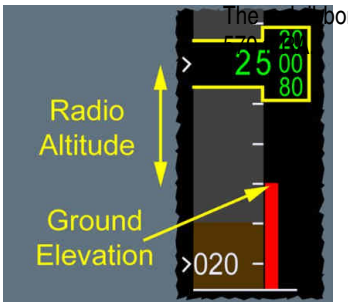
Indicates the landing elevation of the destination airport of the FMS flight plan.

Appears, when:
- The barometric reference is QNH
- The aircraft is:
  - In final approach, or
  - On ground, with a ground speed above 80 kt.
- The difference between the landing elevation and the current aircraft altitude is less than 570 ft.

GROUND REFERENCE

L3 The radioaltimeters provide the ground reference information.

L1 The [illegible]bon indicates the ground elevation, when the aircraft is below



BAROMETRIC REFERENCE

L3 The ADRs provide the barometric reference.

L1 

The flight crew selects the QNH pressure reference on the barometric reference knob of the EFIS CP.

The flight crew selects the QNH pressure reference (in inches of mercury) on the barometric reference knob of the EFIS CP.

The flight crew selects the standard pressure reference on the barometric reference knob of the EFIS CP.

L2 Flashes, when the flight crew selected:
- QNH on the AFS CP, and the aircraft is in the climb phase, above the transition altitude, or
- STD on the AFS CP, and the aircraft is in the approach phase, below the transition flight level.

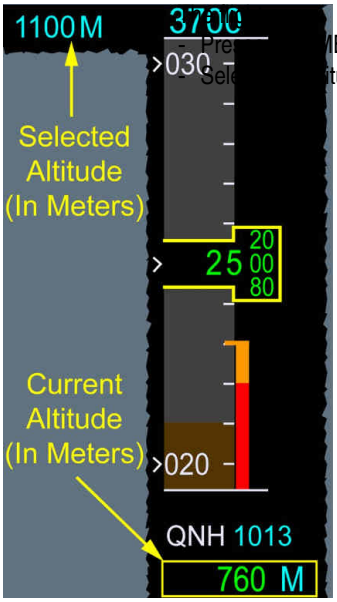
Note: If the transition altitude(flight level) is not available from the FMS, the default transition altitude(flight level) is automatically set to 2 500 ft radio altitude.

METER INDICATION

The selected altitude and the current aircraft altitude indications appear in meters, when the flight crew presses the METER pb on the AFS CP .

L3 The PRIM s provide the meter indication.

L1



ETER pb on the AFS CP
tude target on the AFS CP .

he flight crew:
Presses the METER pb on the AFS CP
The current altitude is below the MDA (MDH).

he altitude is no longer available from the ADR s.
he GPS altitude remains available via the IR s. The accuracy of the altitude is egraded, and the altitude appears with a precision of +/- 500 ft .
Refer to DSC-31-20-20-130-10 Backup Altitude Scale .

Intentionally left blank

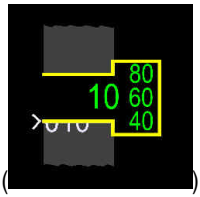
Altitude Alerts

ALTITUDE ALERTS

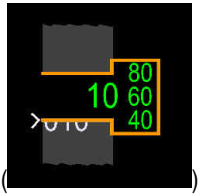
Applicable to: ALL

In manual flight, and when the aircraft approaches the selected altitude(flight level), or when the aircraft significantly deviates from the selected altitude(flight level), the ECAM generates an altitude alert:

-



The altitude frame pulses in yellow (), or flashes in amber



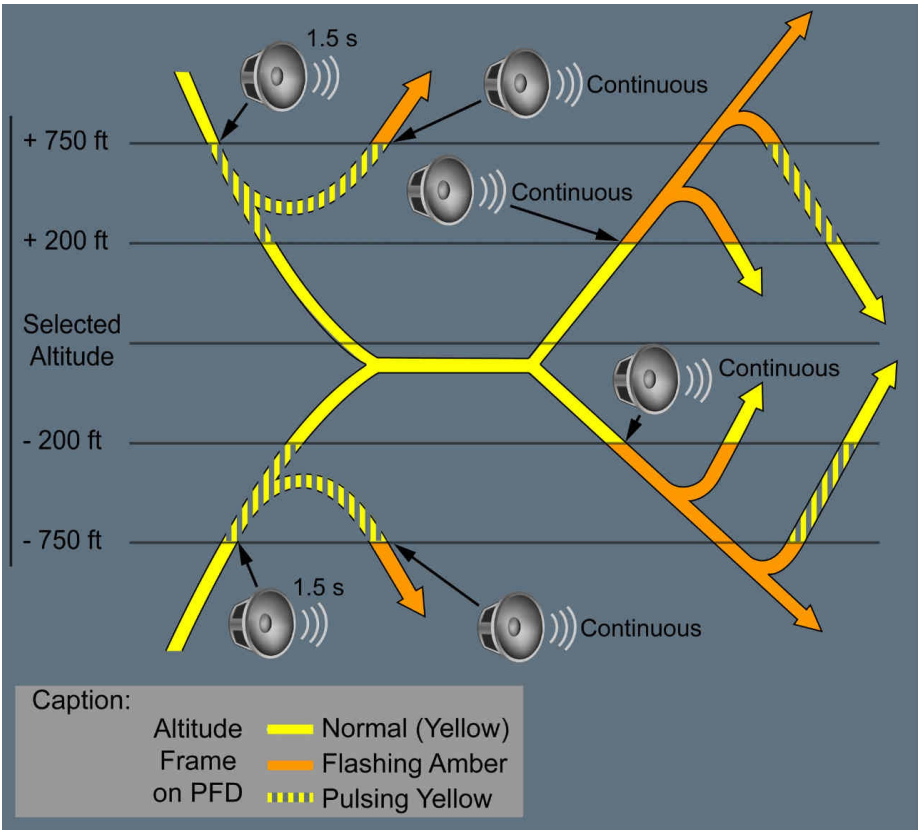
()

- The C chord sound is generated.

C Chord Sound

L3 Altitude alerts are triggered, when the altitude provided by the ADIRS is different from the altitude selected on the AFS CP.

Altitude Alerts



L2 The C chord sound no longer appears, when the flight crew:
- Selects a new altitude target, or
- Presses the EMER CANCEL pb on the ECAM CP, or
- Presses the MASTER WARN pb.

The altitude frame stops pulsing(flashing), when the flight crew selects a new altitude target.

This alert is inhibited:
- In approach, when the aircraft captures the glideslope, or
- When the landing gear is set to down, and the slats are extended, or

- When the landing gear is locked down, or
- When the AP/FD TCAS mode engages upon a Resolution Advisory order.

L3 If the altitude alert is triggered just after the aircraft is clear of conflict, and the AP is engaged, the C chord sound is inhibited.

If the altitude alert is triggered just after the aircraft is clear of conflict, and the AP is not engaged, a C chord sound is generated during 1.5 s.

Intentionally left blank

Radio Altitude

RADIO ALTITUDE

Applicable to: ALL

RADIO ALTITUDE

The radio altitude value appears on the PFD, when the aircraft is below 2 500 ft.

L3 The radio altitude value changes:
- Every10 ft above 50 ft
- Every 5 ft between 5 ft, and 50 ft
- Every foot below 5 ft.

L1

The aircraft is above:
- The minimum entered on the MFD (on the APPR panel of the FMS PERF page) + 100 ft, or
- 400 ft , if the flight crew did not enter a minimum on the MFD (on the APPR panel of the FMS PERF page).

The aircraft is below:
- The minimum entered on the MFD (on the APPR panel of the FMS PERF page) + 100 ft, or
- 400 ft , if the flight crew did not enter a minimum on the MFD (on the APPR panel of the FMS PERF page).

Note: *If the flight crew entered NO, NONE, NO DH, or NODH as the minimum on the MFD (on the APPR panel of the FMS PERF page), the minimum default value is zero.*

L12

DH — Appears above the RA indication, when the aircraft is below the minimum entered on the MFD (on the APPR panel of the FMS PERF page). Flashes for 9 s, then remains steady.

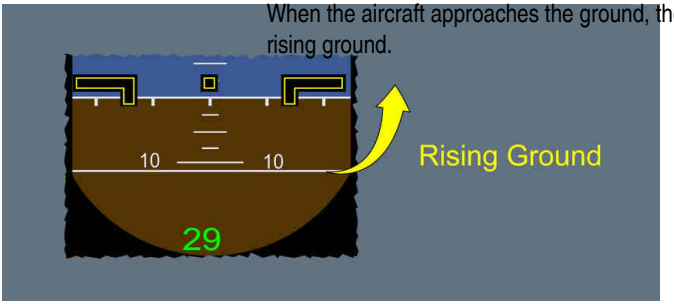
L12

RA
- The three radio altimeters (RA A, RA B, and RA C) are failed
- The aircraft is below the transition altitude.

Note: *The ground reference indication no longer appears on the altitude scale.*

Flashes for 9 s, then remains steady.

When the aircraft approaches the ground, the white line indicates the rising ground.



Vertical Speed

VERTICAL SPEED

Applicable to: ALL

The vertical speed scale ranges from -6 000 ft/min to 6 000 ft/min .

L2 The vertical speed indicated on the PFD is based on the baro inertial vertical speed from the IR s.

L3 *Note:* *To compute the baro inertial vertical speed, each IR mixes its own inertial data to the barometric data received from one ADR :*

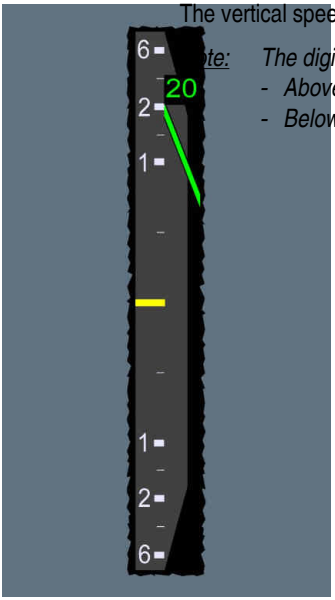
- *In normal configuration, each I R uses its own ADR (IR 1 uses ADR 1, IR 2 uses ADR 2 and IR 3 uses ADR 3).*
- *The IR 1(2) changes its ADR source based on the ADR status (operative or failed), independently from the position of the AIR DATA and the ATT HDG selectors.*
- *The IR 3 changes its ADR source based on the position of the AIR DATA and the ATT HDG selectors and on the ADR status (operative or failed).*

L2 If the baro inertial vertical speed from the IR s is no longer available, the vertical speed indicated on the PFD is based on a pure barometric vertical speed, provided by the ADR s.

The scale has markers:

- Every 500 ft/min , between -2 000 ft/min and 2 000 ft/min
- Every 2 000 ft/min :
  - Between -6 000 ft/min and -2 000 ft/min
  - Between 2 000 ft/min and 6 000 ft/min .

L12

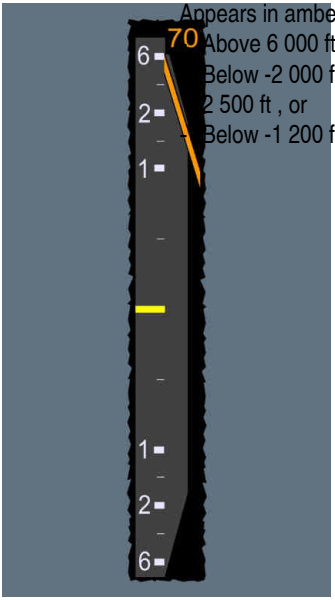


The vertical speed of the aircraft is between -6 000 ft/min and 6 000 ft/min .

Note: The digital indication only appears, when the vertical speed is:

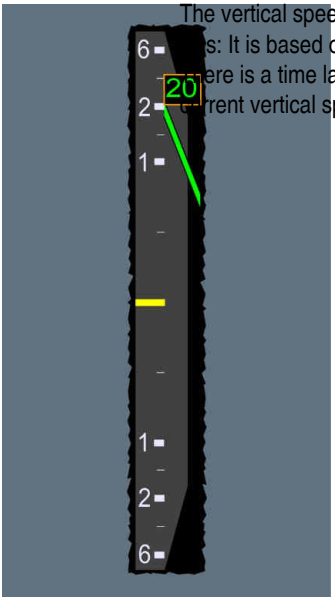
- *Above 200 ft/min , or*
- *Below - 200 ft/min .*

L1



Appears in amber, if the vertical speed is:
Above 6 000 ft/min (below -6 000 ft/min), or
Below -2 000 ft/min , and the aircraft radio altitude is between 1 000 ft and 2 500 ft , or
Below -1 200 ft/min , and the aircraft radio altitude is below 1 000 ft .

L12



The vertical speed is no longer based on the baro inertial vertical speed from the
s: It is based on the barometric vertical speed from the ADR s.
ere is a time lag between the vertical speed that appears on the PFD , and the
rrent vertical speed of the aircraft.

L12

V/S — The vertical speed information is not available, neither from the IR s, nor from the ADR s.
Flashes for 9 s , then remains steady.

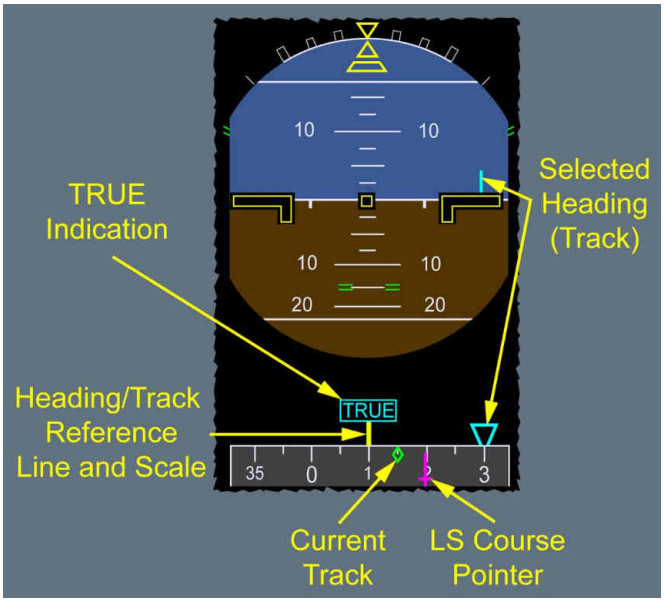
For more information on TCAS indications, *Refer to 34-Surveillance/TCAS/Controls and Indicators/PFD* .

Heading/Track

HEADING/TRACK

Applicable to: ALL

Heading/Track



L12

CHECK HDG — Heading information on both PFD s differs by more than 5 ° .
Flashes for 9 s , then remains steady.

L12

HDG — Appears, instead of the heading scale, when the heading information is not available.
Flashes for 9 s , then remains steady.

HEADING/TRACK REFERENCE LINE AND SCALE

L3 The ADIRS provide the heading information.

L2 Degrees are indicated in increments of 5 ° , with a numerical value every 10 ° .

The heading/track scale is in the TRUE reference, when:
- The flight crew presses the TRUE/MAG pb , on the AFS CP
- At high latitudes, the ADIRS automatically changes the MAG north reference to the TRUE north reference.

For more information on the polar navigation, *Refer to 22/AFS-FLIGHT MANAGEMENT SYSTEM/NAVIGATION FUNCTIONS/POLAR NAVIGATION* .

L13

Indicates the current heading of the aircraft, on the heading scale.
The ADIRS provide the heading value, in the TRUE or MAG reference, depending on the MAG/TRUE pb selection.

CURRENT TRACK

L3 The ADIRS provide the current track information.

L1

Indicates the current track of the aircraft, on the heading scale.

SELECTED HEADING(TRACK)

L3 If all three PRIMs are lost, the FCU backup provides the selected heading(track) information. In all other cases, the PRIMs provide the selected heading(track) information.

L12

Indicates the selected heading(track) that the flight crew selected on the AFS CP.

Appears, when:
- The HDG/TRACK mode is engaged, or
- The APs and FDs are off.

L1

The selected heading(track) is not within the display area, the numerical value appears instead of the symbol on the right(left) side of the heading/track scale.

L12

The heading(track) bar also appears on the horizon line of the PFD, when the FDs are off.
The heading scale of the PFD horizon line has markers every 10 °.

TRUE INDICATION

L123

The heading reference is TRUE north.

Appears when:
- The flight crew presses the TRUE/MAG pb , on the AFS CP
- At high latitudes, the ADIRS automatically change the MAG north reference to the TRUE north reference.

  The aircraft is at high latitude:
  - Above 82.5 ° North, or
  - Above 73.5 ° North, with a longitude between 117.5 ° West, and 92.5 ° West, or
  - Below 60.5 ° South.

  When the aircraft approaches high latitudes, the SELECT TRUE NORTH REF message appears on the ND , and requests that the flight crew selects the TRUE north reference.

For more information on the polar navigation, *Refer to 22/AFS-FLIGHT MANAGEMENT SYSTEM/NAVIGATION FUNCTIONS/POLAR NAVIGATION* .
Flashes for 9 s , then remains steady when the slats are extended.

LS COURSE POINTER

L3 The Multi Mode Receiver (MMR) and the PRIMs provide the LS course.

L1 Indicates the QFU of the LS course on the heading scale.

L2 Appears, when the flight crew:
- Selects an approach on the FMS ARRIVAL page
- Presses the LS pb on the EFIS CP.

L1

The flight crew selected a precision approach on the FMS ARRIVAL page.

The flight crew selected a Non-Precision Approach (NPA) on the FMS ARRIVAL page.

The LS course pointer is not within the display area, the numerical value appears instead of the symbol on the right(left) side of the heading/track scale.

Intentionally left blank

Guidance

GUIDANCE

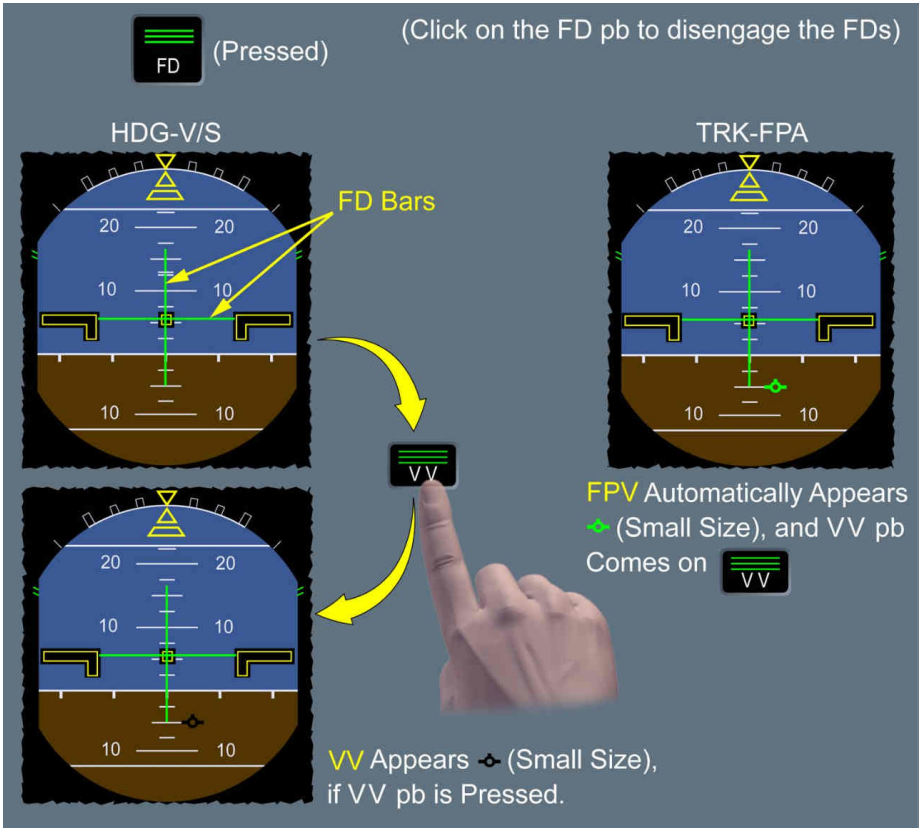
Applicable to: ALL

The guidance indications on the PFD depend on:

- The FD selection

  When the flight crew presses the FD pb :
  - Both FD 1 and FD 2 engage, and both FMA s display 1FD2 .
  - FD 1 guidance orders appear on the Captain's PFD , and FD 2 guidance orders appear on First Officer's PFD .

- The HDG-V/S/TRK-FPA selection
- The VV pb selection
  - Whatever the flying reference selected by the flight crew (HDG-V/S or TRK-FPA), the Flight Path Vector (FPV) (or Velocity Vector (VV)) can appear on the PFD .
  - The FPV (VV) can appear regardless the FD selection.



Note: *It is not recommended to have the FD s off, with the AP engaged.*

FD BARS

Applicable to: ALL

FD BARS

When the FD s are engaged, the PFD displays:

- The roll bar, when a lateral mode is engaged

L2 No longer appears in RWY and ROLL OUT .

L1 - The pitch bar, when a vertical mode is engaged

L2 No longer appears in ROLL OUT .

L1 - The yaw bar, in RWY , FLARE , and ROLL OUT .

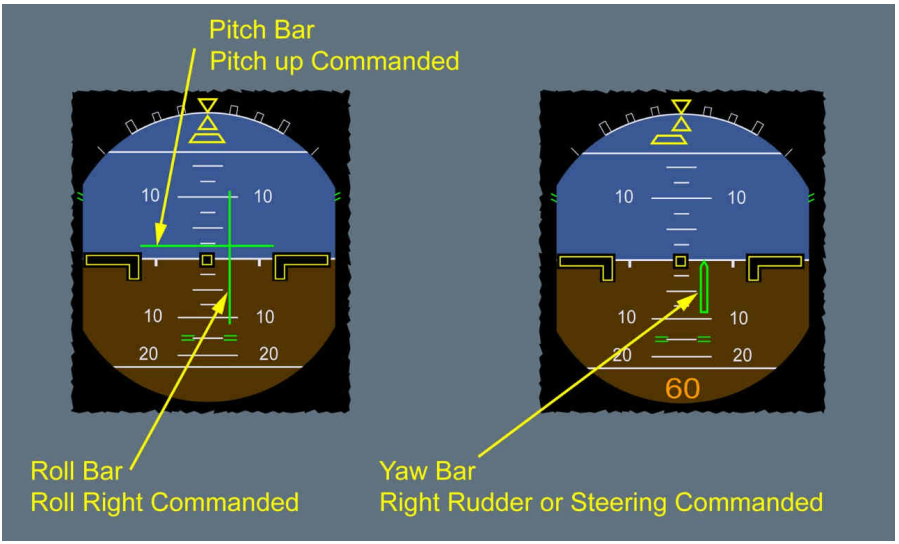
L2 The FD bars no longer appear, if:

- The pitch attitude exceeds 13 ° down or 25 ° up, or
- The bank angle exceeds 45 ° .

L1 For more information on the FD s, *Refer to 22-FG/Flight Director* .

L3 The PRIM s provide the FD bars informations.

FD Bars



L12

FD	Indicates that one or more guidance orders (i.e. roll, pitch, or yaw) are not valid. Flashes for 9 s , then remains steady.

FLIGHT PATH VECTOR(VELOCITY VECTOR)

Applicable to: ALL

FLIGHT PATH VECTOR(VELOCITY VECTOR)

L3 The ADIRS provide the flight path angle that is necessary in order to display the FPV.

L1 The Flight Path Vector (Velocity Vector) indicates the lateral (i.e. track), and vertical (i.e. flight path angle) aircraft trajectory, with respect to the ground, taking into account the wind effect.

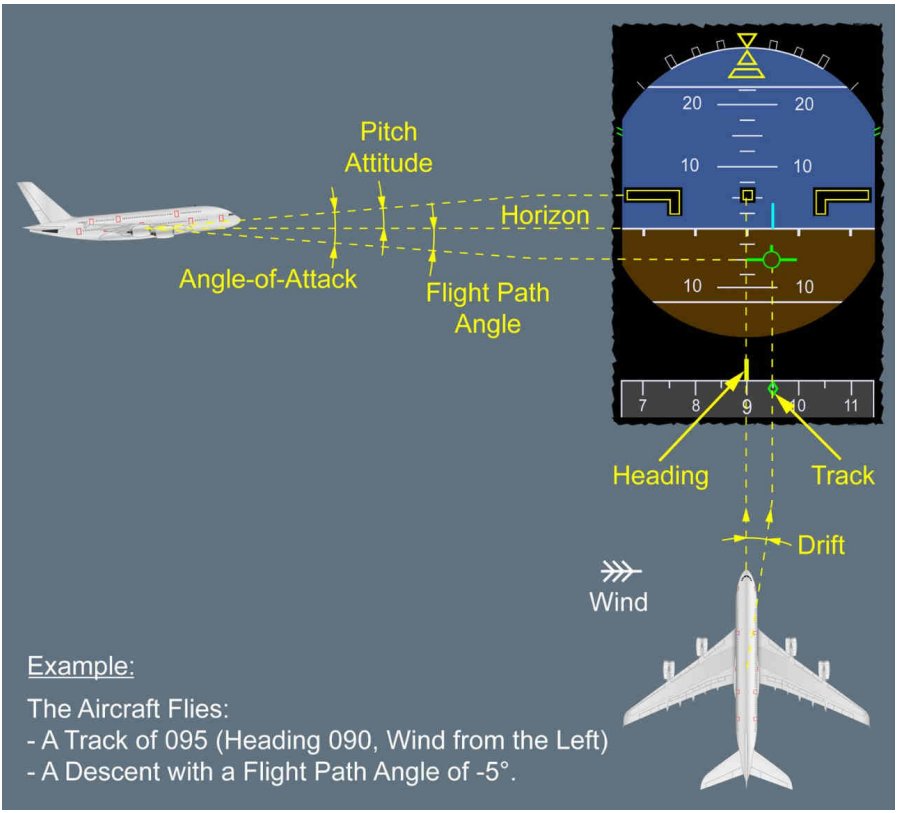
- In the TRK-FPA flying reference, the symbol is called the Flight Path Vector (FPV)
- In the HDG-V/S flying reference, the symbol is called the Velocity Vector (VV).

The FPV appears, when the flight crew selects TRK-FPA by pressing the HDG-V/S / TRK-FPA pb on the AFS CP.
If the FDs are not engaged, the size of the symbol increases.

The VV appears, when the flight crew:
- Selects HDG-V/S by pressing the HDG-V/S / TRK-FPA pb on the AFS CP
- Presses the VV pb on the EFIS CP.

If the FDs are not engaged, the size of the symbol increases.

FPV(VV)



L12

FPV — The FPV symbol is not available, i.e.:

- The flight path angle is not available, or
- The drift angle is not available.

Flashes for 9 s, then remains steady.

Intentionally left blank

Approach Guidance

APPROACH GUIDANCE

Applicable to: ALL

The approach guidance indications on the PFD differ, when the aircraft flies a:

- Precision approach (ILS (GLS) approach): *Refer to DSC-31-20-20-110-GILSA ILS Approach*), or
- Non-Precision Approach (NPA):
  - VOR, VOR/DME, RNAV approach (*Refer to DSC-31-20-20-110-10 VOR, VOR/DME, or RNAV Approach*)
  - ILS approach with G/S deselected (*Refer to DSC-31-20-20-110-10 LOC Only Approach*)
  - LOC only approach (*Refer to DSC-31-20-20-110-10 LOC Only Approach*)
  - LOC B/C approach (*Refer to DSC-31-20-20-110-10 LOC B/C Approach*).

ILS APPROACH

Applicable to: ALL

ILS (GLS) APPROACH

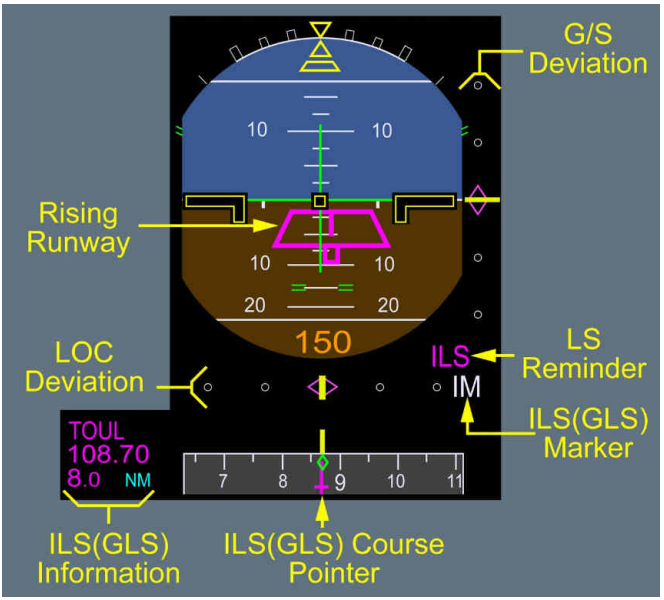
To perform an ILS (GLS) approach, the flight crew must:

- Select an ILS (GLS) approach on the FMS ARRIVAL page
- Press the LS pb on the EFIS CP .

L2 *Note:* *If an ILS (GLS) is manually-tuned on the FMS POSITION/NAVAIDS page:*

- *The approach selected on the FMS ARRIVAL page is automatically disregarded*
- *The LOC and G/S modes flies the manually-tuned ILS (GLS).*

ILS(GLS) Approach



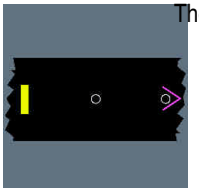
L1 **LOC DEVIATION**

L3 The MMR provides the LOC deviation.

L1 Appears, when:
- The LS pb is pressed
- The localizer signal is available.

L2 Flashes, and continues to flash if:
- The aircraft is between 15 ft and 1 000 ft
- CAT2 or CAT3 appears on the FMA
- LOC , LAND , or FLARE is engaged
- The deviation exceeds one quarter dot.

L1  The LOC deviation is within the scale.



The LOC deviation is not within the scale.

L12

LOC — Appears, instead of the LOC scale, when the LOC receiver on the same side is failed.
Flashes for 9 s , then remains steady.

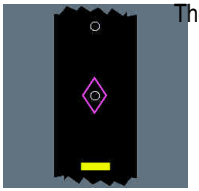
G/S DEVIATION

L3 The MMR provides the G/S deviation.

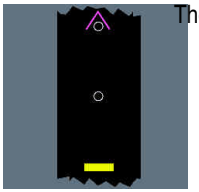
L1 Appears, when:
- The LS pb is pressed
- The G/S signal is available
- The flight crew did not select a back beam course.

L2 Flashes, and continues to flash if:
- The aircraft is between 100 ft and 1 000 ft
- CAT2 or CAT3 appears on the FMA
- G/S or LAND is engaged
- The deviation exceeds one dot.

L1



The G/S deviation is within the scale.



The G/S deviation is not within the scale.

L12

Appears, instead of the G/S scale, when the G/S receiver on the same side is failed.
Flashes for 9 s , then remains steady.

ILS (GLS) INFORMATION

L3 The MMR , the DME , and the FMS provide the ILS (GLS) information.

L123

Indicates the following information about the ILS (GLS):
The ILS (GLS) identification
The ILS (GLS) identification is decoded by the receiver.
The ILS Frequency (in MHz), or the GLS channel
The aircraft distance to the DME , if the ILS has a DME , or the aircraft distance to the threshold (GLS approach).

Note: CAPT PFD displays ILS (GLS) 1 information, F/O PFD displays ILS (GLS) 2 information.

L12

ILS — Appears, when one of the following is not available during an ILS approach:
- The LOC signal, or
- The G/S signal.

Flashes for 9 s , then remains steady.

L12

GLS — Appears, when one of the following is not available during a GLS approach:
- The LOC signal, or
- The G/S signal.

Flashes for 9 s , then remains steady.

L12

LS — The MMR sends inconsistent information about the selected approach.
Flashes for 9 s , then remains steady.

L12

DME — Appears, if:
- The ILS has a DME
- The distance to the DME is not available.

Flashes for 9 s , then remains steady.

L1 **ILS (GLS) MARKER INDICATION**

L2 Appears when:
- The LS pb is pressed
- The aircraft flies over the marker beacon.

L3 The VOR provides the marker beacon information.

L1

OM	The aircraft is flying over the outer marker of the ILS (GLS) approach.
MM	The aircraft is flying over the middle marker of the ILS (GLS) approach.
IM	The aircraft is flying over: - The inner marker of the ILS (GLS) approach, or - An airway marker.

L12

LS	The approach mode is armed(engaged), and the LS pb is not pressed. Flashes for 9 s , then remains steady.

LS REMINDER

L3 The MMR and the FMS provide the LS reminder information.

L12

ILS	The flight crew selected an ILS approach, and the LS pb is pressed. Flashes for 9 s , then remains steady.

L12

GLS	The flight crew selected a GLS approach, and the LS pb is pressed. Flashes for 9 s , then remains steady.

L1 **ILS (GLS) COURSE POINTER**

L3 The MMR and the PRIM provide the ILS (GLS) course pointer information.

L12

Indicates the QFU of the ILS (GLS) course on the heading scale. For more information on the LS course pointer, *Refer to DSC-31-20-20-90-10 LS Course Pointer* .

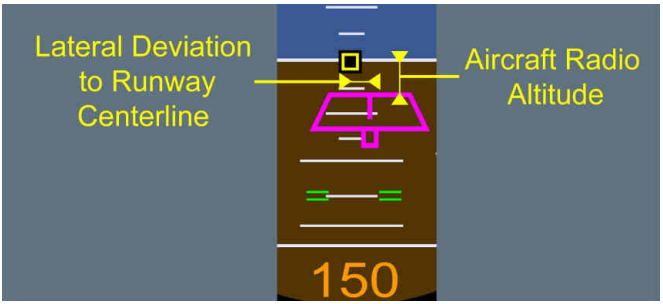
Note: *If an ILS (GLS) is manually-tuned on the FMS POSITION/NAVAIDS page, the approach selected on the FMS ARRIVAL page is disregarded. Therefore, the LS course symbol indicates the LS course of the manually-tuned ILS (GLS) .*

RISING RUNWAY

The rising runway appears, when:

- The aircraft radio altitude is below 200 ft
- The localizer signal is available
- The flight crew did not select the FLS function.

Rising Runway

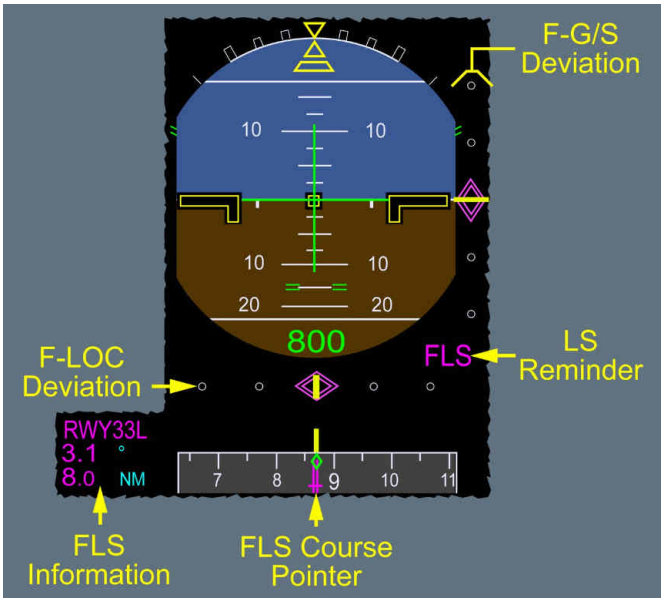


NON-PRECISION APPROACH

Applicable to: ALL

VOR , VOR / DME , OR RNAV APPROACH FLOWN WITH FLS FUNCTION

VOR, VOR/DME, or RNAV approach flown with FLS Function



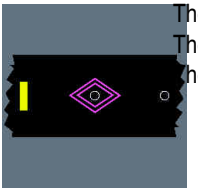
F-LOC DEVIATION

Appears, when:

- The flight crew pressed the LS pb
- The flight crew selected the FLS function
- The F-LOC deviation is valid.

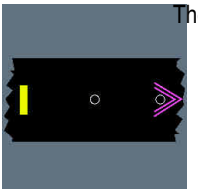
L3 The MMR provides the F-LOC deviation.

L12



The F-LOC deviation is within the scale.
The F-LOC deviation pulses, when the approach capability is RAW ONLY: The flight crew must press the LS pb .

L1



The F-LOC deviation is not within the scale.

L123

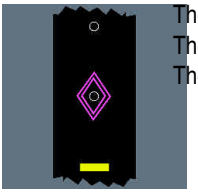
F-LOC — Appears, instead of the F-LOC scale, when the F-LOC deviation is not valid.
The F-LOC deviation is not available when the FLS function of the MMR on the same side is lost.
Flashes for 9 s , then remains steady.

F-G/S DEVIATION

Appears, when:
- The flight crew pressed the LS pb
- The flight crew selected the FLS function
- The F-G/S deviation is valid.

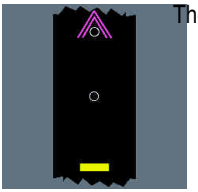
L3 The MMR provides the F-G/S deviation.

L12



The F-G/S deviation is within the scale.
The F-G/S deviation pulses, when the approach capability is RAW ONLY: The flight crew must press the LS pb .

L1



The F-G/S deviation is not within the scale.

L123

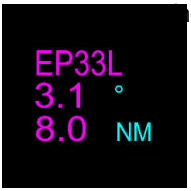
Appears, instead of the F-G/S scale, when the F-G/S deviation is not available.
The F-G/S deviation is not available when the FLS function of the MMR on the same side is lost.
Flashes for 9 s , then remains steady.

FLS INFORMATION

L13

Indicates:
The FLS anchor point identification, when the anchor point is on the runway threshold
The FLS beam slope
The aircraft distance to the anchor point.
The FMS computes this distance.

L13



Indicates:
The anchor point is not located on the runway threshold: In this case, the anchor point is also referred to as End Point (EP)
The FLS beam slope to the end point
The aircraft distance to the end point.
The FMS computes this distance.

L12

When the flight crew flies a NPA without the FLS function, indicates:
The side of the selected VOR
The ident of the VOR / DME
If the navigation station ident is not valid, the ND displays the station frequency, instead of the ident.
If the VOR frequency is not valid, the ND displays the DME frequency, instead of the VOR frequency.
The ND displays nothing, if both the identifier and the frequency are not valid.

- The distance from the aircraft to the selected VOR / DME beacon.

L12

FLS — Appears, when one of the following is not available:
- The FLS function, or
- The F-LOC signal, or
- The F-G/S signal, or
- The distance to the anchor point.

Flashes for 9 s , then remains steady.

L12

LOC/FLS — Appears, when one of the following is not available:
- The LOC / FLS function, or
- The LOC signal, or
- The F-G/S signal, or
- The distance to the anchor point.

Flashes for 9 s , then remains steady.

L12

LS — The MMR sends inconsistent information about the selected approach.
Flashes for 9 s , then remains steady.

LS REMINDER

L3 The MMR and the FMS provide the LS reminder information.

L12

FLS — The approach mode is armed(engaged), and the flight crew pressed the LS pb on the EFIS CP .
Flashes for 9 s , then remains steady.

L1 **FLS COURSE POINTER**

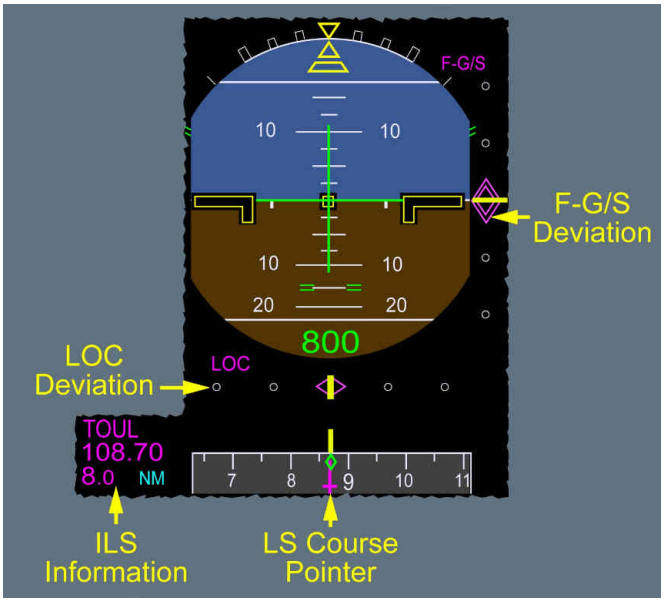
L3 The MMR and the PRIM provide the FLS course pointer information.

L1

Indicates the FLS course for a Non-Precision Approach flown with the FLS function. For more information on the LS course pointer, *Refer to DSC-31-20-20-90-10 LS Course Pointer* .

LOC ONLY OR ILS G/S OUT APPROACH FLOWN WITH FLS FUNCTION

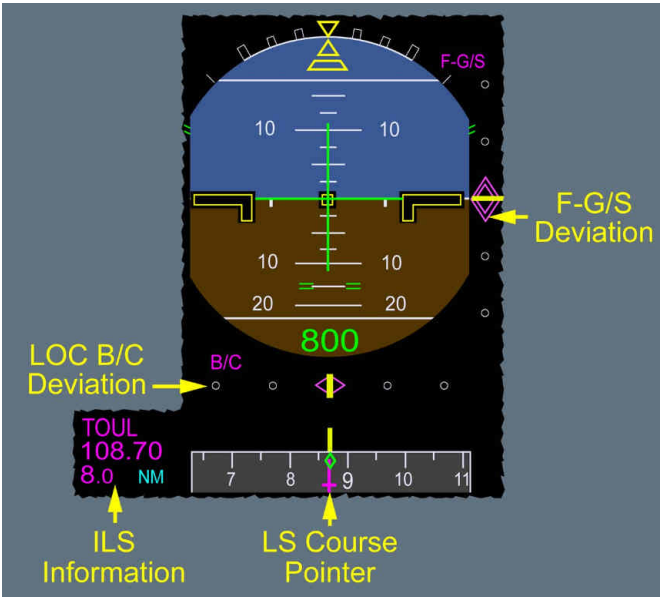
LOC Only or ILS G/S out Approach Flown with FLS function



The LOC deviation and the LS course pointer are the same as for the ILS approach.
The F-G/S deviation is the same as for the VOR, VOR/DME, or RNAV approach with the FLS function.
The ILS information is the same as for an ILS approach.

LOC B/C APPROACH FLOWN WITH FLS FUNCTION

LOC B/C Approach Flown with FLS Function



The LOC B/C deviation is the same as for an ILS approach.
The LS course for the LOC B/C approach corresponds to the QFU of the runway + 180 °. The display of the LS course is the same as for the ILS approach.
The F-G/S deviation is the same as for the VOR, VOR/DME, or RNAV approach flown with the FLS function.
The ILS information is the same as for an ILS approach.

Flight Mode Annunciator (FMA)

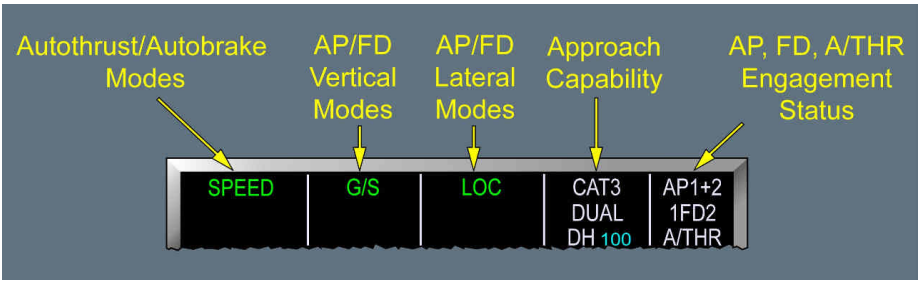
FLIGHT MODE ANNUNCIATOR (FMA)

Applicable to: ALL

The Flight Mode Annunciator (FMA) indicates:
- The status of the A/THR
- The AP / FD vertical and lateral modes
- The approach capability
- The AP / FD and A/THR engagement status
- The autobrake arming status.

Messages from the Flight Guidance, the Flight Controls, and the FMS can also appear below the FMA .
For more information on guidance indications on the FMA , *Refer to 22-FG/CONTROLS AND INDICATORS/FMA* .

FMA



Intentionally left blank

Backup Scales

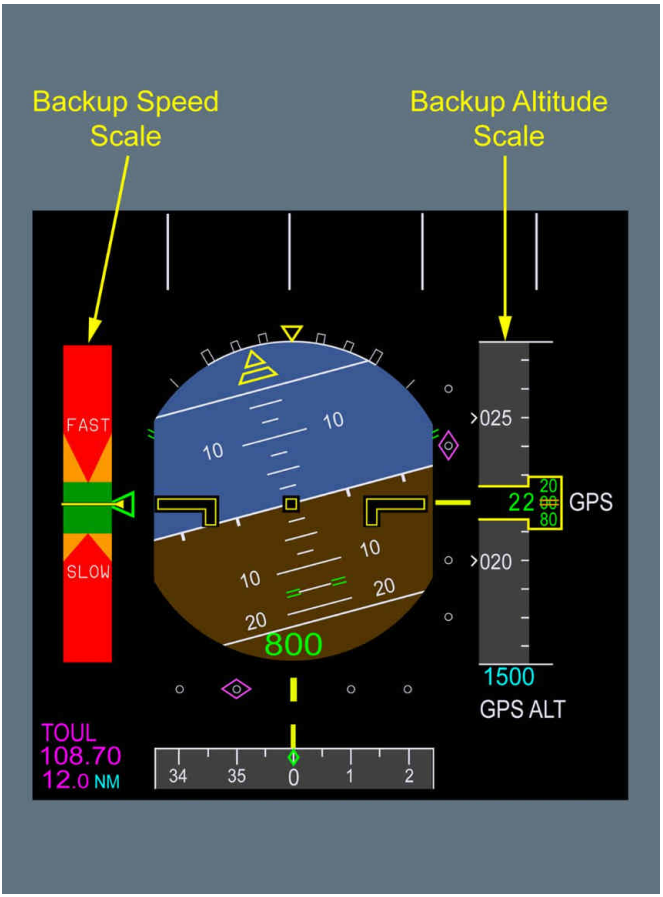
BACKUP SCALES

Applicable to: ALL

In flight, when all ADR s are off, the following backup scales appear:

- The backup speed scale
- The backup altitude scale.

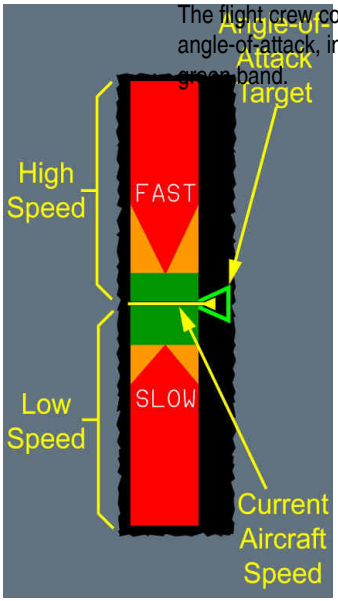
Backup Scales



BACKUP SPEED SCALE

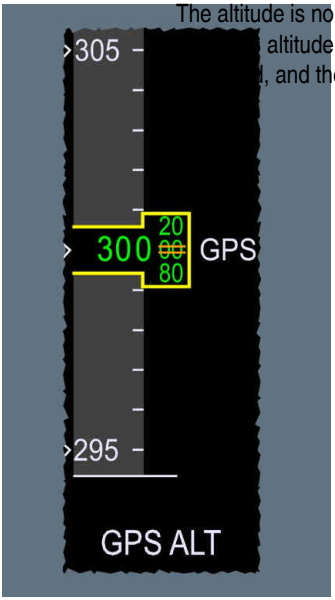
L3 The IRS provide the necessary information for the backup speed scale.

L1



The flight crew controls the aircraft speed by adjusting the aircraft angle-of-attack, in accordance with the angle-of-attack target that is in the green band.

BACKUP ALTITUDE SCALE



The altitude is no longer available from the ADR s.
altitude remains available via the IR s. The accuracy of the altitude is
, and the altitude appears with a precision of +/- 500 ft .

For more information on the backup speed and altitude scales, *Refer to DSC-34-10-30-10 Backup Speed Scale* .

Slats/Flaps Display

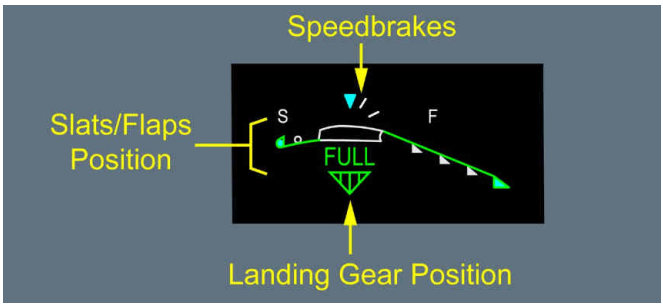
SLATS/FLAPS DISPLAY

Applicable to: ALL

The lower part of the PFD indicates the position of the:
- Slats/flaps
- Speedbrakes
- Landing gear.

For more information about the slats/flaps display, *Refer to DSC-27-20-30-273001 Slats/flaps displays* .

Slats/Flaps Display



Intentionally left blank

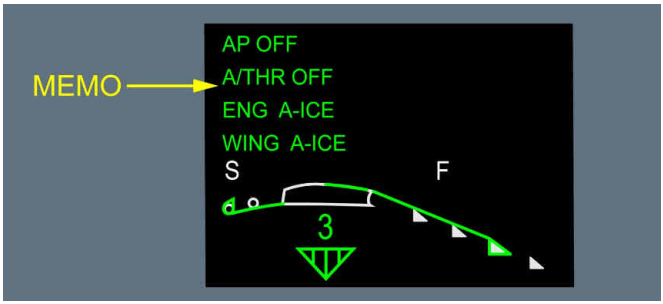
MEMO

MEMO

Applicable to: ALL

A maximum of four memo lines can appear on the lower part of the PFD .
The first line displays the most important memo. The other memos appear in decreasing order of importance.
Memos also appear on the EWD : *Refer to DSC/31/ECAM/System Description/Memos* .

MEMO



MEMO NOT AVAIL	The FWS cannot display the memos on the PFD .

Intentionally left blank

Limitations and Pitch Trim

LIMITATIONS AND PITCH TRIM

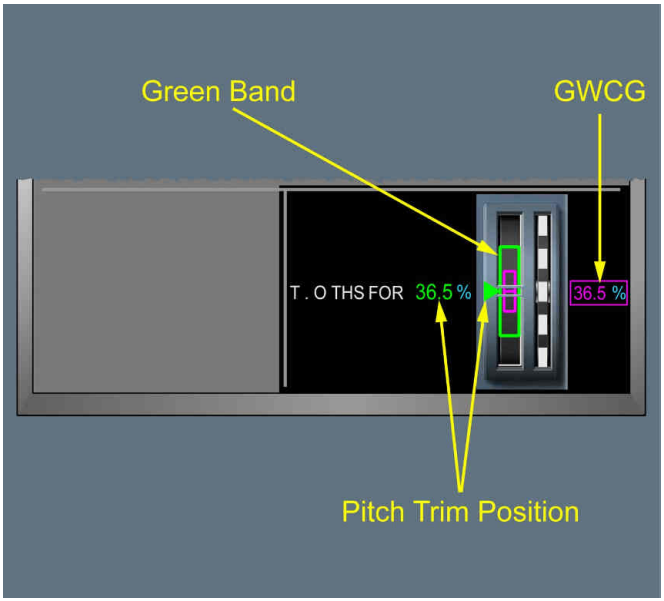
Applicable to: ALL

In flight, the lower part of the PFD displays the limitations that have a direct impact on the flight performance of the aircraft.

Limitations

LIMITATIONS NOT AVAIL The FWS cannot display limitations on the PFD .
At takeoff and after landing, the pitch trim indications appear on the lower part of the PFD .
For more information on the pitch trim display, *Refer to DSC/27/CONTROLS AND INDICATORS/PITCH TRIM DISPLAY* .

Pitch Trim



Overview

OVERVIEW

Applicable to: ALL

The Navigation Display (ND) provides the flight crew with mid-term information of the status of the lateral navigation of the aircraft, according to:

- The flight plan
- The navigation database data (waypoints, NAVAIDS , airports).

The flight crew can change some items of the flight plan directly from the ND . For more information, *Refer to Interactive ND* .

The ND also displays:

- The weather radar, the terrain, or information about traffic collision avoidance
- The airport navigation function. For more information, *Refer to Airport Navigation* .

For navigation, the flight crew can select one of the following ND modes:

- ARC
- PLAN
- ROSE-NAV
- ROSE-VOR
- ROSE-LS.

In PLAN mode, it is not possible to display additional information about the weather radar, the terrain, or traffic collision avoidance.
The lower part of the ND display unit also provides the Vertical Display (VD) information. For more information, *Refer to VD* .

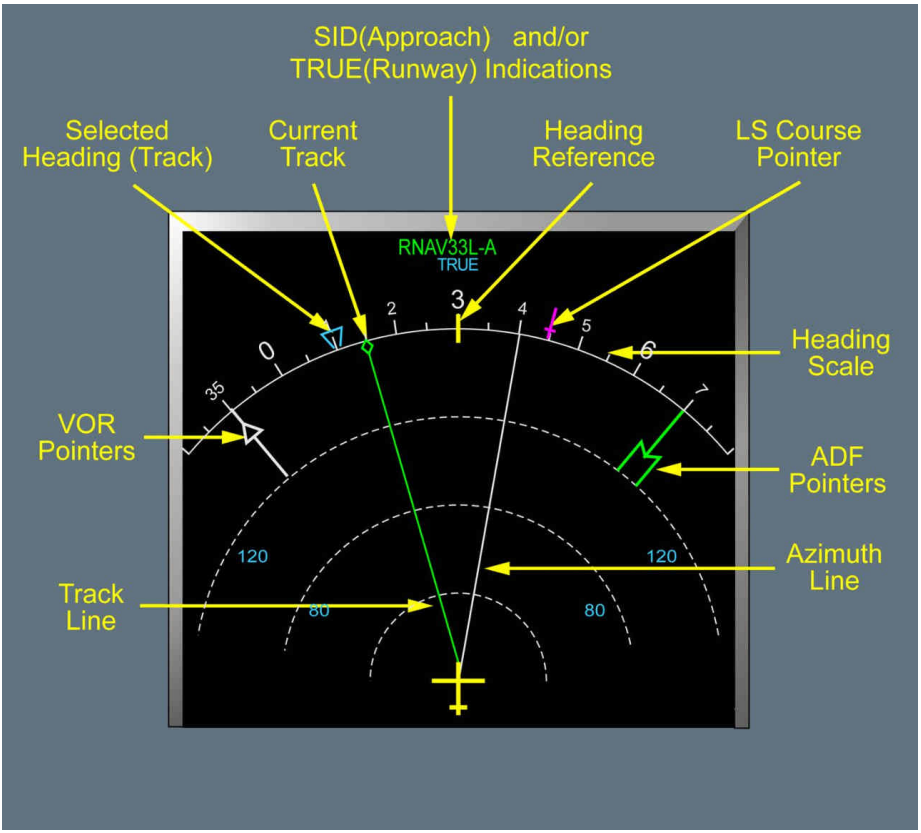
ARC Mode

ARC MODE

Applicable to: ALL

In ARC mode, the ND displays a sector that corresponds to 100 ° in front of the aircraft.

ARC Move Overview

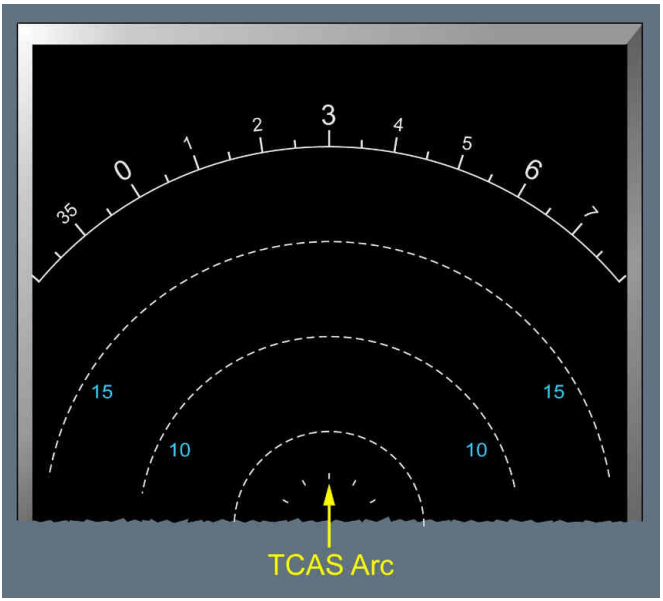


HEADING SCALE

The heading scale takes into account a sector of 100 ° . Degrees are indicated in increments of 5 ° , with a numerical value every 10 ° .
The radius of the heading scale corresponds to the range that the flight crew has selected on the EFIS CP .
The dotted arcs in front of the aircraft correspond to 1/4, 1/2 and 3/4 of the selected range.
For more information, *Refer to DSC-31-20-50-GEFIS ND Range Sel* .
The range values, on both sides of the ARC display, correspond to 1/2 and 3/4 of the selected range.

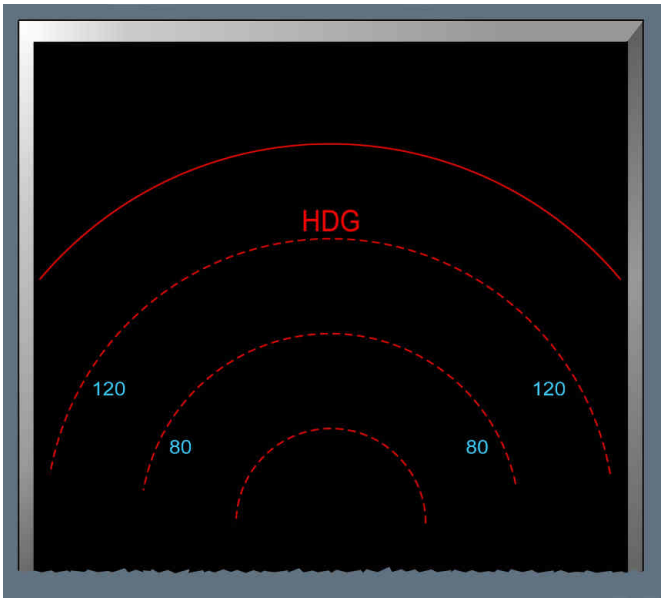
The TCAS arc indicates 2.5 nm , when:
- The selected range is less than, or equal to, 20 nm
- The flight crew selects the TRAF pb on the EFIS CP , or a TCAS alert is triggered.

TCAS Arc



L2 When the aircraft heading is not valid, the ND displays the heading scale in red.

Heading Scale Not Valid



HEADING REFERENCE

Indicates the current aircraft heading on the heading scale.

L2 The ADIRS provides the heading value, in the TRUE or MAG reference, depending on the MAG/TRUE pb selection.

L1 At high latitudes, the ADIRS automatically changes the MAG north reference to the TRUE north reference.

L3 The aircraft is at high latitude:
- Above82.5 °North, or
- Above 73.5 ° North, with a longitude between 117.5 ° West, and 92.5 ° West, or
- Below 60.5 ° South.

L1 When the aircraft approaches high latitudes, the SELECT TRUE NORTH REF message requests that the flight crew select the TRUE north reference.

L3 This message appears:
- Above 82 ° North, or
- Above 73 ° North, with a longitude between 120 ° West, and 90 ° West, or
- Below 60 ° South.

L1 The flight crew can manually change the north reference by pressing the TRUE/MAG pb, on the AFS CP.

CURRENT TRACK

Indicates the current aircraft track on the heading scale.

L2 The ADIRS provides the aircraft track.

SELECTED HEADING(TRACK)

L12

Indicates the heading(track) that the flight crew has selected on the AFS CP.

Appears when:
- HDG/TRACK mode is engaged, or
- APs and FDs are off.

L2 If the selected heading(track) is above the maximum value displayed on the ARC scale, the numerical value appears instead of the symbol on the right (left) side of the heading scale.

LS COURSE POINTER

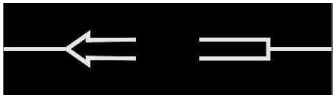
Indicates the QFU of the LS course on the heading scale.
Appears when the flight crew has selected a precision approach on the FMS.

Indicates the QFU of the LS course on the heading scale.
Appears if the FLS function performs the lateral guidance.

L2 The Multi Mode Receiver (MMR) provides the LS course.

VOR POINTERS

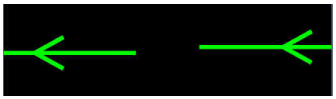
Indicates the bearing of the selected VOR1.
Appears when the flight crew presses the VOR/ADF1 pb on the EFIS CP.



Indicates the bearing of the selected VOR2.
Appears when the flight crew presses the VOR/ADF2 pb on the EFIS CP.

L3 The VOR pointer has an angle equal to the VOR bearing minus the aircraft heading.
If the tuned VOR reference in the FMS database (MAG or TRUE) is different from the current aircraft reference (MAG or TRUE), the VOR pointer appears in magenta, and is corrected from the IRS magnetic deviation.

ADF POINTERS



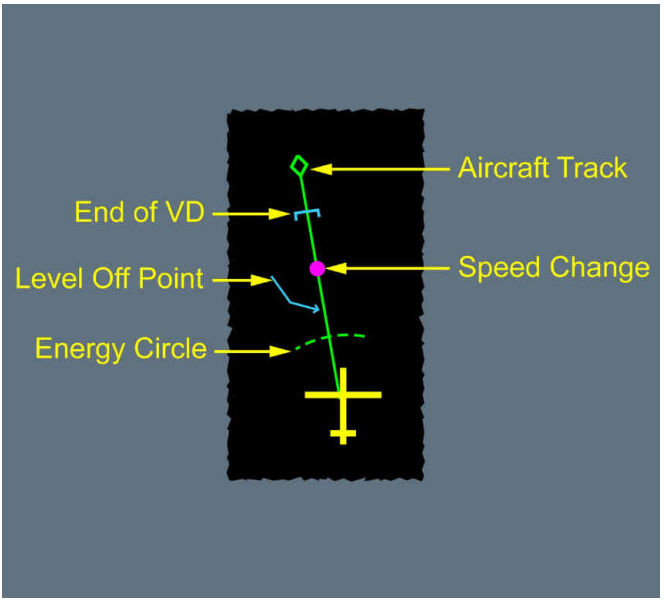
Indicates the bearing of the selected ADF.
Appears when the flight crew presses the VOR1/ADF pb two times (on the EFIS CP).

L3 The ADF pointer has an angle that is equal to the ADF bearing.

TRACK LINE

When a selected lateral mode is engaged, the ND displays the predicted track of the aircraft, based on the current aircraft track.
This predicted track is referred to as the track line:

Track Line



ENERGY CIRCLE

L12

Indicates the distance that the aircraft is required to descend and decelerate, in order to reach the selected landing point.
Appears when the aircraft is within 180 nm of the destination airport.

L2 The FMS provides the energy circle.

L1 ### SPEED CHANGE

Indicates the point at which the flight crew must change the aircraft speed, in order to reach a speed target.

L2 The FMS provides the speed change.

L1 ### LEVEL OFF POINT

The aircraft is descending.
Indicates the point at which the aircraft will reach the altitude target that was selected on the AFS CP .

The aircraft is climbing.
Indicates the point at which the aircraft will reach the altitude target that was selected on the AFS CP .

END OF VD

Indicates the end of the VD display on the aircraft trajectory.
For more information, *Refer to VD / RANGE* .

AZIMUTH LINE

A white line indicates the azimuth that is used for the computation of the vertical cut of the VD . For more information, *Refer to VD* .
The flight crew can manually select the VD AZIM mode via the VD AZIM knob , on the SURV panel. For more information, *Refer to SURV / WXR / WXR DISPLAY FUNCTION* .

SID(APPROACH) AND/OR TRUE(RUNWAY) INDICATIONS

The ND can display:
- The SID name, or
- The approach name.

The TRUE indication can be combined with the SID or the approach name.
If the ND does not display the TRUE indication, the BTV indication or the runway name can be combined with the approach name.

Indicates the SID name.

Appears when:
- The SID exists in the flight plan, and
- • The PRE-FLIGHT flight phase is active, or
  • T.O or CLB flight phase is active, and the aircraft flies the departure procedure as defined in the FMS (*Refer to DEPARTURE of the FMS*

L12

Indicates the type and the name of the approach.

Appears when:
- The approach exists in the flight plan, and
- • One of the DES , APP , or GA flight phases is active, or
  • The active flight phase is CRZ , and the along track distance to destination is less than 250 nm

The heading reference is magnetic.

L123

The heading reference is TRUE north.
At high latitudes, the ADIRS automatically changes the MAG north reference to the TRUE north reference.

The aircraft is at high latitude:
- Above 82.5 ° North, or
- Above 73.5 ° North, with a longitude between 117.5 ° West, and 92.5 ° West, or
- Below 60.5 ° South.

When the aircraft approaches high latitudes, the SELECT TRUE NORTH REF message requests that the flight crew selects the TRUE north reference.

This message appears:
- Above 82 ° North, or
- Above 73 ° North, with a longitude between 120 ° West, and 90 ° West, or
- Below 60 ° South.

The flight crew can manually change the north reference by pressing the TRUE/MAG pb , on the AFS CP .
The TRUE message flashes for 10 seconds and remains steady when the slats are extended.

L12

The heading reference is TRUE north. The grid track indicates the true track value, minus the aircraft longitude.
The TRUE message flashes for 10 seconds and remains steady when the slats are extended.

L12

Indicates the BTV indication composed by:
- BTV label
- The selected runway name
- The selected exit name.

Appears when the flight crew selects the BTV function on the AUTO BRK Mode selector .

L12

Indicates the runway name.

Appears for autobrake mode (i.e. LO , 2, 3 or HI), or for manual braking when:

- The aircraft reaches 500 ft in final, or
- The flight crew selects a runway on the OANS .

Intentionally left blank

PLAN Mode

PLAN MODE

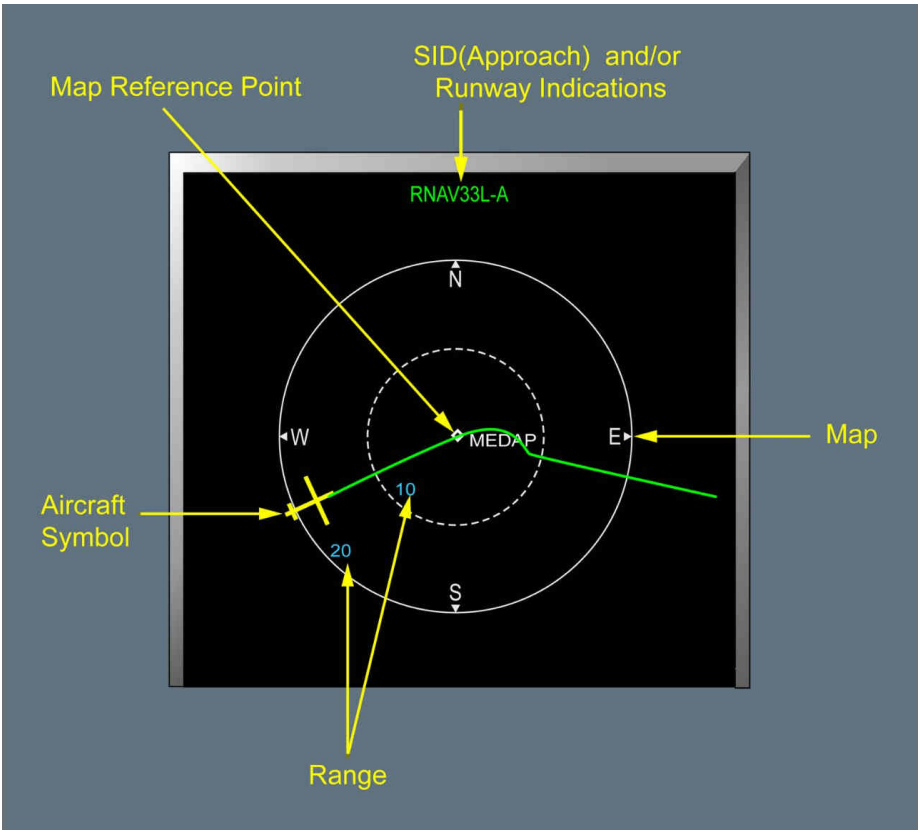
Applicable to: ALL

The PLAN mode displays the flight plan on a map, using the North (N)/South (S) and West (W)/East (E) references.

L2 Raw navigation station data is not available in this mode.

L1 In PLAN mode, the flight crew can scroll through, and display, the entire flight plan.

PLAN Mode Overview



MAP

The map is in the direction of TRUE north. The ND adjusts the center of the map to a Map Reference Point (MRP), that the flight crew selects on the MFD.

RANGE

The diameter of the outer circle corresponds to the range selected by the flight crew on the EFIS CP.
The range values correspond to 1/2 and 1/4 of the selected range.

AIRCRAFT SYMBOL

Indicates the aircraft position in relation to the flight plan. The mock-up orientation indicates the aircraft heading in relation to TRUE north.

L2 The FMS provides the aircraft position, and the ADIRS provides the aircraft heading.

MAP REFERENCE POINT

The Map Reference Point (MRP) is at the center of the map, and is:
- The first waypoint beyond the first line of the flight plan, when the MFD displays a flight plan page, or
- The TO waypoint of the active flight plan or of any secondary flight plan, if the MFD displays any other page than the flight plan page, or
- The current aircraft position, if there is no waypoint on the flight plan.

(SID)APPROACH AND/OR RUNWAY INDICATIONS

The ND can display:
- The SID name, or
- The approach name.

The BTV indication or the runway name can be combined with the approach name.

Indicates the SID name.

Appears when:
- The SID exists in the flight plan, and
- • The PRE-FLIGHT flight phase is active, or
  • T.O or CLB flight phase is active, and the aircraft flies the departure procedure as defined in the FMS (*Refer to DEPARTURE of the FMS*

L12

Indicates the type and the name of the approach.

Appears when:
- The approach exists in the flight plan, and
- • One of the DES , APP , or GA flight phases is active, or
  • The active flight phase is CRZ , and the along track distance to destination is less than 250 nm

The heading reference is magnetic.

L12

Indicates the BTV indication composed by:
- BTV label
- The selected runway name
- The selected exit name.

Appears when the flight crew selects the BTV function on the AUTO BRK Mode selector .

L12

Indicates the runway name.

Appears for autobrake mode (i.e. LO , 2, 3 or HI), or for manual braking when:
- The aircraft reaches 500 ft in final, or
- The flight crew selects a runway on the OANS .

Intentionally left blank

ROSE-NAV Mode

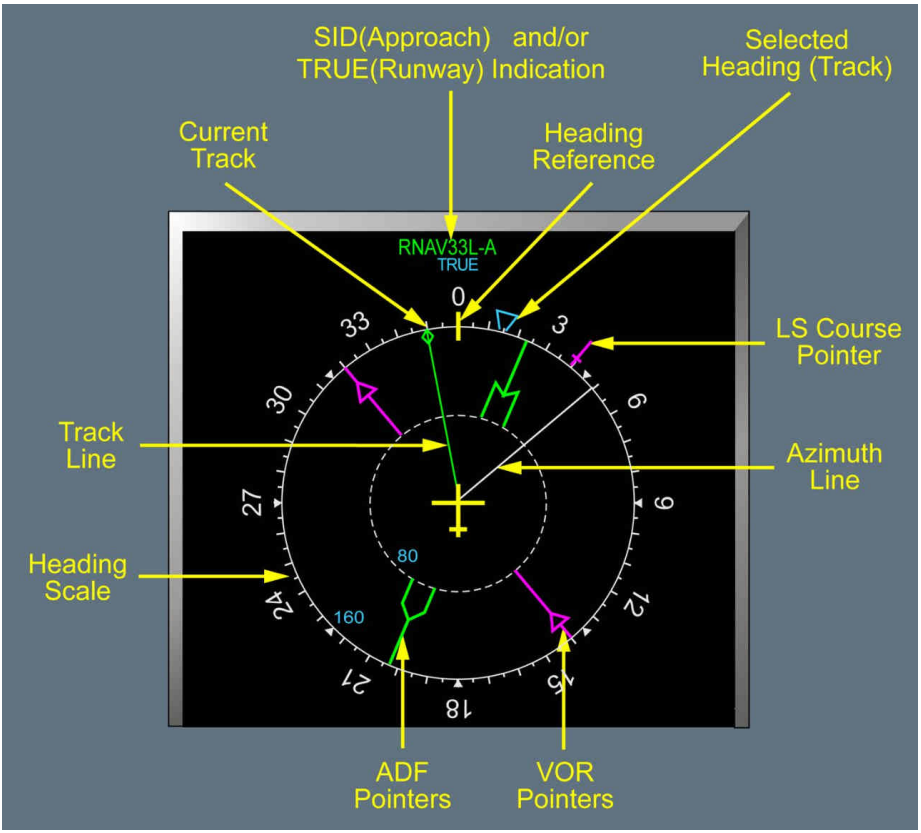
ROSE-NAV MODE

Applicable to: ALL

The ROSE-NAV mode provides the same information as the ARC mode, but on a 360 ° sector. The ND displays the ROSE-NAV in relation to the aircraft heading.

L2 If the ND mode, or the ND range, are not valid, the ND displays the ROSE-NAV mode by default, with a range of 80 nm .

ROSE-NAV Mode Overview

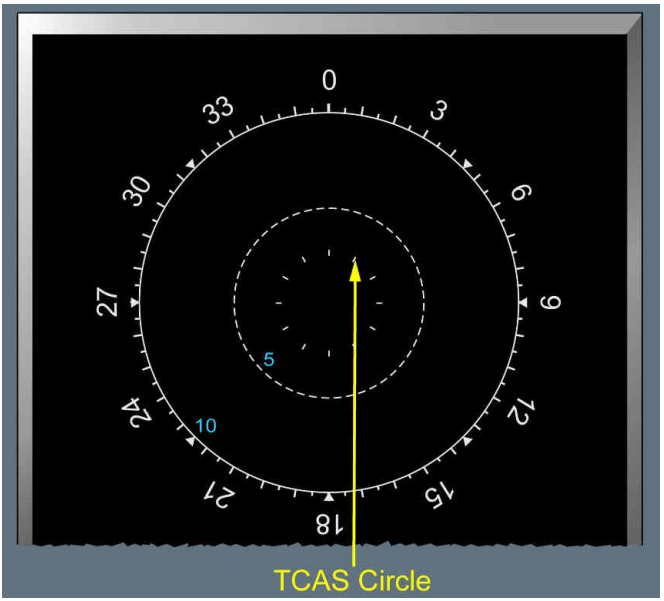


HEADING SCALE

The heading scale takes into account a sector of 360 °. Degrees are indicated in increments of 5 °, with a numerical value every 30 °.
The diameter of the heading scale corresponds to the range that the flight crew has selected on the EFIS CP.
The diameter of the dotted circle corresponds to 1/2 of the selected range.
The range values, on both sides of the ROSE display, correspond to 1/4 and 1/2 of the selected range.

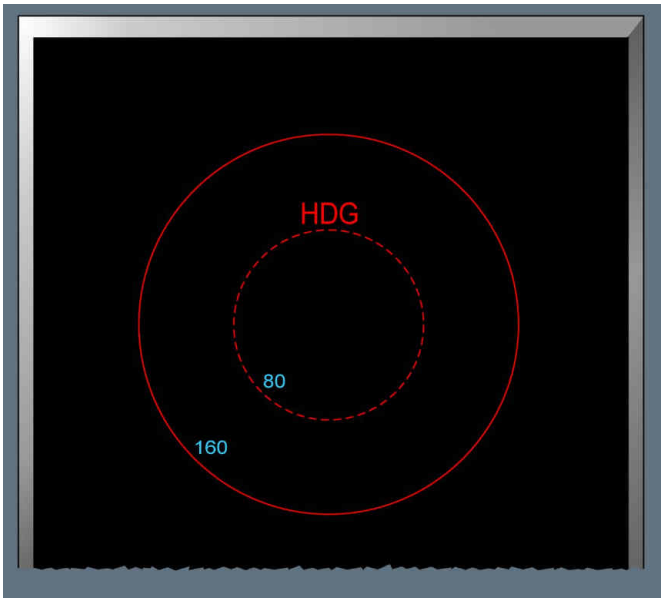
The TCAS circle indicates 2.5 nm, when:
- The selected range is less than, or equal to, 20 nm
- The flight crew selects the TRAF pb on the EFIS CP, or a TCAS alert is triggered.

TCAS Circle



L2 When the aircraft heading is not valid, the ND displays the heading scale in red.

Heading Scale Not Valid



HEADING REFERENCE

Indicates the current aircraft heading on the heading scale.

L2 The ADIRS provides the heading value, in the TRUE or MAG reference, depending on the MAG/TRUE pb selection.

L1 At high latitudes, the ADIRS automatically changes the MAG north reference to the TRUE north reference.

L3 The aircraft is at high latitude:
- Above82.5 °North, or
- Above 73.5 ° North, with a longitude between 117.5 ° West, and 92.5 ° West, or
- Below 60.5 ° South.

L1 When the aircraft approaches high latitudes, the SELECT TRUE NORTH REF message requests that the flight crew select the TRUE north reference.

L3 This message appears:
- Above 82 ° North, or
- Above 73 ° North, with a longitude between 120 ° West, and 90 ° West, or
- Below 60 ° South.

L1 The flight crew can manually change the north reference by pressing the TRUE/MAG pb, on the AFS CP.

CURRENT TRACK

Indicates the current aircraft track on the heading scale.

L2 The ADIRS provides the aircraft track.

SELECTED HEADING(TRACK)

L12

Indicates the heading(track) that the flight crew has selected on the AFS CP.

Appears when:
- HDG/TRACK mode is engaged, or
- APs and FDs are off.

LS COURSE POINTER

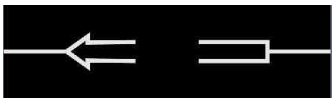
Indicates the QFU of the LS course on the heading scale.
Appears when the flight crew has selected a precision approach on the FMS.

Indicates the QFU of the LS course on the heading scale.
Appears if the FLS function performs the lateral guidance.

L2 The Multi Mode Receiver (MMR) provides the LS course.

VOR POINTERS

Indicates the bearing of the selected VOR1.
Appears when the flight crew presses the VOR/ADF1 pb on the EFIS CP.



Indicates the bearing of the selected VOR2.
Appears when the flight crew presses the VOR/ADF2 pb on the EFIS CP.

L3 The ND displays the VOR pointer with a angle that is equal to the VOR bearing, minus the aircraft heading.
If the tuned VOR reference in the FMS database (MAG or TRUE) is different from the current aircraft reference (MAG or TRUE), the VOR pointer appears in magenta, and is corrected from the IRS magnetic deviation.

ADF POINTERS

Indicates the bearing of the selected ADF.
Appears when the flight crew presses the VOR1/ADF pb two times (on the EFIS CP).

L3 The ADF pointer has an angle that is equal to the ADF bearing.

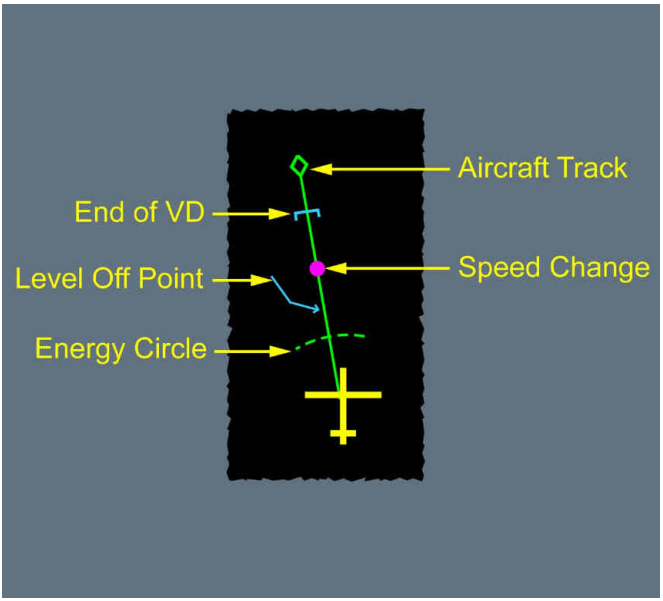
AZIMUTH LINE

A white line indicates the azimuth that is used for the computation of the vertical cut of the VD . For more information, *Refer to VD* .
The flight crew can manually select the VD AZIM mode via the VD AZIM knob , on the SURV panel. For more information, *Refer to SURV / WXR / WXR DISPLAY FUNCTION* .

TRACK LINE

When a selected lateral mode is engaged, the ND displays the predicted track of the aircraft, based on the current aircraft track.
This predicted track is referred to as the track line:

Track Line



ENERGY CIRCLE

L12

Indicates the distance that the aircraft is required to descend and decelerate, in order to reach the selected landing point.
Appears when the aircraft is within 180 nm of the destination airport.

L2 The FMS provides the energy circle.

L1 ### SPEED CHANGE

Indicates the point at which the flight crew must change the aircraft speed, in order to reach a speed target.

L2 The FMS provides the speed change.

L1 ### LEVEL OFF POINT

The aircraft is descending.
Indicates the point at which the aircraft will reach the altitude target that was selected on the AFS CP .

The aircraft is climbing.
Indicates the point at which the aircraft will reach the altitude target that was selected on the AFS CP .

END OF VD

Indicates the end of the VD display on the aircraft trajectory.
For more information, *Refer to VD / RANGE* .

SID(APPROACH) AND/OR TRUE(RUNWAY) INDICATIONS

The ND can display:
- The SID name, or
- The approach name.

The TRUE indication can be combined with the SID or the approach name.
If the ND does not display the TRUE indication, the BTV indication or the runway name can be combined with the approach name.

Indicates the SID name.

Appears when:
- The SID exists in the flight plan, and
- • The PRE-FLIGHT flight phase is active, or
  • T.O or CLB flight phase is active, and the aircraft flies the departure procedure as defined in the FMS (*Refer to DEPARTURE of the FMS*

L12

Indicates the type and the name of the approach.

Appears when:
- The approach exists in the flight plan, and
- • One of the DES , APP , or GA flight phases is active, or
  • The active flight phase is CRZ , and the along track distance to destination is less than 250 nm

The heading reference is magnetic.

L123

The heading reference is TRUE north.
At high latitudes, the ADIRS automatically changes the MAG north reference to the TRUE north reference.

The aircraft is at high latitude:
- Above 82.5 ° North, or
- Above 73.5 ° North, with a longitude between 117.5 ° West, and 92.5 ° West, or
- Below 60.5 ° South.

When the aircraft approaches high latitudes, the SELECT TRUE NORTH REF message requests that the flight crew selects the TRUE north reference.

This message appears:
- Above 82 ° North, or
- Above 73 ° North, with a longitude between 120 ° West, and 90 ° West, or
- Below 60 ° South.

The flight crew can manually change the north reference by pressing the TRUE/MAG pb , on the AFS CP .
The TRUE message flashes for 10 seconds and remains steady when the slats are extended.

L12

The heading reference is TRUE north. The grid track indicates the true track value, minus the aircraft longitude.
The TRUE message flashes for 10 seconds and remains steady when the slats are extended.

L12

Indicates the BTV indication composed by:
- BTV label
- The selected runway name
- The selected exit name.

Appears when the flight crew selects the BTV function on the AUTO BRK Mode selector .

L12

Indicates the runway name.

Appears for autobrake mode (i.e. LO , 2, 3 or HI), or for manual braking when:

- The aircraft reaches 500 ft in final, or
- The flight crew selects a runway on the OANS .

Intentionally left blank

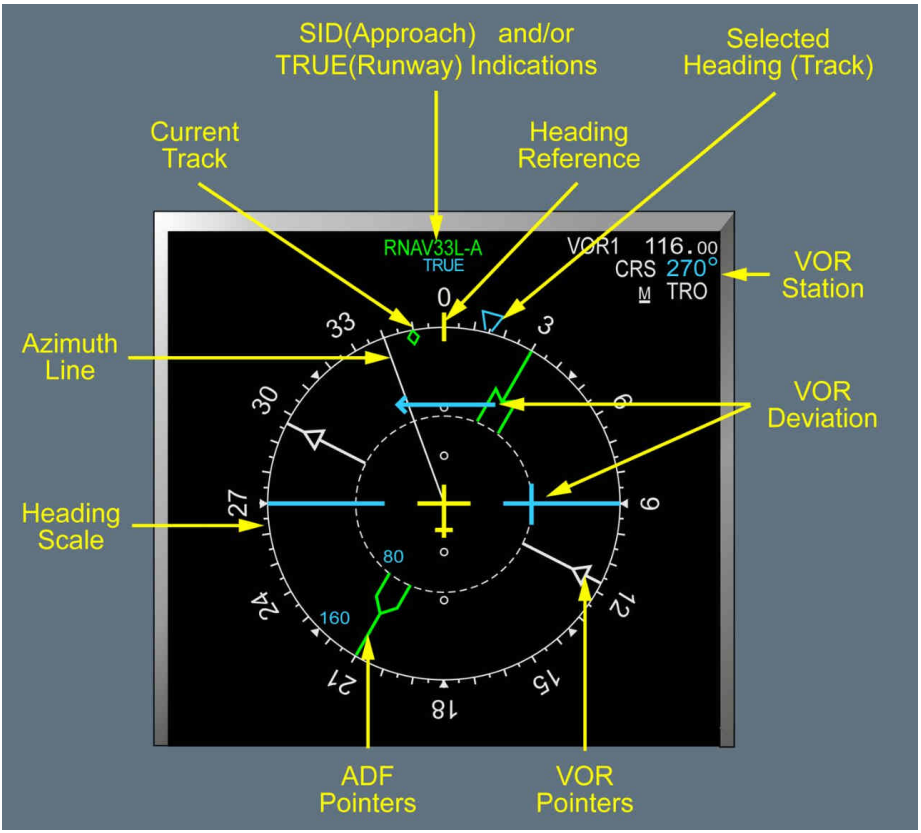
ROSE-VOR Mode

ROSE-VOR MODE

Applicable to: ALL

The ROSE-VOR mode displays the horizontal position of the aircraft, in relation to the tuned VOR . The ND displays the ROSE-VOR in relation to the aircraft heading.

ROSE-VOR Mode Overview

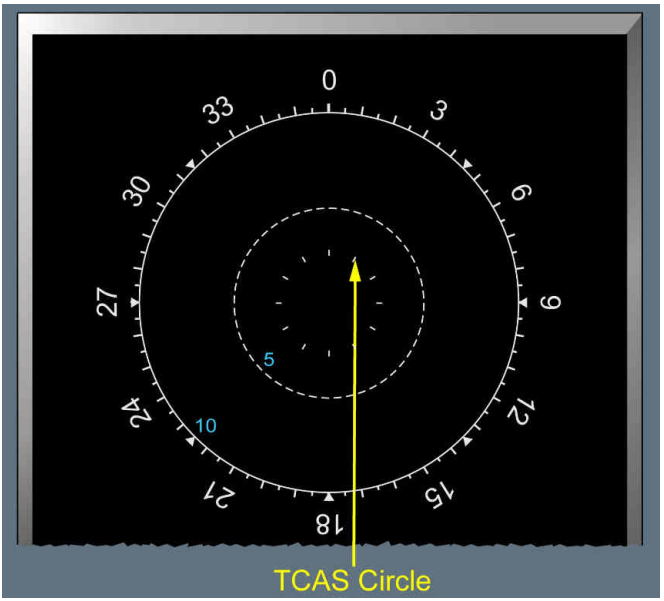


HEADING SCALE

The heading scale takes into account a sector of 360 °. Degrees are indicated in increments of 5 °, with a numerical value every 30 °.
The diameter of the heading scale corresponds to the range that the flight crew has selected on the EFIS CP.
The diameter of the dotted circle corresponds to 1/2 of the selected range.
The range values, on both sides of the ROSE display, correspond to 1/4 and 1/2 of the selected range.

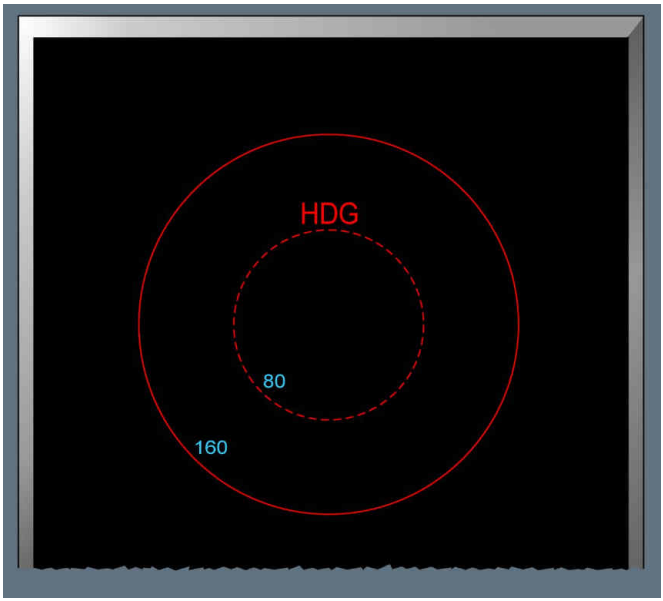
The TCAS circle indicates 2.5 nm, when:
- The selected range is less than, or equal to, 20 nm
- The flight crew selects the TRAF pb on the EFIS CP, or a TCAS alert is triggered.

TCAS Circle



L2 When the aircraft heading is not valid, the ND displays the heading scale in red.

Heading Scale Not Valid



HEADING REFERENCE

Indicates the current aircraft heading on the heading scale.

L2 The ADIRS provides the heading value, in the TRUE or MAG reference, depending on the MAG/TRUE pb selection.

L1 At high latitudes, the ADIRS automatically changes the MAG north reference to the TRUE north reference.

L3 The aircraft is at high latitude:
- Above82.5 °North, or
- Above 73.5 ° North, with a longitude between 117.5 ° West, and 92.5 ° West, or
- Below 60.5 ° South.

L1 When the aircraft approaches high latitudes, the SELECT TRUE NORTH REF message requests that the flight crew select the TRUE north reference.

L3 This message appears:
- Above 82 ° North, or
- Above 73 ° North, with a longitude between 120 ° West, and 90 ° West, or
- Below 60 ° South.

L1 The flight crew can manually change the north reference by pressing the TRUE/MAG pb, on the AFS CP.

CURRENT TRACK

Indicates the current aircraft track on the heading scale.

L2 The ADIRS provides the aircraft track.

SELECTED HEADING(TRACK)

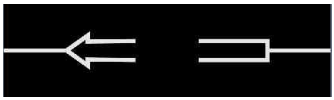
L12

Indicates the heading(track) that the flight crew has selected on the AFS CP.

Appears when:
- HDG/TRACK mode is engaged, or
- APs and FDs are off.

VOR POINTERS

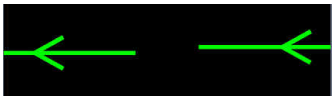
Indicates the bearing of the selected VOR1.
Appears when the flight crew presses the VOR/ADF1 pb on the EFIS CP.



Indicates the bearing of the selected VOR2.
Appears when the flight crew presses the VOR/ADF2 pb on the EFIS CP.

L3 The ND displays the VOR pointer with a angle that is equal to the VOR bearing, minus the aircraft heading.
If the VOR reference (MAG or TRUE) is different from the current aircraft reference, the VOR pointer indication is not corrected.

ADF POINTERS

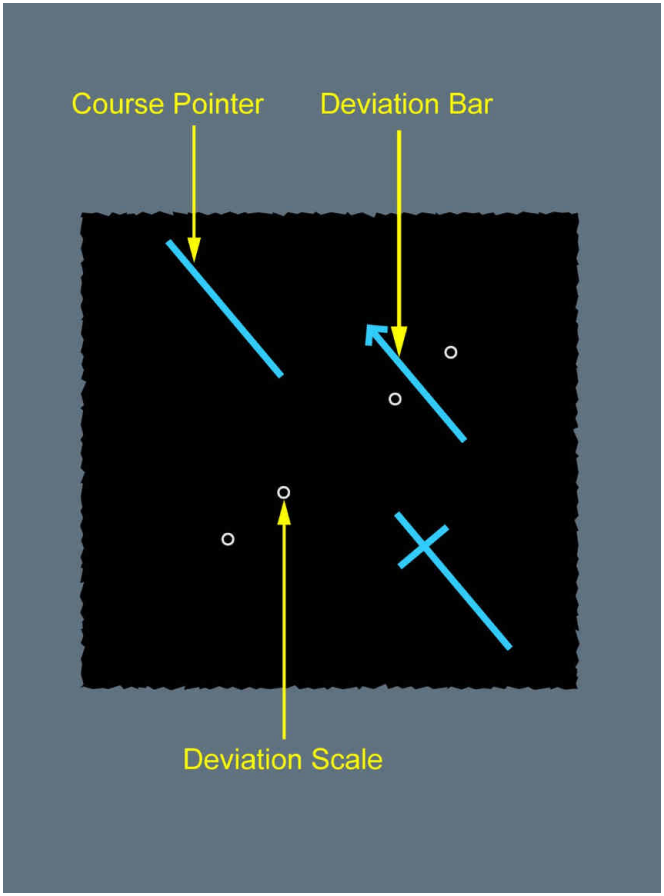


Indicates the bearing of the selected ADF.
Appears when the flight crew presses the VOR1/ADF pb two times (on the EFIS CP).

L3 The ADF pointer has an angle that is equal to the ADF bearing.

VOR DEVIATION

VOR Deviation

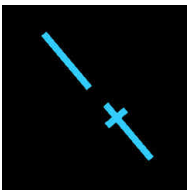


When the VOR bearing is not valid, the ND displays the VOR message in the middle of the ND screen.

L2 The VOR message flashes for 9 seconds, then remains steady.

L1 **COURSE POINTER**

L12



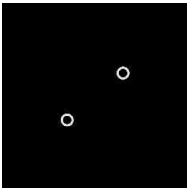
Indicates the course of the selected VOR .

The VOR course is selected:
- Automatically by the FMS , or
- Manually by the flight crew, via the MFD or the RMP .

For more information about the tuned NAVAID for display, *Refer to FMS / CONTROLS AND INDICATORS / MFD PAGES / POSITON / NAVAID PAGE* .
The VOR course pointer rotates with an angle equal to the VOR course minus the aircraft heading. If the VOR course, or the aircraft heading, is not valid, the pointer stays in a vertical position.

DEVIATION SCALE

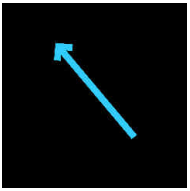
L12



The maximum deviation range of the deviation scale is 20 ° . Each dot on the scale represents 5 ° .
The scale flashes, if the VOR deviation becomes excessive.

DEVIATION BAR

L12



Indicates the aircraft deviation in relation to the selected VOR course. The ND displays the deviation bar at ±11 ° , if the VOR deviation becomes excessive.

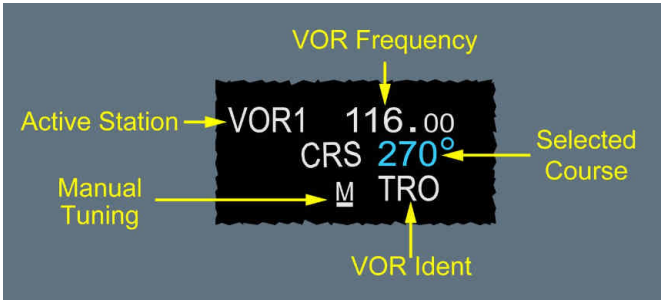
The distance of the deviation bar from the VOR course pointer is equal to:
- The VOR bearing, minus the VOR course, or
- The VOR bearing, minus the aircraft heading, if the VOR course is not valid.

The arrow on the deviation bar indicates TO / FROM information.

VOR STATION

The ND displays the characteristics of the selected VOR station. For more information on the tuned NAVAID for display, *Refer to FMS / CONTROLS AND INDICATORS / MFD PAGES / POSITON / NAVAID page* .

VOR Station



ACTIVE STATION

Indicates the side (1 or 2) of the selected VOR navigation station.

L2

The selected bearing is not valid.
VOR flashes for 9 seconds, then remains steady.

L1 **VOR FREQUENCY**

Indicates the VOR frequency of the selected VOR in MHz.

L2

The VOR frequency is not valid.

L1 **SELECTED COURSE**

Indicates the selected course in degrees.

L2

The selected course is not valid.

The course is Non Computed Data (NCD).

L1 **MANUAL TUNING**

The flight crew has manually tuned the NAVAID, via the RMP .

The flight crew has manually tuned the NAVAID, via the MFD .

AZIMUTH LINE

A white line indicates the azimuth that is used for the computation of the vertical cut of the VD . For more information, *Refer to VD* .
The flight crew can manually select the VD AZIM mode via the VD AZIM knob , on the SURV panel. For more information, *Refer to SURV / WXR / WXR DISPLAY FUNCTION* .

SID(APPROACH) AND/OR TRUE(RUNWAY) INDICATIONS

The ND can display:
- The SID name, or
- The approach name.

The TRUE indication can be combined with the SID or the approach name.
If the ND does not display the TRUE indication, the BTV indication or the runway name can be combined with the approach name.

Indicates the SID name.

Appears when:
- The SID exists in the flight plan, and
- • The PRE-FLIGHT flight phase is active, or
  • T.O or CLB flight phase is active, and the aircraft flies the departure procedure as defined in the FMS (*Refer to DEPARTURE of the FMS*

L12

Indicates the type and the name of the approach.

Appears when:
- The approach exists in the flight plan, and
- • One of the DES , APP , or GA flight phases is active, or
  • The active flight phase is CRZ , and the along track distance to destination is less than 250 nm

The heading reference is magnetic.

L123

The heading reference is TRUE north.
At high latitudes, the ADIRS automatically changes the MAG north reference to the TRUE north reference.

The aircraft is at high latitude:
- Above 82.5 ° North, or
- Above 73.5 ° North, with a longitude between 117.5 ° West, and 92.5 ° West, or
- Below 60.5 ° South.

When the aircraft approaches high latitudes, the SELECT TRUE NORTH REF message requests that the flight crew selects the TRUE north reference.

This message appears:
- Above 82 ° North, or
- Above 73 ° North, with a longitude between 120 ° West, and 90 ° West, or
- Below 60 ° South.

The flight crew can manually change the north reference by pressing the TRUE/MAG pb , on the AFS CP .
The TRUE message flashes for 10 seconds and remains steady when the slats are extended.

L12

The heading reference is TRUE north. The grid track indicates the true track value, minus the aircraft longitude.
The TRUE message flashes for 10 seconds and remains steady when the slats are extended.

L12

Indicates the BTV indication composed by:
- BTV label
- The selected runway name
- The selected exit name.

Appears when the flight crew selects the BTV function on the AUTO BRK Mode selector .

L12

Indicates the runway name.

Appears for autobrake mode (i.e. LO , 2, 3 or HI), or for manual braking when:
- The aircraft reaches 500 ft in final, or
- The flight crew selects a runway on the OANS .

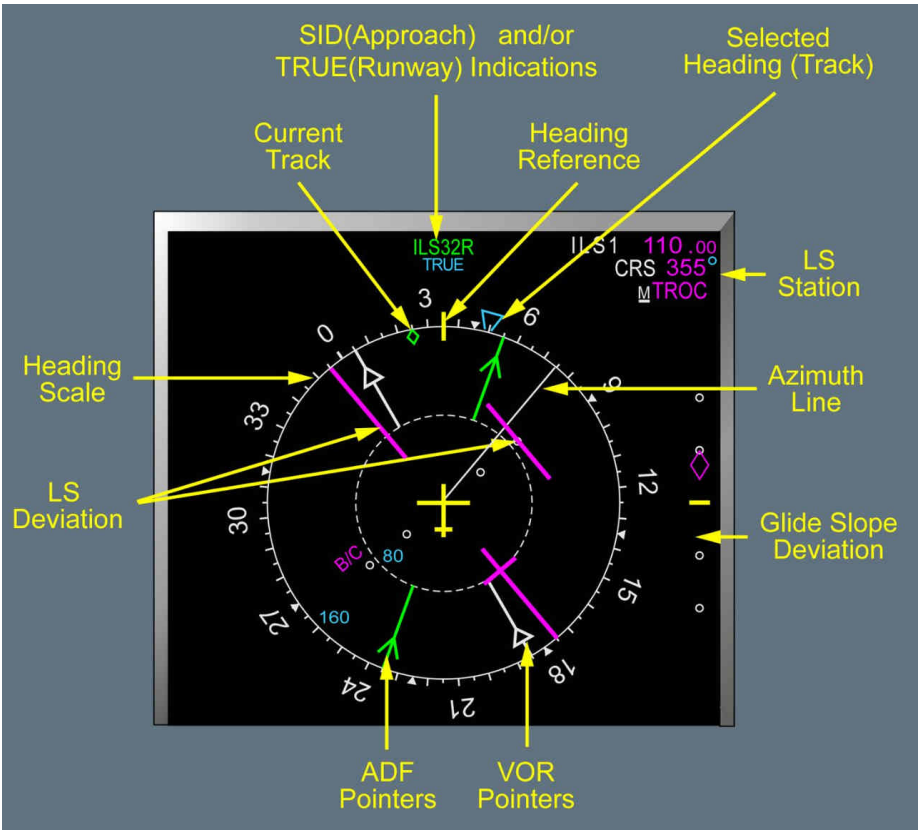
ROSE-LS Mode

ROSE-LS MODE

Applicable to: ALL

The ROSE-LS mode displays the horizontal position of the aircraft, in relation to the LOC , F-LOC , G/S and F-G/S indications. The ND displays the ROSE-LS in relation to the aircraft heading.

ROSE-LS Mode Overview

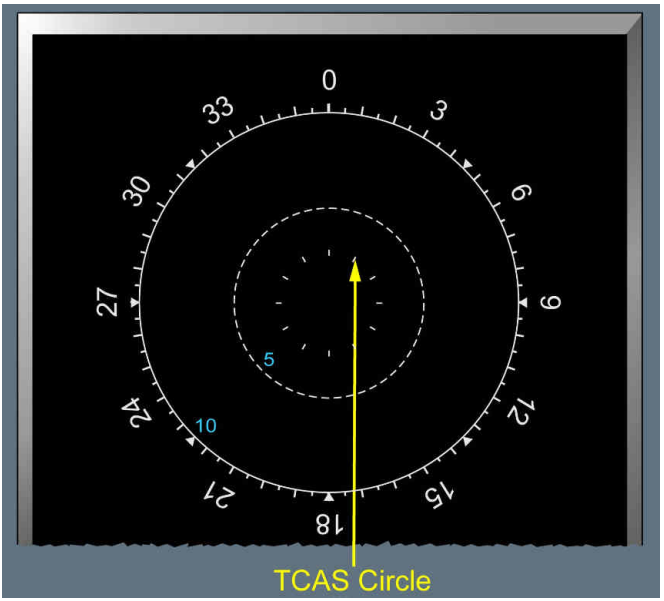


HEADING SCALE

The heading scale takes into account a sector of 360 °. Degrees are indicated in increments of 5 °, with a numerical value every 30 °.
The diameter of the heading scale corresponds to the range that the flight crew has selected on the EFIS CP.
The diameter of the dotted circle corresponds to 1/2 of the selected range.
The range values, on both sides of the ROSE display, correspond to 1/4 and 1/2 of the selected range.

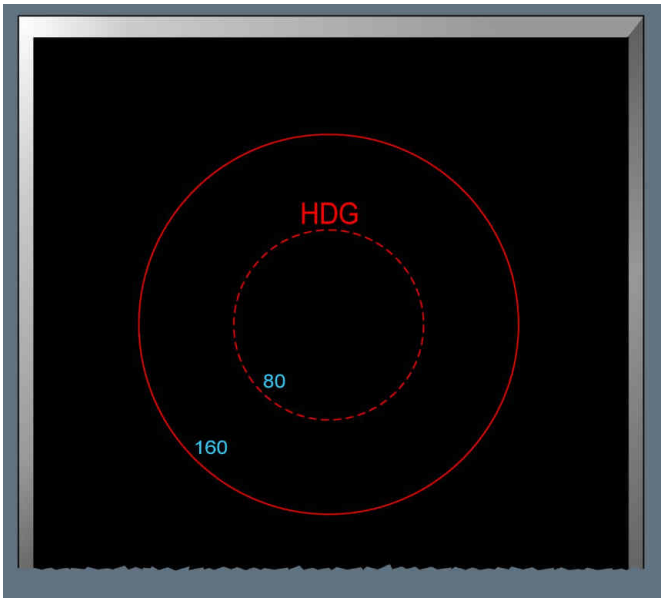
The TCAS circle indicates 2.5 nm, when:
- The selected range is less than, or equal to, 20 nm
- The flight crew selects the TRAF pb on the EFIS CP, or a TCAS alert is triggered.

TCAS Circle



L2 When the aircraft heading is not valid, the ND displays the heading scale in red.

Heading Scale Not Valid



HEADING REFERENCE

Indicates the current aircraft heading on the heading scale.

L2 The ADIRS provides the heading value, in the TRUE or MAG reference, depending on the MAG/TRUE pb selection.

L1 At high latitudes, the ADIRS automatically changes the MAG north reference to the TRUE north reference.

L3 The aircraft is at high latitude:
- Above82.5 °North, or
- Above 73.5 ° North, with a longitude between 117.5 ° West, and 92.5 ° West, or
- Below 60.5 ° South.

L1 When the aircraft approaches high latitudes, the SELECT TRUE NORTH REF message requests that the flight crew select the TRUE north reference.

L3 This message appears:
- Above 82 ° North, or
- Above 73 ° North, with a longitude between 120 ° West, and 90 ° West, or
- Below 60 ° South.

L1 The flight crew can manually change the north reference by pressing the TRUE/MAG pb, on the AFS CP.

CURRENT TRACK

Indicates the current aircraft track on the heading scale.

L2 The ADIRS provides the aircraft track.

SELECTED HEADING(TRACK)

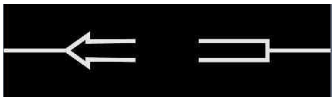
L12

Indicates the heading(track) that the flight crew has selected on the AFS CP.

Appears when:
- HDG/TRACK mode is engaged, or
- APs and FDs are off.

VOR POINTERS

Indicates the bearing of the selected VOR1.
Appears when the flight crew presses the VOR/ADF1 pb on the EFIS CP.



Indicates the bearing of the selected VOR2.
Appears when the flight crew presses the VOR/ADF2 pb on the EFIS CP.

L3 The ND displays the VOR pointer with a angle that is equal to the VOR bearing, minus the aircraft heading.
VOR pointers are in white, if the aircraft heading is valid. They do not appear in any other case.
If the VOR reference (MAG or TRUE) is different from the current aircraft reference, the VOR pointer indication is not corrected.

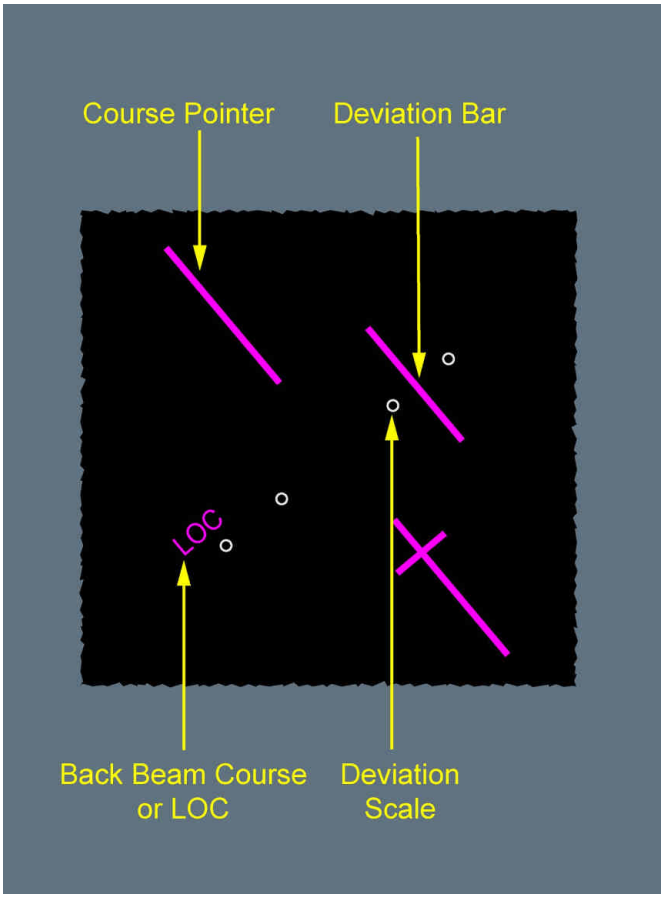
ADF POINTERS

Indicates the bearing of the selected ADF.
Appears when the flight crew presses the VOR1/ADF pb two times (on the EFIS CP).

L3 The ADF pointer has an angle that is equal to the ADF bearing.

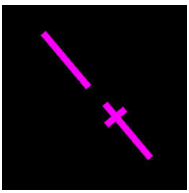
LS DEVIATION

LS Deviation



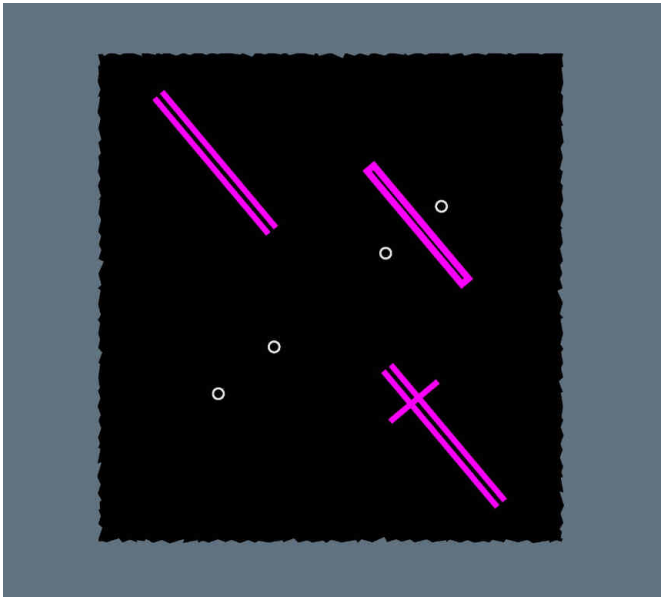
COURSE POINTER

L12



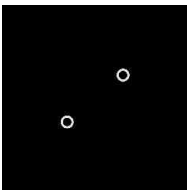
Indicates the course of the selected LS.
The LS course pointer rotates at an angle that is equal to the LS course, minus the aircraft heading.
During a Non-Precision Approach (NPA), flown with the FLS function, the deviation bar and the course pointer appear in pairs.

FLS Deviation



DEVIATION SCALE

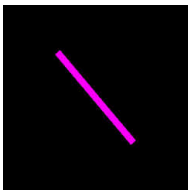
L12



The deviation scale is indicated via 4 dots.
The scale flashes, if the LS deviation becomes excessive.

DEVIATION BAR

L12



Indicates the aircraft deviation in relation to the LS course. The ND displays the flashing deviation bar on the outer dot of the scale, when the LS deviation becomes excessive.

The distance of the deviation bar from the LS course pointer is equal to:
- The LOC deviation, or
- Minus the LOC deviation, if the back beam mode is active.

During a NPA flown with the FLS function, the deviation bar in the middle pulses, if the ND receives only raw data.

BACK BEAM COURSE/LOC

LOC The flight crew has not selected a back beam course, when in LOC/FLS mode.

B/C The flight crew has selected a back beam course.

MESSAGES

L12

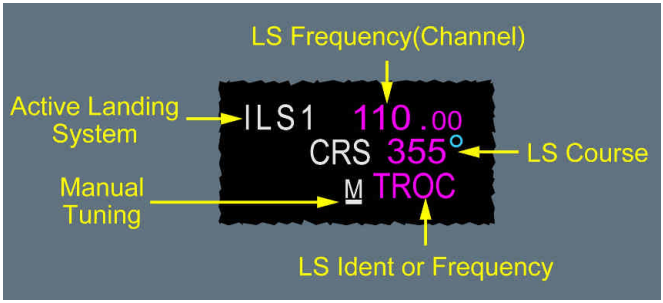
LOC The LOC deviation is not valid.
Flashes for 9 seconds, then remains steady.

L12

F-LOC During a NPA flown with the FLS function, the F-LOC deviation is not valid.
Flashes for 9 seconds, then remains steady.

LS STATION

The ND displays the selected LS station information.



ACTIVE LANDING SYSTEM

ILS1 — Indicates the side (MMR 1(2)) of the selected LS station.

L2 ILS1
- The glide slope deviation is not valid, or
- The localizer deviation is not valid, or
- The MMR is not active, or
- The approach is flown with the FLS function, and the distance to the runway threshold is not valid.

L1

LS FREQUENCY(CHANNEL)(SLOPE)

Indicates the ILS frequency in MHz.

Indicates the FLS slope.

Indicates the GLS channel.

L2 --- — The LS frequency(channel)(slope) is not valid.

L3 The range of the ILS frequency is between 108.0 MHz and 112.0 MHz.
The range of the GLS channel is between 20001 and 39999.

L1

LS COURSE

Indicates the LS course in degrees.

L2

The selected course is not valid.

The course is Non Computed Data (NCD).

L1

LS IDENT OR FREQUENCY

For precision approaches, the ND displays the LS station ident.
For NPA, the ND displays the ident of the anchor point.

In LOC only, or ILS G/S out or LOC B/C with the /FLS function, the ND displays the ILS ident. If the ILS ident is not valid (and if the frequency is not out of range), the ND displays the ILS frequency instead of the LS ident.

MANUAL TUNING

The flight crew has manually tuned the NAVAID, via the RMP.

The flight crew has manually tuned the NAVAID, via the MFD.

AZIMUTH LINE

A white line indicates the azimuth that is used for the computation of the vertical cut of the VD . For more information, *Refer to VD* .
The flight crew can manually select the VD AZIM mode via the VD AZIM knob , on the SURV panel. For more information, *Refer to SURV / WXR / WXR DISPLAY FUNCTION* .

SID(APPROACH) AND/OR TRUE(RUNWAY) INDICATIONS

The ND can display:
- The SID name, or
- The approach name.

The TRUE indication can be combined with the SID or the approach name.
If the ND does not display the TRUE indication, the BTV indication or the runway name can be combined with the approach name.

Indicates the SID name.

Appears when:
- The SID exists in the flight plan, and
- • The PRE-FLIGHT flight phase is active, or
  • T.O or CLB flight phase is active, and the aircraft flies the departure procedure as defined in the FMS (*Refer to DEPARTURE of the FMS*

L12

Indicates the type and the name of the approach.

Appears when:
- The approach exists in the flight plan, and
- • One of the DES , APP , or GA flight phases is active, or
  • The active flight phase is CRZ , and the along track distance to destination is less than 250 nm

The heading reference is magnetic.

L123

The heading reference is TRUE north.
At high latitudes, the ADIRS automatically changes the MAG north reference to the TRUE north reference.

The aircraft is at high latitude:
- Above 82.5 ° North, or
- Above 73.5 ° North, with a longitude between 117.5 ° West, and 92.5 ° West, or
- Below 60.5 ° South.

When the aircraft approaches high latitudes, the SELECT TRUE NORTH REF message requests that the flight crew selects the TRUE north reference.

This message appears:
- Above 82 ° North, or
- Above 73 ° North, with a longitude between 120 ° West, and 90 ° West, or
- Below 60 ° South.

The flight crew can manually change the north reference by pressing the TRUE/MAG pb , on the AFS CP .
The TRUE message flashes for 10 seconds and remains steady when the slats are extended.

L12

The heading reference is TRUE north. The grid track indicates the true track value, minus the aircraft longitude.
The TRUE message flashes for 10 seconds and remains steady when the slats are extended.

L12

Indicates the BTV indication composed by:
- BTV label
- The selected runway name
- The selected exit name.

Appears when the flight crew selects the BTV function on the AUTO BRK Mode selector .

L12

Indicates the runway name.

Appears for autobrake mode (i.e. LO , 2, 3 or HI), or for manual braking when:
- The aircraft reaches 500 ft in final, or
- The flight crew selects a runway on the OANS .

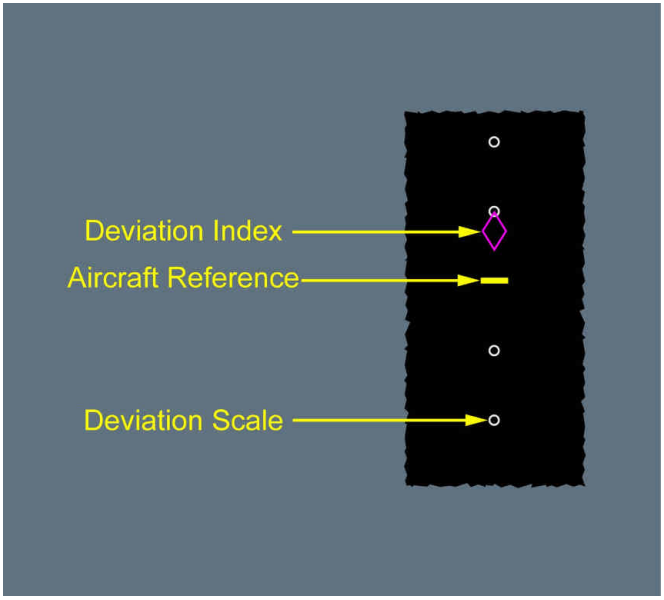
GLIDE SLOPE DEVIATION

Indicates the vertical deviation of the aircraft from the glide slope, during the approach phase.

L2 Appears when:
- The flight crew has selected an approach on the FMS
- The distance to the destination airport is less than 250 nm.

L1 The glide slope deviation is not available, when the flight crew has selected a back beam course approach.

Glide Slope Deviation



DEVIATION SCALE

If the glide slope deviation becomes excessive, the scale and the aircraft reference flash.

DEVIATION INDEX

For Precision Approaches

The glide slope deviation is within the scale.

The aircraft is above the glide slope.
The glide slope deviation is not within the scale.

The aircraft is below the glide slope.
The glide slope deviation is not within the scale.

For NPA Flown with the FLS Function

The glide slope deviation is within the scale.

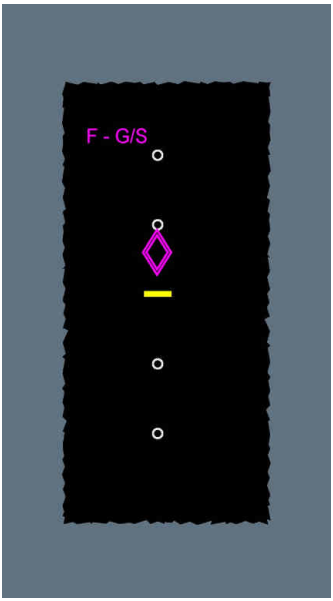
The aircraft is above the FMS glide slope.
The glide slope deviation is not within the scale.

The aircraft is below the FMS glide slope.
The glide slope deviation is not within the scale.

F-G/S LABEL

The ND displays F-G/S, when the flight crew selects the LOC/FLS mode on the FMS.

F-G/S Label



DEVIATION NOT VALID

If the glide slope data is not valid, the ND displays the following flags, instead of the glide slope deviation:

L12

The flight crew has selected a precision approach, and the glide slope deviation is not valid.
Flashes for 9 s, then remains steady.

L12

The flight crew has selected a NPA flown with the FLS function, and the F-G/S deviation is not valid.
Flashes for 9 s, then remains steady.

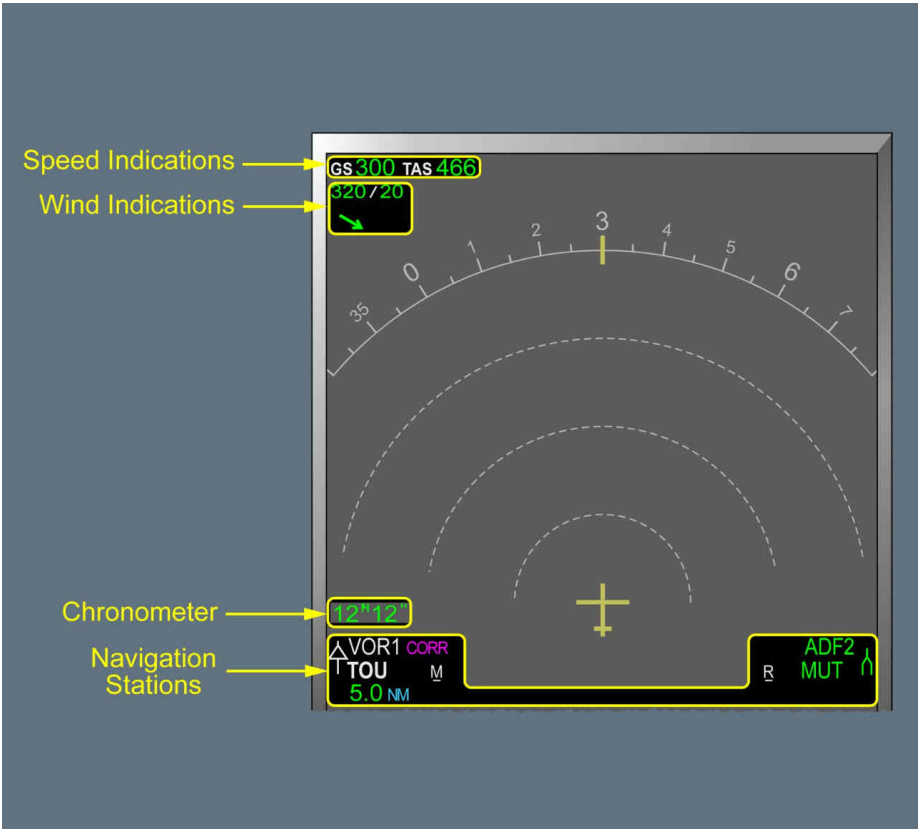
Intentionally left blank

Common Data

COMMON DATA

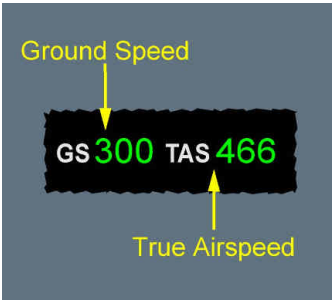
Applicable to: ALL

Common Data Overview



SPEED INDICATIONS

Speed Indications

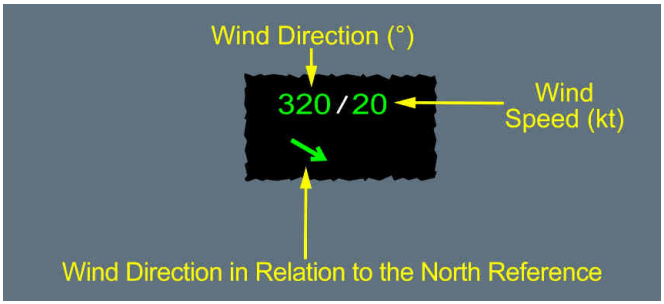


Indicates the current ground speed (GS), and the current true airspeed (TAS), in knots.

L2 The ADIRS provide the GS and the TAS. The ADIRS use the GPS and the IRS data for GS computation.

WIND INDICATIONS

Wind Indications



Indicates the current wind direction (in degrees, TRUE North reference) and the current wind speed (in knots).

If the wind speed is above 2 kt, the ND also displays a green arrow, that indicates the wind direction.

L2

The wind data is not valid.

The ADIRS provides the wind direction and speed data.

CHRONOMETER

The flight crew displays the elapsed time by pressing the onside CHRONO pb , on the EFIS CP . For more information, *Refer to CHRONO pb* .

Indicates the elapsed time in minutes and seconds.

Indicates the elapsed time in hours and minutes.

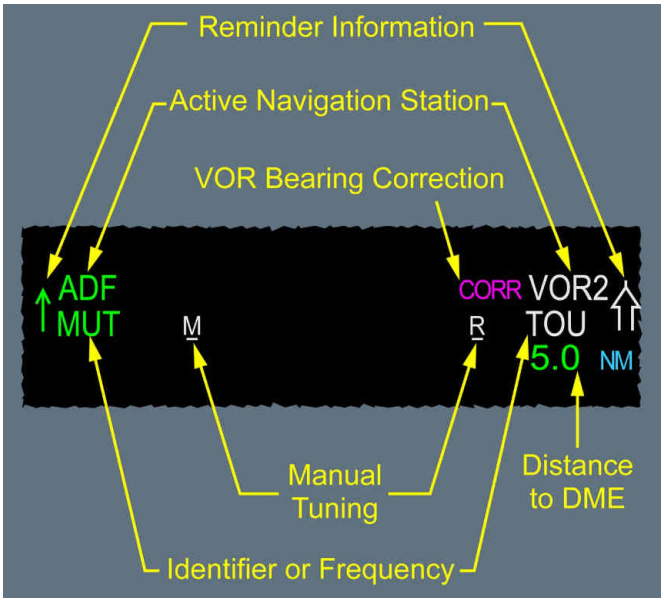
NAVIGATION STATIONS

The ND displays the raw navigation stations data:

- Only in ARC, or ROSE mode
- If the flight crew presses the VOR/ADF pb or the VOR pb , on the EFIS CP.

The left side of the ND corresponds to receiver 1, and the right side of the ND corresponds to receiver 2.

Navigation Stations



ACTIVE NAVIGATION STATION

Indicates the side (1 or 2) of the selected VOR (in white), or of the selected ADF (in green).

L2

The selected bearing is not valid.

L1 **IDENTIFIER OR FREQUENCY**

Indicates the ident of the VOR, DME, or ADF.

L2 If the navigation station ident is not valid, the ND displays the station frequency, instead of the ident.
If the VOR frequency is not valid, the ND displays the DME frequency, instead of the VOR frequency.
The ND displays nothing, if both the identifier and the frequency are not valid.

L1 **MANUAL TUNING**

The flight crew has manually tuned the NAVAID, via the RMP.

The flight crew has manually tuned the NAVAID, via the MFD.

L2 If the FMS automatically tunes the NAVAID, the ND does not display a letter.

L1 **VOR BEARING CORRECTION**

Indicates the VOR bearing correction, when the VOR reference that is in the FMS database (TRUE or MAG), is different from the current aircraft reference (TRUE or MAG).

In ARC or ROSE-NAV mode, the displayed bearing is corrected in relation to the magnetic deviation.

In ROSE-VOR or ROSE-LS mode, the VOR reference is MAG. No correction is applied to the bearing data.

In ROSE-VOR or ROSE-LS mode, the VOR reference is TRUE. No correction is applied to the bearing data.

REMINDER INFORMATION

The reminder information symbol is the same as the symbol of the associated navigation station pointer, displayed on the ARC or ROSE scale.

Indicates the VOR1 reminder information.

Indicates the VOR2 reminder information.

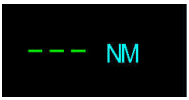
In ARC or ROSE-NAV mode, if the VOR reference (TRUE or MAG) is different from the aircraft flying reference (TRUE or MAG), the ND displays the VOR symbols in magenta. This is because they are corrected in relation to the magnetic deviation.

Indicates the ADF reminder information.

DISTANCE TO DME

Indicates the distance from the aircraft to the selected VOR/DME beacon.

L2



The DME distance is not computed.

The DME distance is not valid.

FMS Data

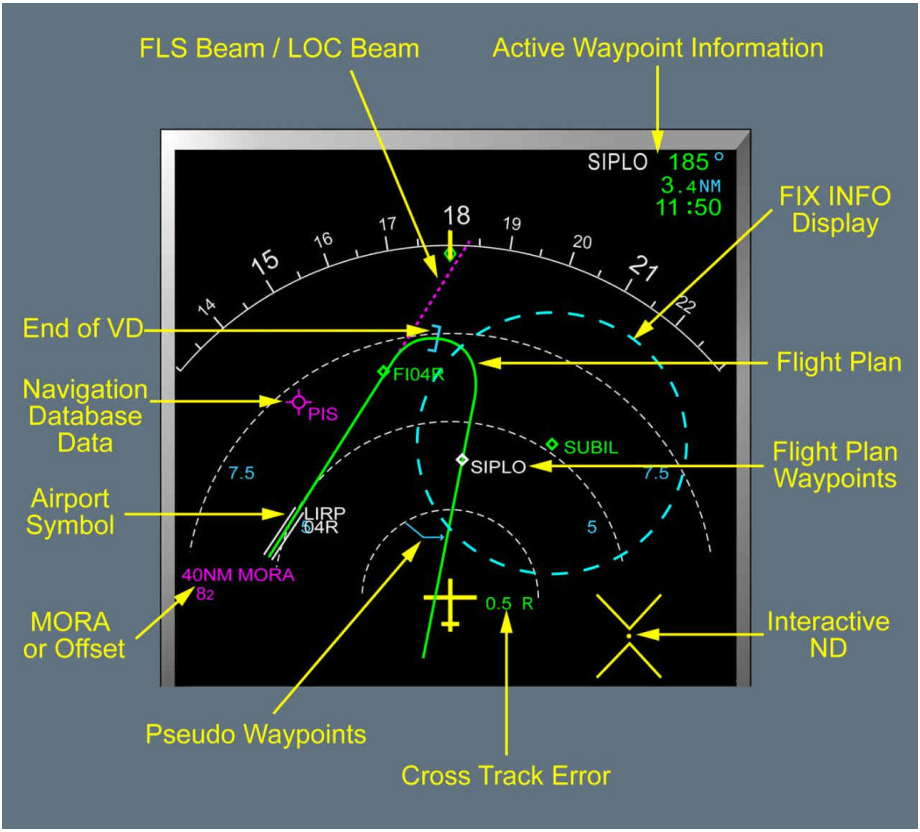
FMS DATA

Applicable to: ALL

The ND displays the flight plan information, if the flight crew has selected:

- The ARC, PLAN, or ROSE-NAV mode
- An ND range that is more, or equal to, 10 nm .

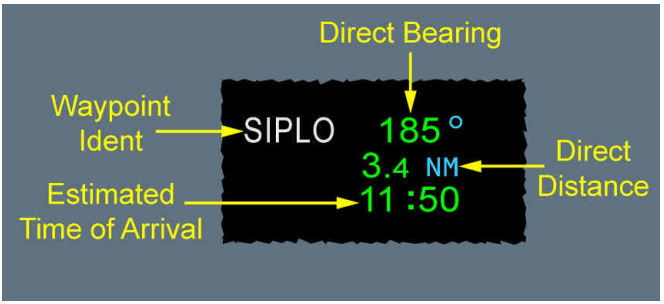
FMS Data



ACTIVE WAYPOINT INFORMATION

Indicates the following active waypoint.

Active Waypoint Information



Note: *The indicated Estimated Time of Arrival (ETA) is based on the estimate that the aircraft will fly directly from its present position to the active waypoint, at its current ground speed.*

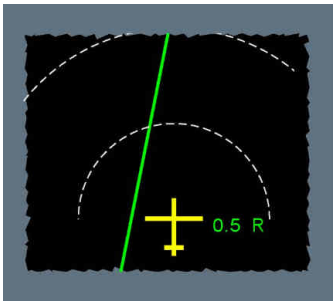
The aircraft flies in the polar zone.
Indicates the bearing to the active waypoint, in the TRUE north reference.

CROSS TRACK ERROR

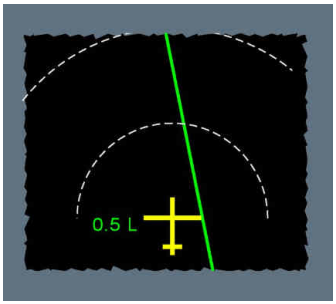
Indicates the lateral deviation of the aircraft from the active flight plan, in nautical miles (nm).

L2 Appears when the lateral deviation is above 0.2 nm.
No longer appears when the lateral deviation is below 0.1 nm.

L1



The aircraft is on the right side of the active flight plan.



The aircraft is on the left side of the active flight plan.

MORA

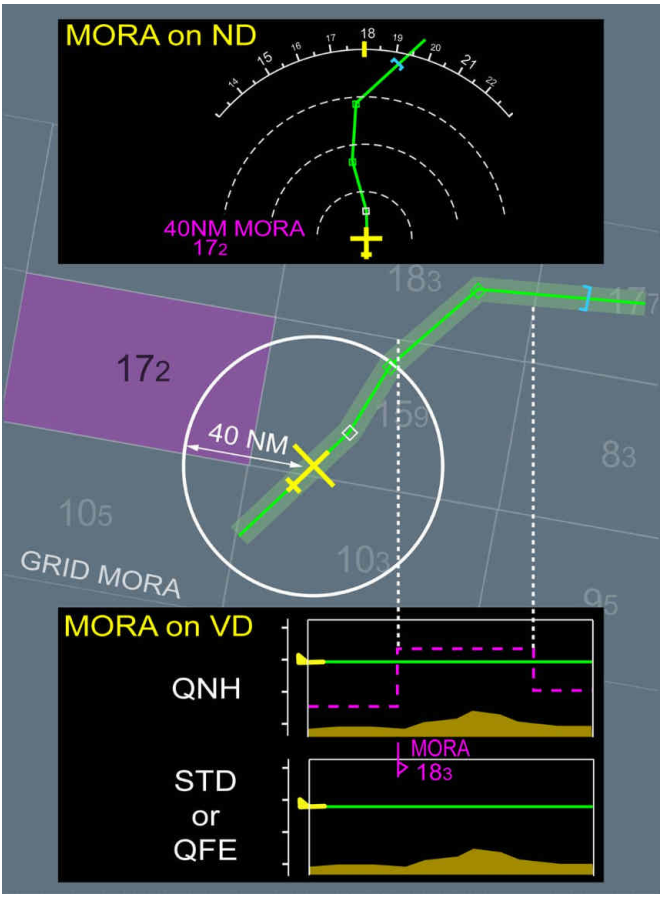
Indicates the highest grid Minimum Off Route Altitude (MORA) in a circular area, that has a fixed radius of 40 nm .

Appears when the flight crew:
- Has pressed the CSTR pb , on the EFIS CP
- Selects an ND range, that is above, or equal to 40 nm .

L3 The MORA unit is the same as the one that is in the charts.

L1 The VD also displays safety altitudes. However, the VD displays the highest grid MORA , or the MSA , along the aircraft trajectory and in the VD range. For more information, *Refer to VD / SAFETY ALTITUDES* .

Safety Altitudes



OFFSET

OFST
L5

Indicates the offset side and distance, when:
- The aircraft is flying the offset trajectory, or
- The offset trajectory is on standby in the temporary flight plan.

Appears in the same color as the flight plan, if the MORA is not already displayed.

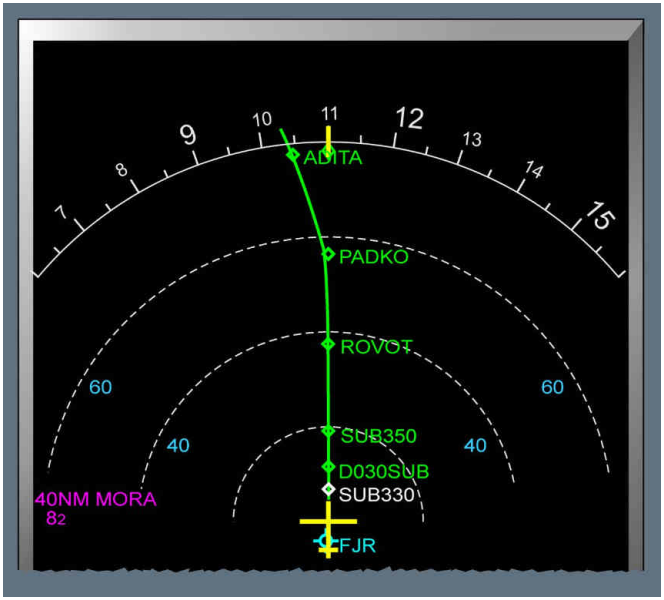
FLIGHT PLAN

The ND displays the following flight plans:

- The active flight plan (in green): If NAV mode is engaged, and the aircraft is on this flight plan

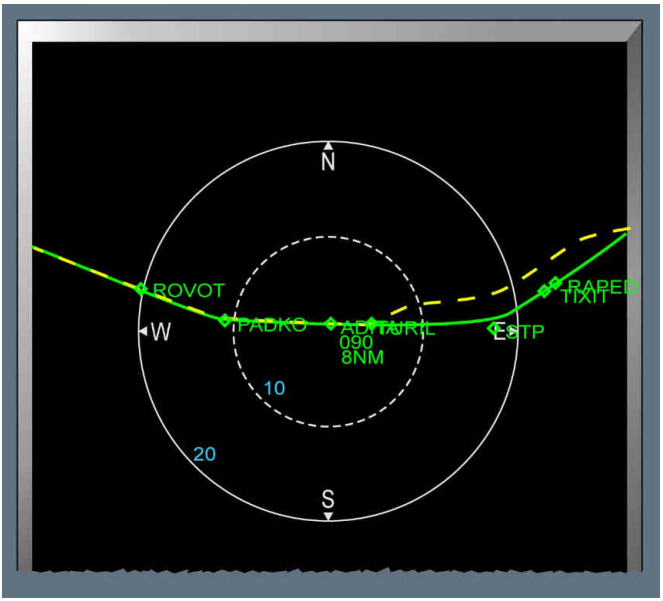
  The active flight plan is associated with:
  - The FROM waypoint
  - The waypoints that are in front of the aircraft.

Active Flight Plan



- The temporary flight plan (in dashed yellow), in addition to the active flight plan

Temporary Flight Plan



- Any of the three secondary flight plans (in white), in addition to the active flight plan. Appears, if the flight crew has selected a SEC page on the onside MFD .

L2 The ND displays only the legs that are different from the active flight plan in white.

Secondary Flight Plan

L1 In PLAN mode, the ND displays only the secondary flight plan, not the active flight plan, if the first leg of the secondary plan and the active leg are different.

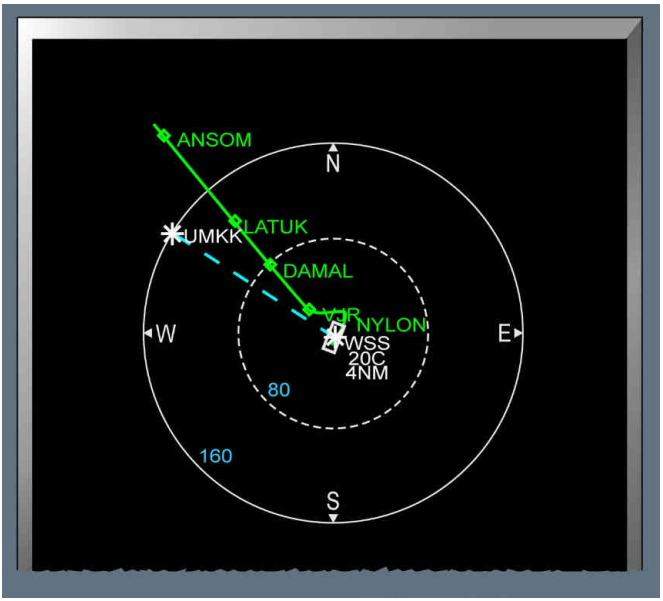
ALTERNATE FLIGHT PLAN

The ND displays the alternate flight plan as a dashed blue line.

Appears when:
- In ARC or ROSE-NAV mode, at least one waypoint of the alternate flight plan is on the FMS F-PLN page of the onside MFD .
- In PLAN mode, the Map Reference Point (MRP) is one of the waypoints of the alternate flight plan.

For more information, *Refer to FMS / FLIGHT PLANING / LATERAL REVISIONS / ALTERNATE* .

Alternate Flight Plan



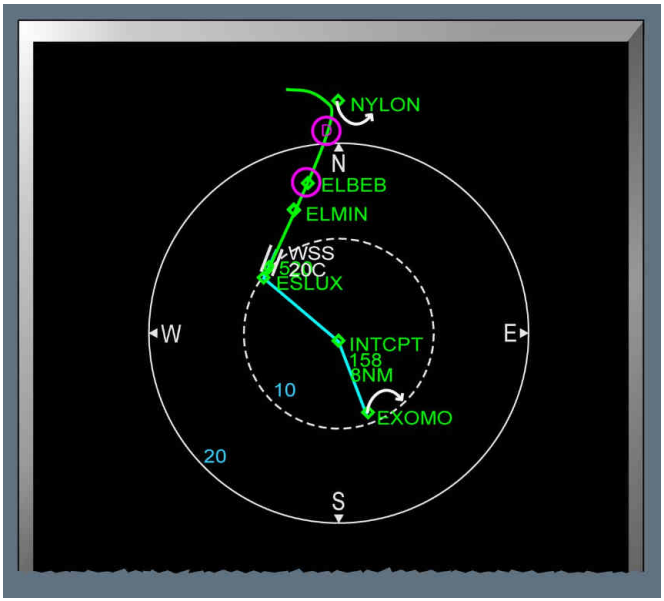
MISSED APPROACH

The ND displays the missed approach as a blue line.

Appears when:

- In ARC or ROSE-NAV mode, at least one waypoint of the missed approach is on the onside MFD .
- In PLAN mode, the MRP is one of the waypoints of the missed approach.

Missed Approach



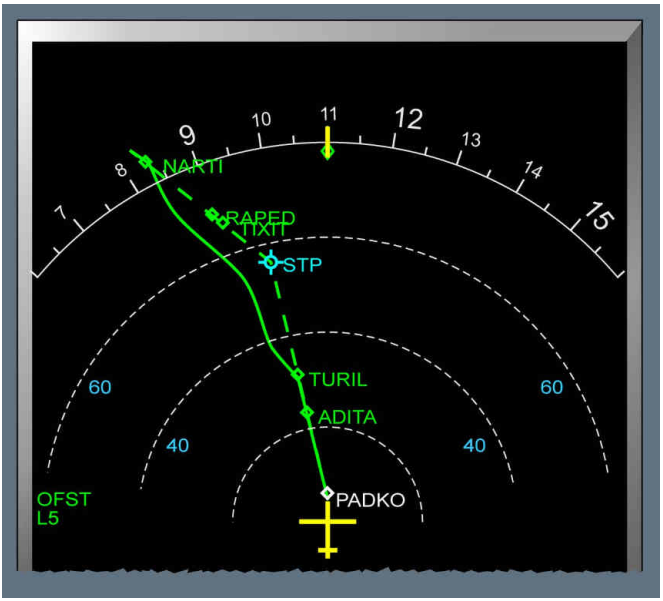
OFFSET PATH

The offset path is parallel to the initial lateral flight plan. For more information, *Refer to FMS / FLIGHT PLANNING / LATERAL REVISIONS / OFFSET* .

In the active (or secondary) flight plan, the ND displays:
- The offset path as a solid line
- The initial path as a dashed line.

Both the offset and the initial paths are the same color as the flight plan.
In the temporary flight plan, the ND displays the offset and the initial paths as dashed yellow lines.
The offset path is not associated with waypoint symbols. The ND only displays the waypoints that are on the initial path.

Offset Path

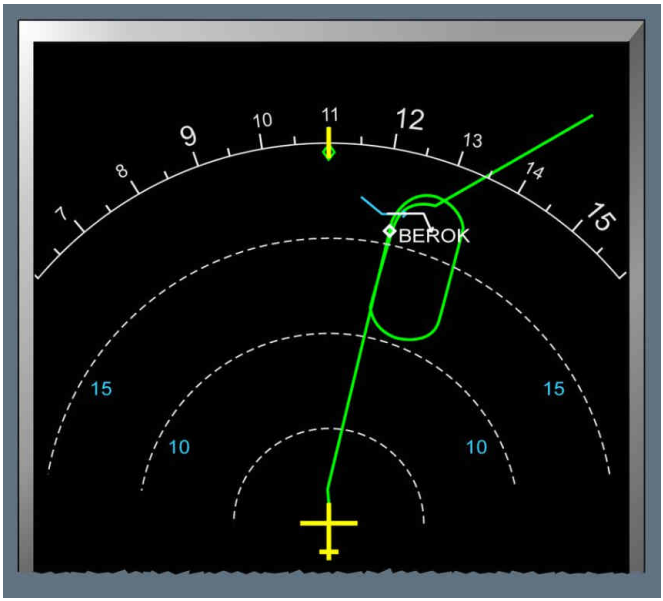


HOLDING PATTERN

The ND displays the entire holding pattern and its entry trajectory, only when:

- The ND range is 80 nm or less, and
- The aircraft has sequenced the waypoint that precedes the hold entry fix or has passed the hold deceleration point.

Holding Pattern



In all other cases, the ND displays the holding pattern symbol.

ENGINE OUT SID (EOSID)

If an engine failure occurs before the diversion point, the ND displays the Engine Out SID (EOSID) as a temporary flight plan (dashed yellow line), until:

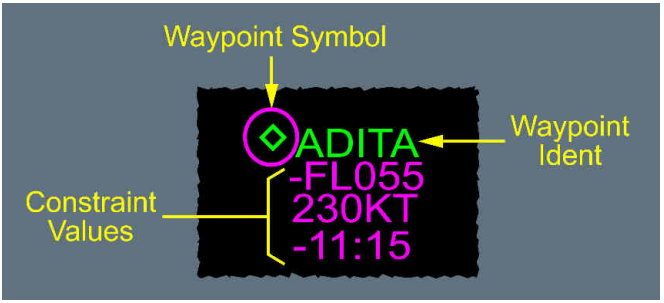
- The aircraft sequences the diversion point, or
- The flight crew inserts or clears the EOSID .

The ND displays a solid yellow line, instead of a dashed yellow line, if:

- An engine failure occurs after the diversion point, or
- An engine failure occurs before the diversion point, and the flight crew has erased the temporary flight plan that contains the EOSID .
- The EOSID is displayed in PLAN mode (even if all engines are operating).

For more information, *Refer to FMS / FLIGHT PLANNING / LATERAL REVISIONS / DEPARTURE* .

FLIGHT PLAN WAYPOINTS



WAYPOINT SYMBOL

Indicates a flight plan waypoint that is in the active flight plan.

Indicates:
- The TO waypoint in the active flight plan, or
- Any secondary flight plan waypoint.

Indicates a flight plan waypoint that is in the temporary flight plan.

If the flight plan waypoint is a tuned NAVAID , the following blue NAVAID symbols appear, instead of the waypoint symbol:

Indicates a DME only, or a TACAN .

Indicates a VOR .

Indicates either a VORTAC , a collocated or non-collocated VOR / DME , or a non-collocated VORTAC .

The ND does not display any symbol for ILS (GLS)-tuned NAVAIDS.
If the flight plan waypoint is a tuned NDB , the following blue NDB symbol appears, instead of the waypoint symbol:

ADF (NDB)

When an altitude constraint is associated with the active flight plan waypoint, the ND displays a circle around the waypoint symbol.

Note: *The ND displays a circle that indicates an altitude constraint, even if the flight crew has not pressed the CSTR pb on the EFIS CP .*

The FMS predicts that the aircraft will comply with the altitude constraint at the waypoint.

The FMS predicts that the aircraft will not comply with the altitude constraint at the waypoint.
An altitude constraint is not satisfied, if the predicted altitude is different from the constraint altitude by 250 ft .

The FMS predicts that the aircraft will not take into account the altitude constraint at the waypoint.

WAYPOINT IDENT

The ND displays the waypoint ident in the same color as the associated flight plan, except for the:
- TO Waypoint that is in white, or
- FIX INFO reference, that is in green, or
- Tuned NAVAID , or NDB , that is in blue.

For more information, *Refer to FMS/CONTROLS AND INDICATORS/MFD PAGES/F-PLN PAGE* .

CONSTRAINT VALUES

If the flight crew presses the CSTR pb on the EFIS CP , the ND displays the constraints values below the waypoint ident.

If there is more than one constraint at the same waypoint, the ND displays the constraint values in the following order:
- The altitude constraint

L2 The ND displays the altitude constraint value:
- In FL , if the altitude is above the transition altitude, or if the barometric setting is STD
- In feet in all other cases.

L1 - The speed constraint
L2 The ND displays the speed constraint value in knots, or in Mach numbers.
L1 - The time constraint.

Note: *For ILS / GLS approaches, the ND only displays speed and time constraints at the FAF waypoint up to destination.*

The constraint value and the constraint symbol have identical color coding.

Note: *In PLAN mode, and at the MRP waypoint, the ND also displays the track and the distance to the next waypoint.*

PSEUDO WAYPOINTS

Pseudo waypoints indicate a vertical flight plan event, only in the active flight plan.

L2 The ND displays pseudo waypoints, according to the following color coding system:
- Blue indicates what the aircraft will do, without any required flight crew action
- White indicates that flight crew action is required, in order to follow the vertical flight plan
- Magenta indicates what the aircraft will do, in order to comply with an FMS constraint, without any required flight crew action
- Green indicates an information.

L12

Pseudo Waypoint	Definition
	Indicates the point at which the aircraft will reach the level that is defined by an altitude constraint. Appears when NAV mode is engaged, and: - CLB, or DES, mode is armed, or - One of the CLB, OPEN CLB, DES, OPEN DES, V/S, or FPA modes is engaged.
	Indicates the point at which the aircraft will reach the target altitude that is selected on the AFS CP. Appears when NAV mode is engaged, and: - CLB, or DES, mode is armed, or - One of the CLB, OPEN CLB, DES, OPEN DES, V/S, or FPA modes is engaged.
	Indicates the predicted Top of Descent (TOD), regardless of the active mode.
	Indicates the predicted TOD. Appears when NAV mode is engaged, and: - DES mode is armed, and ALT mode is engaged, or - One of the CLB, DES, OPEN DES, V/S, or FPA modes is engaged.
	Indicates the predicted start of climb. Appears when NAV mode is engaged, and CLB mode is not armed.

Continued on the following page

Continued from the previous page

Pseudo Waypoint	Definition
	Indicates the predicted start of climb. Appears when NAV mode is engaged, and: - CLB mode is armed, and ALT mode is engaged, or - One of the CLB, OPEN CLB, V/S, or FPA modes is engaged, and the pseudo waypoint indicating that the aircraft reaches the level of an altitude constraint is displayed.
	Indicates the point at which the aircraft will intercept the FMS-predicted descent or approach path, before the AFS CP-selected altitude. Appears when NAV mode is engaged, and V/S, or FPA, mode is engaged.
	Indicates the point at which the aircraft will intercept the FMS-predicted descent or approach path, before the AFS CP-selected altitude. Appears when NAV mode is engaged, and DES, or CLB, mode is armed or engaged.
	In NAV mode and managed speed modes, indicates the starting point of an acceleration or deceleration segment, as computed by the FMS.
	In HDG/TRK and managed speed modes, indicates the point at which the flight crew must change the speed due to the speed limit, while maintaining the selected track.
	Indicates the predicted start of an automatic deceleration, for an approach in a managed speed mode. In the descent or go-around phase, the flight crew must also engage NAV mode (or, if NAV is armed, the FMS must predict NAV mode engagement before the deceleration point).
	Indicates the predicted point at which the flight crew should start the deceleration, for an approach in a selected speed mode.
	Indicates the time marker.
	Indicates the equitime point.

FIX INFO DISPLAY

The flight crew uses the fix info revision (FIX INFO), to compute the intersection of the flight plan with:

- A radial from a specified reference point, and/or
- A circle with a specified reference point as the center, and/or
- The abeam line from a specified reference point.

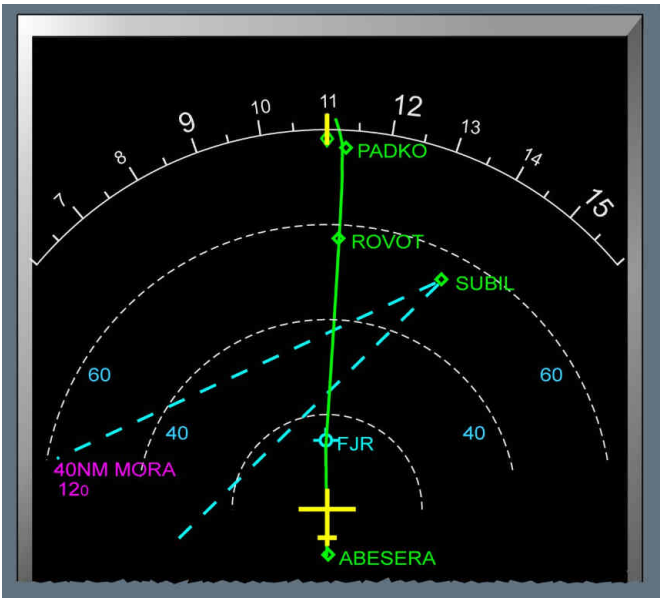
The reference FIX is in green on the onside ND .
For more information, *Refer to FMS / FLIGHT PLANNING / LATERAL REVISIONS / FIX INFO* .

RADIAL INTERCEPT

The ND displays the radial as dashed blue line, whether an intersection with the flight plan exists, or not.

If the flight crew inserts the radial intercept point in the temporary flight plan, the radial no longer appears.

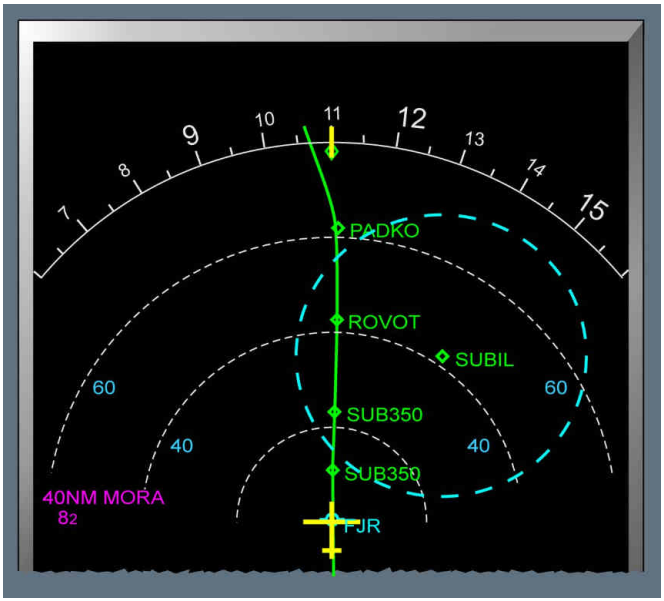
Radial Intercept Point



CIRCLE INTERCEPT

The ND displays the circle intercept as dashed blue circle, whether an intersection with the flight plan exists, or not.
If the flight crew inserts the circle intercept point in the temporary flight plan, the circle no longer appears.

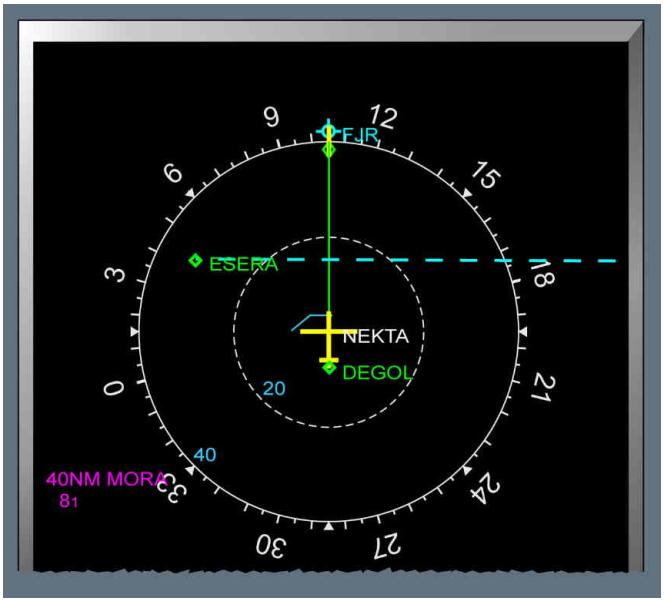
Circle Intercept Point



ABEAM INTERCEPT

The ND displays the abeam radial as dashed blue line, only when an intersection with the flight plan exists.
If the flight crew inserts the abeam intersect point in the temporary flight plan, the radial no longer appears.

Abeam Intercept Point



NAVIGATION DATABASE DATA

The flight crew can display all the data of the navigation database, and of the pilot stored elements database, on the ND.

WAYPOINTS

Indicates all the waypoints defined in the navigation database and/or stored waypoints, that are different from the flight plan waypoints
Appears when the flight crew presses the WPT pb on the EFIS CP.

NAVAIDS

Indicates the DME or the TACAN stations.
Appears when the flight crew presses the VORD pb on the EFIS CP.

Indicates the VOR stations.
Appears when the flight crew presses the VORD pb on the EFIS CP.

Indicates the VORTAC, the collocated or the non-collocated VOR/DME, or the non-collocated VORTAC stations.
Appears when the flight crew presses the VORD pb on the EFIS CP

Indicates the ADF stations.
Appears when the flight crew presses the NDB pb on the EFIS CP.

Note: The ND displays the tuned NAVAIDS in blue.

AIRPORT

Indicates all the airports (defined in the navigation database) and/or the stored airports that are different from the origin and the destination of the flight plan.
Appears when the flight crew presses the ARPT pb on the EFIS CP.

AIRPORT SYMBOL

The ND displays the origin and the destination airports for the active, temporary, and secondary flight plans.

The origin or the destination waypoint is an airport, and the runway is not specified.

The origin or the destination waypoint is a runway, and the flight crew has selected an ND range that is more, or equal, to 160 nm. The ND adjusts the display of the runway based on the QFU.

L12

The origin or the destination waypoint is a runway, and the flight crew has selected an ND range thatislowerthan160 nm. The ND adjusts the display of the runway based on the QFU.
The runway length that is displayed is the real length of the runway, in relation to the selected range.

FLS BEAM

Indicates in dotted magenta line the F-LOC beam of the Non Precision Approach (NPA): VOR, VOR/DME, RNAV (including GPS).

L2 Appears when the flight crew:
- Selects a VOR, VOR/DME, or RNAV (including GPS) approach, in the active flight plan
- Presses the LS pb on the EFIS CP, or the APPR pb on the AFS CP
- Selects an ND range that is less than or equal to:
  - 80 nm in ARC or PLAN mode, or
  - 160 nm in ROSE-NAV mode.

L1 If the anchor point is not defined at the runway threshold, the FMS displays the anchor point ident in magenta.

FLS Beam

LOC BEAM

Indicates in dotted magenta line the LOC beam of ILS, LOC, or BAC approach.

L2 Appears when the flight crew:
- Selects an ILS, LOC, or BAC approach, in the active flight plan
- Presses the LS pb on the EFIS CP, or the APPR pb on the AFS CP
- Selects an ND range that is less than or equal to:
  - 80 nm in ARC or PLAN mode, or
  - 160 nm in ROSE-NAV mode.

LOC Beam

END OF VD SYMBOL

Indicates the end of the VD , when the aircraft follows a flight plan.

L2 *Note: When the destination airport is in the VD range, the end of VD symbol is not displayed.*

L1 For more information, *Refer to VD / RANGE* .

INTERACTIVE ND

The flight crew can use the KCCU to change the flight plan on the ND . For more information, *Refer to DSC-31-20-30-90 Interactive ND Overview* .

Interactive ND

INTERACTIVE ND OVERVIEW

Applicable to: ALL

The flight crew can perform the following FMS tasks, via the interactive functions of the ND :
- Direct TO (FROM P.POS DIR TO or DIR TO). *Refer to DIRECT TO revision*
- Insert a waypoint (INSERT NEXT WPT). *Refer to INSERT NEXT WPT revision*
- Delete a waypoint (DELETE). *Refer to DELETE function*
- Select an airport for data consultation (DATA). *Refer to Airport DATA display*
- Insert or delete/undo a temporary flight plan. *Refer to INSERT or ERASE TMPY* .

The flight crew can use the interactive functions of the ND only in ARC, PLAN, or ROSE-NAV mode, because these functions are associated with the flight plan display.
In PLAN mode, the flight crew can scroll through the entire flight plan, using the KCCU trackball.

ACCESS

The flight crew can use the KCCU to move the cursor to the ND , by:
-
  Pressing the ND key 

, or
-
  Pressing the navigation key  (One time, if the cursor is on the MFD , and two times, if the cursor is on the mailbox).

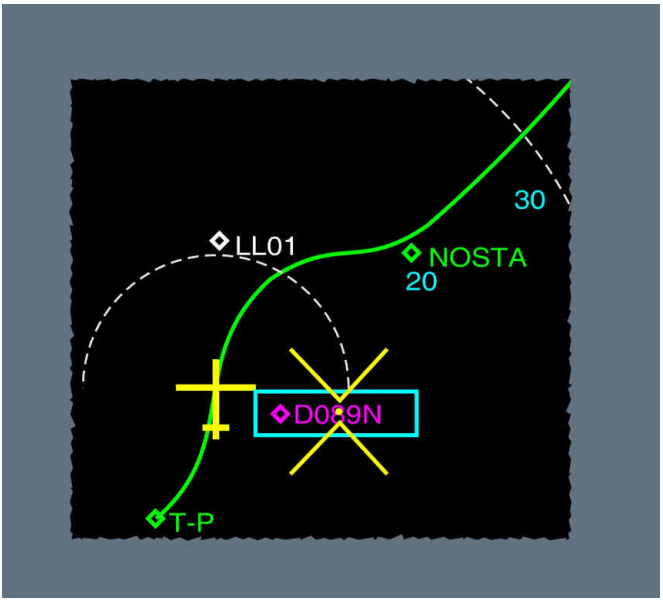
INTERACTIVE ELEMENTS

The flight crew can use the cursor to access:
- The aircraft symbol
- The flight plan waypoints
- The navigation database waypoints, the airports, and the NAVAIDS.

L2 If the ND displays a DIR TO temporary flight plan, no FMS revision is available via the interactive ND .
If the ND displays a secondary flight plan, the interactive functions are only available for the optional airports.

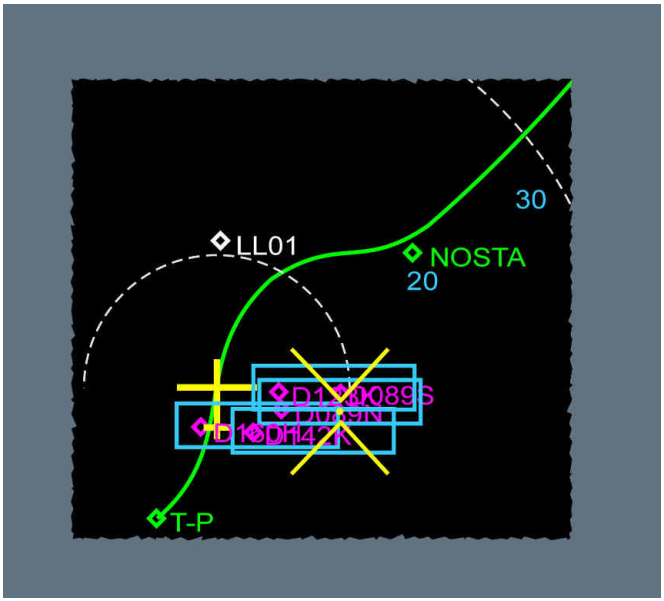
L1 A blue rectangle highlights the interactive areas around the selected element.

Interactive Area



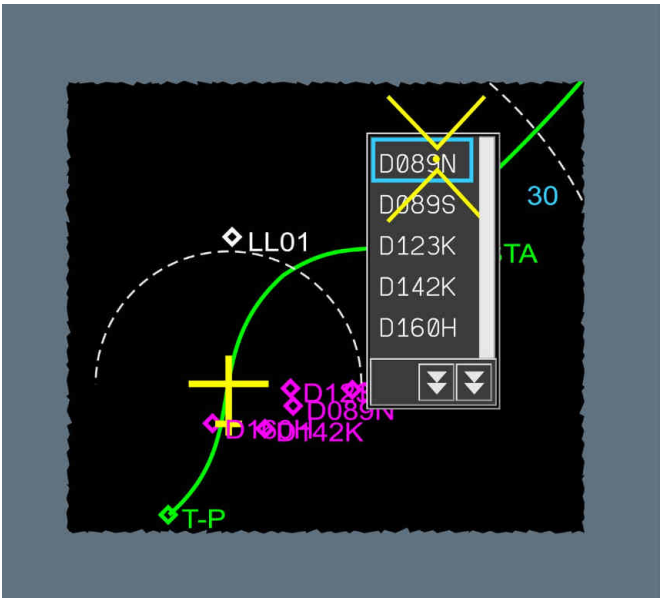
L2 If the active zone, below the cursor, contains more than one element, all the areas are highlighted.

Cursor Selection



If the flight crew clicks on an interactive area, the ND displays a list of all the interactive elements.

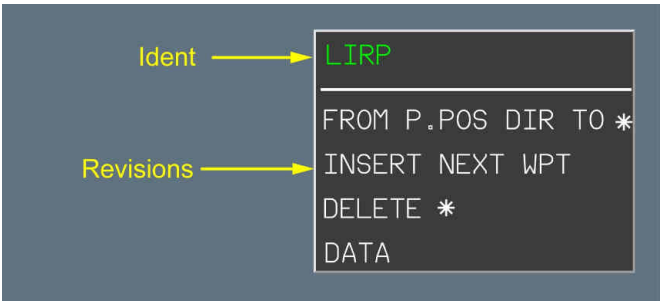
Dialog Box



If the flight crew selects one of the elements from the list, the ND displays the following revision list.

L1 If the flight crew clicks on the blue rectangle, the ND displays the list of the revisions that are available on the selected element.

Revisions List



IDENT

Indicates the ident of the selected element.

Appears:

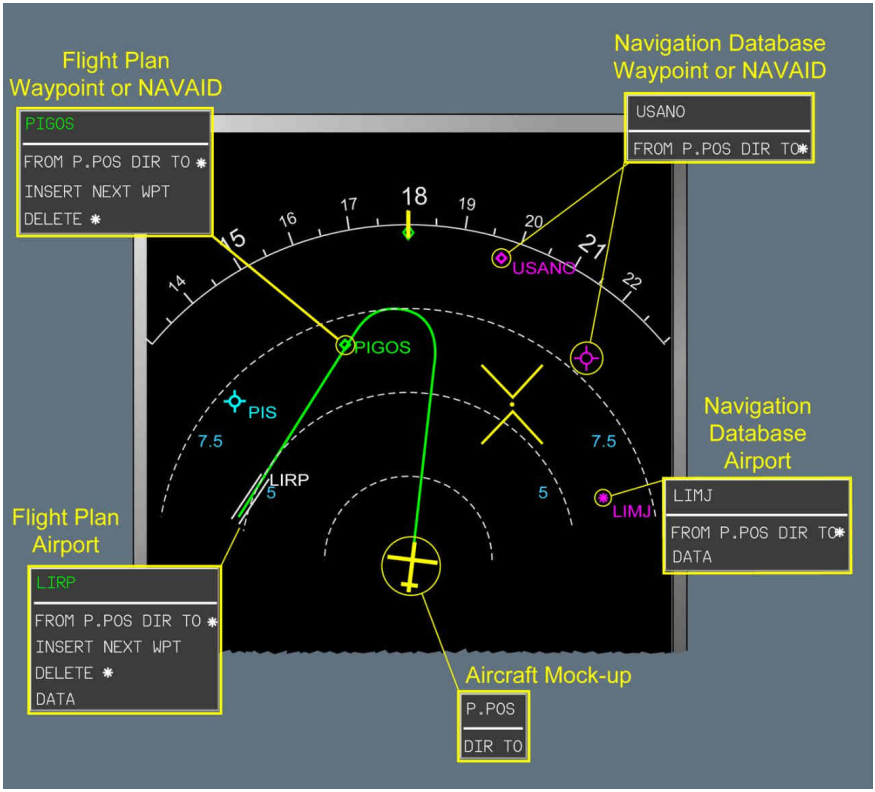
- In green, if the selected element is a waypoint (or an airport) in the active flight plan, or
- In yellow, if the selected element is a waypoint (or an airport) in the temporary flight plan, or
- In white, in all other cases.

If the selected element is the aircraft mock-up, the ident is P.POS.

REVISIONS

The list of the revisions depends on the type of the selected element:

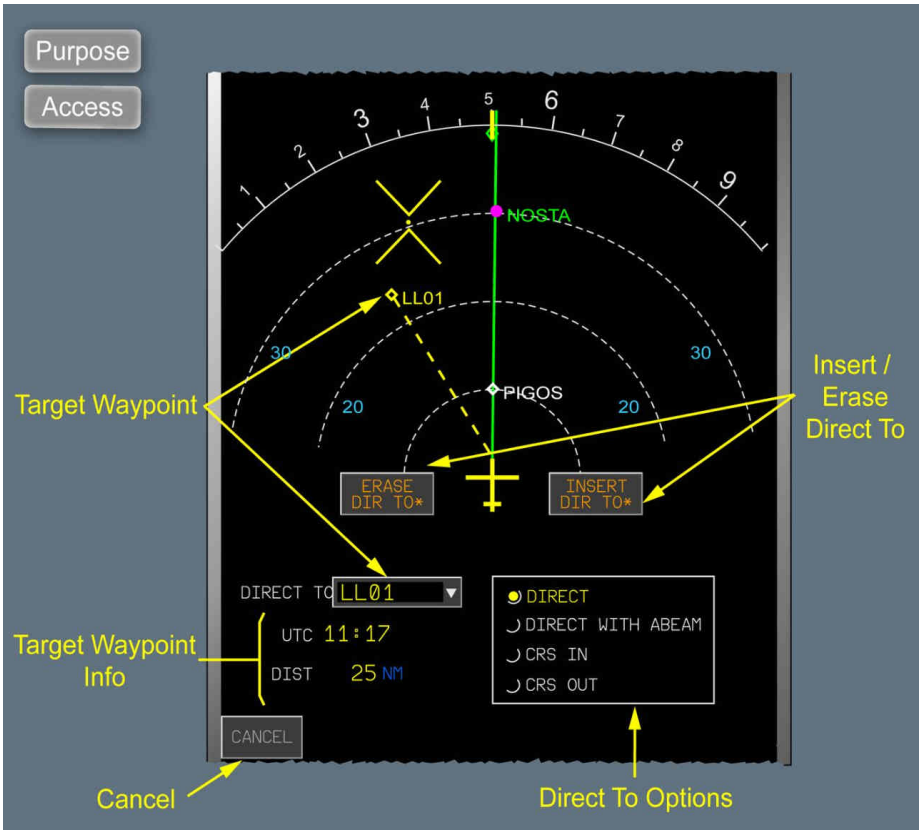
Interactive Areas and Revisions



DIRECT TO

Applicable to: ALL

DIRECT TO



PURPOSE

The DIRECT TO page enables the flight crew to insert:

- A DIRECT TO leg (DIRECT)
- A DIRECT TO leg with abeam waypoints (DIRECT WITH ABEAM)
- A DIRECT TO leg with interception of an inbound radial (CRS IN)
- A DIRECT TO leg with interception of an outbound radial (CRS OUT).

The DIRECT TO page is only available for the active flight plan.

LINKS

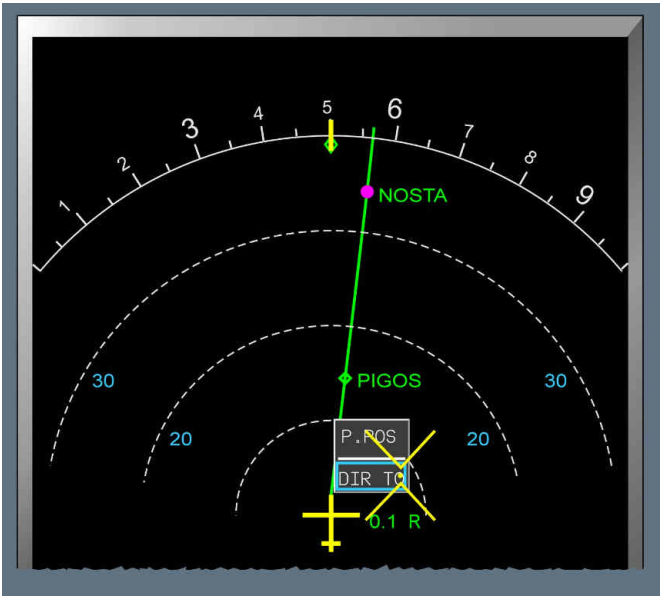
For more information, *Refer to FMS/FLIGHT PLANNING/LATERAL REVISIONS/DIRECT TO revision* .

ACCESS

The flight crew can access the DIRECT TO revision, via the interactive function of the ND, by selecting either:

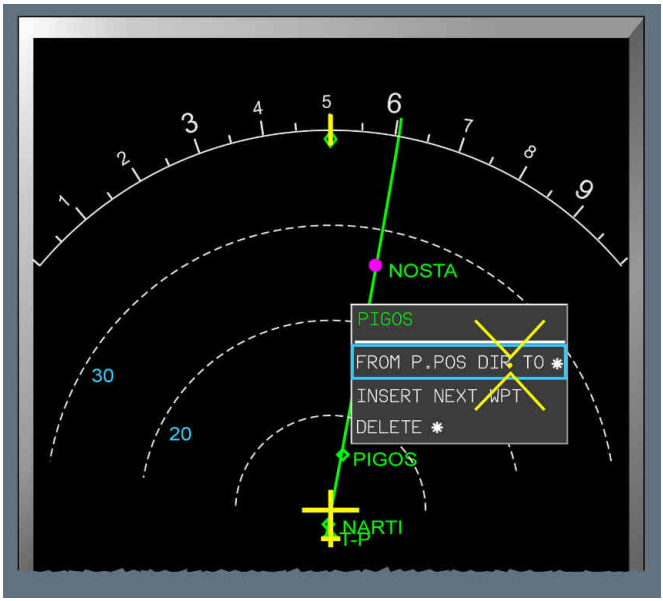
- DIR TO from the aircraft mock-up, or

DIR TO Revision



- FROM P.POS DIR TO * from any other interactive element.

DIRECT TO Revision



L2 If the ND displays a temporary flight plan, the flight crew cannot access the DIRECT TO revision.

TARGET WAYPOINT

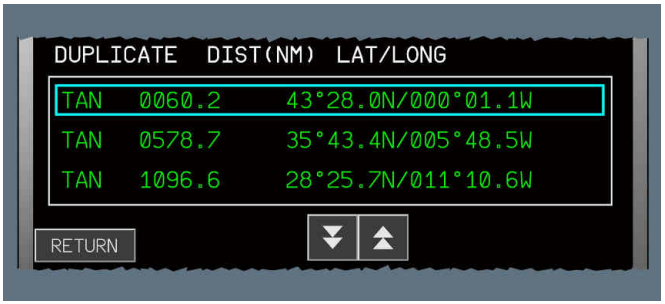
The flight crew can enter the target waypoint:

- Automatically:
  - If the flight crew selects the DIRECT TO revision on the FROM P.POS DIR TO menu. The target waypoint is the element from which the menu is selected.
  - If the flight crew selects the DIRECT TO revision at the aircraft mock-up, and the flight crew has selected the target waypoint via the cursor. The flight crew selects the target waypoint by clicking on an existing element, or by clicking on an blank area of the ND to create a latitude/longitude waypoint.
- Manually:
  - By selecting the waypoint ident from the list, or

Waypoint Entry Field and List

  - By entering the waypoint ident in the entry field, using the KCCU.
    If the entered ident is not the only ident in the database, a DUPLICATE window appears for the flight crew to select the appropriate waypoint.

DUPLICATE Page



DIRECT TO OPTIONS

The flight crew can select the DIRECT TO option.

L2 The default DIR TO option is DIRECT, or DIRECT WITH ABEAM, depending on the Operator's selection. The AMI files defines the default DIRECT TO option. (*Refer to AMI file)*

L1 When the flight crew selects the CRS IN or the CRS OUT option the ND displays an associated entry field.

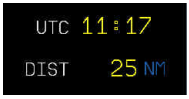
CRS ENTRY FIELD

If the DIRECT TO target waypoint is a flight plan waypoint, the FMS enters a default value for the inbound or outbound radial.
The default CRS IN is the course from the flight plan waypoint that precedes the target waypoint, to the target waypoint.
The default CRS OUT is the course from the target waypoint to the flight plan waypoint that follows the target waypoint.

ENTRY FORMAT

Refer to CRS IN (CRS OUT) ENTRY FORMAT

TARGET WAYPOINT INFO



Indicates the UTC time of arrival at the target waypoint, and the distance between the current position of the aircraft and the target waypoint.

INSERT DIRECT TO BUTTON

L12

When clicked, inserts the temporary flight plan, and the ND displays the new active flight plan.

The ND displays the INSERT DIRECT TO button, if:
- A DIR TO temporary flight plan exists
- The cursor is in the ND window.

ERASE DIRECT TO BUTTON

L12

When clicked, erases the temporary flight plan, and the ND displays the active flight plan. (*Refer to Page*)

The ND displays the ERASE DIRECT TO button, if:
- A DIR TO temporary flight plan exists
- The cursor is in the ND window.

CANCEL BUTTON

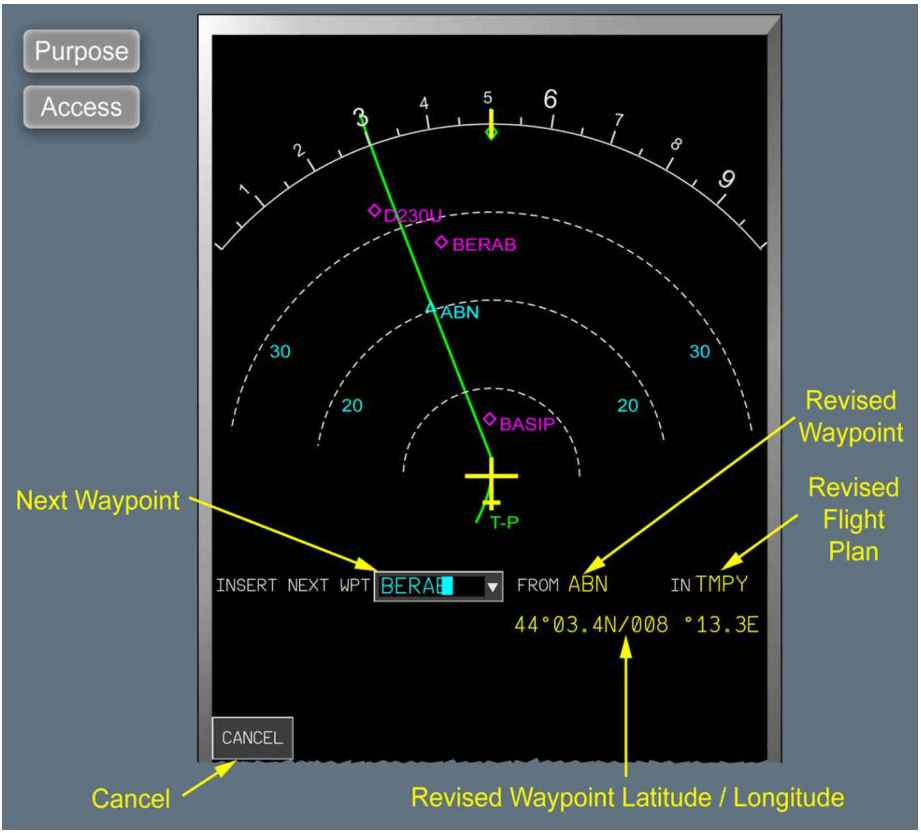
L12

When clicked, closes the DIRECT TO ND page, and the ND returns to the flight plan display.
Appears if no temporary flight plan is on standby.

INSERT NEXT WPT

Applicable to: ALL

INSERT NEXT WPT



PURPOSE

The flight crew uses the insert next waypoint (INSERT NEXT WPT) revision to insert a waypoint after the revised waypoint.

The flight crew can insert:
- A flight plan waypoint
- Any navigation database waypoint, airport, or NAVAID
- A latitude/longitude (LL), a place/bearing/distance (PBD), a place-bearing/place-bearing (PB / PB), or a place/distance (PD) waypoint.

L2 *Note:*
- *A PD waypoint, with a negative distance (example: LMG/-15), is inserted "before" the revised waypoint*
- *The "place" waypoint needs to be the revised waypoint*
- *The distance of the PD waypoint is limited so that the PD cannot be before (after) the waypoint that precedes (follows) the revised waypoint.*

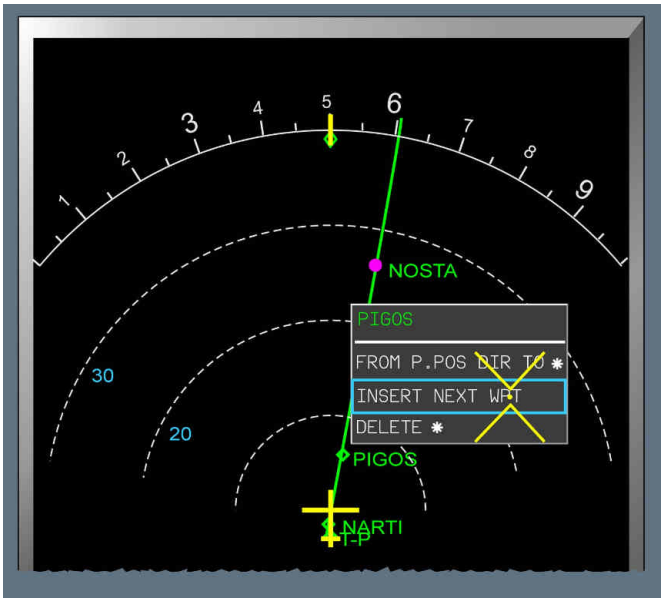
L1 **LINKS**

For more information, *Refer to FMS / FLIGHT PLANING / LATERAL REVISIONS / INSERT NEXT WPT Revision* .

ACCESS

The flight crew can access the INSERT NEXT WPT revision on the ND, by selecting INSERT NEXT WPT from any interactive element of the flight plan.

INSERT NEXT WPT Revision



REVISED WAYPOINT

Indicates the waypoint from which the flight crew has selected the INSERT NEXT WPT revision.

Appears:
- In green, if the waypoint is part of the active flight plan, or
- In yellow, if the waypoint is part of the temporary flight plan.

REVISED FLIGHT PLAN

Indicates that the revised waypoint is part of the temporary flight plan.
Appears if the revised flight plan is the temporary flight plan.

REVISED WAYPOINT LATITUDE/LONGITUDE

Indicates the latitude and the longitude of the revised waypoint, unless the revised waypoint is the FROM waypoint.

Appears:
- In green, if the waypoint is part of the active flight plan, or
- In yellow, if the waypoint is part of the temporary flight plan.

NEXT WAYPOINT

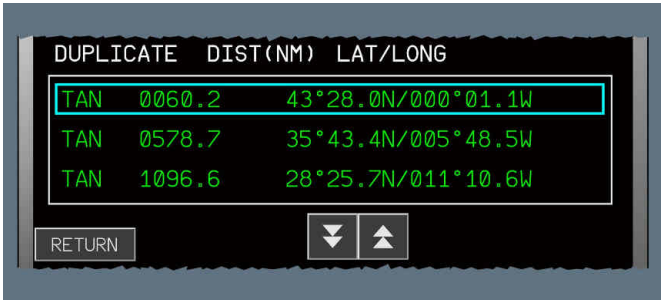
The flight crew can enter the next waypoint:

- With the cursor, if the flight crew clicks on an existing element, or on an blank area of the ND to create a latitude/longitude waypoint, or
- By selecting the waypoint ident from the list, or

Waypoint Entry Field and List

- By entering the waypoint ident in the entry field, using the KCCU. If the entered ident is not unique in the database, a DUPLICATE window appears. This window enables the flight crew to select the appropriate waypoint from a list of all the elements that have the same ident.

DUPLICATE Page



CANCEL BUTTON

L12

When clicked, closes the INSERT NEXT WPT ND page, and the ND returns to the flight plan display.
Appears if no temporary flight plan is on standby.

DELETE

Applicable to: ALL

PURPOSE

The flight crew uses the DELETE revision:

- To remove a waypoint from the flight plan
- To insert a discontinuity.

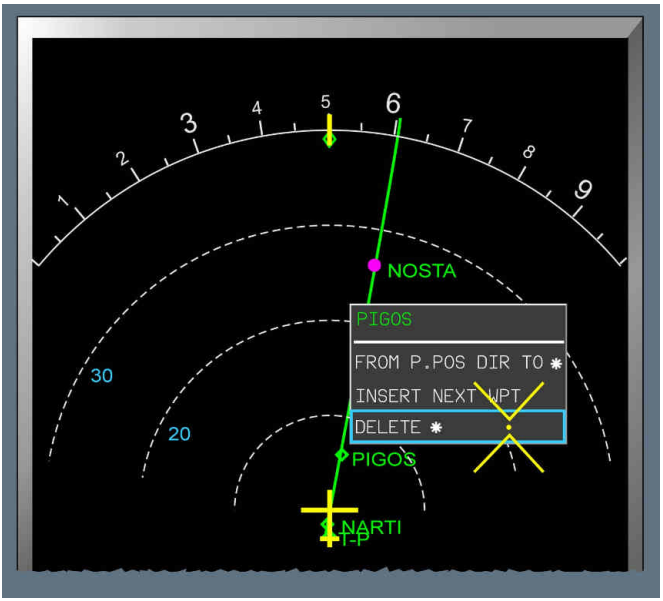
LINKS

For more information, *Refer to FMS/ FLIGHT PLANING / LATERAL REVISIONS / DELETE revision* .

ACCESS

The flight crew can access the DELETE revision on the ND by selecting DELETE * option on any interactive element of the flight plan.

DELETE Revision



DATA

Applicable to: ALL

PURPOSE

The flight crew can display the DATA / AIRPORT page on the MFD , by selecting the DATA option from any airport in the flight plan, or in the navigation database.

ARPTs Panel of the DATA / AIRPORT Page

LINKS

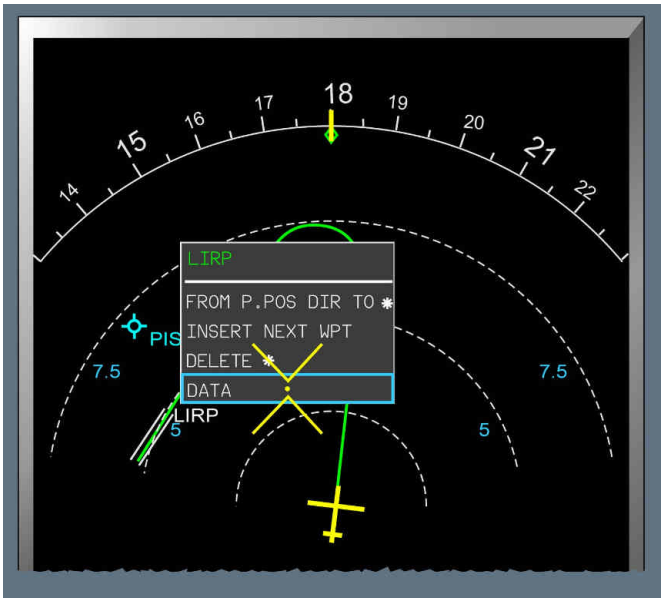
For more information, *Refer to FMS / MFD PAGES / DATA / AIRPORT page* .

ACCESS

The flight crew can access the DATA option on the ND by selecting DATA option on any airport in:

- The flight plan, or

Flight Plan Airport



- The navigation database.

Navigation Database Airport

INSERT OR ERASE TMPY

Applicable to: ALL

PURPOSE

The flight crew can insert, or erase, the temporary flight plan that is displayed on the ND.

Note: *The ND displays the INSERT and ERASE buttons only when the cursor is in the ND.*

ACCESS

The flight crew can access the INSERT or the ERASE functions by clicking on the applicable button with the cursor.

INSERT or ERASE TMPY

AIRPORT NAVIGATION MESSAGES

Applicable to: ALL

ARPT NAV POS LOST

Appears in PLAN, ARC, or ROSE-NAV mode when the ND RANGE selector is set to ZOOM, and:
- An IRS failed, or
- Both MMRs failed.

ARPT NOT IN ACTIVE F-PLN

Appears in PLAN mode, when:
- The flight crew set the ND RANGE selector to ZOOM position
- The moving airport map is not part of the active F-PLN (i.e. origin, alternate, or destination airports). For more information, *Refer to DSC-34-10-70-20-GND Additional Functions* .

NOT AVAIL

Appears in PLAN, ARC or ROSE-NAV mode when the ND RANGE selector is set to ZOOM, and the airport navigation display is not available.

PLEASE WAIT

Appears in PLAN, ARC or ROSE-NAV mode when the ND RANGE selector is set to ZOOM. The flight crew request related to the airport navigation display is in progress.

FMS MESSAGES

Applicable to: ALL

CHECK NORTH REF

Appears in ARC, ROSE-NAV, or PLAN mode, when:
- The reference (TRUE or MAG) of the origin airport in the FMS database is not in accordance with the TRUE/MAG pb selection at takeoff, or
- The reference (TRUE or MAG) of the destination airport in the FMS database is not in accordance with the TRUE/MAG pb selection.

L2 The FMS provides the CHECK NORTH REF message.
L1 The flight crew can change TRUE or MAG reference, via the TRUE/MAG pb on the AFS CP.

Indicates that another FMS message is on standby.

CHECK NORTH REF

GPS PRIMARY

Appears in any ND mode, when:
- The navigation mode is GPIRS
- The navigation accuracy is HIGH.

For more information, *Refer to FMS / NAVIGATION FUNCTIONS / GPIRS position* .

L2 The FMS provides the GPS PRIMARY message.

L1 ↓ Indicates that another FMS message is on standby.

GPS PRIMARY

GPS PRIMARY LOST

Appears in any ND mode when the GPS is no longer the primary means for the computation of the FMS position.

For more information, *Refer to DSC-22-FMS-10-30-10-22FMS30E Aircraft Position Accuracy - Navigation Accuracy* .

L2 The FMS provides the GPS PRIMARY LOST message.

GPS PRIMARY LOST

MAP PARTLY DISPLAYED

Appears in ARC, ROSE-NAV, or PLAN mode:

- If the data transmission between the FMS and the CDS is not complete, or
- If the CDS cannot provide the entire map.

L2 The FMS or the CDS provides the MAP PARTLY DISPLAYED message.

MAP PARTLY DISPLAYED

NAV ACCUR DOWNGRADED

Appears in ARC, ROSE-NAV, or PLAN mode, when the navigation accuracy changes from HIGH to LOW. In the approach phase, the NAV ACCUR DOWNGRADED message appears only one time, to avoid disturbing the flight crew.

For more information, *Refer to FMS / NAVIGATION FUNCTIONS / POSITION ACCURACY* .

L2 The FMS provides the NAV ACCUR DOWNGRADED message.

L1 

Indicates that another FMS message is on standby.

NAV ACCUR DOWNGRADED

NAV ACCUR UPGRADED

Appears in ARC, ROSE-NAV, or PLAN mode, when:
- The navigation accuracy changes from LOW to HIGH
- The aircraft is not in the approach phase.

For more information, *Refer to FMS / NAVIGATION FUNCTIONS / POSITION ACCURACY* .

L2 The FMS provides the NAV ACCUR UPGRADED message.

L1

Indicates that another FMS message is on standby.

NAV ACCUR UPGRADED

SELECT TRUE NORTH REF

Appears in ARC, ROSE-NAV, or PLAN mode, when:

- The aircraft enters the polar zone

L3
- Above82 °North, or
- Above 73 ° North, with a longitude between 120 ° West, and 90 ° West, or
- Below 60 ° South.

L1 - The TRUE/MAG pb is set to MAG.

L2 The FMS provides the SELECT TRUE NORTH REF message.

L1  Indicates that another FMS message is on standby.

SELECT TRUE NORTH REF

SPECIFIC VOR-D NOT AVAIL

Appears In ARC, ROSE-NAV, or PLAN mode, when the FMS does not receive the tuned NAVAID for the selected approach, or departure.

L2 The FMS provides the SPECIFIC VOR-D NOT AVAIL message.

L1  Indicates that another FMS message is on standby.

SPECIFIC VOR-D NOT AVAIL

ND DISPLAY MESSAGES

Applicable to: ALL

CHECK HDG

Appears in ARC or ROSE mode, when the CDS detects a discrepancy between the heading parameters on the Captain's ND and on the First Officer's ND .

L2 Flashes for 9 seconds, then remains steady.

The CDS detects a discrepancy, if the difference between the two headings is more than:
- 5 ° in TRUE reference
- 7 ° in MAG reference.

L1 For more information about the warning and the procedure associated with the CHECK HDG message, *Refer to NAV CAPT AND F/O HDG DISAGREE* .

CHECK HDG

MAP NOT AVAIL

Appears when:

- ND MODE CHANGE or ND RANGE CHANGE appears for more than 6 s, or
- The aircraft true heading is not valid, or
- The FMS is not valid.

L2 The FMS provides the MAP NOT AVAIL message.

MAP NOT AVAIL

ND MODE CHANGE

Appears when:

- The FMS mode, and ND mode, of the EFIS CP are temporarily different (e.g. due to a change of mode), or
- A new page is being prepared for display.

ND MODE CHANGE

ND RANGE CHANGE

Appears when the FMS range, and ND range, of the EFIS CP are temporarily different (e.g. due to a change of range).

ND RANGE CHANGE

NO AZIM IN PLAN

Appears when:

- The flight crew selects the manual AZIM mode of the SURV system
- The ND is in PLAN mode.

L2 *Note:* *The AZIM mode is only available in ARC or ROSE mode.*

NO AZIM IN PLAN

OFFSIDE FM CONTROL

Appears in ARC, ROSE-NAV, or PLAN mode, when the offside FMS supplies the ND . When the FMS selector is set to BOTH ON 1(BOTH ON 2), the active FMC on the Captain's (First Officer's) side provides data to the flight management interfaces of both sides. For more information on the displays when BOTH ON1(2) is selected, *Refer to FMS Selector* .

OFFSIDE FM CONTROL

SURV MESSAGES

Applicable to: ALL

TA ONLY

Appears when the TCAS is in TA ONLY mode.

The flight crew can select this mode by:
- Pressing the TA pb on the SURV panel, or
- Selecting the TA ONLY option on the SURV/CONTROLS page of the MFD.

TA ONLY

TCAS

Appears when:
- The TCAS is failed
- The TRAF pb is pressed on the EFIS CP.

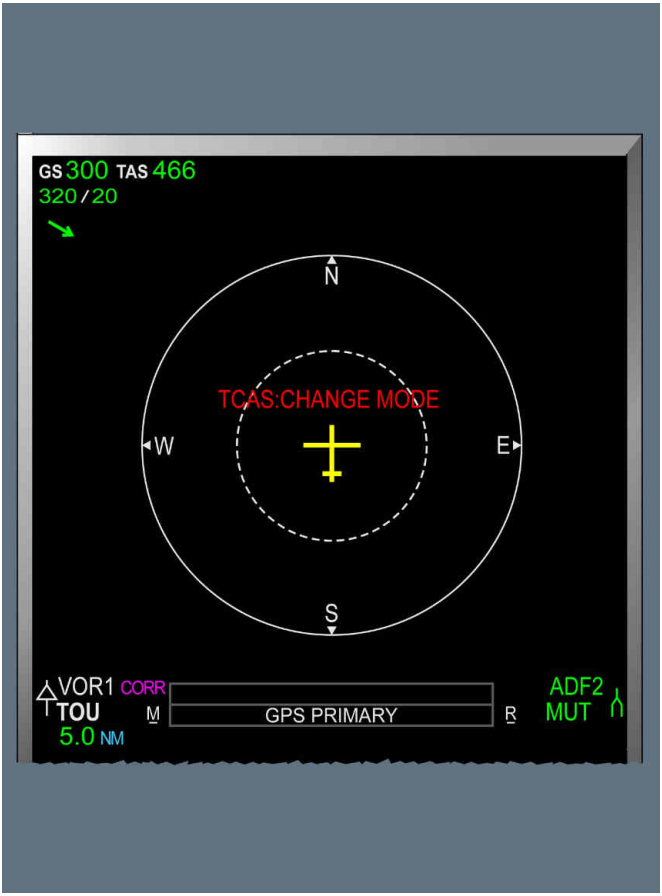
TCAS

TCAS:CHANGE MODE

Appears in PLAN mode, when the TCAS identifies at least one RA intruder.
The flight crew should select ARC or ROSE mode to see the RA intruder.
Appears in amber, if the TCAS identifies at least one TA intruder.
If the flight crew sets the range selector to ZOOM, the ND does not display the TCAS:CHANGE MODE message, when the aircraft is on ground.

L2 The SURV system (TCAS) provides the TCAS:CHANGE MODE message.

TCAS:CHANGE MODE



TCAS:INCREASE RANGE

Appears in ROSE-VOR or ROSE-LS mode, when:
- The flight crew sets the range selector to ZOOM
- The aircraft is not on ground
- The TCAS identifies at least one RA intruder.

Appears in amber, if the TCAS identifies at least one TA intruder.

L2 The SURV system (TCAS) provides the TCAS:INCREASE RANGE message.

TCAS: INCREASE RANGE

TCAS:REDUCE RANGE

Appears when:
- The flight crew selects a range on the EFIS CP that is more than 40 nm
- The TCAS identifies at least one RA intruder.

Appears in amber, if the TCAS identifies at least one TA intruder.

L2 The SURV system (TCAS) provides the TCAS:REDUCE RANGE message.

TCAS:REDUCE RANGE

TCAS STBY

Appears when:
- The TCAS is in standby mode
- The TRAF pb is pressed on the EFIS CP.

The flight crew can activate this mode by selecting the STBY option on the SURV page of the MFD.

TCAS STBY

TCAS TEST

Appears when:
- The TCAS is in test
- The TRAF pb is pressed on the EFIS CP.

TCAS TEST

TERR:CHANGE MODE

Appears in PLAN mode, when the TAWS triggers a warning.
The flight crew should select ARC or ROSE mode, to see the terrain data.
Appears in amber, if the TAWS triggers a caution.
L2 The SURV system (TAWS) provides the TERR:CHANGE MODE message.

TERR: CHANGE MODE

TERR:INCREASE RANGE

Appears in ARC or ROSE mode, when:
- The flight crew sets the range selector to ZOOM
- The TAWS triggers a warning.

Appears in amber, if the TAWS triggers a caution.

L2 The SURV system (TAWS) provides the TERR:INCREASE RANGE message.

TERR: INCREASE RANGE

TERR:REDUCE RANGE

Appears in ARC or ROSE mode, when
- The flight crew selects a range on the EFIS CP that is more than 80 nm
- The TAWS triggers a warning.

Appears in amber, if the TAWS triggers a caution.

L2 The SURV system (TAWS) provides the TERR:REDUCE RANGE message.

TERR: REDUCE RANGE

W/S:CHANGE MODE

Appears in PLAN mode, when the PWS (of the SURV system) triggers a warning.
The flight crew should select ARC or ROSE mode, to see the weather data.
Appears in amber, if the PWS triggers a caution.

L2 The SURV system (WXR/PWS) provides the W/S:CHANGE MODE message.

W/S:CHANGE MODE

W/S:INCREASE RANGE

Appears in ROSE-VOR or ROSE-LS mode, when:
- The flight crew sets the range selector to ZOOM
- The PWS (of the SURV system) triggers a warning.

Appears in amber, if the PWS triggers a caution.

L2 The SURV system (/PWS) provides the W/S:INCREASE RANGE message.

W/S:INCREASE RANGE

W/S:SET RNG 10 NM

Appears in ARC or ROSE mode, when:
- The flight crew has selected a range different from 10 nm
- The PWS triggers a warning.

Appears in amber, if the PWS triggers a caution.

L2 The SURV system (WXR/PWS) provides the W/S:SET RNG 10 NM message.

W/S:SET RNG 10 NM

OTHER MESSAGES

Applicable to: ALL

CHECK EWD

Appears when the monitoring of the Display Units (DU) detects a difference between the critical parameters that the EWD s display.

For more information on the warnings and the procedures that are associated with this message, *Refer to CDS DISPLAY DISAGREE* .

L2 The CDS DISPLAY DISAGREE message flashes for 9 seconds, then remains steady.

CHECK EWD

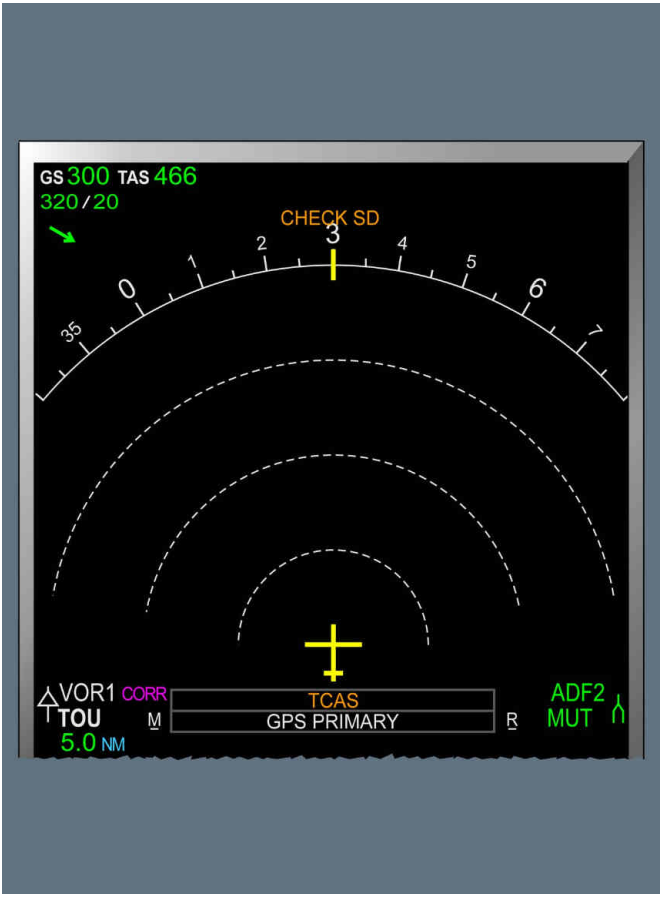
CHECK SD

Appears when the display units (DU) monitoring detects a difference between the critical parameters that the SD s display.

For more information on the warnings and procedures that are associated with this message, *Refer to CDS DISPLAY DISAGREE* .

L2 The CDS DISPLAY DISAGREE message flashes for 9 s , then remains steady.

CHECK SD



DISPLAY SYSTEM VERSIONS DISAGREE

Appears when:

- The aircraft is on ground, before engine start, or after landing
- The display units have different software.

DISPLAY SYSTEM VERSIONS DISAGREE

FMS PAGE NOT AVAIL

Appears instead of the ND when the FMS is no more able to provide data on the ND.

FMS PAGE NOT AVAIL

Weather

WEATHER

Applicable to: ALL

The ND displays weather information, when the flight crew presses the WX pb on the EFIS CP . For more information, *Refer to SURV / WXR / ND* .

Airport Navigation

AIRPORT NAVIGATION

Applicable to: ALL

The Onboard Airport Navigation System (OANS) provides the flight crew with an improved awareness of the aircraft location in the airport area. The ND displays the airport navigation when the flight crew sets the range selector to ZOOM on the EFIS CP . The flight crew uses the keyboard and the KCCU to interact with the airport navigation display. For more information, *Refer to AIRPORT NAVIGATION* .

Airport Navigation

Vertical Display Description

VERTICAL DISPLAY

Applicable to: ALL

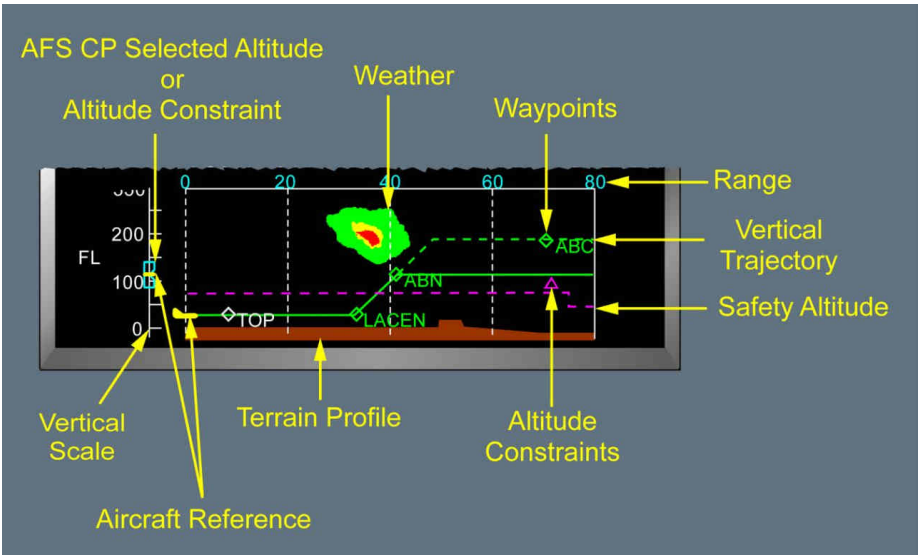
The Vertical Display (VD) provides the flight crew with an overview of the vertical position of the aircraft. The VD is a secondary means of navigation, that helps increase the flight crew's awareness of the aircraft vertical location.
The VD is only available in ARC and ROSE-NAV modes.
When the flight crew sets the EFIS CP RANGE selector to ZOOM, the airport navigation function appears instead of the vertical display. For more information on the airport navigation function, *Refer to DSC-34-10-70-10 General* .

The VD provides the current aircraft position, in relation to the:
- Safety altitudes
- Predicted trajectory
- Weather information
- Terrain information.

The VD is below the Navigation Display (ND).

L2 *Note:* *The VD update occurs after the computations of the FMS , and may last a few seconds longer than the ND update.*

Vertical Display



L1 The vertical display takes into account a vertical cut along the aircraft trajectory, in order to display terrain, weather and safety altitudes.

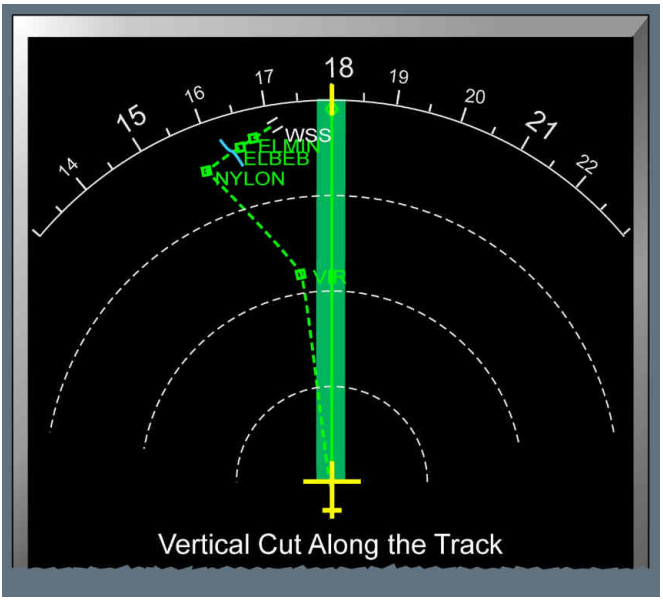
The vertical cut runs along:

- The active flight plan or the LS beam, if the aircraft is in a managed mode, or

Vertical Cut Along the Flight Plan

- The current track, if the aircraft is in a selected mode or manually flown, or if the aircraft deviates from the flight plan, or

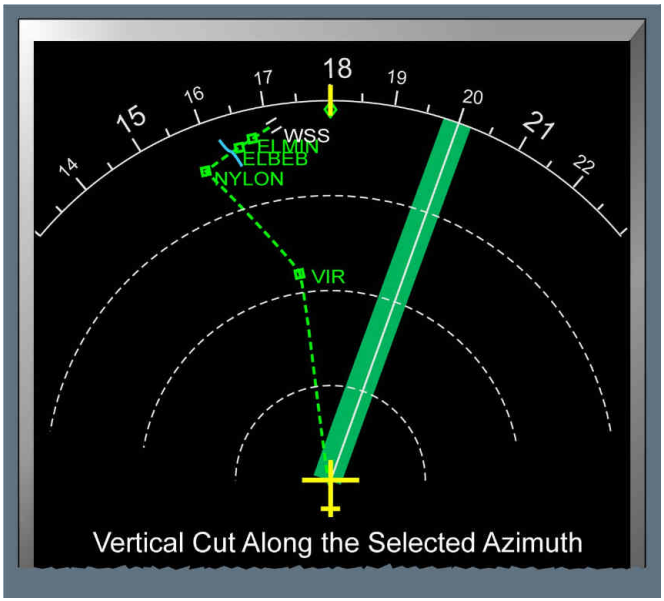
Vertical Cut Along the Track



- The azimuth, if the flight crew has selected the manual AZIM mode of the SURV system. For more information on the AZIM mode, *Refer to DSC-34-20-30-10-10 Manual Azimuth Mode* .

L2 In this case, weather and terrain displayed on the VD are limited to 160 nm ahead of the aircraft.

Vertical Cut Along the Selected Azimuth



There are different ways of determining the width of the vertical cut, for terrain and safety altitudes:

- If the vertical cut is defined along the active flight plan, the width for the safety altitudes and terrain display is equal to:
  - Two times the maximum EPU or FMS RNP, on the active leg
  - Two times the predicted RNP , on the other legs of the flight plan.
- If the vertical cut is defined along the aircraft track, the width is equal to:
  - Two times the TAWS RNP , for the terrain display
  - Two times the maximum EPU or FMS RNP , for the safety altitudes display.
- If the vertical cut is defined along the azimuth, the width is equal to two times the TAWS RNP , for the terrain display.

L3 For more information on the EPU and the FMS RNP , *Refer to FMS / NAVIGATION FUNCTIONS / POSITION ACCURACY* .

The TAWS RNP values are the following:

- In the takeoff area: 1 nm
- In the enroute area: 2 nm

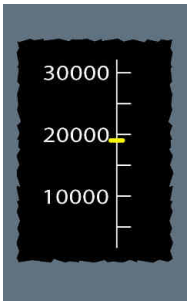
- In the terminal area: 1 nm
- In the approach area: The smallest of either 0.5 nm , or the runway required accuracy (from the runway database).

L2 The width of the vertical cut for the terrain display cannot exceed 10 nm .
For the weather display, WXR (of the SURV system) considers a zero-width vertical cut.

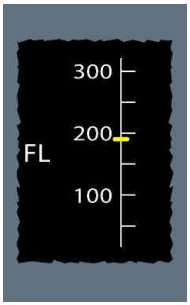
VERTICAL SCALE

The FMS defines the origin of the vertical scale, in order to display:
- The aircraft mock-up
- Most of the aircraft trajectory.

The vertical scale depends on the barometric setting that is selected by the flight crew on the EFIS CP . For more information, *Refer to EFIS CP/BAROMETRIC REFERENCE* .



The vertical scale is displayed in feet (FT). The flight crew selects a QNH barometric setting.



The vertical scale is displayed in flight levels (FL). The flight crew selects a STD barometric setting.

L3 The vertical scale cannot exceed 70 000 ft or FL 700 .
The vertical scale is associated with the VD range that the flight crew selects on the EFIS CP : The diagonal of the VD is equal to a 4 ° slope.

RANGE

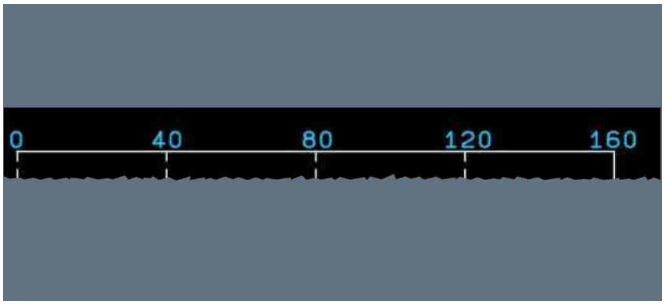
The VD range corresponds to the area that is displayed in front of the aircraft. The flight crew selects the range using the ND range selector on the EFIS CP . For more information, *Refer to ND RANGE selector* .

The VD range cannot exceed 160 nm .

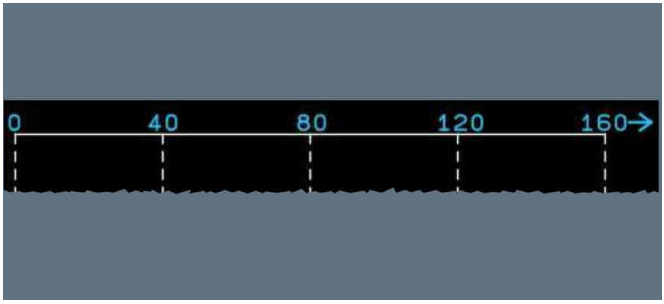
L3 The aircraft mock-up is the reference of the range scale (0 nm).

L1 For example:

- In ARC mode, the flight crew selects 160 nm , via the ND range selector , or
- In ROSE-NAV mode, the flight crew selects 320 nm , via the ND range selector .

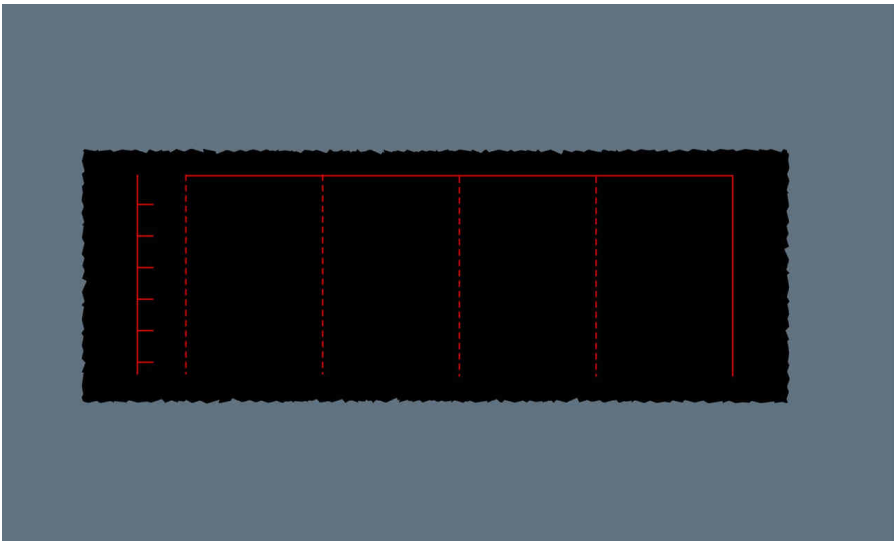


- In ARC mode, the flight crew selects 320 nm or 640 nm , via the ND range selector , or
- In ROSE-NAV mode, the flight crew selects 640 nm via the ND range selector .



L2 If the information necessary for the vertical display is not valid, the VD displays the following red scales:

Data not Valid



AIRCRAFT REFERENCE

The aircraft reference indicates the current barometric altitude.

L2 The CDS computes the aircraft reference.

L1 **ALTITUDE SYMBOL**

Indicates the aircraft altitude on the vertical scale.

AIRCRAFT MOCK-UP

The flight crew selects the AUTO AZIM mode of the SURV system. The aircraft mock-up is adjusted in relation to the aircraft pitch attitude, the angle-of-attack, and the flight path angle.

L2 *Note: The aircraft mock-up may no longer appear on the VD scale, if the aircraft descends, and if the target altitude of the AFS CP is set too high.*

L1 **NOT VALID PITCH ATTITUDE**

L12

Indicates the aircraft altitude on the vertical scale, if the pitch attitude is not valid.
The **ATT** message flashes for 9 s, then remains steady.

MANUAL AZIM MODE

The flight crew selects the manual AZIM mode of the SURV system.

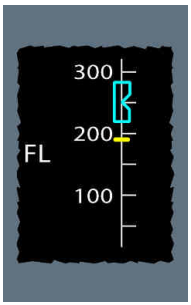
AFS CP SELECTED ALTITUDE OR ALTITUDE CONSTRAINT

AFS CP SELECTED ALTITUDE

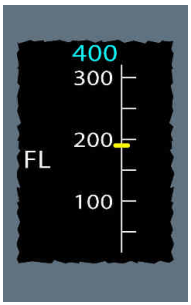
If the flight crew selects an altitude target on the AFS CP , this target appears on the vertical scale of the VD . For more information on the altitude target selection, *Refer to 22 - AFS - Flight Guidance / Controls and Indicators / Vertical Control* .

L3 The position of the AFS CP selected altitude depends on the barometric setting (feet or FL).

L1



The flight crew selects an altitude target on the AFS CP . This altitude target is in the vertical scale.

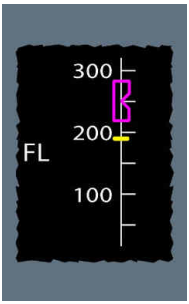


The flight crew selects an altitude target on the AFS CP . This altitude target is not in the vertical scale. The VD displays a numerical value, instead of the symbol. This value appears either on the top, or on the bottom of the scale.

L12

The selected altitude is not available.
The ALT SEL message flashes for 9 s , then remains steady.

ALTITUDE CONSTRAINT



ALT CST* or ALT CST mode is engaged.

ALTITUDE CONSTRAINTS

The VD always displays altitude constraints that are defined in the active flight plan. For more information, *Refer to FMS / FLIGHT PLANING / VERTICAL REVISIONS* .

L2 The VD never displays numerical values of the altitude constraints.

L1 The VD displays the respected altitude constraints with the following symbols:

-  The constraint AT this altitude is predicted to be respected.
-  The constraint AT or BELOW this altitude is predicted to be respected.
-  The constraint AT or ABOVE this altitude is predicted to be respected.
-  The constraint between these two altitudes is predicted to be respected.

The same symbols appear in white, if the altitude constraint is ignored.

In selected mode, the FMS can no longer predict, if the altitude constraint will be respected. The VD displays the constraint symbol in white.

The constraint is predicted to be missed. The constraint symbol is associated with an dotted amber line. This helps the flight crew to identify the missed constraint, even if the symbol is not in the VD window.

SAFETY ALTITUDE

Safety altitudes are the minimum altitudes at which the aircraft must be flown above the terrain.

The FMS database provides the following safety altitudes:
- The grid MORA , or
- The MSA
  The MSA is only displayed, when the flight crew selects a departure, or an arrival procedure (SID , TRANS or APPR) in the FMS .

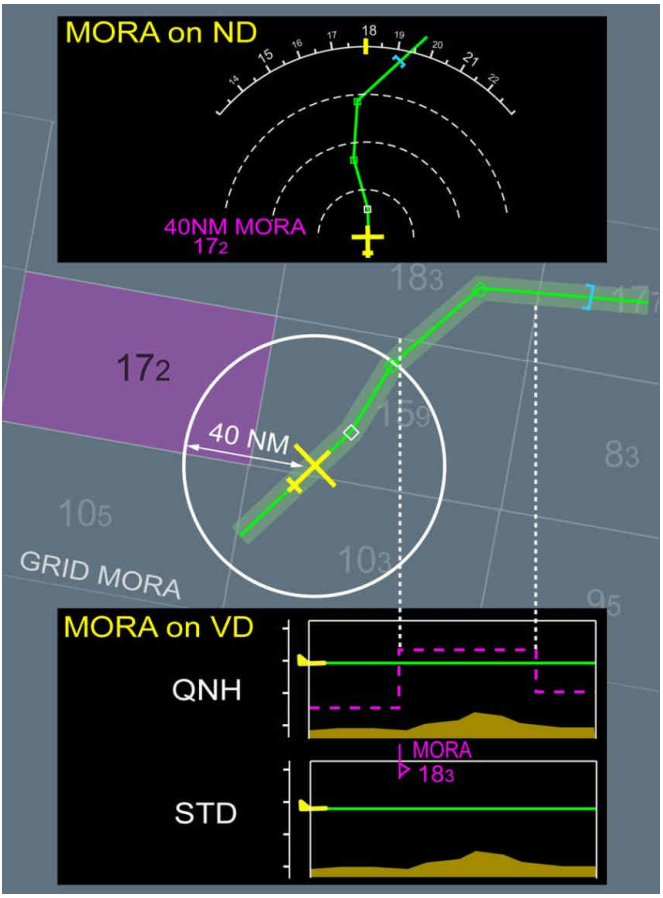
The FMS computes the safety altitudes:
- In the vertical cut, along the aircraft trajectory
- Limited by the VD range.

Note: *Grid MORA on the VD and on the charts may be slightly different, due to the fact that the grid used in the FMS navigation database may be tighter than the grid in the charts.*

The grid MORA is also displayed on the ND . However, the ND displays the highest grid MORA within a circular area of 40 nm around the aircraft. For more information, *Refer to ND/FMS DATA/MORA or OFFSET* .

L2 Safety altitudes are not available in manual AZIM mode, because they are applicable to the flight plan computations.

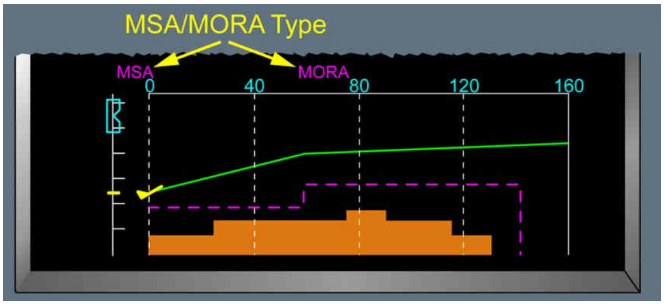
Safety Altitudes



L1 In the QNH barometric setting, the safety altitude profile is displayed as segments, all along the VD range, except in a flight plan discontinuity.

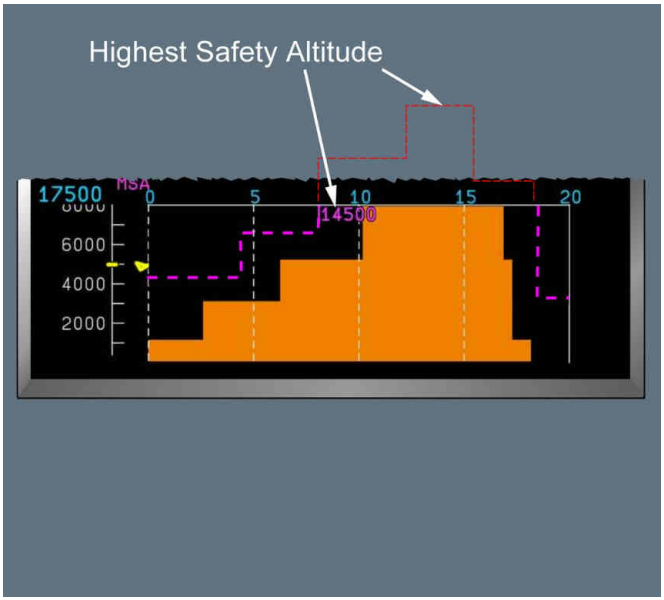
The MORA , or the MSA , label appears:
- Above or below the aircraft mock-up, and/or
- If the safety altitude type is changed.

MSA/MORA Type



If the highest safety altitude is not within the vertical scale, the highest safety altitude value is displayed, when the segments no longer appears on the VD .

Safety Altitude Not Within the Vertical Scale



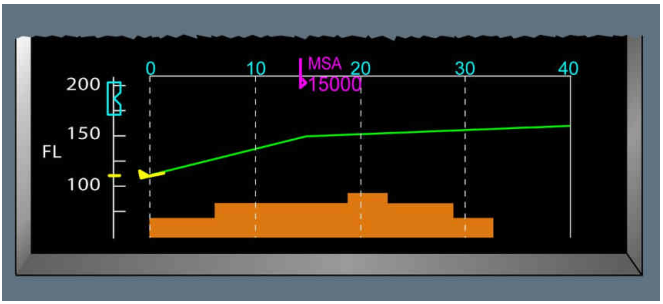
Indicates the type and the value of the highest safety altitude, along the VD range.

Appears when:
- The flight crew selects a QNH barometric setting on the EFIS CP , and none of the safety altitudes is within the vertical scale, or
- The flight crew selects the STD barometric setting on the EFIS CP .

Note: *Regardless of the barometric setting, the value of the safety altitude is always displayed in QNH reference to be in accordance with the safety altitude value provided by the charts.*

Appears on the:
- Upper part of the VD , if the aircraft is below the highest safety altitude
- Lower part of the VD , if the aircraft is above the highest safety altitude.

Safety Altitude in STD Barometric Setting



VERTICAL TRAJECTORY

For more information on the aircraft vertical trajectory, *Refer to VERTICAL TRAJECTORY* .

WAYPOINTS

The VD displays waypoints that are defined in the active flight plan.

L2 If G/S*, or F-G/S*, or G/S, or F-G/S mode is engaged, the FMS corrects the waypoint altitude of the destination temperature that the flight crew has entered in the PERF page.

If the flight crew defines an offset in the flight plan, the VD displays the waypoints that are associated with the initial flight path (i.e. the flight path that is displayed in green dashes on the ND). However, the vertical cut considers the green solid line on the ND that is associated with the active flight plan.

L1 **FLIGHT PLAN WAYPOINTS**

Indicates the TO waypoint of the active flight plan.

Indicates any other waypoint that is in the active flight plan.

L2 At the destination airport, the VD displays the destination symbol, instead of the flight plan waypoint symbol.
If the FMS predicts a waypoint and an altitude constraint to be at the same altitude, the VD only displays the altitude constraint symbol.

L1 **ORIGIN AND DESTINATION WAYPOINTS**

The origin or destination waypoint is an airport, and the flight crew did not select a runway.

The origin or destination waypoint is a runway, and the flight crew has selected an ND range that is above orequalto160 nm.

L12

The origin or destination waypoint is a runway, and the flight crew has selected an ND range lower than 160 nm.
The length of the symbol corresponds to the real size of the runway, according to the selected range.

L2 The FMS always corrects the destination waypoint altitude, in relation to the destination temperature that the flight crew enters on the PERF page.

L1 **PSEUDO WAYPOINTS**

The VD only displays the two pseudo waypoints:

L12

Indicates the starting point of an acceleration, or a deceleration, segment that is computed by the FMS.

Appears when:
- NAV mode is engaged
- Managed speed is engaged.

L12

Indicates the predicted start of the automatic deceleration, for an approach in managed speed.

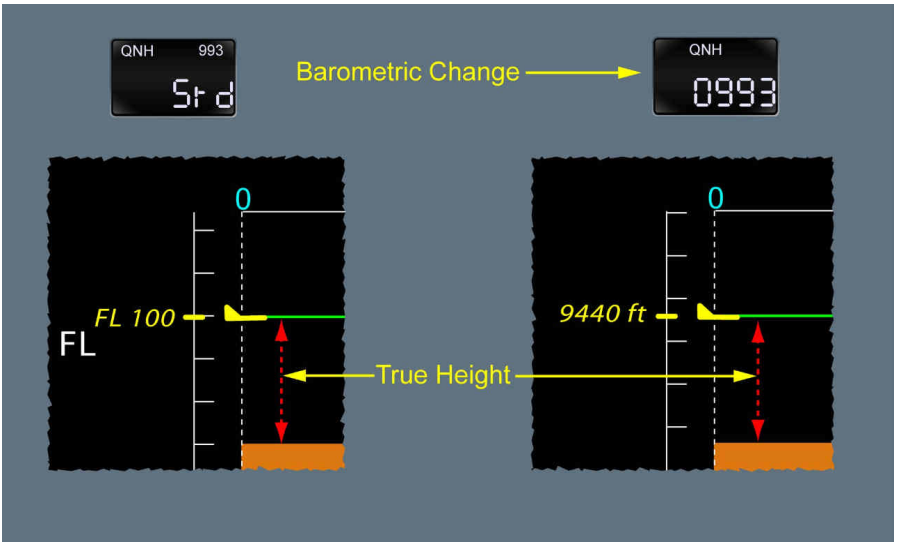
Appears in magenta, when:
- The aircraft is in the descent or go-around phase
- NAV mode is engaged (or NAV mode is armed. The FMS predicts that NAV mode will engage before the deceleration point).

Appears in white, in all other cases.

TERRAIN PROFILE

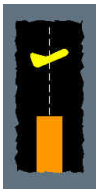
The TAWS (in the SURV system) computes the terrain elevation profile, along the vertical cut. The VD displays the terrain in relation to the aircraft altitude. The elevation between the terrain and the aircraft is the true height. The true height does not change with the barometric setting.

Barometric Setting Change



L2 *Note:* *In the polar zone, the TAWS cannot compute the terrain profile.*

L1



Indicates the real location of the terrain. The zone elevation in amber is based on the measured radio-altimeter information.
Appears when the aircraft radio-altimeter altitude is below 5 000 ft.

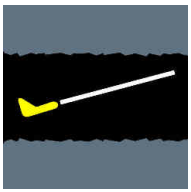
WEATHER DISPLAY

The WXR / PWS (in the SURV system) computes the weather display, along the vertical cut.
The flight crew can display the weather on the VD and on the ND , by pressing the WX pb on the EFIS CP . The flight crew can clear the weather display only from the VD , by selecting the WX ON VD option, on the MFD SURV page. For more information, *Refer to SURV / WXR / MFD / WX ON VD OPTION* .
The colors of the weather display are the same on the VD and the ND . The different colors indicate the intensity of the precipitation (black, green, yellow, and red). For more information, *Refer to SURV / WXR / ND* . Magenta indicates areas of turbulence, but these areas are not displayed on the VD .

L2 *Note: In the polar zone, the WXR is not able to compute the weather display.*

L1

Indicates the selected altitude, in manual elevation mode.



Indicates the selected tilt angle, in manual tilt mode.

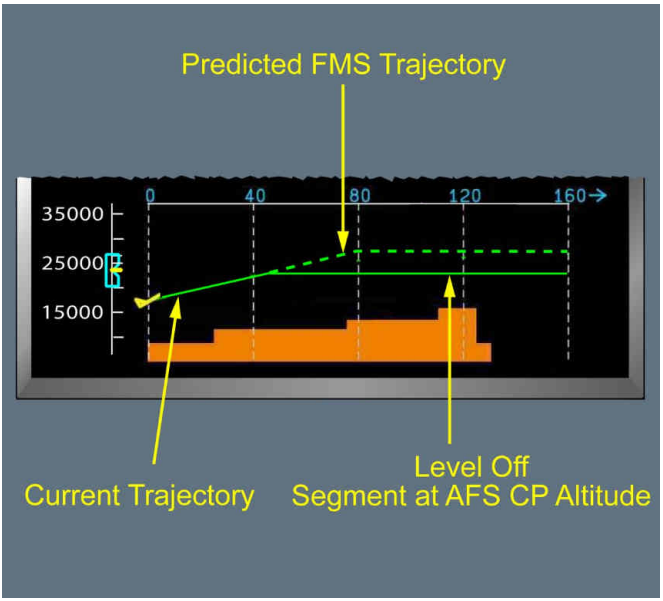
Intentionally left blank

Vertical Trajectory

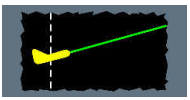
VERTICAL TRAJECTORY

Applicable to: ALL

Vertical Trajectory



L123



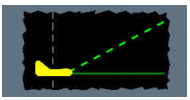
Indicates which trajectory the aircraft will fly, without any further action from the flight crew.

Appears, when:
- The aircraft flies in managed mode, and follows the flight plan or the LS beam, or
- The aircraft flies in a vertical selected mode.

If the flight crew selects an altitude target on the AFS CP, the solid green line follows a level-off segment at this altitude, except in final descent, when one of the G/S*, G/S, F-G/S*, or F-GS mode is engaged.

Note: *If the V/S mode is engaged, the solid green line takes into account the V/S value selected on the AFS CP. The FMS does not determine if the aircraft can physically achieve this vertical speed.*

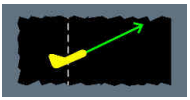
L12



Indicates the predicted FMS trajectory that the aircraft would fly, if managed vertically.

Note: *On the ND, the green dotted line indicates the initial path, if the flight crew has created an offset in the flight plan.*

L12



The aircraft does not achieve the conditions that are associated with the green lines.
The direction of the arrow depends on the current flight path angle of the aircraft.

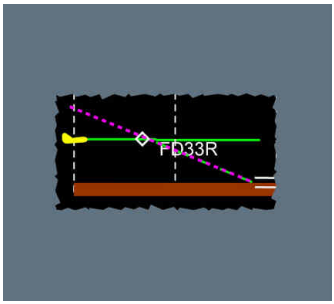
L2 HOLDING PATTERN

When the FMS takes into account the holding pattern in its predictions, the VD unfolds the holding trajectory.

FMS predictions take into account the holding pattern when:
- The deceleration point is flown in managed speed, or
- The entry fix is sequenced in another selected speed mode.

FLS BEAM

L12



Indicates the F-G/C beam of the Non Precision Approach (NPA).

Appears when:
- An NPA is in the active flight plan
- The flight crew presses the LS pb on the EFIS CP or the APPR pb on the AFS CP
- The vertical cut is defined along the flight plan, or along the LS axis.
- The ND range is less than or equal to:
  - 80 nm in ARC mode, or
  - 160 nm in ROSE-NAV mode.

When the flight crew enters a destination temperature on the PERF page of the MFD below the ISA temperature, the F-G/S beam is corrected.

If the anchor point is not defined at the runway threshold, the FMS displays the anchor point ident in magenta.

L2 **COLD WEATHER DISPLAY**

In the case of cold weather, the following information on the VD may not be consistent until the G/S* or the F-G/S* mode is engaged.

BEFORE GLIDE CAPTURE

The FMS does not correct the vertical trajectory of the active flight plan, in relation to the destination temperature.

The FMS corrects the FLS beam and the runway symbols in relation to the temperature, that the flight crew has entered on the PERF page of the MFD, when this temperature is below the ISA temperature.

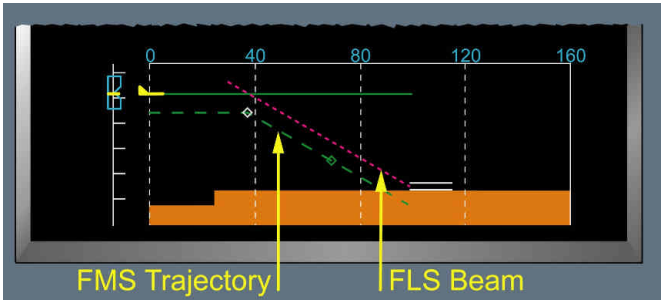
The terrain display is vertically positioned in relation to the aircraft, via the true altitude. The elevation between the terrain and the aircraft mock-up is always true, regardless of the outside temperature (only the terrain altitude value retrieved on the vertical scale may not be correct).

Due to the fact that the runway and the FLS beam are corrected in relation to the temperature, their position in relation to the terrain and the aircraft location is correct.

In cold weather, the flight crew selects an altitude target on the AFS CP, taking into account a manual temperature correction. Due to the fact that it is a barometric altitude, this altitude target

is higher than the true altitude. If the aircraft follows this altitude target, the aircraft is then higher than the FMS predicted trajectory.
If the aircraft flies an ILS(GLS) approach in cold weather, the information on the VD may not be consistent.

Cold Weather with FLS Function



AFTER GLIDE CAPTURE

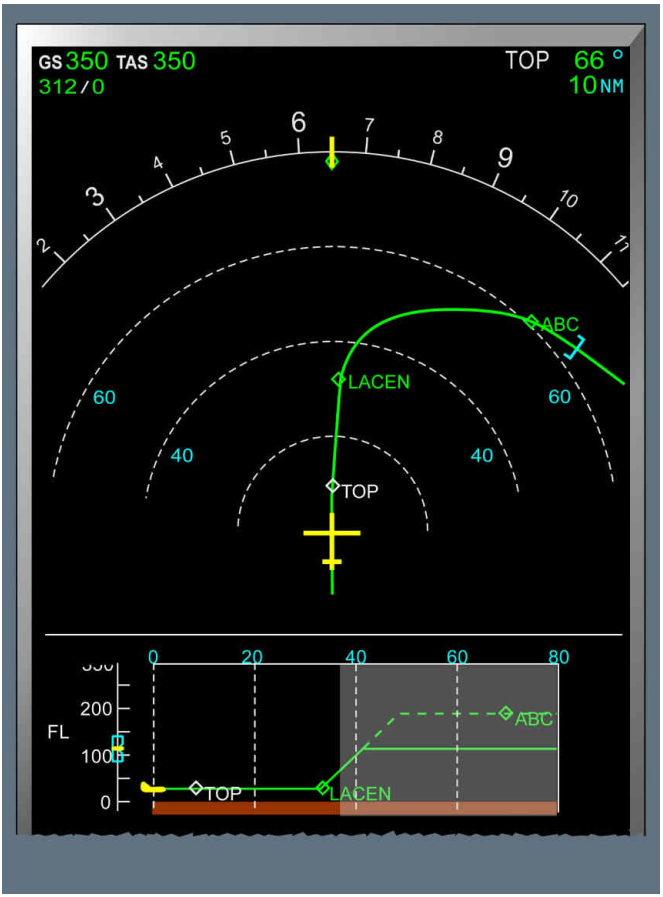
During the glide capture, the FMS vertical trajectory is corrected in relation to the external temperature. The FLS beam (if any), the FMS trajectory, the terrain and the runway are correctly displayed.

GREY AREA

If the aircraft follows the active flight plan, the grey area indicates that the next track turns by more than 3 °. The terrain displayed in this grey area, no longer corresponds to the terrain that is located directly in front of the aircraft.

L2 The SURV system defines the grey area. Therefore, in the case of a system failure, the grey area is no longer displayed.

Grey Area

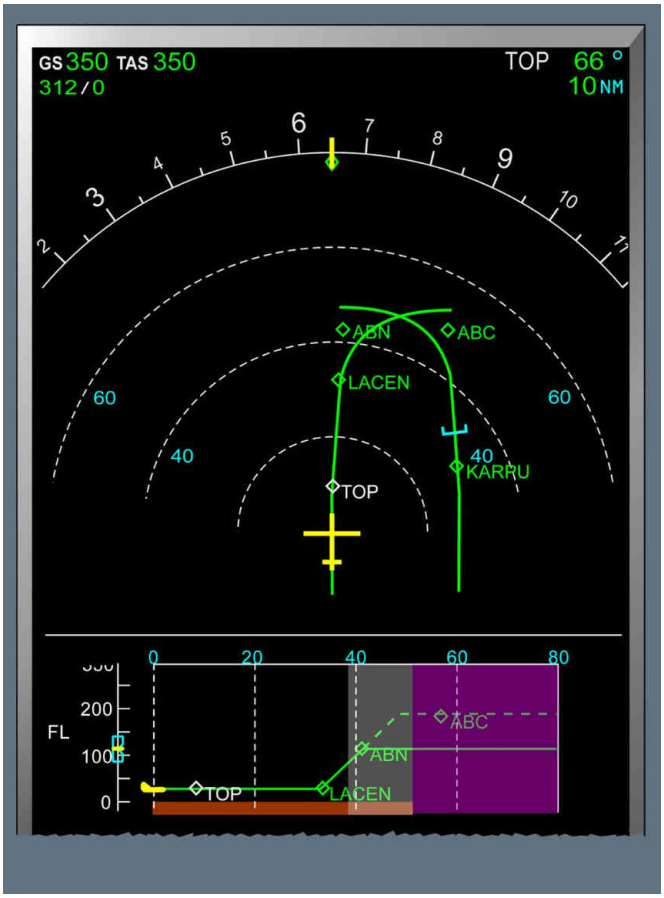


MAGENTA AREA

The magenta area indicates the area where the TAWS (of the SURV system) stops displaying the terrain on the VD.

L2 In some cases, the FMS may not be able to compute a continuous trajectory for the display on the ND. This creates a gap (sometimes not visible) on the flight plan that is displayed on the ND. However, this has no impact on the guidance. In this case, the SURV stops displaying the terrain and the weather on the VD, ahead of the gap up to the destination runway.

Magenta Area



Intentionally left blank

VD Messages

INDEX

Applicable to: ALL

Refer to CHECK ALT
Refer to NO TERR & WX DATA AVAILABLE
Refer to SAFETY ALTS PARTLY DISPLAYED
Refer to TERR INOP
Refer to TRAJ NOT AVAIL
Refer to VD MODE CHANGE
Refer to VD RANGE CHANGE
Refer to VIEW ALONG AZIM XX°
Refer to VIEW ALONG ACFT TRACK
Refer to WX NOT SEL
Refer to WXR INOP

FMS MESSAGES

Applicable to: ALL

SAFETY ALTS PARTLY DISPLAYED

Appears when the safety altitude type and/or numeric values are not available.

TRAJ NOT AVAIL

Appears when:
- The VD MODE CHANGE, or the VD RANGE CHANGE message is displayed, for more than 6 s, or
- The ground speed is not valid, or
- The FMS trajectory is not available.

L2 The FMS provides the TRAJ NOT AVAIL message.

SURV MESSAGES

Applicable to: ALL

NO TERR AND WX DATA AVAILABLE

Appears when the flight crew:
- Selects PLAN mode on the EFIS CP, or
- Sets to OFF the TERR SYS button on the SURV CONTROLS page of the MFD.

L2 The VD does not display the weather when the TERR function is not available, because it cannot locate the weather vertically (i.e. with respect to the terrain).

TERR INOP

Appears when:
- The TAWS has failed, or
- The flight crew turns off the TAWS, via the SURV page of the MFD, or
- The aircraft is flying in the polar zone.

VIEW ALONG AZIM XX°

The message is associated with the azimuth value, when the flight crew selects the manual AZIM mode.

L2 The VD is computed along the selected azimuth.

WX NOT SEL

Appears, when the flight crew:
- Presses the WX pb on the EFIS CP
- Sets the WX ON VD button to OFF on the SURV/CONTROLS page of the MFD.

WXR INOP

Appears, when the flight crew presses the WX pb on the EFIS CP, and:
- The WXR (on the SURV system) is failed, or
- The aircraft is flying in the polar zone.

VD DISPLAY MESSAGES

Applicable to: ALL

CHECK ALT

Appears when the CDS detects a difference between the Captain's and the First Officer's altitude parameters, and this difference is more than:

- 500 ft , if the flight crew selects the STD barometric setting, or
- 250 ft , if the flight crew selects the QNH barometric setting.

L2 The message flashes for 9 seconds, then remains steady.

L1 For more information about the warning and the procedure that are associated with this message, *Refer to NAV CAPT AND F/O ALT DISAGREE* .

VD MODE CHANGE

Appears when the FMS mode and ND mode of the EFIS CP are temporarily different (e.g. due to a change of mode).

VD RANGE CHANGE

Appears when the FMS range and ND range of the EFIS CP are temporarily different (e.g. due to a change of range).

VIEW ALONG ACFT TRK

Appears when the vertical cut for the VD is defined along the aircraft track, but the ND does not display a track line.

L3 *Note:* *Appears:*

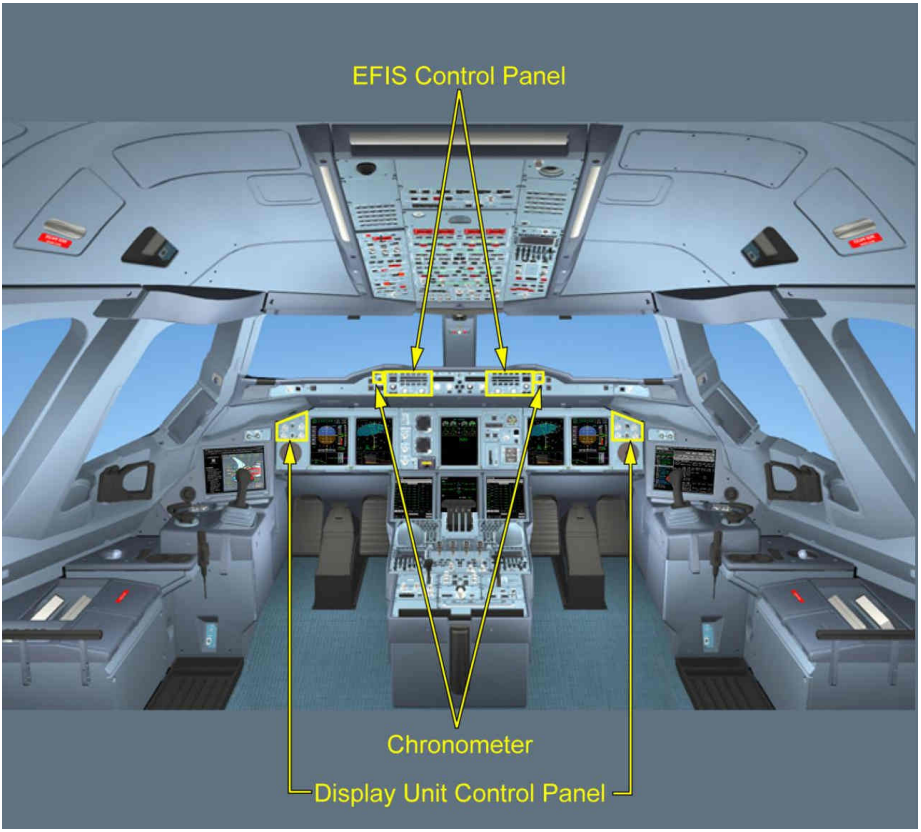
- *In managed mode, when the aircraft deviates from the flight plan or from the LS beam, or*
- *During the transition from HDG to LOC mode, or*
- *When the GA TRK mode is engaged, or*
- *When the aircraft is flying a manual leg, or*
- *At takeoff, when there is no ILS associated with the runway.*
  In this case, the RWY mode does not engage, and the VD also displays the flight path arrow symbol.
  The VD recovers the flight plan trajectory after a few seconds, when one of the NAV mode, the RWYmode, the TRK mode , or the HDG mode is engaged.

Intentionally left blank

COCKPIT VIEW

Applicable to: ALL

Cockpit View



The flight crew can access the EFIS CP backup from the MFD , at any moment, or if an EFIS CP failure occurs. For more information, *Refer to FLIGHT GUIDANCE / ABNORMAL OPERATIONS / FCU BACKUP* .

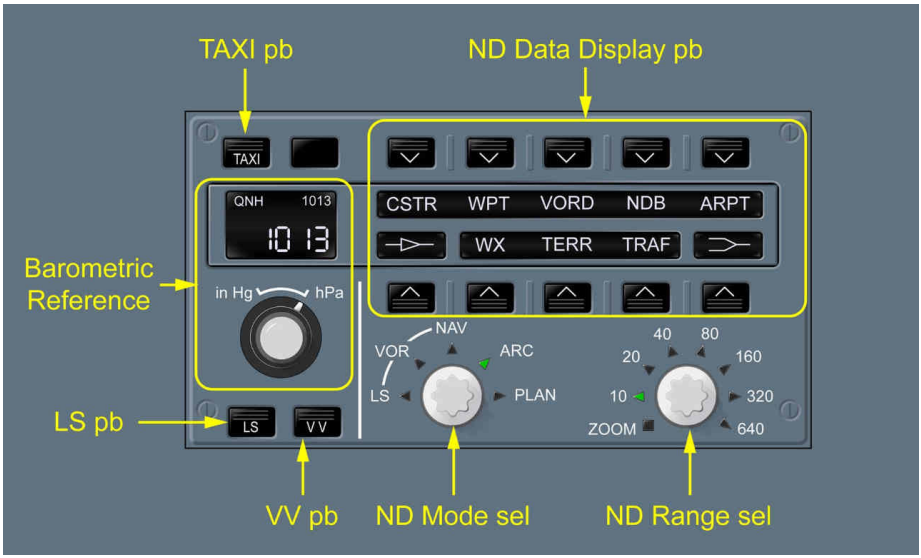
EFIS CONTROL PANEL

Applicable to: ALL

There are two identical EFIS Control Panels (EFIS CP s):
- One on the Captain's side
- One on the First Officer's side.

Each EFIS CP is associated with the onside PFD and ND .

EFIS CP



In the case of abnormal operations of the EFIS CP , the flight crew should use the FCU backup on the MFD . For more information, *Refer to FLIGHT GUIDANCE / ABNORMAL OPERATIONS / FCU backup* .

Taxi pb

The onside PFD does not display the ETACS videos.

The onside PFD displays the ETACS videos.

Impacted DU: 00000371 Barometric Reference

BAROMETRIC REFERENCE

Barometric Reference

BAROMETRIC REFERENCE WINDOW

The barometric reference is QNH 1 024 hPa.
The range of QNH is from 745 hPa(22.00 inHg) to 1 100 hPa(32.48 inHg).

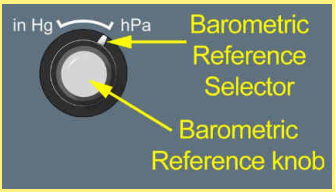
Note: *The flight should not preset the limit values (i.e. 745 hPa and 1 100 hPa, or 22.00 inHg and 32.48 inHg) to avoid the loss of FMS vertical functions.*

The barometric reference is STD. If the flight crew selects the QNH barometric reference, the barometric reference is automatically set to the preset value, i.e. 1 024 hPa.

BAROMETRIC REFERENCE CONTROLS

The barometric reference controls have an outer selector, and an inner knob.

Barometric Reference Controls



The flight crew uses the barometric reference selector to select the barometric unit (hectoPascal, or mercury inches) that is associated with the values displayed in the barometric reference window.

Note: *The PFDs do not display the selected barometric unit.*

The flight crew uses the barometric reference knob to select the barometric reference value. At the EFIS CP power-up, the barometric reference value starts at 1 013 hPa, or at 29.92 inHg, depending on the selected barometric unit.

When flight crew:

- Presses the barometric reference knob, the barometric reference is set to STD. The flight crew can turn the barometric reference knob to preset a QNH value. Then, when the flight crew reverts to the QNH barometric reference, the barometric reference automatically displays this preset value.
- Pulls the barometric reference knob, the barometric reference is set to QNH, and the preset value is selected.

Note: *The selected value appears in the barometric reference window, and under the altitude scale on the PFD.*

Impacted by TDU: 00024027 Barometric Reference

BAROMETRIC REFERENCE

Barometric Reference

BAROMETRIC REFERENCE WINDOW

L12

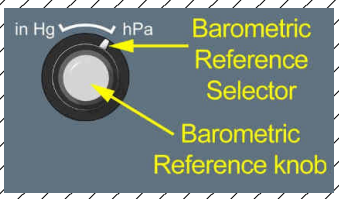
The barometric reference is QNH 1 024 hPa.
The range of QNH is from 745 hPa(22.00 inHg) to 1 100 hPa(32.48 inHg).

The barometric reference is STD. If the flight crew selects the QNH barometric reference, the barometric reference is automatically set to the preset value, i.e. 1 024 hPa.

BAROMETRIC REFERENCE CONTROLS

The barometric reference controls have an outer selector, and an inner knob.

Barometric Reference Controls



The flight crew uses the barometric reference selector to select the barometric unit (hectoPascal, or mercury inches) that is associated with the values displayed in the barometric reference window.

Note: The PFDs do not display the selected barometric unit.

The flight crew uses the barometric reference knob to select the barometric reference value. At the EFIS CP power-up, the barometric reference value starts at 1 013 hPa, or at 29.92 inHg, depending on the selected barometric unit.

When flight crew:

- Presses the barometric reference knob, the barometric reference is set to STD. The flight crew can turn the barometric reference knob to preset a QNH value. Then, when the flight crew reverts to the QNH barometric reference, the barometric reference automatically displays this preset value.
- Pulls the barometric reference knob, the barometric reference is set to QNH, and the preset value is selected.

Note: The selected value appears in the barometric reference window, and under the altitude scale on the PFD.

VV pb

The Captain's (First Officer's) PFD displays the Velocity Vector (VV).

The Captain's (First Officer's) PFD does not display the VV.

When TRK-FPA is selected, both PFD s automatically display the Flight Path Vector (FPV).

L3 When TRK-FPA is selected, pressing the VV pb has no effect: Both PFD s continue to display the FPV , and the VV light remains on.

L1 When HDG-V/S is selected, the PFD s do not automatically display the VV. However, the Captain (First Officer) can display the VV on their PFD by pressing the VV pb .

The PFD s no longer display the FPV (VV), when:
- The flight crew changes from TRK-FPA to HDG-V/S
  For more information on HDG-V/S / TRK-FPA selection, *Refer to AP/FD Modes / HDG-V/S / TRK-FPA Selection* .
- The flight crew performs a go-around.

LS pb

L12

The Captain's (First Officer's) PFD displays the following landing system data in accordance with the approach selected on the FMS ARRIVAL page: Deviation scales, deviation signals, course pointer, information.
For information on the landing system data, *Refer to PFD / Approach Guidance* .
If the flight crew selected an NPA on the FMS ARRIVAL page, and the FMS flight phase is descent or approach, the Captain's (First Officer's) FMA displays the FLS capability.
However, the FLS capability will not appear, if the NO FLS FOR THIS APPR message appeared on the MFD .

Note: *1. If the direct distance to the destination airport is more than 300 nm , only the deviation scales appear.*
2. The LS light automatically comes on when LOC , LOC B/C or F-LOC arms.

The Captain's (First Officer's) PFD does not display the landing system data.

ND MODE selector

L12

The flight crew can select one of the following navigational modes:

- PLAN mode
  For more information, *Refer to PLAN mode*
  If the flight crew selects the PLAN mode, the ND does not display terrain, weather, or traffic information.
- ARC mode
  For more information, *Refer to ARC mode*
- ROSE-NAV mode
  For more information, *Refer to ROSE-NAV mode*
- ROSE-VOR mode
  For more information, *Refer to ROSE-VOR mode*
- ROSE-LS mode.
  For more information, *Refer to ROSE-LS mode*

ND range selector

The flight crew selects the range for the ND and the VD , in nautical miles.

When the flight crew sets the ND range selector to ZOOM, the ND displays the moving airport map. For more information, *Refer to Airport Navigation* .

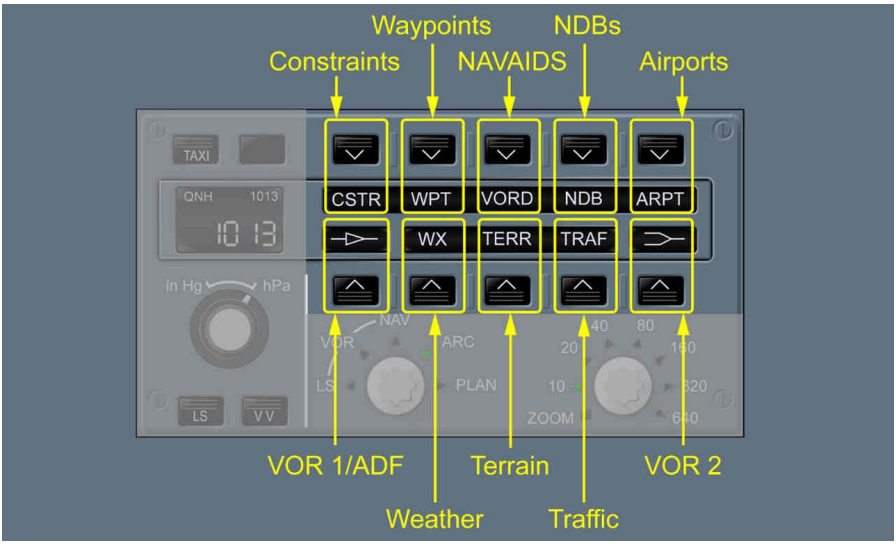
L3 *Note:* *The VD range is limited to 160 nm .*
The ND can only display the weather, if the selected range is below, or equal to, 320 nm .
If the flight crew sets the ND range selector to ZOOM, the VD display is no longer available.

L2 If the flight crew changes ND mode from ARC to one of the ROSE or PLAN modes, the ND range automatically increases to the next value. Therefore, the distance in front of the aircraft mock-up remains the same. If the flight crew changes ND mode to ARC mode, the ND range automatically decreases to the previous range value.

ND DATA DISPLAY

The flight crew can use the following pushbuttons to display associated optional data on the ND and/or on the VD :

ND Data Display



CONSTRAINTS

The ND displays:

- The constraint values associated with the flight plan waypoints
  The constraints values are the speed, altitude and time constraints.
  For more information, *Refer to ND / FMS DATA / Flight Plan Waypoints* .
- The Minimum Off Route Altitudes (MORA).
  If the flight crew selects a range that is equal to 20 nm or 10 nm , the MORA value is no longer displayed on the ND . For more information, *Refer to ND / FMS DATA /MORA or Offset* .

WAYPOINTS

L12

The ND displays all the waypoints that are stored in the navigation database and in the pilot stored database.
The flight crew can only press one of the WPT pb , VORD pb or NDB pb at the same time.

NAVAIDS

L12

The ND displays all the VOR s and the DME s of the navigation database and all the pilot stored NAVAIDS.
The flight crew can only press one of the WPT pb , VORD pb or NDB pb at the same time.

NDBS

L12

The ND displays all the non-directional beacons of the navigation database.
The flight crew can only press one of the WPT pb , VORD pb or NDB pb at the same time.

AIRPORTS

The ND displays all the airports of the navigation database, that are different from the origin or destination airports.

WEATHER

L12

Both ND and VD display the weather information.
If the flight crew has set the WX on VD option on the MFD to OFF, the VD does not display the weather information.
The flight crew cannot select the WXR pb and the TERR pb at the same time.
For more information, *Refer to SURV / WXR / ND.*

TRAFFIC

The ND displays all of the surrounding aircraft that have a transponder.
For more information, *Refer to SURV / TCAS / ND* .

TERRAIN

L12

The ND displays the terrain representation, and the TAWS messages.
The flight crew cannot select the WXR pb and the TERR pb at the same time.
For more information, *Refer to SURV / TAWS / ND* .

VOR1 /ADF

When pressed, the ND displays the following selected VOR 1 characteristics:
- The VOR 1 pointers, on the heading scale
- The VOR 1 station characteristics, on the lower left corner of the ND .

When pressed two times, the ND displays the following selected ADF characteristics:
- The ADF pointers, on the heading scale
- The ADF station characteristics, on the lower left corner of the ND .

VOR 2

When pressed, the ND displays the following selected VOR 2 characteristics:
- The VOR 2 pointers, on the heading scale
- The VOR 2 station characteristics, on the lower right corner of the ND .

CHRONOMETER

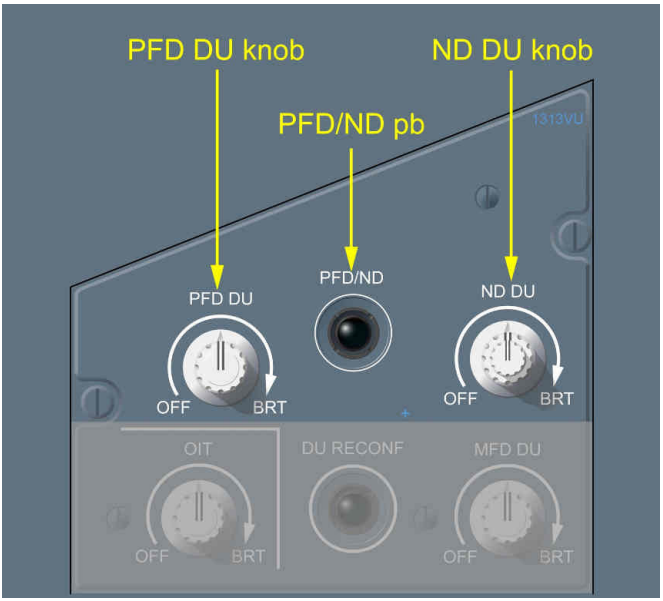
Applicable to: ALL

When pressed one time, the ND displays and starts the chronometer.
When pressed two times, the ND freezes the time that appears on the ND.
When pressed three times, the ND resets the chronometer, and the ND no longer displays the time.

DISPLAY UNIT CONTROL PANEL

Applicable to: ALL

Display Unit Control Panel



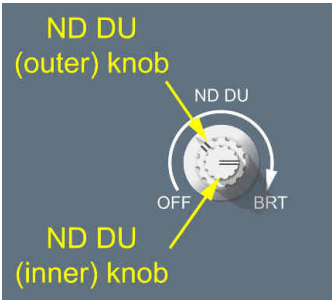
PFD DU knob

When turned, turns on or off the PFD screen, and adjusts the brightness of the PFD display unit.

The two light sensors that are located on the bottom of the display unit enable the automatic tuning of the brightness (in a limited range), according to the ambient lighting in the cockpit.

ND DU knob

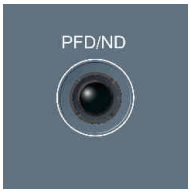
ND DU Knob



The inner knob:
- Turns on or off the ND
- Adjusts the brightness of the ND.
  The two light sensors that are located on the bottom of the display unit enable the automatic tuning of the brightness (in a limited range), according to the ambient lighting in the cockpit.

The outer knob controls the brightness of both the weather radar image and the terrain display.
L2 In the case of a terrain alert, the background lighting is set to 75 % of the overall lighting, regardless of the position of the ND DU knob. After the alert, the lighting returns to its default value.

PFD/ND pb



When pressed, exchanges the onside PFD and the ND, regardless of their default position.

Intentionally left blank

GENERAL

Applicable to: ALL

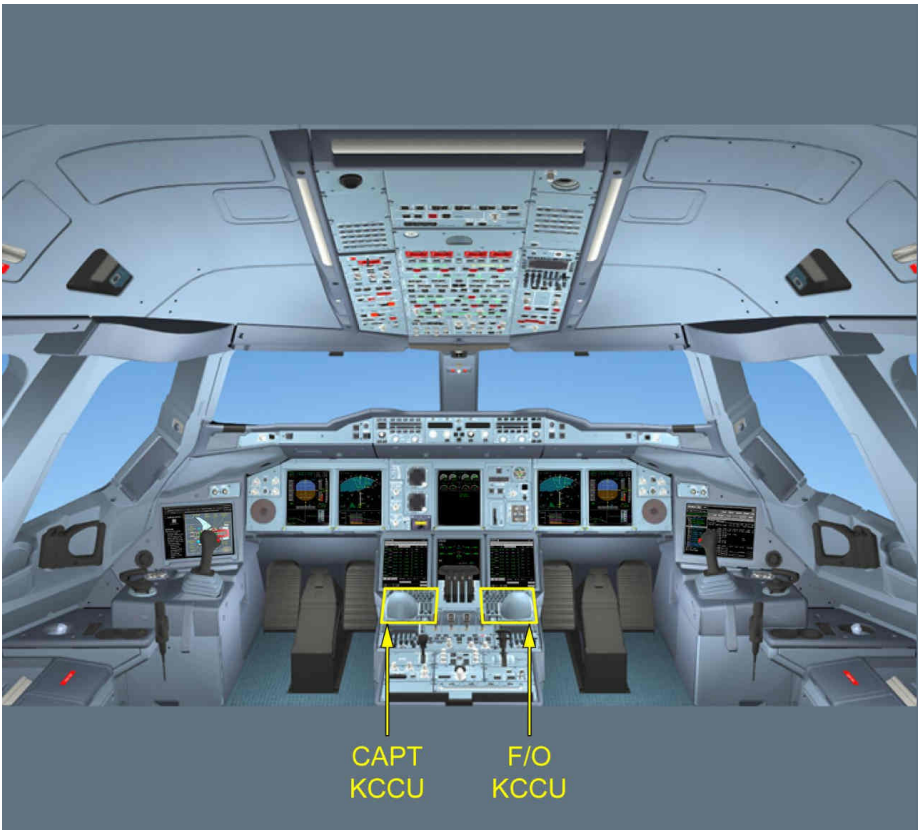
There are two Keyboard and Cursor Control Units (KCCUs) on the center pedestal. There is one for the Captain and one for the First Officer.

The KCCUs are used to:

- Interface with the Navigation Display (ND), the Multifunction Display (MFD), and the System Display (SD)
- Select and/or modify parameters.

L3 The two units are functionally identical.

Cockpit Presentation



L1 Each KCCU has a:

- Keyboard, to enter alphanumeric information.
  The keyboard also has shortcut keys that provide direct access to specific pages on a display unit.
- Cursor control device, that has a Validation pb, a wheel, a trackball and four control keys.

L2 The keyboard and the cursor control device are independent of each other: The failure of one does not affect the other.

The Captain KCCU

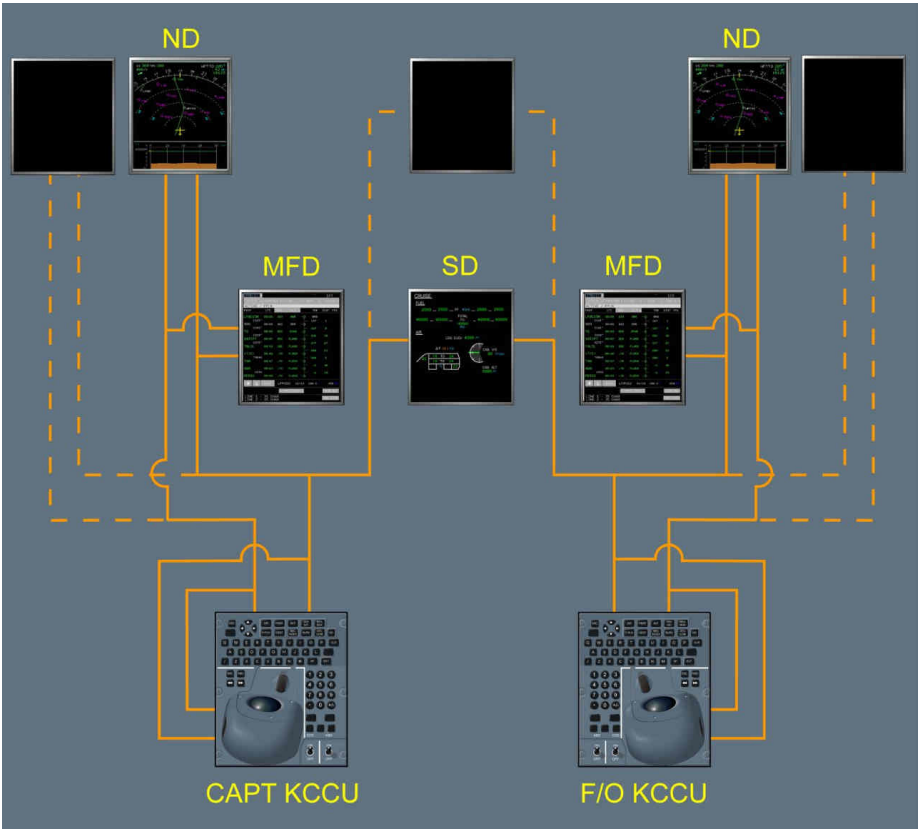
ARCHITECTURE

Applicable to: ALL

The KCCU s are directly-connected to the ND , MFD , and SD . They are also connected to the other display units for reconfiguration purposes (*Refer to Reconfiguration description*).

L3 They are connected via two redundant Controller Area Network (CAN) busbars.

Architecture

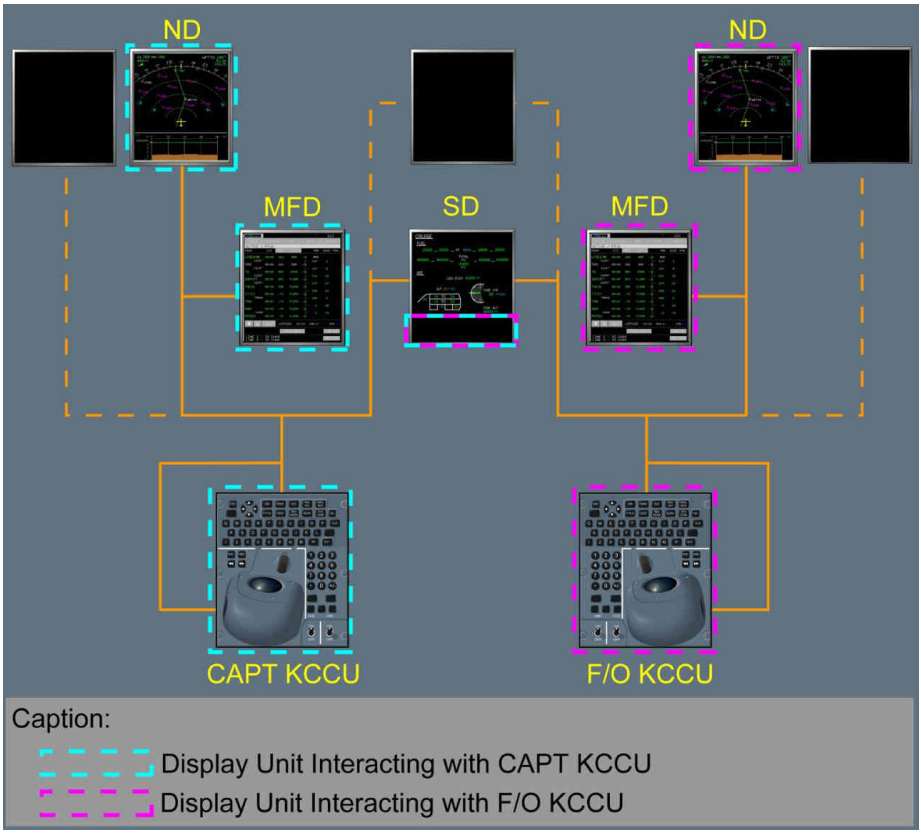


INTERACTION WITH DISPLAY UNITS

Applicable to: ALL

Each KCCU enables the flight crew to directly interact with:
- The onside ND
- The onside MFD
- The mailbox section of the SD.

Interaction with the Display Units



Note: *The KCCU continues to interact with the ND, MFD, and SD, irrespective of the display unit reconfiguration.*

CURSOR DISPLAY

Each KCCU displays a different cursor.

The Captain's cursor is :

The First Officer's cursor is :

Both cursors can appear in the mailbox section of the SD at the same time. However, only one KCCU can interact with the SD at one time. The active KCCU is the one that last interacted with the SD.

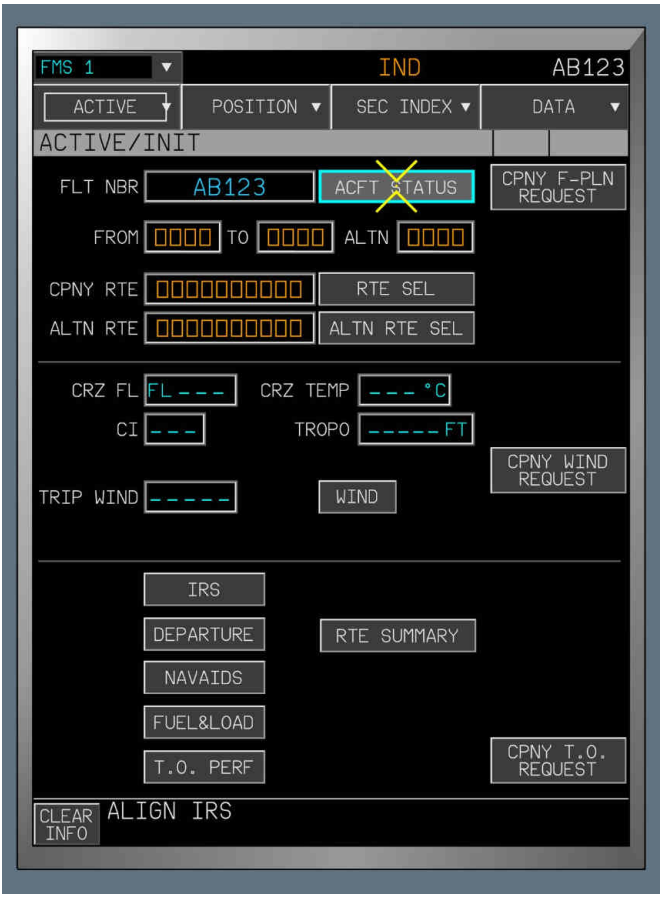
The KCCU is active on the display that shows the cursor.

However, the cursor may disappear when the KCCU is not used for an extended period of time. It reappears, when the flight crew uses any key, or the trackball of the KCCU.

INTERACTIVE ZONES

The flight crew can use the KCCU to interact with the objects on the different display units.

Interactive Zone



When the cursor is moved over a modifiable field of the display unit, a blue box appears around that field.

INTERACTION WITH THE ND

The lateral navigation part is the only interactive part of the ND.

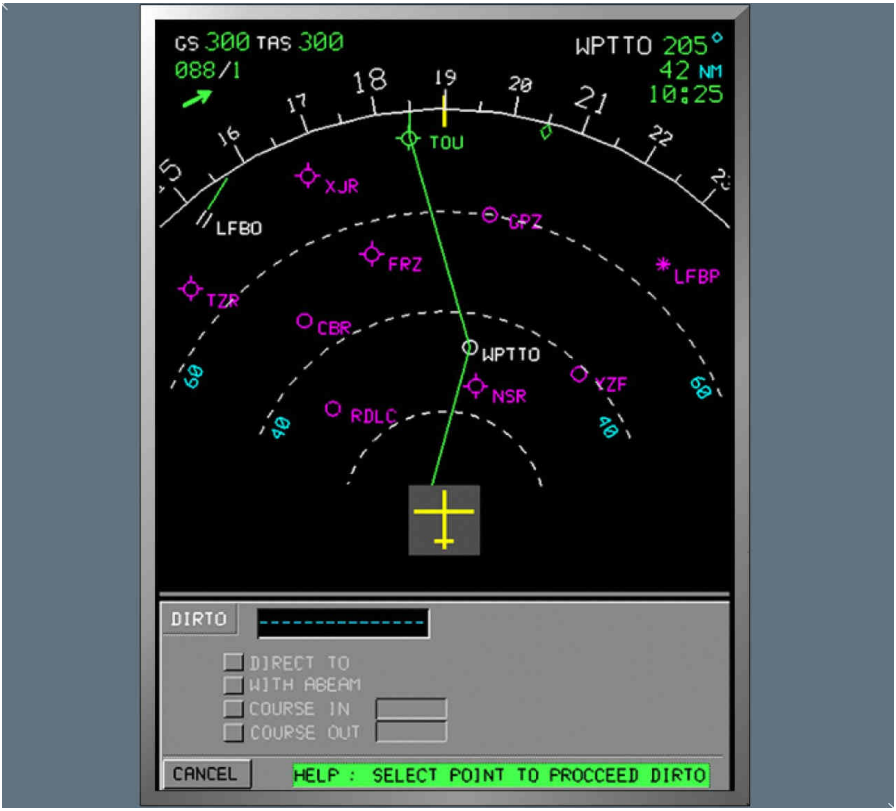
The interactive objects are:
- The aircraft symbol
- All displayed waypoints

- All displayed navaids
- All displayed airports.

The KCCU can be used to perform the following functions:
- Direct To
- Insert or delete a waypoint
- Access data on any displayed airport
- Insert, erase, or undo the temporary flight plan.

For the Direct To and the Insert functions, an interactive dialog box replaces the vertical display part of the ND. This dialog box enables the flight crew to enter parameters with the KCCU.

The ND



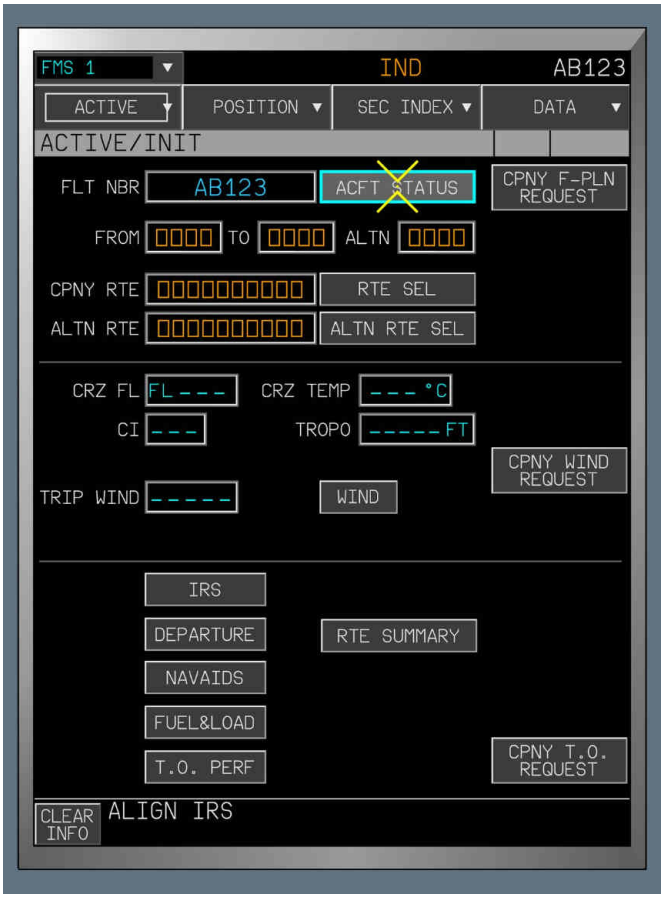
INTERACTION WITH THE MFD

The entire MFD screen is interactive.

The MFD displays the pages of the following applications:

- FMS
  The MFD enables to manage the flight planing functions of the aircraft.

FMS



- SURV(eillance)
  The MFD enables to manage the surveillance functions of the aircraft (TAWS, WXR, TCAS, XPDR).

GENERAL

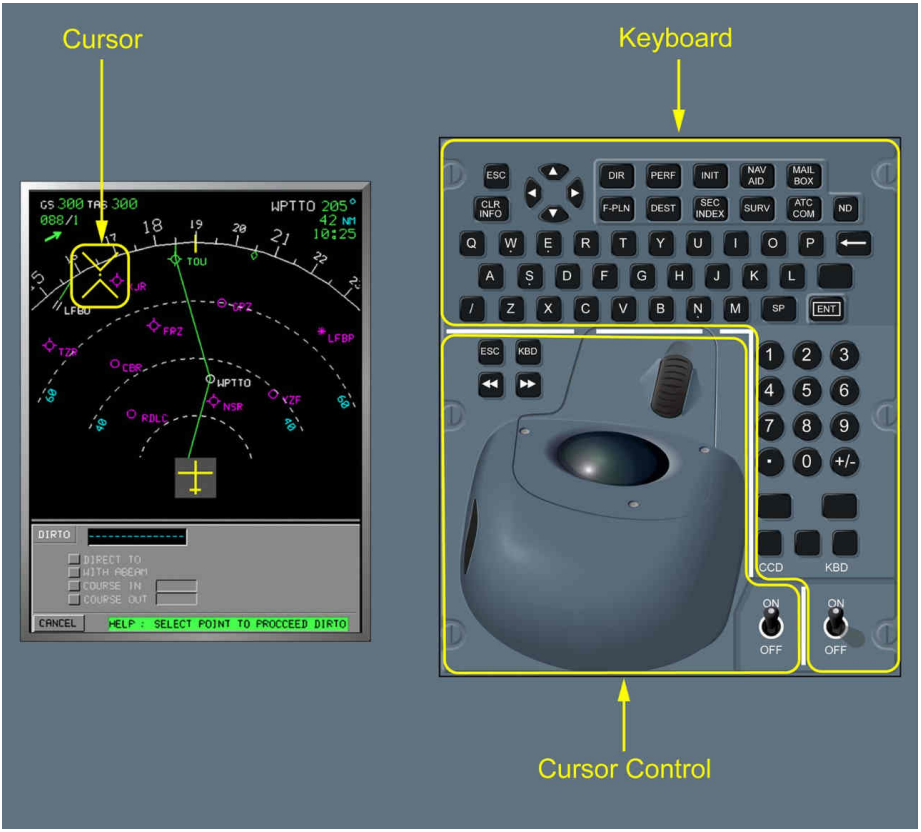
Applicable to: ALL

The KCCU has a:

- Keyboard
- Cursor control device.

The KCCU keys are backlit.

KCCU Parts



CURSORS

Applicable to: ALL

Each KCCU has a unique cursor. The symbol changes to indicate the status of the cursor.

The Captain's cursor is active.

The Captain's cursor is not active.
This only occurs when both cursors appear on the mailbox (on SD), and the First Officer's cursor is active.

The First Officer's cursor is active.

The First Officer's cursor is not active.
This only occurs when both cursors appear on the mailbox (on SD), and the Captain's cursor is active.

Appears:
- Before the cursor is displayed: The circle becomes increasingly smaller, until it disappears. Then, the cursor is active.
- When the flight crew selects a different page on the MFD, or moves the cursor to a different display unit.

KEYBOARD

Applicable to: ALL

Keyboard

The keyboard module has:

- Shortcut keys
- One Backspace key
- One ENT key
- Numeric keys
- One ON/OFF sw
- Alphabet keys

- One CLR INFO key
- One ESC key
- Four direction arrow keys.

DIR KEY

When pressed:
- Displays the FMS DIRECT TO page on the MFD (*Refer to FMS - DIRECT TO page*)
- Moves the cursor back to the MFD if it was on an other display before.

PERF KEY

When pressed:
- Displays the FMS ACTIVE / PERF page (on the panel that corresponds to the active flight phase) on the MFD (*Refer to FMS - PERF page*)
- Moves the cursor back to the MFD if it was on an other display before.

INIT KEY

When pressed:
- Displays the FMS ACTIVE / INIT page on the MFD (*Refer to FMS - INIT page*)
- Moves the cursor back to the MFD if it was on an other display before.

NAVAID KEY

When pressed:
- Displays the FMS POSITION / NAVAIDS page on the MFD (*Refer to POSITION / NAVAIDS page*)
- Moves back the cursor to the MFD if it was on an other display before.

F-PLN KEY

When pressed:
- Displays the top of the flight plan on the FMS ACTIVE / F-PLN page on the MFD , (*Refer to FMS - F-PLN page*)
- Moves the cursor back to the MFD if it was on an other display (ND , or ATC Mailbox) before.

DEST KEY

When pressed:
- Displays the bottom of the primary flight plan on the FMS ACTIVE / F-PLN page on the MFD (*Refer to FMS - F-PLN page*)
- Moves the cursor back to the MFD if it was on an other display before.

SEC INDEX KEY

When pressed:
- Displays the FMS SEC / INDEX page on the MFD (*Refer to FMS - SEC / INDEX page*)
- Moves the cursor back to the MFD if it was on an other display before.

SURV KEY

When pressed:
- Displays the SURV CONTROLS page on the MFD (*Refer to SURV - CONTROLS page*)
- The cursor moves back to the MFD if it was on an other display before.

Mailbox KEY

When pressed, the cursor moves to the mailbox section of the SD (*Refer to Mailbox*), if it was on an other display before.

ATC COM KEY

- Displays the ATC COM REQUEST page on the MFD (*Refer to ATC COM REQUEST page*)
- Moves the cursor back to the MFD if it was on an other display before.

ND KEY

When pressed, moves the cursor to the ND.

ENT KEY

Operates the same way as the Validation pb of the cursor control device.

- Edits an entry field:
  - The cursor is positioned in the field, and is ready for a new entry
  - When data is entered, another click validates the entry, and the cursor moves to the field, or to the action-button, that is most likely to be used next.
- Edits an option-list:
  - The option-list opens to the first option that is selected
  - The flight crew uses the wheel, or the direction arrow keys, to change the selected option, if required
  - Another click validates the selection, and the cursor moves to the field, or to the action-button, that is most likely to be used next.
- Activates an action-button.

← KEY

- Clears the entry field, if the entire field is selected, or

Example of Selection Clear

Note: *In some entry fields, such as NAVAIDS, clearing a previously entered value will set the entry field to the default value.*

- Clears the entry field, one character at a time, from right to left.

Example of Character Clear

NUMERIC KEYS

NUMBER KEYS

Inserts a number at the cursor position in the entry field.

+/- KEY

Inserts a plus or minus sign in front of the edited value.

. KEY

Inserts a "." (decimal point) at the cursor position in the entry field.

ALPHABET KEYS

LETTER KEYS

Inserts an alphabet character at the cursor position in the entry field.
The alphabet keys are organized in the "QWERTY" (US keyboard) layout.

N, E, S, W (CARDINAL POINT) KEYS

Inserts a cardinal point (N, E, S, W) in fields, when applicable.
There is a dot under these letters. This dot helps the flight crew to easily find these keys.

/ KEY

Inserts a "/" (slash) at the cursor position in the entry field.

SP KEY

Inserts a space at the cursor position in the entry field.

ON/OFF sw

The KCCU keyboard is active.

The KCCU keyboard is not active.

CLR INFO KEY

When pressed, the information message that is currently displayed in the FMS, ATC COM, or Surveillance message area is cleared.

ESC KEY

When pressed, cancels the current field edition. The field returns to the last valid value.
There is a similar key on the cursor control device.

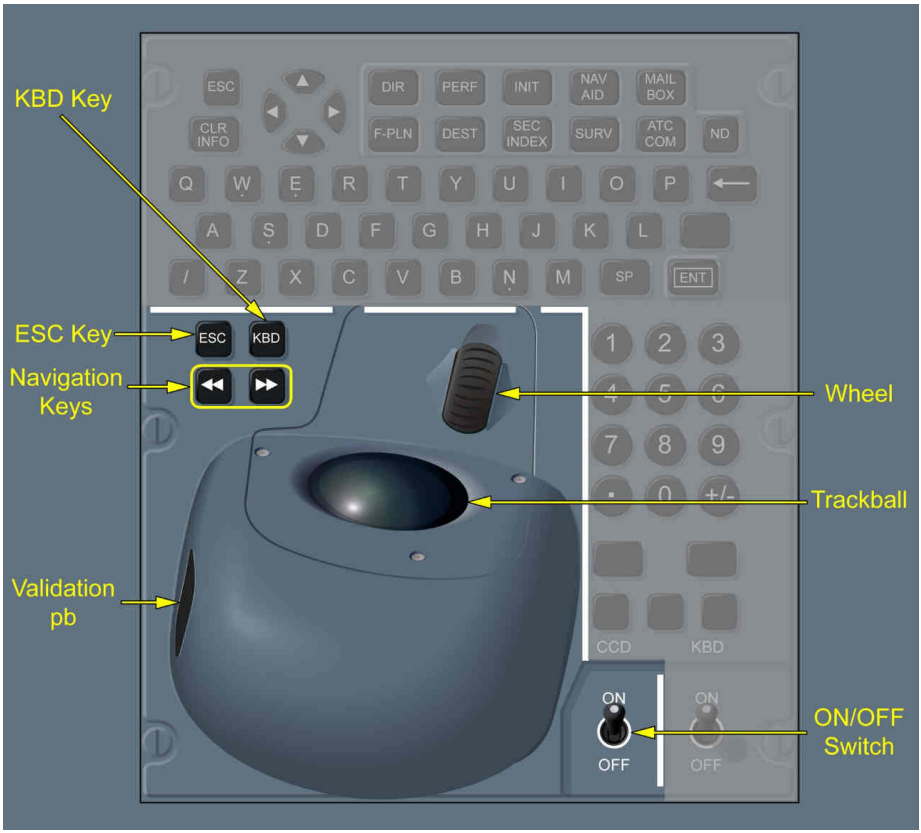
DIRECTION ARROW KEYS

- Move the cursor from one field to another in the direction of the pressed key. The cursor remains in the selected display unit.
  These keys operate in the same way as the trackball on the cursor control device.
- Move the blue selection box in the option-list, in the direction of the pressed key. These keys operate in the same way as the wheel on the cursor control device.

CURSOR CONTROL

Applicable to: ALL

Cursor Control



The cursor control device has:
- One wheel
- One trackball
- One ON/OFF sw
- One Validation pb
- Two navigation keys

- One ESC key
- One KBD key.

WHEEL

Enables the flight crew:
- To change the selection in an option-list
- To scroll to a specific page display, for example, to the F-PLN or to the message list
- To increment a value in an entry field.

TRACKBALL

Operates the same way as the direction arrow keys on the keyboard. Enables the flight crew to move the cursor over the interactive section of the selected display unit.

ON/OFF sw

The KCCU cursor control device is active.

The KCCU cursor control device is not active.

Validation pb

Operates the same way as the ENT key of the keyboard.

Enables the flight crew to:

- Edit an entry field:
  - The cursor is positioned in the field, and is ready for a new entry
  - When data is entered, another click validates the entry, and the cursor moves to the field, or to the action-button, that is most likely to be used next.
- Edit an option-list:
  - The option-list opens to the first option that is selected
  - The flight crew uses the wheel, or the direction arrow keys, to change the selected option, if required
  - Another click validates the selection, and the cursor moves to the field, or to the action-button, that is most likely to be used next.
- Activates an action-button.

NAVIGATION KEYS

Moves the cursor to the display unit that is to the right, or to the left, of the one that is currently selected (if applicable).

ESC KEY

When pressed, cancels the current field edition. The field returns to the last valid value.
There is a similar key on the keyboard.

KBD KEY

L12

When pressed, displays the soft keyboard on the MFD.
By default, it appears in the lower part of the MFD, unless the field to be edited is in the lower part of the display unit.
The soft keyboard acts a backup to the KCCU keyboard.
When pressed again, the soft keyboard disappears from the MFD.

Note: *If the keyboard fails, or is switched off, the soft keyboard automatically appears, when the flight crew modifies an entry field.*

LOSS OF KEYBOARD

Applicable to: ALL

KEYBOARD BACKUP

In case of a total or partial loss of the keyboard, the flight crew can use a soft keyboard as a backup.

The soft keyboard has:
- Alphabet softkeys
  "A" to "Z" keys, organized in a "QWERTY" layout.
- Numeric softkeys
  "0" to "9", "." (decimal point) and "+/-" (plus and minus) keys.
- A CLR softkey
- An ENT softkey
- A "/" (slash) softkey
- An SP softkey
- An ESC softkey
- N, E, S, W softkeys
  These insert cardinal points. There is a dot under these letters. This dot helps the flight crew to easily find these keys.
- Left and right arrow softkeys
  These softkeys operate in the same way as the left and right keys of the direction arrow keys.

SOFT KEYBOARD DISPLAY

The soft keyboard appears in either the upper, or lower, part of the MFD:
- Automatically, if the hard keyboard fails, as soon as the flight crew edits any field
- If the flight crew presses the KBD key on the cursor control device.

It appears in the lower part of the MFD by default, unless the field to be edited is in the lower part of the display unit.

Note: The soft keyboard cannot be used to edit an entry field on the ND, even if the flight crew can continue to interact with the ND, via the cursor control device.
Therefore, when the hard keyboard fails, it is not recommended to access the FMS functions via the ND, but to use the MFD instead.

SOFT KEYBOARD EXIT

The soft keyboard is no longer displayed on the MFD:

- When the flight crew presses the ENT key or the ESC key
- When the flight crew presses the KBD key on the cursor control device, while the soft keyboard is displayed

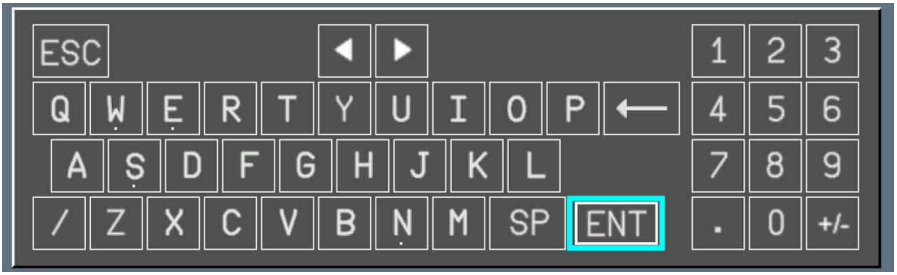
L3 *Note: Pressing the KBD key to remove the soft keyboard from the MFD, will leave the cursor in its current position.*

L1 - In case of a display unit reconfiguration involving the MFD.

USE OF THE SOFT KEYBOARD

When the soft keyboard is displayed, the “ENT” softkey is highlighted by a blue outline around the softkey.

Soft Keyboard



The blue box highlights the currently-selected softkey. The flight crew can change the selection with the trackball of the cursor control device.
Only one softkey is highlighted at a time.
When the flight crew presses the cursor control Validation pb, the selected character is entered in the active entry field.

ECAM ALERTS

Applicable to: ALL

CDS CAPT (F/O) CURSOR CTL FAULT (*Refer to Procedure*)

CDS CAPT (F/O) CURSOR CTL+KEYBOARD FAULT (*Refer to Procedure*)

CDS CAPT (F/O) KEYBOARD FAULT (*Refer to Procedure*)

CDS CAPT (F/O) MAILBOX ACCESS FAULT (*Refer to Procedure*)

ELECTRICAL SUPPLY

Applicable to: ALL

System	Subsystem	Electrical Supply
KCCU	CAPT KCCU Keyboard	DC ESS / DC 1
	CAPT KCCU Cursor and Control Device	DC ESS
	F/O KCCU Keyboard	DC 1 / DC 2
	F/O KCCU Cursor and Control Device	DC 2

Intentionally left blank

GENERAL

Applicable to: ALL

Electronic Centralized Aircraft Monitoring (ECAM) provides necessary information to the flight crew, for both normal and abnormal operations. It displays this information on the:

- Engine and Warning Display (EWD):
  For normal checklists, abnormal and emergency procedures, limitations, and memos
- System Display (SD):
  For system displays, aircraft status, and permanently-displayed data
- Primary Flight Display (PFD):
  For limitations that have an immediate impact on the flight, or to increase the flight crew awareness on memos.

ECAM ARCHITECTURE

Applicable to: ALL

The ECAM has:

- Two FWS s

L2 These FWS s collect data from aircraft systems, and trigger applicable alerts. When an alert is triggered, the FWS s send the information for display to the display units.

L1 - An ECAM Control Panel (ECP)

L2 The flight crew uses the ECP to interface with the ECAM .

L1 - Four attention-getters, referred to as master-lights.

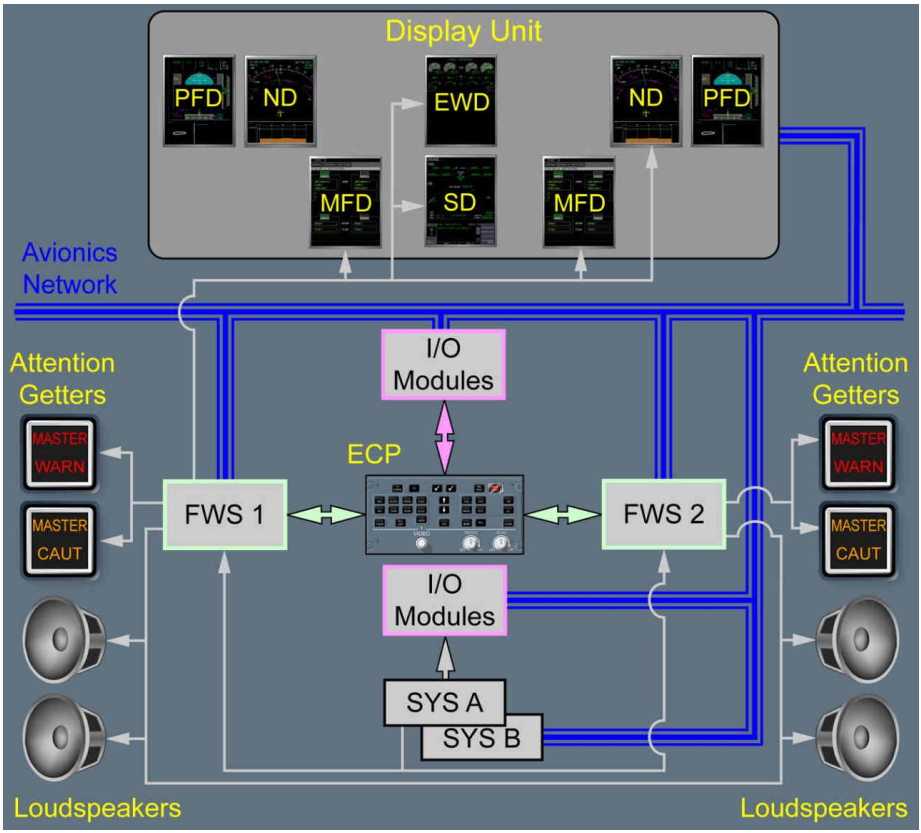
L2 These master lights include two MASTER CAUT lights, and the two MASTER WARN lights, that are on the cockpit glareshield.

L1 - Four loudspeakers

L2 There are two loudspeakers on the Captain's side, and two on the First Officer's side.

L1 - Can display information on the EWD , the SD , and the PFD .

ECAM Architecture



FLIGHT WARNING SYSTEM (FWS)

The ECAM monitors most aircraft systems, triggers alerts, and provides operational information to the flight crew.

The ECAM has two identical FWS s that:

- Monitor aircraft systems, and aircraft configuration.
  Both FWS s receive information from aircraft systems, and compute alerts (warnings and cautions) in real time.

L3 The FWS receives this information directly, via the avionics network. Systems that do not support direct avionics network connection, transmit the parameters via the assigned IMA input/output modules.
In the case of an avionics network failure, conventional buses ensure direct communication, and act as a backup between the ECAM and specific systems.

L1 - Operate independently, and in parallel. Therefore, if one FWS fails, the remaining FWS is sufficient to perform all functions, and there is no operational impact.
- Trigger failure messages and applicable alerts, and manage alert priority and flight phase inhibition (*Refer to DSC-31-40-10 Alert Types and Levels*).
  The ECAM also computes the flight phases that determine when alerts are displayed, if required.
- Display recovery procedures and, if required, associated limitations, aircraft status, memos, and system display pages.
- Produce applicable aural warnings, and visual attention-getters.

L2 These are linked to alerts, and attract the flight crew's attention, or emphasize the severity.

L1 - Provide not-sensed abnormal procedures (not detected by the FWS), when selected by the flight crew via the ECP .

L2 Some system failures that the ECAM cannot detect, or some aircraft configurations, may require the flight crew to access specific procedures. The flight crew can manually display this procedure on the EWD , by using the ABN PROC pb on the ECP .

L1 - Provide normal checklists, when requested by the flight crew.

L2 The flight crew can, at any time, display the normal checklists, and the deferred procedures, if any, by using the C/L pb on the ECP .

L1 If procedures are deferred to all phases or to the approach or landing phases, these deferred procedures will automatically appear during the approach phase.

- Emit automatic altitude callouts and audio indicators.

L3 The two FWS s are installed on two distinct CPIOM-C s.

L1 Each FWS has three databases:

- A database with all ECAM procedures of a FWS standard, abnormal, emergency, normal checklists (C/L), memos and limitations

L3 This database contains all the logics and procedures to ensure ECAM functions.

L1 - A temporary quick change database, to enable Airbus to update ECAM procedures in between two FWS standards, if necessary.
This database is also referred to as the Airbus Temporary Quick Change (ATQC) database.
An ECAM procedure modified, or updated via the ATQC database is temporary, and remains applicable until the appropriate technical solution is applied to the aircraft (new FWS standard, or new system standard).

L3 The ATQC enables Airbus to:
- Modify abnormal and emergency procedures
- Modify aircraft status, memos and limitations.

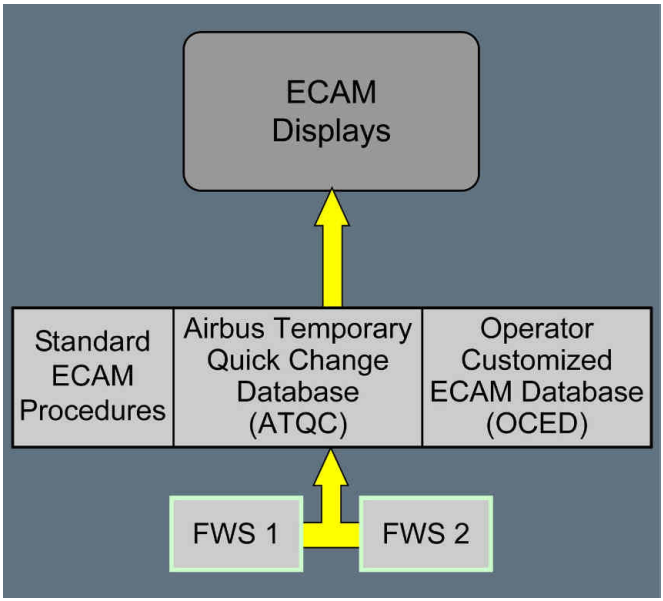
L1 - A customization database, to enable Operators to customize some of the ECAM procedures, if necessary.
This database is also referred to as the Operator Customized ECAM Database (OCED).

L3 The OCED enables Operator to:
- Modify the normal C/L
- Add not sensed abnormal procedures
- Add more information to a not sensed abnormal procedure or to an alert.

- The ATQC and the OCED databases have separate domains. Any parts of the ECAM procedures that are modified by one database, ATQC or OCED , cannot be modified by the other database.

L1 All ECAM displays take the three databases into account.
- If the ATQC database is not compatible with the FWS standard, the ECAM alert FWS ATQC DATABASE REJECTED is triggered on ground only at electrical power-up. For more information on this alert *Refer to DSC-31-40-60-10 FWS ATQC DATABASE REJECTED*
- If the OCED database is not compatible with the FWS standard, the ECAM alert FWS AIRLINE CUSTOMIZATION REJECTED is triggered on ground only at electrical power-up. For more information on this alert *Refer to PRO-ABN-ECAM-10-31-165 FWS AIRLINE CUSTOMIZATION REJECTED* .

FWS Databases



ECAM CONTROL PANEL (ECP)

The ECAM Control Panel (ECP) enables the flight crew to:

- Select and interface with the procedures and checklists displayed on the EWD
- Select the system display pages
- Control the video system.

Refer to DSC-31-40-20-AAA ECAM Control Panel .

ATTENTION-GETTERS

There are two attention-getters on the glareshield of each flight crew member's station: One MASTER WARN light , and one MASTER CAUT light , depending on the severity of the failure. These attention-getters inform the flight crew of an alert.
When pressed, the lights go off and the associated aural warnings stop.
MASTER WARN flashes in the case of emergency situations (e.g. emergency procedure displayed on the EWD).
MASTER CAUT lights up in the case of abnormal situations (e.g. abnormal procedure displayed on the EWD).

Note: *In the case of multiple failures, both MASTER WARN lights and MASTER CAUT lights may come on at the same time.*

Refer to ECAM - Glareshields Controls .

LOUDSPEAKERS

There are four loudspeakers in the cockpit: Two on the left, and two on the right side of the cockpit.
The loudspeakers can emit audio indicators, including synthetic voice messages.

Note: *1. The volume control knobs of the loudspeakers cannot adjust the volume of FWS audio indicators. These knobs can only adjust the volume of radio communication broadcasts.*
2. The ECAM controls the emission of aural indicators by managing priorities.

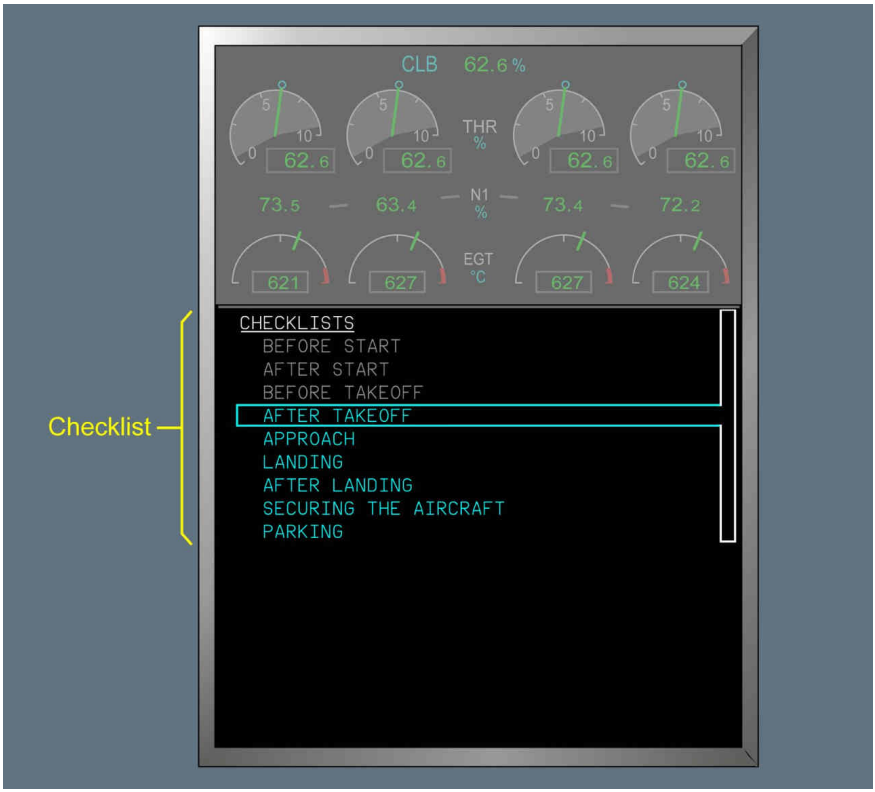
DISPLAY UNITS

The ECAM displays information on the Display Units:
- Engine and Warning Display (EWD)
- System Display (SD)
- Lower part of the Primary Flight Display (PFD).

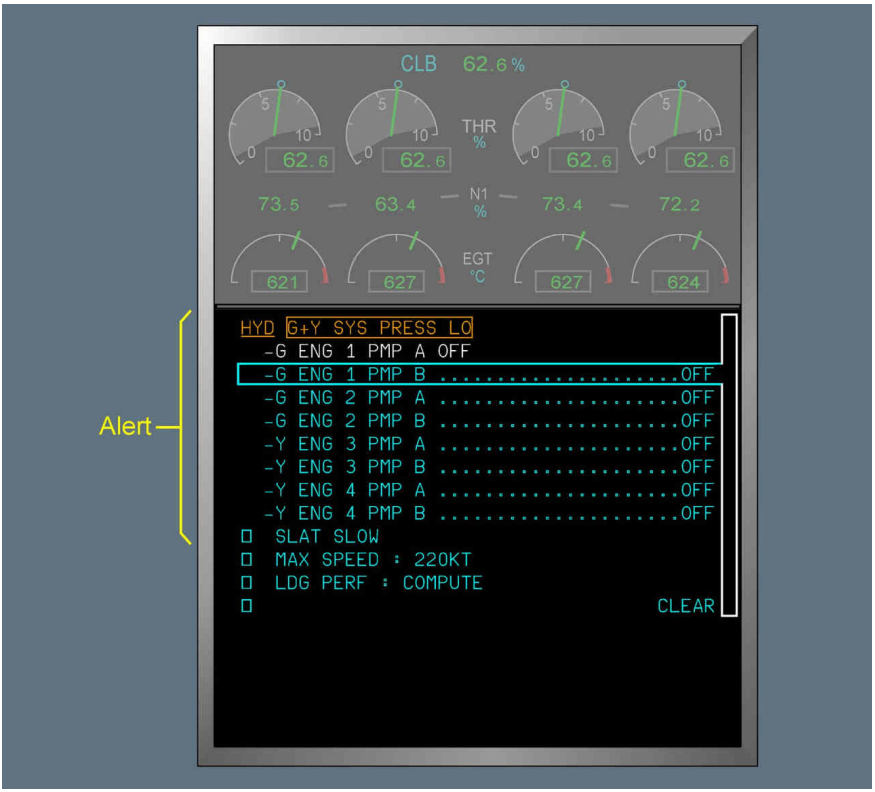
EWD

The EWD displays alerts, not-sensed procedures, memos, and checklists. *Refer to ECAM Display on the EWD* .

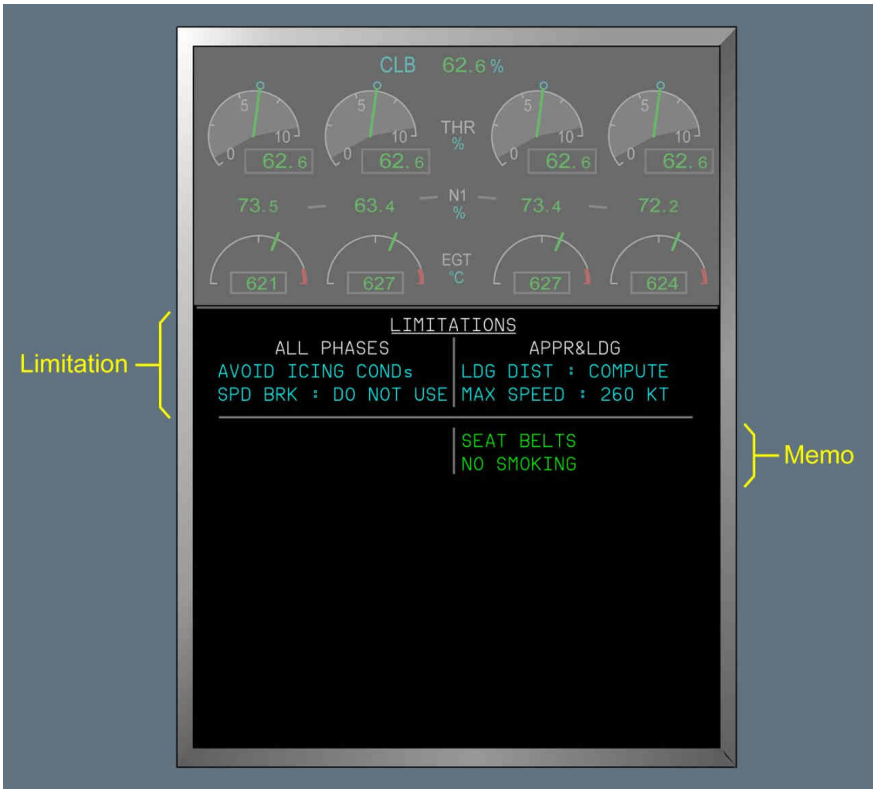
Checklist Display on the EWD



Alert Display on the EWD



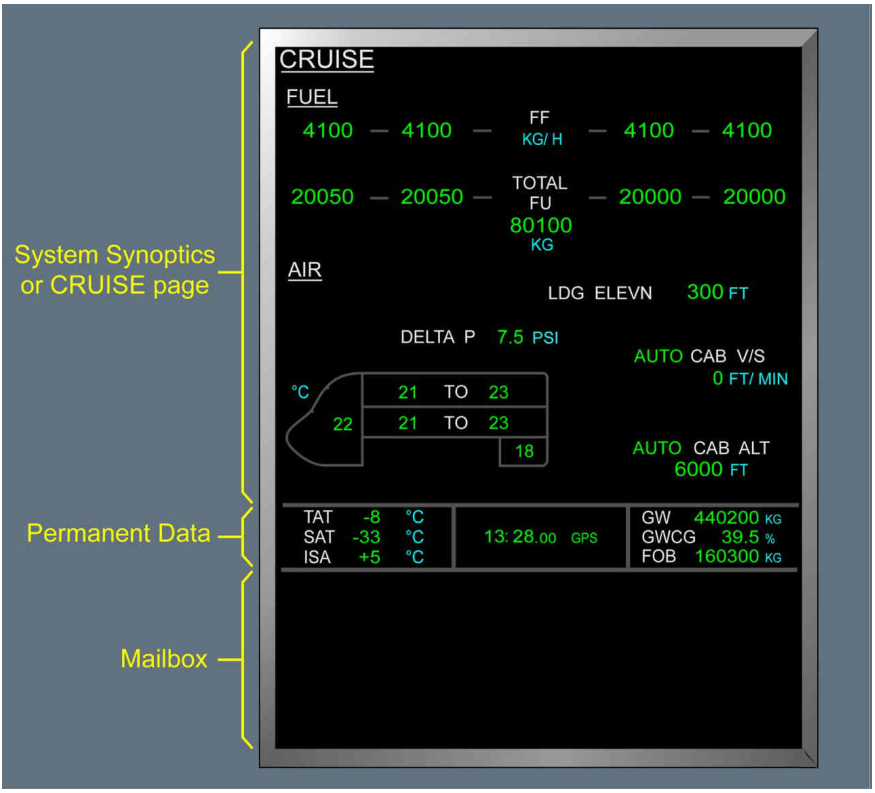
Memo and Limitation Display on the EWD



SD

The SD displays aircraft status, STATUS pages, and system pages. *Refer to ECAM Display on the SD* .

ECAM Display on the SD — GENERAL



PFD

The lower part of the PFD displays memos (*Refer to DSC-31-40-10 Memos*) and limitations (*Refer to DSC-31-40-10 Limitations*).

ECAM on the PFD — General

ECAM COLOR CODES

Applicable to: ALL

The ECAM displays information in various colors. Each color indicates the importance of the displayed information, or of the failure.

RED
- For configurations, or failures, that require immediate action.
- For specific limitations (e.g. LAND ASAP), or specific memo items (e.g. AP OFF).

AMBER	- For configurations, or failures, that the flight crew should be aware of, but that do not require immediate action. However, when time and situations permit, these cautions should be considered without delay, to prevent any further degradation of the affected system or of any other related system. - For specific limitations (e.g. LAND ANSA), or specific memo items (e.g. A/THR OFF).
GREEN	- For information in the procedure, or in the STATUS page. - For checklist items completed by the flight crew. - For memo items.
WHITE	- For a procedure completed by the flight crew. - For submenus, condition lines, and titles. - For more information item on the STATUS MORE page. - For a completed deferred procedure title in the checklist menu.
BLUE	- For actions to be completed, limitations to be followed, checklist items to be checked, or for not completed checklists in the checklist menu.
MAGENTA	- For a specific memo (e.g. TO or LDG inhibition).
GREY	- For checklists completed by the flight crew. - For an action not yet validated by the flight crew (e.g. condition items or a not-sensed procedure that are not activated).

ALERT TYPES AND LEVELS

Applicable to: ALL

ALERT

Alert : An alert is a visual, or aural, signal that helps the flight crew to detect and identify a system fault, the abnormal operation of a system, or a degraded condition of the aircraft.

ALERT LEVELS

The ECAM receives information from aircraft systems, computes alerts (warnings, and cautions) in real time, and displays or sounds these alerts in the cockpit. These alerts are organized, according to their level of importance, and the priority of required actions.

Alert Level	Color	Description	Aural Signals	Visual Signals
Warning (Level 3)	Red	For an emergency situation, that requires immediate flight crew action, because: - The aircraft is in a dangerous configuration, or in a limiting flight condition - Failure of a system that impacts the safety of the flight	Continuous Repetitive Chime (CRC), or a specific sound, or a synthetic voice.	- MASTER WARN light, and/or specific local red light. - Red warning displayed on EWD. - Applicable system page automatically displayed on SD, if any.
Caution (Level 2)	Amber	For an abnormal situation, that the flight crew should be aware of, but that does not require immediate action, because the failure does not immediately impact the flight. However, when time and situations permit, these cautions should be considered without delay, to prevent any further degradation of the affected system, or of any other associated system.	Single Chime (SC)	- Steady MASTER CAUT light. - Amber cuation displayed on EWD. - Applicable system page automatically displayed on SD, if any.
Caution (Level 1)	Amber	For a situation that requires the flight crew to be informed (crew awareness), but does not require a flight crew action (e.g. redundancy loss, or system degradation).	None	Amber caution message displayed on EWD without a procedure.

PRIORITY OF ALERTS

There are three levels of priority associated with warnings and cautions:

- Warnings (level 3)
- Caution (level 2)
- Caution (level 1).

Level 3 warnings have priority over level 2 cautions, that have priority over the level 1 cautions. In addition, if the ECAM detects multiple alerts that have the same level, it displays these alerts in their descending order of priority. In all cases, the ECAM will first display the alert that has the highest priority, and that should be treated first.

ALERT TYPES

There are three different types of alerts. They are classified by their potential impact on other systems.

Alert Type	ECAM Display	Description
Independent	Independent Alert F/CTL PRIM 1 FAULT	For a failure that affects an isolated system, but does not degrade other aircraft systems.
Primary	Primary Failure HYD G SYS PRESS LO	For a failure that affects a system, and causes the loss of other systems, or other system equipments.
Secondary	Secondary Alert *F/CTL	For the loss of a system, or a system reconfiguration , or a system limitation, that is the result of a primary failure. Affected parts of the failed system are indicated on the associated SD page.

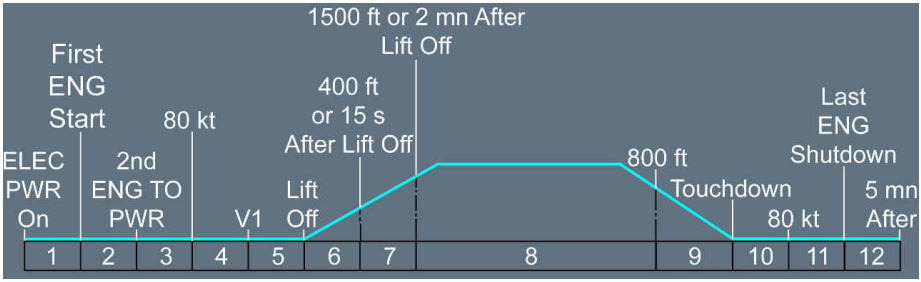
ECAM FLIGHT PHASES

Applicable to: ALL

The ECAM defines the flight phases for each flight.

L2 Each flight is divided into 12 flight phases. Flight phases change according to the aircraft configuration and system input.

Flight Phase Inhibition



L1 The ECAM uses flight phases to improve overall operational efficiency during each flight:
